# CHEMICAL ABSTRACTS

Vol. 23.

JUNE 10, 1929

No. 11

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

**Air separator for the laboratory.** R. E. ZINN. Victor Chem. Works, Chicago. *Ind. Eng. Chem., Anal. Ed.* 1, 112(1929). E. H.

**Mixing apparatus suitable for laboratory use.** G. FRANK. *Chem.-Ztg.* 53, 259 (1929).—A vertical glass tube is provided with a stirrer consisting of a spiral flight on the lower end of a belt-driven shaft. A side-arm, extending from the bottom of the tube to a point just below the top of the flight, permits a circulation of the solns. to be mixed. J. H. MOORE

**Construction and operating principles of the Frederking apparatus.** H. WINKEL-MANN. *Chem. Fabrik* 1929, 111-3.—In the construction of app. for evapg., drying, distg., subliming, etc., the use of double walls gives rise to the hazards of ordinary boilers; hence these forms must comply with certain legal requirements. In the Frederking app. cast-iron construction is employed, with coils cast directly into the vessels in such a way that the walls of the app. are not subjected to strain thereby. Good heat transfer, economy, long life, adaptability to varied operating conditions, etc., are claimed. W. C. EBAUGH

**The lighting of balances.** J. A. M. VAN LIEMPT. Philips Gloeilamp-fabrieken, Eindhoven. *Chem. Weekblad* 26, 149(1929).—An oblong window display type of bulb and reflector are set on top of the balance case. G. CALINGAERT

**Light source devised by Auer von Welsbach.** K. WURM. *Z. wiss. Phot.* 25, 365-79(1928).—The older source of light used by Welsbach has been described in Kayser's *Handbuch der Spectroskopie*, Vol. 1. The present instrument consists of 2 electrodes, one of which is fastened to one arm of a lever, which vibrates in such a way that the spark gap is rapidly opened and closed. The instrument has been used with a concave grating and the spectra of various metals studied. No lines were found which had not already been observed in arcs and sparks. M. E. RUSSELL

**A new type of conductivity cell.** A. LOTTERMOSER AND E. BUCHHOLZ. Tech. Hochschule, Dresden. *Z. angew. Chem.* 41, 1181-2(1928).—The type of cell especially suited for the detn. of the change of cond. of a soln. over a long period of time while maintained at const. temp. is described.

J. H. PERRY

**A motorless circulator for liquids.** CHARLES RECORD.

*J. Sci. Instruments* 5, No. 9, 299-300 (1928).—Three forms of app. suitable for circulating or agitating liquids without a motor or moving parts, but using a water suction pump, are described. The ends of the tubes B and C are placed in the liquid to be circulated, the end of B being lower than that of C. Upon aspirating through D, the liquid rises in B and C until its surface in the vessel is lowered to the bottom of C, the chamber A being partly filled. Air then enters through C, and continues to carry liquid up with it, the liquid returning down B. Liquids may be raised several feet to A. If B and C are of equal bore, the

then enters through C, and continues to carry liquid up with it, the liquid returning down B. Liquids may be raised several feet to A. If B and C are of equal bore, the

action is intermittent, which is satisfactory for agitation. For one-way circulation  $C = 8-10$  mm. and  $B = 5-6$  mm. diam.; the level in  $A$  remains const.

**A new melting-point apparatus.** F. KERCKOV. *Chem.-Zig.* 53, 219(1929).—A hard-glass tube bent at a right angle is placed with the short arm at the bottom. This arm is insulated and contains an elec. heating spiral over which air is blown. The thermometer with melting tube attached is immersed in a small glass tube contg. paraffin oil and lowered into the vertical arm of the app. The rate of heating is controlled by the current.

**Abolishing the Baumé hydrometer.** TH. WALLIS. *Chem. Fabrik* 1929, 135-6.—W. advocates replacing the Bé. with one giving sp. gr. readings, and proposes 20° as the standard temp.

**A modern factory refractometer.** W. EWALD. *Chem. Fabrik* 1929, 133-5.—The Askania universal refractometer is described with 2 cuts.

**A novel self-recording apparatus for determination of the expansion of solids.** WILLI M. COHN. Kaiser Wilhelm Inst. Silikatforschung Berlin-Dahlem. *Z. tech. Physik* 10, 103-6(1929).—The app. of Braun (*C. A.* 21, 343) for the detn. of thermal expansion was provided with a photographic recording device. By a suitable use of prisms and a mirror on the galvanometer, which registers the temp. of the object, direct photographic curves of expansion vs. temp. can be detd. in a range up to 800°. The app. is described in detail with photographs.

**Apparatus for the determination of benzene by the activated-carbon method.** HEINE. TRAMM. *Chem. Fabrik* 1929, 113-4.—A sturdy form of app., requiring little supervision, yet yielding accurate results, consists of a cylindrical vessel for contg. activated carbon, a steam generator and superheater and a condenser, all contained in a completely enclosed Al housing, which is supported by a frame of angle-iron. Gas to be tested is dried ( $\text{CaCl}_2$ ), purified from S (Fe-purifier) and then passed in measured quantities through the app. To recover the  $\text{C}_6\text{H}_6$ , superheated steam (about 200°) is passed through the activated C, the distillate condensed and the vol. of  $\text{C}_6\text{H}_6$  read from a buret. Built-in resistances provide elec. heating for boiler and evaporator.

**An apparatus for the combined determination of benzene and benzene in the atmosphere.** P. ANDREIEV. *Chem. Fabrik* 1929, 147-9.—Description and directions are given for operating an app. for recovering with great accuracy, by cooling and absorption, hydrocarbons from the air in practically unaltered condition so that they can be examd. and identified.

**Self-emptying suction flask for sugar determinations.** GILBERT PITMAN. Fruit Products Lab., Univ. Calif. *Ind. Eng. Chem., Anal. Ed.* 1, 112(1929).

**Contribution to the history of the counter-current cooling apparatus.** MAX SPETER. *Chem. App.* 16, 59-61(1929).—Numerous references are given.

**Gas-burner design.** WALTER SCHLECHTRIEM. *Gas u. Wasserfach* 72, 222-8(1929).—Gas-burner design is discussed with respect to the kinetic energy of the gas, injector action of the burner and gas velocity. Simple formulas are developed for the design of burner units and burner opening size, area of air inlets and pressure relations calcd. for a typical burner.

**Water heating by electricity at The Hague.** G. J. T. BAKER. *Elec. World* 93, 790-2(1929).—Six illustrations.

**Electric water-heating developments.** M. O. F. ENGLAND. *Electrician* 102, 385(1929).

**1000 kw. electric steam boiler for heating service.** J. B. KITCHEN. *Elec. News* (Toronto) 38, 45(1929).

**Utility shaking machine.** W. M. SHAW. *Ind. Eng. Chem., Anal. Ed.* 1, No. 2, 93(1929).—S. describes a shaking app. of simple construction and large capacity, adaptable to different types and sizes of containers. A system of trays and overhead clamps are arranged radially about a shaft every sixty degrees, propelled by a small electric or water motor with intervening countershaft.

**Spasskii's extraction apparatus.** A. MOSHKIN. (N. Novgorod.) *Masloboino Zhirovoe Delo* (Oil & Fat Ind. (Russia)) 1928, No. 1, 18-9.—Polemical (*cf. C. A.* 22, 4275).

**The steam pressure converter; an innovation in the field of heat technic.** J. HAUSEN. *Chem. App.* 16, 69-71(1929).—A discussion of some of the possibilities of E. Koenemann's process for utilizing the heat in exhaust steam (*cf. Chem. App.* 1926, 73).

**New construction of chlorine compressor, with elimination of the heretofore**

necessary confining liquid and gas loss, in multistage compressing operations. KIRSCH. *Chem. Fabrik* 1928, 547.—A 3-stage compressor built by Amag-Hilpert-Pegnitzhütte, Nürnberg, is described. J. H. MOORE

The treatment of metals and ores in a current of chlorine. ROLAND WASMUHT. *Tech. Hochschule, Aachen. Chem. Fabrik* 1929, 121-2.—A train of app. for the chlorination of ores and metals is described and illustrated. Cl and N are passed through drying and purifying trains and then led at will through a tube of glass or SiO<sub>2</sub> placed in an elec. furnace, mounted on rollers so that it can be used at any part of the tube, provided with 3 independent windings for the better regulation of temps., and then connected with condenser or sublimate chamber and an outlet to the hood. The said chamber is retort-shaped and so adjusted that the gas stream follows a circuitous path around its walls before reaching the exit tube, which is fused through the wall and projects into the chamber. The whole app. is built in duplicate so that 2 detns. can be carried out simultaneously. W. C. EBAUGH

Plastic cellulose in scientific research. K. HICKMAN AND D. E. HYNDMAN. *Kodak Research Lab. J. Franklin Inst.* 207, 231-44(1929).—Directions, with 24 cuts, for constructing app. from pyroxylin and cellulose acetate sheeting. J. H. MOORE

The dynamometer of Pierre Breuil. ANON. *Caoutchouc & gutta-percha* 26, 14405-34(1929) (In French and English); cf. following abstrs.—An illustrated description of the Breuil dynamometer, with the technic employed for stress, strain, compression, bending, abrasion, friction and puncture tests of various materials, particularly rubber goods and fabrics. Quant. data are given for tests of rubber and fabrics under various conditions, including stress-strain curves, and the influence of hot and cold conditions on the phys. properties of vulcanized rubber. In studying the influence of temp. (from -10° to 100°), static stress, momentary stress, alternating stress and release, static compression, momentary compression, elasticity, hardness and abrasion tests were made on the rubber samples. In general, the lower the temp. the harder and stronger the rubber and the less its extensibility. With a rubber-S (95-5) mixt., however, the greatest elongation was at 10°. The residual elongation after rupture varied little with the temp. After repeated stresses, rubber samples showed strains which diminished with increase of temp. The compressibility varied but little with temp., except for hard rubber. At 100° the latter softened and behaved like loaded rubber with a low S content. C. C. DAVIS

The elasto-durometer of Pierre Breuil. ANON. *Caoutchouc & gutta-percha* 26, 14434-42(1929); cf. preceding abstr.—An illustrated description of the app., with quant. data on the elasticity and hardness of rubber mixts. tested by this contrivance. With this elasticity test, the elasticity of soft vulcanized rubber samples diminished with lowering of the temp. The hardness diminished with increase in temp. This test is also capable of distinguishing between different grades of raw rubber. C. C. DAVIS

Use of the elasto-durometer of Pierre Breuil for determining the hardness of metals and other materials by the height of rebound of a steel ball. ANON. *Caoutchouc & gutta-percha* 26, 14442-6(1929); cf. preceding abstrs.—Small differences among various steels or other materials, which cannot be distinguished by the Brinell hardness test, are readily measured by the Breuil elasto-durometer. Quant. data on a large no. of samples are given to show the results obtained. C. C. DAVIS

Aging phenomena in quartz mercury-vapor lamps. W. MEYN. *Z. wiss. Phot.* 25, 345-53(1928).—The decrease of intensity of quartz lamps was investigated by a simple photometric method. This decrease depends on the no. of hrs. the lamp is used. The absorption is caused by a 0.1 mm. thick layer of colored quartz at the inner side of the lamp. A. P. H. TRIVELLI

Automatic control in the chemical industries. ISMAR GINSBERG. *Ind. Eng. Chem.* 21, 410-4(1929).—A discussion of different types of automatic indicating and controlling devices. M. C. ROGERS

Cylinder testing and I. C. C. regulations. H. E. STÜRCKE. *Bull. Compressed Gas Manufs. Assoc., Tech. Series* 1928, 347-58.—Test data and conclusions are given for testing gas cylinders. M. C. ROGERS

Cylinders for liquefiable gases. H. C. H. CARPENTER. *Dept. Sci. Ind. Research, 4th Rept. Gas Cylinders Research Committee*, 151 pp.—Recommendations for cylinders to be used with liquefiable gases are given. Methods of testing and data taken in tests are also given. M. C. ROGERS

Alloy-steel light cylinders. H. C. H. CARPENTER. *Dept. Sci. Ind. Research, 3rd Rept. Gas Cylinders Research Committee*, 74 pp.—Recommendations for light cylinders of nickel-chromium-molybdenum steel used for storing permanent gases are given with an appendix showing exptl. work. M. C. ROGERS

**New device favored for identifying colors.** W. C. HOLMES. *Am. Dyestuff Reprtr.* 18, 2-3(1929).—See *C. A.* 23, 736.  
T. G. HAWLEY, JR.

Molecular measurements by the optical lever (BOND) 2. Effective diameter and molecular structure of the pseudo-rare series:  $\text{Ne-HF-H}_2\text{O-NH}_2\text{-CH}_3$  (BRUCHÉ) 2. The metastability of the elements and compounds as a result of enantiotropy or monotropy. XIII. The differential gas dilatometer of C. J. Smith and its accuracy (COHEN, BRÉDÈS) 2. Estimation of unsaturated hydrocarbons in gases (DAVIS) 7.

FURTH, A.: *Die Werkstoffe für den Bau chemischer Apparate.* Leipzig: Otto Spamer. 220 pp. M. 18. Reviewed in *Génie civil* 93, 492(1928).

**Filters.** ÉDOUARD H. LABITOTIÈRE. Fr. 649,101, Feb. 15, 1928. A filter for liquids of high viscosity, particularly for substances used in the manuf. of synthetic textiles, consists of removable candle-shaped filtering elements, which can be removed for cleaning without stopping the operation of filtering.

**Filters.** LEONHARD KAISER. Swiss 129,269, Oct. 27, 1927. A filter mass is prepd. by mixing unvulcanized caoutchouc with a filling material such as prepd. chalk.

**Filters.** S. C. SMITH. Brit. 298,172, April 5, 1927. Filters such as those of the rotary drum type for filtering corrosive liquids in the treatment of complex ores (as described in Brit. 264,569, *C. A.* 22, 143) are formed with a protecting medium such as a perforated rubber sheet or a mesh fabric of rubber cords or rubber-coated wire. Various structural details are described.

**Rotary filter for liquids.** J. B. VERNAY. Brit. 297,394, Sept. 20, 1927. Structural features.

**Filter for viscous liquids.** ALFRED MAURER. Swiss 129,574, Nov. 23, 1927. The liquid passes along the small spaces left between the surfaces of groups of contiguous cylinders.

**Filter for oil.** SOC. ANON. DES ÉTABLISSEMENTS TECALEMIT (to Tecalemit, Ltd.). Brit. 298,197, Oct. 5, 1927. Structural features.

**Filter for oils, gasoline, or other liquids.** JOHN TEKAVEC. U. S. 1,709,237, April 16. Structural features.

**Filter press.** B. GOWSHALL. Brit. 298,282, July 12, 1927.

**Filter press.** PAUL G. HOLLSTEIN (to J. M. Lehmann Co.). U. S. 1,709,349, April 16.

**Filter press.** F. B. LEHMANN (trading as the firm of J. M. Lehmann). Brit. 297,354, Sept. 19, 1927.

**Filter presses.** SOC. E. GEOFFROY ET G. FERNIN. Fr. 648,118, Feb. 3, 1928. Construction of gratings.

**Apparatus for gravity separation of oil and water.** B. D. COMYN and L. ROTTENBURG. Brit. 297,936, Aug. 25, 1927.

**Apparatus for separating liquids such as oil and water by gravity.** B. D. COMYN and L. ROTTENBURG. Brit. 297,551, Aug. 10, 1927.

**Apparatus for gravity separation of liquids of different specific gravities such as oil and water.** HARRISON S. COE (to Dorr Co.). U. S. 1,709,971, April 23.

**Tank and baffle apparatus for separating oil and gas.** WILLIAM G. McMURRAY (to M. & V. Tank Co.). U. S. 1,710,178, April 23.

**Device for removing suspended particles from air or other gases by centrifugal action.** A. C. SPARK PLUG CO. Brit. 297,870, June 29, 1927.

**Filtering apparatus suitable for separating solids from gases.** CLARK C. BOARDMAN (to Theromatic Carbon Co.). U. S. 1,710,469, April 23.

**Device for distributing liquids to filter beds, etc.** W. W. LEINERT. Brit. 298,253, May 7, 1927.

**Apparatus for indicating the loss of head of liquids passing through filter beds, etc.** W. PATERSON. Brit. 298,170, April 4, 1927.

**Apparatus for separating materials of different densities by combined vibration and pneumatic pressure.** G. RAW. Brit. 297,757, May 26, 1927.

**Apparatus for separating different mineral particles by shaking and pneumatic treatment.** H. M. SUTTON, W. L. STEELE and E. G. STEELE. Brit. 297,876, June 30, 1927. An app. is described suitable for sepg. coal from slate.

**Apparatus for purifying air from compressors, fans, etc., by baffling and filtration.** W. H. TAYLOR and C. SHAW. Brit. 297,510, June 29, 1927.

**Apparatus for removing oil vapors, etc., from compressed air.** FERDINAND E. LAMBERT. U. S. 1,709,530, April 16.

**Rotary pulp-straining apparatus.** J. WHITE. Brit. 298,045, March 31, 1928. Structural features.

**Rotary pulp-straining apparatus.** J. WHITE. Brit. 297,649, March 31, 1928.

**Stainless-steel shaking sieve for separating solids from liquids as in coal washing or similar operations.** SIMONCARVES, LTD., and V. H. ADAMS. Brit. 297,511, June 30, 1927. Various structural features are described.

**Elutriation apparatus for testing samples of granular materials.** L. ANDREWS. Brit. 297,369, June 14, 1927.

**Hydrometer for testing the density of liquids.** CHARLES W. FOULK (to Kauffman & Lattimer Co.). U. S. 1,709,258, April 16. A calibrated tube open at its lower end contains a float, which has attached to it a chain, also attached to a projection from the lower end of the calibrated tube.

**Hydrometer and thermometer box and associated features for testing the specific gravity and temperature of circulating lubricating oil or other liquids.** ROBERT H. MANCHSTER and LEONARD W. ELY. U. S. 1,709,139, April 16. Structural features.

**Gas-stream protective device for radiation pyrometer lenses.** SIEMENS & HALSKE A.-G. Ger. 473,064, Sept. 18, 1927. Addn. to 392,571.

**Catalytic apparatus.** H. HARTER. Brit. 298,108, July 1, 1927. An app. for oxidation of  $\text{NH}_3$  for production of  $\text{CH}_4$  from  $\text{CO}$  and  $\text{H}_2$  for production of  $\text{H}$  and  $\text{CO}_2$  by decompn. of hydrocarbons with steam, or for production of  $\text{CH}_2\text{O}$  from  $\text{CH}_4$ , etc., consists of a rotary fan, bladed wheel, or impeller, which is formed of, or has applied to it, a catalyst such as Pt; it may be electrically heated and is supplied with pipes through which a reacting gas is introduced. Cf. C. A. 22, 3556.

**Photometric apparatus utilizing a photoelectric cell.** J. NEALE. Brit. 298,094, April 2, 1927.

**Röntgen-ray tube.** NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 297,587, Oct. 31, 1927. Structural features.

**X-ray apparatus.** ARTHUR MUTSCHELLER (to Wappler Electric Co.). U. S. 1,709,866, April 23. Structural features.

**Thermionic valve.** SOC. FRANÇAISE DES LAMPES À INCANDESCENCE LUXOR. Brit. 298,083, Oct. 1, 1927. In a valve suitable for operation with a.c., a cathode comprises an inert filament coated with a suitable oxide or other material capable of emitting electrons at relatively low temp. •

**Thermionic valves.** FRANÇOIS PERI. Fr. 648,178, June 11, 1927.

**Electric discharge tubes for use as rectifiers.** A. GEHRTS. Brit. 298,120, June 29, 1927. Tubes comprise a filling of A, N, or other gas inert to the anode or Hg vapor at a pressure of "some hundredths of a mm. to 100 mm." and have a cathode of an alloy or mixt. of Mo with Th, U, Ti, or their compds. increasing electron emission as described in Brit. 230,492, Brit. 234,435 and Brit. 237,270. Zr, Ta, W and other suitable metals may be added to delay recrystn. of the Mo. Thoriated Mo, if used, requires no activation by heat treatment.

**Crystallizers.** AKTIESELSKAPET KRYSTAL. Fr. 648,701, Feb. 13, 1928. An app. for crystallizing salt, etc., is described in which a soln. supersaturated by evapn. passes down through a pipe and, along with an upwardly directed portion of the soln., which is not or only slightly saturated, passes through granules to deposit crystals and back to the heater.

**Wax sweating and crystallizing apparatus.** THE BURMAH OIL CO., LTD. Fr. 648,265, Dec. 28, 1927.

**Distillation plant.** STANDARD OIL DEVELOPMENT CO. Fr. 648,965, Feb. 14, 1928. Plant contg. corrosive substances to be treated at high temps. is lined with a corrosion-resisting alloy, such as an Fe alloy contg. Cr 16-18, Si 1.25-1.75 and C 0.1%, fused to the surface.

**Plant for distilling and concentrating liquids.** ALFREDO PONZINI. Swiss 129,573, Sept. 12, 1927. Details of arrangement.

**Condenser for vacuum drying plants.** THE GENERAL ENGINEERING CO. (RADCLIFFE), LTD., and SIDNEY TAYLOR. Ger. 473,133, Nov. 1, 1925. Corresponds to Brit. 244,233.

**Drying apparatus with endless conveying bands.** HERMANN HAAS. Ger. 473,130, Feb. 18, 1928.

**Endless band evaporating machine for producing dry products from liquids.** KARL W. PFEFFERKORN. Swiss 128,717, Nov. 17, 1927. Details of construction.

**Heating system for apparatus for drying sugar or other finely divided materials.**

EDWARD C. READER and VINCENT P. FINN. U. S. 1,709,154, April 16. Structural features.

Apparatus for drying fabrics, leather, yarns, etc. BARROW, HEPBURN & GALE, LTD., and ALBERT HAWKYARD. Ger. 473,150, Nov. 27, 1926. The materials are suspended in a reciprocated frame. Corresponds to Brit. 266,464 (C. A. 22, 517).

Apparatus for recovery of salts from solutions by evaporation. THE MARTIN-COLVIN Co. Fr. 648,271, Dec. 31, 1927.

Atomizer. HEINRICH JUNGHANS. Swiss 128,594, Sept. 16, 1927. Gaseous media are finely divided by introduction in liquid form into metal tubes with axial slits. The tubes are wrapped with fibrous material and wound with non-oxidizable wire.

Electric manometer for high vacuums. MASCHINENFABRIC OERLIKON. Swiss 128,768, Nov. 30, 1927.

Mercury-vapor pump for high vacuums. AKT. GES. BROWN, BOVERI & CIE. Fr. 649,061, Feb. 15, 1928. Constructional details.

Rectifying apparatus for liquids or gases. ARNOLD FREYMAN. Fr. 648,286, Jan. 5, 1928.

Apparatus for carbonating beverages or other liquids. HENRY J. IRWIN (to Crown Cork & Seal Co.). U. S. 1,709,579, April 16.

Atmospheric gas condenser. W. BLAKELEY. Brit. 298,143, June 28, 1927. Structural features.

Apparatus for purifying gases as by desulfurization with nickel or copper or metal oxides which may be regenerated with air. COMPAGNIE INTERNATIONALE POUR LA FABRICATION DES ESSENCES ET PETROLES (formerly Soc. internationale des procedes Prudhomme Houdry). Brit. 298,236, Oct. 6, 1927. An app. is described which is provided with large radiating surfaces to prevent overheating.

Apparatus for separating solids from distillation gases. TROCKNUNGS-VERSCHEWELUNGS-UND VERGASUNGS- G. M. B. H. Fr. 648,920, Feb. 6, 1928.

Apparatus for impregnating liquids with gases. MAX GUGGENBUHL. Swiss 129,314, Oct. 15, 1927. Details of construction.

Locking device for gas cocks. HARRY M. ROSENBERG. U. S. 1,709,594, April 16.

Automatic pressure-controlled valve suitable for gases or liquids. JACK C. CUNNINGHAM and WILLIAM S. NELSON. U. S. 1,709,119, April 16. Structural features.

Waterless gas holder with a concrete foundation and sealing medium such as sand or tar solution. R. & J. DEMPSTER, Ltd., H. S. KNIGHT, W. S. HUBBARD and WATERLESS GAS-HOLDER Co., LTD. Brit. 298,053, April 14, 1928. Structural features.

Tower gas-scrubber construction. S. E. SPENCER. Brit. 298,360, Oct. 3, 1927.

Metal containers for storing gases and liquids under pressure. R. H. CAMPBELL and SPARKLETS, LTD. Brit. 298,278, July 11, 1927. Structural features.

Safety gas valve. SIMON ROMAN. U. S. 1,710,515, April 23.

Pressure-controlled automatic carbide feed device for acetylene generators. ELMER H. SMITH. U. S. 1,709,885, April 23.

Apparatus for generating acetylene for use in internal-combustion engines. H. GEBHARDT. Brit. 297,337, June 27, 1927. Numerous structural details are described.

Furnace. HUGO BAUER. Ger. 473,046, July 25, 1925. An underfed furnace is described comprising several longitudinal feed troughs along which the fuel is fed by reciprocating bars. The ash is conveyed to the front of the furnace by a rocking chute.

Furnaces. Soc. GENEVE ET CIE. Fr. 649,013, July 4, 1927. Industrial furnaces are made to consume their own smoke by the introduction above the current of flame of either a current of hot air, hot air and steam, or steam alone.

Hearth furnace heated with powdered coal. WITKOWITZER BERGBAU UND EISENHÜTTEN-GEWERKSCHAFT and CARL SALAT. Fr. 648,463, Feb. 6, 1928.

Hearth furnace for melting blast-furnace dust or similar materials. A. DAWANS. Brit. 297,813, Sept. 30, 1927. Structural features.

Furnace for damp fuels. FRANZ HOF. Ger. 473,116, Jan. 25, 1928. Drying and distn. shafts are provided in advance of an inclined grate.

Automatically operated annealing furnace. AKT. GES. BROWN, BOVERI & CIE. Swiss 129,409, Nov. 2, 1927. Details of arrangement.

Crucible furnace and associated gas-burner construction. DEUTSCHE GOLD-UND SILBER-SCHNEIDANSTALT VORM. ROESSLER. Brit. 297,449, Sept. 23, 1927.

Furnace for heating steam generators, retorts, coke ovens, etc. R. HICKTON, W. W. GULEY, G. BIRKS and R. G. HICKTON. Brit. 297,395, March 18, 1927. Structural features.

**Furnace lining.** ARTHUR J. JACKMAN (to Vesuvius Crucible Co.). U. S. 1,709,350, April 16. Structural features.

**Heat-exchange apparatus.** R. SELIGMAN. Brit. 297,589, Nov. 3, 1927.

**Columnar heat-exchange apparatus.** J. HEIZMANN. Brit. 297,643, March 7, 1928.

**Tubular heat-exchange apparatus.** S. ROBSON. Brit. 297,509, June 28, 1927. Structural features.

**Heat-exchange columns for gases or liquids.** MENZEL A.-G. Fr. 649,147, July 8, 1927.

**Gas burner.** J. and C. G. BOLINDERS MEKANISKA VERKSTADS AKTIEBOLAG and E. A. BOLINDER. Brit. 297,647, March 26, 1928.

**Gas burner.** ANDREW CLARK. U. S. 1,710,012, April 23.

**Gas burner.** HERMAN C. DANIELS. U. S. 1,710,147, April 23.

**Gas burner.** PHILIP J. SONNER. U. S. 1,709,197, April 16.

**Combined coal-dust, gas and oil burner suitable for use with coke-oven or blast-furnace gas.** WITKOWITZER BERGHAU UND EISENHÜTTEN GEWERKSCHAFT and C. SALAT. Brit. 298,080, Oct. 1, 1927. Structural features.

**Oil cooler.** MASCHINENFABRIK OERLIKON. Swiss 129,687, Dec. 16, 1927. The oil is cooled by water, the pressure of which is dependent upon the oil pressure.

**Sectional retort.** E. G. BLACKWELL. Brit. 297,445, Sept. 22, 1927.

**Measuring device for benzene and other oils.** PAUL BREITSCHUH. Swiss 128,688, Nov. 28, 1927. To prevent the formation of bubbles and consequent delivery of inaccurate quantities, the measuring vessel is enclosed in an air jacket with an air outlet and is surrounded by a perforated cylinder. When the liquid reaches a certain height, it overflows through the perforation and prevents formation of bubbles.

**Storage tank for gasoline or other volatile liquids.** HART H. FLEMING. U. S. 1,709,257, April 16. A top and "false top" form a condensing chamber and trap for vapors rising to the upper part of the tank and may contain a sealing liquid.

**Device for heating liquids while preventing undue foaming or overflowing of liquid.** DIRK HEYNIS. U. S. 1,709,529, April 16. A heating app. is so constructed that rise of foam on liquid being heated serves to decrease the heat supplied by a heating burner.

**Apparatus for determining the hardness of metals and similar non-elastic materials.** JOHN A. CHAPPUIS. Swiss 129,625, Dec. 7, 1927.

**Apparatus for testing the bursting strength of materials such as sheet metal, paper, or cloth by penetration of a falling body through the sample.** CHARLES B. TEWING (to Thwing Instrument Co.). U. S. 1,709,638, April 16.

**Device for stripping plastic asbestos windings from tubes.** CARL HERZOG. Swiss 129,227, Nov. 22, 1927.

**Conveyer belts for handling chemicals, etc.** T. O. WILTON and CHEMICAL ENGINEERING & WILTON'S PATENT FURNACE CO., LTD. Brit. 297,630, Jan. 28, 1928. An endless-belt conveyer is formed of woven wire of corrosion-resisting material such as an alloy of Ni and Cu. Such a belt is suitable for carrying  $(\text{NH}_4)_2\text{SO}_4$  in an app., which is described.

**Thermostat for controlling electric circuits.** HUBERT R. LORANGER and DALLAS D. PARSHALL (Loranger to Automatic Freezer Corp.). U. S. 1,709,944, April 23.

**Thermostatic control apparatus for electric circuits.** EARL K. CLARK (to Westinghouse Elec. & Mfg. Co.). U. S. 1,709,656, April 16.

**Thermostatically controlled electric apparatus for operating furnace dampers, etc.** EDMOND VERSTRAETE. U. S. 1,708,980, April 16.

**Thermostatic control device for steam heating systems.** L. FRIEDMANN, M. FRIEDMANN and N. SCHOFF (trading as the Firm of A. Friedmann). Brit. 297,601, Dec. 2, 1927. Structural features.

**Thermostatic control for gas valves.** BRITISH BRASS FITTINGS, LTD., and G. N. SPERRY. Brit. 298,293, July 20, 1927.

**Thermostatically controlled gas valve.** RADIATION, LTD., and H. J. YATES. Brit. 297,917, Aug. 2, 1927.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

**Albert Einstein's fiftieth birthday.** M. V. LAUR. *Naturwissenschaften* 17, 173 (1929).  
B. J. C. VAN DER HOEVEN

**Homer J. Wheeler.** E. W. ALLEN. *Ind. Eng. Chem.* 21, 510-11(1929).—Biographical note with portrait.  
E. C. M.

**Measurements of the amount of ozone in the earth's atmosphere and its relation to other geophysical conditions. Part III.** G. M. B. DOBSON, D. N. HARRISON and J. LAWRENCE. *Proc. Roy. Soc. (London)* **A122**, 456-87(1929); cf. *C. A.* **21**, 2097.—Tables are given of daily ozone values for one station from Nov., 1926, for 4 stations from March, 1927, and 6 stations from April, 1927, to Oct., 1927; monthly mean values for 6 stations from July, 1926, to Oct., 1928; and monthly mean values for N. W. Europe for July, Aug. and Sept., 1926, and Mar. to Oct., 1927. It is concluded from observations in Chile that ozone values in the tropics must be nearly uniform. The ozone content is above normal ahead of a low pressure, and below normal ahead of a high-pressure area. There is no definite relation between ozone content and magnetic conditions. The authors conclude that the polar air currents are the source of the excess ozone, but do not offer any explanation for its formation. GREGG M. EVANS

**Additive and subtractive color mixing and decolorization.** HERBERT SCHÖNBORN. *Speersaal* **61**, 432-4(1928).—A discussion on color mixing according to triaxial diagram.

R. A. HEINDL

**A simple experiment on equivalent weight determination.** JOHN E. S. HAN. *Chemist. Analyst* **17**, No. 4, 6(1928).—The expt. is suitable as a lab. exercise. E. J. C.

**A simple method for the determination of  $C_p/C_v$  (as a lecture experiment).** E. RÜCHARDT. Univ. Munich. *Physik. Z.* **30**, 58-9(1929).—A glass tube 55 cm. long, and of a uniform 1.6-cm. inside diam., is passed through a rubber stopper into a 5-6-l. bottle with bottom tubulature, contg. the gas. On dropping a perfectly spherical steel ball of diam. appropriate to the tube into the latter, the ball oscillates in the tube with a period of about 1 sec. By measuring the period for one libration with a 0.1-sec. stop watch, and substituting in the formula (derived), the ratio  $C_p/C_v$  is detd.  

$$\frac{C_p}{C_v} = k = \frac{4\pi^2 m V}{q^2 p T^2}$$
 where  $m$  = mass of ball,  $V$  = vol. of bottle in cc,  $q$  = cross section of tube (in sq. cm.);  $b$  = bar. pressure (in cm.),  $T$  = period,  $g$  = gravitational const. The method provides a rapid and accurate means of measuring  $C_p/C_v$ , and also offers visible proof of the adiabatic elasticity of gases. For air,  $k$  = 1.39 instead of the usual 1.40; for wet  $\text{CO}_2$ ,  $k$  = 1.27 instead of 1.30. L. W.

**Molecular measurements by the optical lever.** W. N. BOND. *Nature* **122**, 169-70(1929).—A brief description of an optical lever of precision giving very large magnification. The instrument was applied to test (1) the accuracy with which a steel-to-steel contact will return after sepn. and (2) whether the thickness of a mica sheet can be detected as varying in multiples of the mol. "length." F. V. J., JR.

**Desiccchlora (anhydrous barium chlorate—Smith). II. Experiments in its use as an economical drying agent and ammonia absorbent.** G. FREDERICK SMITH. *Chemist-Analyst* **18**, 18-24(1929); cf. *C. A.* **23**, 53.—Detailed directions are given for the prepn. of  $\text{Ba}(\text{ClO}_4)_2 \cdot 3\text{H}_2\text{O}$ ; exptl. data comparing the efficacy of the anhyd. salt with that of  $\text{CaCl}_2$  tests of its stability in drying gases; details concerning its reversible absorption of  $\text{NH}_3$ ; and a discussion of the regeneration of the material and its porosity. W. T. H.

**The reduction to *in vacuo* of the weights of powdered substances weighed in air.** III. RUDOLF RUER and JOHANN KUSCHMANN. *Phys. Chem. Inst., Tech. Hochschule, Aachen. Z. anorg. allgem. Chem.* **173**, 233-61(1928); cf. *C. A.* **22**, 1074.—The adsorption by solids of air and other gases was investigated by outgassing the material *in vacuo* at const. temp. for varying periods of time and detg. the amt. of vapor adsorbed upon contact with the solid. Oxides of Cu, Fe, Ce and Si were prepd. by various methods and gave adsorptions dependent upon the mode of manuf.  $\text{SiO}_2$  outgassed at 600° adsorbed 164 mg. air/100 g.;  $\text{CeO}_2$ , 31 mg./100 g.;  $\text{CuO}$ , 31 mg./100 g.  $\text{SiO}_2$  adsorbs more  $\text{H}_2$  than  $\text{N}_2$ ,  $\text{CeO}_2$  less. Heating at higher temps. lessens the adsorption. Of  $\text{KCl}$ ,  $\text{PbSO}_4$ ,  $\text{CeSO}_4$ ,  $\text{CaCl}_2$  and  $\text{NaNO}_3$ , only  $\text{CeSO}_4$  adsorbed more than 1 mg. air/100 g. Investigations on Cu, Fe and Ag (after complete reduction from their oxides by  $\text{H}_2$ ) showed that 100 g. Cu takes up 10 mg.  $\text{H}_2$ ; 100 g. Fe, 30 mg.; and 100 g. Ag, 4 mg. Cu does not take up  $\text{CO}_2$ , while Fe and Ag take up 5 mg./100 g. Variations in adsorptions with time and temp. of outgassing have been detd. and the changes in weight of thin strips of metals placed in vapors have been measured. Much exptl. detail is given and possible errors due to incomplete outgassing are cited.

WILLIAM E. VAUGHAN

**Report of the German Committee on atomic weights.** M. BODENSTEIN, O. HAHN, O. HÖNIGSCHMID and R. J. MEYER. *Ber.* **62B**, 1-23; *Z. anorg. allgem. Chem.* **178**, 411-2(1929); cf. *C. A.* **22**, 1066.—A review of the most important detns. of at. wts. published during 1928. The following new values have been adopted: Ba 137.36,

Ce 140.13, Er 187.64, Ne 20.18, U 238.14. Ne, A, K, Cs, Cu, Ag, Ba, Ce, Er, Ti, U and Rh are discussed. The basis is O = 16. L. I. QUILL

A statistical periodic table. H. H. STEPHENSON. *Chem. News* 138, 129-30 (1929).—By arranging the elements in order of at. no. and then calcg. the percentage increase of at. wt. of each element over its predecessor, then arranging the nos. representing these increases in rows of 3, 4, 5, etc., up to 30, one finds that the sums of the vertical columns are in regular numerical order only for rows of 3 and rows of 6. With the elements arranged in rows of 6, excluding H and U, one finds certain chem. relationships between elements in the vertical columns. R. J. HAVIGHURST

Effective diameter and molecular structure of the pseudo-rare gas series: Ne-HF-H<sub>2</sub>O-NH<sub>3</sub>-CH<sub>4</sub>. ERNST BRÜCHE. Ger. Gen. Elec. Co. Res. Lab. *Ann. Physik* [5], 1, 93-134 (1929).—This gas series was examd. and new effective diam. curves were obtained for H<sub>2</sub>O and NH<sub>3</sub>. The latter curves deviate markedly from those for the rare gases. The assumption of the decisive significance of the number of outer electrons becomes untenable. Above 2.5  $\sqrt{\text{volt}}$  up to the exptl. limit 7  $\sqrt{\text{volt}}$ , the similarity of the curves of the pseudo-rare gas series indicates a confirmation of Grimm's hydride displacement law. Below 2.5  $\sqrt{\text{volt}}$ , the curves show specificity. The curve similarity for CH<sub>4</sub> and Kr indicates an outer shell in CH<sub>4</sub> similar to that of a rare gas. A new type of manometer suitable for vapors is described. FRANK URBAN

The general formulas for calculating the atomic or molecular heat as well as the specific heat of the elements in the solid state. J. MAYDEL. *Chem. Inst. Univ. Laibach. Z. anorg. allgem. Chem.* 178, 113-45 (1929).—Mathematical formulas are given for calcg. the at. and mol. heats as well as sp. heats of the elements in the solid state. Curves and tables are given from data obtained by many investigators. R. C. ROBERTS

The properties of the element 91 (ekatantalum) according to the periodic table. A. v. GROSSE. *J. Russ. Phys.-Chem. Soc.* 60, 843-5 (1928).—A general discussion of the probable physicochem. behavior of Pa as indicated by its position in the periodic table. The elements will possess certain sp. chem. properties which will facilitate its sepn. from the homologs (Ta, Nb). The pentoxide will probably be a white powder of high d. and m. p. and of basic properties. B. SOYENKOFF

The separation of the element 91 (protactinium). A. v. GROSSE. *J. Russ. Phys.-Chem. Soc.* 60, 847-54 (1928).—H<sub>3</sub>PO<sub>4</sub> ppts. Pa quant. from concd. acid soln. together with Zr or Hf, either in the presence or absence of H<sub>2</sub>O<sub>2</sub> (difference from Pa). On treatment of this ppt. with alk. carbonates it does not dissolve (difference from Pa). It is not pptd. by Hf (difference from Th), but seps. quant. on adding NH<sub>3</sub>. Pa can be sepd. from Zr and Hf by fractional crystn. of the chlorides in concd. HCl. It can be pptd. (although not completely) by H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> in the presence of dil. HCl (difference from Zr and Hf). The method of sepn. of Pa used consisted of repetitions of the following cycle: pptn. by H<sub>3</sub>PO<sub>4</sub>, fusion with K<sub>2</sub>CO<sub>3</sub> to remove the acid, fractional crystn. of the chlorides from concd. HCl. Starting with 525 g. residues from the prepn. of Ra and U, 2 mg. of the oxide of Pa was obtained. (The original content of Pa by radiometric analysis was 3.74 mg.) This oxide was a white powder of high m. p. and  $\alpha$  activity 232,000 times that of an equal wt. of U I. Repetition of the purifying process did not increase the radioactivity. The time of half decompn. of Pa is 21,200 years. Or, for every g. of Pa the U ore should contain 0.4 g. Pa. B. SOYENKOFF

The viscosity of atomic hydrogen. PAUL HARTECK. Kaiser Wilhelm Inst., Berlin-Dahlem. *Z. physik. Chem., Aht. A*, 139, 98-106 (1928).—The viscosity of H after subjection to an elec. discharge by Wood's method was measured by the Poiseuille arrangement. Full details are given of the use of a manometer, which consists essentially of a hot-wire gage in which the temp. is measured by a thermocouple, by which the concn. of at. H in the viscosity tube and the pressure prevailing at the ends can be measured. Expts. were performed at the temp. of ether-solid CO<sub>2</sub> at 0°, and at 100°. Taking  $\eta_{25}$  at 0° =  $841 \times 10^{-7}$ , the value for the H at. at 0° is  $\eta_H = (690 \pm 25) \times 10^{-7}$ . The variation with temp. is small, indicating a small value of the Sutherland const., and the conclusion is drawn that the forces exerted by H atoms on one another are very small, as in the case of He and H<sub>2</sub> mols. The gas kinetic value for the mean free path at 0° is  $L_0 = 130 \times 10^{-7}$  cm.; the cross section of action of the atoms in 1 cc. under normal conditions is  $Q_0 = 1.36 \times 10^4$  sq. cm. The values for H<sub>2</sub> are  $L_0 = 112.3 \times 10^{-7}$  cm. and  $Q_0 = 1.57 \times 10^4$  sq. cm. W. WEST

Change of the antisymmetric hydrogen molecule into the symmetric one. A. EUCKEN. *Tech. Hochschule, Berlin. Naturwissenschaften* 17, 182 (1929).—It was expected that the 1:3 ratio at room temp. of transformation velocities of the two H<sub>2</sub>

modifications would change at sufficiently low temp. This would cause a noticeable increase in the sp. heat. A positive result has recently been obtained. The  $H_2$  was cooled in a 45-cc. steel vessel at 50 atm. to liquid air temp. for  $12\frac{3}{4}$  days and the sp. heat measured at 4 different temps. initially, after 6 days and at the end of the period. The molar sp. heat  $C_R$  was found to increase in each series of 3 observations: at  $106^\circ$  from 0.531 over 0.605 to 0.715, at  $147^\circ$  from 1.010 to 1.179 and 1.270. Values for  $C_R$  at these temps. calcd. on the assumption that the mol. fraction  $\gamma$  of the antisymmetric modification (ortho) is 0.750, 0.689 and 0.636, resp., agree well (in 10% of the change) with the data observed; the change of  $\gamma$  with time to a limiting ratio of 1 ( $\gamma = 0.5$ ) is assumed to follow  $\log(4\gamma - 2) = -kt$ . B. J. C. VAN DER HOEVEN

**Experiments on para- and ortho-hydrogen.** K. F. BONHOEFFER AND P. HARTECK. Kais. Wilhelm Inst. f. physik. Chem. u. Elektrochem., Berlin-Dahlem. *Naturwissenschaften* 17, 182(1929).—The two modifications of mol.  $H_2$ , para and ortho, occur in ratio 1:3 in ordinary  $H_2$  (Dennison) as found from the rotational sp. heat. Thermal-cond. measurements at low pressures showed that the half conversion by radiation takes more than one year. At high pressures (350 atm.), however, in metal vessels the change takes place rapidly, in one week at the temp. of liquid air. Para-hydrogen is a gas stable in glass vessels at room temp. and atm. pressure, changing little in one week. At 100 atm. in a metal vessel it has a half-conversion time into ordinary  $H_2$  of 5 hrs., the process is momentary in the presence of platinized asbestos or elec. discharge. Practically pure para- $H_2$  can be made by adsorption on C at liquid- $H_2$  temp. Liquid  $H_2$  one day old contains considerable para- $H_2$  (10% of the equil. proportion). Freshly solidified  $H_2$  still has a 1:3 ratio; synthesis of  $H_2$  from 2 H at the temp. of liquid  $H_2$  gives this same ratio. B. J. C. VAN DER HOEVEN

**The applicability of Smits' theory to the allotropic varieties of phosphorus.** PIERRE JOLIBOIS. *Compt. rend.* 188, 174-6(1929).—Polemical (cf. *C. A.* 17, 3278; 22, 337). Mostly a criticism of Smits and Bokhorst (*C. A.* 211, 737) with a discussion of the exptl. conditions. ALBERT L. HENNE

**The allotropic modifications of phosphorus.** A. SMITS. *Compt. rend.* 188, 390-2 (1929); cf. *C. A.* 23, 1320.—The graph given by Nicolaiev (*C. A.* 22, 3324) showing the relation between vapor pressure and d. could be interpreted as signifying either 3 or 4 allotropic forms of P. More exact data are needed to det. this definitely. AMY LEVESCONTE

**The transformations of liquid sulfur.** PAUL M. MONVAL AND PAUL SCHNEIDER. École Supérieure de Chimie de Mulhouse. *Bull. soc. chim.* 43, 1302-22(1928); cf. *C. A.* 22, 2299.—A study of the variations in the sp. heat, heat of cooling, d. and  $n$  of liquid S between  $120^\circ$  and  $200^\circ$ . All these curves show a particular phenomenon at  $160^\circ$ , indicating the presence between  $159^\circ$  and  $165^\circ$  of 2 allotropic forms of S which are completely miscible during this interval. Curves of d., sp. refraction, displacement of temp. of transformation of liquid S and reciprocal soly. of S and  $Ph_3CH$  are given together with tables and description of app. used. R. C. ROBERTS

**Thermal conductivity of solid and liquid sulfur.** G. W. C. KAYE AND W. F. HIGGINS. Nat'l. Phys. Lab. *Proc. Roy. Soc. (London)* A122, 633-46(1929).—By the same plate method as in former work (cf. *C. A.* 22, 2871) the cond. of S from  $20^\circ$  to  $210^\circ$  has been measured. Tables and curves are given showing the cond. in c. g. s. units of the rhombic form as decreasing from 0.000652 at  $20^\circ$  to 0.000547 at  $95^\circ$ ; monoclinic as between 0.00037 and 0.00040; and liquid as increasing from 0.000314 at  $115^\circ$  to 0.000378 at  $210^\circ$ , with a change of slope between  $160^\circ$  and  $170^\circ$ . Two specimens of plastic S were examd. which showed conductivities higher than that of rhombic. GREGG M. EVANS

**Realization of the black-body temperature at the melting point of palladium by the tube method.** G. RIZAUD AND S. NIKITINE. *Compt. rend.* 188, 618-20(1929).—A simple method for measuring the temp. of fusion of Pd with an error of only  $0.8^\circ$  is described. If the mech. tension is greater than 2.5 g./sq. mm., the m. p. is suddenly lowered  $8^\circ$ , probably because of an allotropic transformation of the metal. M. D.

**Crystal size and magnetic properties of pure nickel.** G. J. SZOZO. *Z. Physik* 53, 449-57(1929).—Conditions for recrystn. with Ni are detd. Only when the Mn content does not exceed 0.2% can recrystn. phenomena be obtained by the mech.-thermal method. Twinning occurs frequently. The magnetic properties are investigated as a function of crystal size. Similar results are obtained with Fe and with Ni (*C. A.* 23, 803). GEORGE GLOCKLER

**The dielectric constant of liquid hydrofluoric acid.** KARL FREDENHAGEN AND JOHANNES DAHMLOS. Chem. Inst. Greifswald. *Z. anorg. allgem. Chem.* 178, 272-4 (1929).—The dielec. consts. for HF at 5 diff. temp. are given:  $-73^\circ$ , 174.8;  $-70^\circ$ ,

174.9. —40°, 134.2; —27°, 110.6; 0°, 83.6. HF is comparable to H<sub>2</sub>O and HCN as a solvent with abnormal dielec. const. R. C. ROBERTS

Density, internal friction, dielectric constant, solvent qualities and dissociating power of hydrocyanic acid. KARL FREDERHAGEN AND JOHANNES DAHMLOS. *Chem. Just., Grosswald. Z. energ. allgem. Chem.* 179, 77-88(1929).—Contrary to predictions of Walden, *et al.*, Kahlenberg and Schmundt (*J. phys. Chem.* 6, 447(1902)) found that HCN is a poorly ionizing solvent in spite of its high dielec. const. F. and D. have repeated most of their work. The cond. of the HCN used was  $0.60 \times 10^{-9}$  mhos at 0°. For the dielec. const. measurements the method previously used for HF (cf. preceding abs.) was used with a Pt condenser of 1 sq. cm. surface at 0.5 cm. plate distance, a 300 m. wave length being used. The values were reproducible within 1%. At —13.4°  $\epsilon$  was 194.4, at —8.0° 175.0, at —1.0° 155.7, at 1.1° 149.8, at 10.2° 132.1, at 17.6° 120.5, at 23.1° 113.2. Above 10° the values agree with Bredig's measurements, lower temps. they are as much as 16% lower. The temp. coeff. of the dielec. const. with temp., the values of  $\epsilon$  are higher than those of any other substance.

HCN was detd. in a 2-cc. dilatometer, accurate to 0.001: at —13° 0.7326, 0.7230, at 0° 0.7150, at 10° 0.7017, at 20° 0.6884; it changes almost linearly in good agreement with results of other authors. The viscosity,  $\eta \times 10^5$  cts, was 269.1 at —7.5°, 232.3 at 5.0°, 218.4 at 10.8°, 211.2 at 15.1°, 201.4 *i. e.*, about  $\frac{1}{2}$  the viscosity of water. The soly. of KCN, KCl and KNO<sub>3</sub> (reported "trace" by K. and S.) in HCN and the cond. of the solns. was detd. At 0° the soly. is in moles per l. 0.10, 0.037 and 0.050, resp., with  $\chi$  in mhos of 0.0085, 0.0044 and 0.0103, values which are only  $\frac{1}{100}$  to  $\frac{1}{10}$  of those of water. The low cond. results with many acids and salts are discussed; AgNO<sub>3</sub> is almost insol., but is decompd. into AgCN and HNO<sub>3</sub>. Conclusion: HCN is a poor solvent for inorg. salts and does not give the extent of dissocn. expected from its high dielec. const.; the authors therefore agree with K. and S. that the cond. of a soln. depends not on the dielec. const. but on the sp. nature of complexes formed between solute and solvent (cf. F., C. A. 22, 7700).

B. J. C. VAN DER HOEVEN

The dielectric constant of methylene chloride and methylene bromide. P. C. MAHANTI AND D. N. SEN-GUPTA. *J. Indian Chem. Soc.* 5, 673-81(1928).—The theory that the dielec. const. of polar mols. decreases with the temp. has been confirmed with CH<sub>2</sub>Br<sub>2</sub> and CH<sub>2</sub>Cl<sub>2</sub>. The heterodyne beat method of loosely coupling 2 oscillating circuits was used. A temp. range of 303° to 430° K. was covered. The formation of mols. by attraction between positively charged org. radicals and negatively charged halogen ions is discussed. Because of the size of CH<sub>3</sub><sup>+</sup> as compared to H<sup>+</sup>, the org. halides and HCl are considered to be bound together by different mechanisms. It is believed that CH<sub>3</sub><sup>+</sup> retains its own electron orbits. The net dipole moment of CH<sub>2</sub>Br<sub>2</sub> is shown to be greater than that of CH<sub>2</sub>Cl<sub>2</sub>, thus causing the latter to be more stable. The vapor pressure of the iodide is so high and its instability so great even at room temp. that such a liquid cannot be studied by this arrangement.

RAYMOND H. LAMBERT

The Barkhausen effect. G. J. SZOO. Natuurk. Lab., Philips Gloeilampenfabrieken, Eindhoven. *Physica* 9, 43-50(1929).—The Barkhausen effect, that is discontinuity in the magnetization of iron (cf. B., *Physik. Z.* 20, 401(1919)) was studied in different parts of the hysteresis loop. A wire of electrolytic iron 20 cm. by 1 mm., ignited for 5 hrs. *in vacuo*, was placed in a 40-cm. magnetization coil with 3 independent windings. One winding provided the main field, a second one, activated by the variable current of 3 parallel triodes, provided a supplementary field, the third winding compensated the terrestrial field. A sep. coil connected to amplifiers and a loud speaker served to detect the Barkhausen effect. After complete demagnetization of the wire (Gumlich and Rogowski, *Ann. Physik* 34, 235(1911)) the field was gradually raised to 0.20 gauss; at 0.25 gauss the Barkhausen effect became audible, ceasing again on opening the circuit. It follows that for the re-orientation of coherent groups of elementary magnets in iron (theory of B. and of van de Pol) a field of at least 0.24 gauss (induction 200) is necessary. On the virginal hysteresis curve the effect was present in the region of induction from  $B = 200$  to  $B = 9200$ ; on the complete loop it was heard between +9200 and —9200 inductions. The min. value for the field change appeared also between 0.25 and 0.30 gauss on executing small loops at arbitrary points in the hysteresis figure, again requiring the same energy for dislocating the magnet groups (except above 9200 induction). Even below a range of 0.24 gauss, *i. e.*, without Barkhausen effect, the loops show a measurable width, indicating a non-reversible process of induction change before the Barkhausen effect appears. The small field strengths used in these expts. make it apparent that the effect cannot be caused by magneto-

striction stresses (theory of Gerlach, Leites and Zschiesche). For the influence of crystal size 2 electrolytic bars of 20 cm.  $\times$  1 mm. were recrystd. by alternate ignition and deformation (3 and 20%, resp.); their crystal size was about 10 and 0.1 mm., resp. (20 and 5000 crystals per wire). Oscillographic examn. of these wires with frequencies of 5 to 15,000 per sec., field 0 to 3 gauss, failed to show any difference in B. effect; similar results were obtained with monocrystal wires. Conclusion: The groups of elementary magnets are present regardless of the cryst. condition and probably are of purely magnetic nature.

**Magnetic susceptibility of sodium and potassium.** C. T. LANE AND E. S. BIELER. *Trans. Roy. Soc. Can.* [3], 22, III, 117-23 (1928); cf. *C. A.* 22, 1897.—The magnetic susceptibilities of Na and K were measured and found to be  $0.67 \times 10^{-6}$  and  $0.60 \times 10^{-6}$ , resp.

**The absence of effect of an electric field on the magnetic susceptibilities of hydrochloric acid and nitric oxide.** L. M. MOTT-SMITH. Rice Inst., Houston, Texas. *Phys. Rev.* 32, 817-23 (1928).—The magnetic susceptibilities of the polar gases NO and HCl were unaltered by the application of an elec. field of 8000 v. per cm. whether the measurements were made parallel or perpendicular to the elec. field. The method would have detected changes in the vol. susceptibilities as small as 0.18% for NO and 9.7% for HCl measured parallel to the field and 0.48% for NO and 22% for HCl measured perpendicular to the field. The classical theory predicts a change of 13% in the paramagnetic susceptibility of NO measured parallel to the field but no change when measured perpendicular to the field. No attempt was made to compute the theoretical change in susceptibility for the diamagnetic HCl, although a slight change was expected.

**The modification of Baeyer's strain theory.** F. E. AYLING. Univ. Coll., Swansea. *Chem. News* 138, 164-5 (1929).—The best value of the C-C angle is obtained when the d. figures of LeBas ("Molecular Values," 1915 pp. 20-1) are used in the formula of Ingold (*C. A.* 17, 977).

**The theory of complex compounds.** I. I. I. CHERNYAEV. *Ann. inst. platine* (Leningrad) No. 5, 118-56 (1927).—The varying mobility of groups connected with a central atom is explained by the "trans influence" or by the decrease in the magnitude of the passive resistance within the internal area opposed to the edge substituent and also by the simultaneous increase in the passive resistance of the side directed toward the edge substituent (according to the cosine law). The "trans influence" of the atoms is inversely proportional to their metallic character. Atoms with a smaller "trans influence" are arranged in the center of the mol., while those with larger "trans influence" are arranged on the periphery. The electronegative groups which are able to form complex compds. (NO<sub>2</sub>, NCS, F, Cl, Br, I) have a higher "trans influence" than substituents of a neutral character (NH<sub>3</sub>, amines, H<sub>2</sub>O, etc.); whence are deduced the rules of Jergenson, Peirone and Kurnakov as well as many features of the reactions of bivalent and quadrivalent Pt. Many inner mol. reactions of complex compds. of Cr, Co, Te and Os are investigated; their stereochem. similarity to Pt is shown by the fact that the no. of substituted groups and the shape of the complexes is due to the "trans influence." The ability of C to give chain-like configurations of atoms is due to the stability of the tetrahedral configuration of mols. contg. C; it can hardly be due to the "trans influence" on the central forces of the mol.

**Molecular refraction and number of molecules.** W. HERZ. *Z. anorg. allgem. Chem.* 179, 211-4 (1929).—According to Clausius-Mosotti the mol. refraction calcd. by means of the Lorenz-Lorentz formula represents the true vol. of one mol. This was substantiated by H. by calcg. for a large no. of compds. the product of mol. refraction and the no. of mols. per cc. at the b. p. With the exception of some low-boiling elements an approx. const. value of  $(1.2 - 2) \times 10^{23}$  was obtained for about 50 different compds.

**Molecular theory of the diffusion of light by fluids.** I. The intermolecular field is neglected. YVES ROCARD. *Ann. phys.* 10, 116-79 (1928).—Mathematical. A bibliography of 118 references is given, many of which are accompanied by an abstract of the work cited. The equation obtained for the total diffused intensity is,  $i = (\pi^2/2\lambda^4)(\epsilon - 1)\Gamma[(RT\beta'/N)c^2 + (1/\nu)\{K\rho_1(2 - c^2)/(2 - \rho_1) + c^2(K - 1)\}]$ . In deriving this equation use is made of a mol. model which enters into the equation by means of 2 characteristic const. besides the index of refraction, whereas the current mol. model (that of Langevin) introduces only one const., anisotropy. R.'s mol. model may be considered to be formed of oscillating, isotropic ions; if the ions do not oscillate the mol. model is the ordinary one of Langevin. There are reasons for thinking that the mols. of org. compds. are approx. of this type. A brief critical study of

Einstein's old theory of diffusion indicates the necessity of revising it. II. Intermolecular field; and résumé of results. *Ibid* 181-231.—Mathematical. Equations are derived for the total diffused intensity and the depolarization when the intermol. field is taken into consideration. The original paper should be consulted for the form of these equations because of their intricacy. The existence of the intermol. field and the exactness of its calcn. may be tested experimentally by measuring the slight depolarization which exists at the state of crit. opalescence when the diffused beam is viewed at 90°. In seeking to verify this general theory with gases it was found that the measurements of Daure on EtCl agree well with the theory, whereas the Einstein-Gaus theory fails by about 10%. With liquids where the ions in the mol. do not oscillate, as in H<sub>2</sub>O, or where their oscillation produces an *a priori* negligible diffusion, the theory and expt. are in good accord. When the oscillation of the ions of the mol. must be taken into account, the corresponding term in the diffusion equation cannot be calcd. theoretically, but may be arrived at satisfactorily from expt. This term is quite important for compds. of the aromatic series. This conception of mols. with oscillating ions has the merit of explaining the seeming disagreement in measurements made on the aliphatic series and aromatic series, when interpreted by aid of the older theories.

Rayleigh-Jeans radiation law. K. C. KAR AND R. C. MAZUMDAR. *Z. Physik* 53, 308-11(1929).—Mathematical derivation.

GEORGE GLOCKLER

Physico-chemical studies on bioluminescence. VII. The solubility of Cypridina luciferin in organic solvents. S. KANDA. *Sci. Papers Inst. Phys. Chem. Res.* (Tokyo, Japan) 10, 91-8(1929); cf. *C. A.* 23, 1915.—Luciferin from *Cypridina hilgendorfi* is usually isolated by extn. of the crushed insects first with petroleum ether, and with Et<sub>2</sub>O and benzene, resp., to remove fats and similar substances, and then with MeOH to remove the luciferin. The concd. MeOH ext. is only partly sol. in abs. EtOH, the insol. portion being protein. Luciferin, which is sol. in the abs. EtOH soln., is now sol. in benzene, giving a non-colloidal soln. This soly. behavior indicates that luciferin is non-protein in nature, which conclusion is confirmed by the fact that the product gives no Millon or ninhydrin reaction. Luciferin thus prepd. is sol. also in CHCl<sub>3</sub>, Et<sub>2</sub>O and petroleum ether.

W. D. LANGLEY

Nomenclature of electric discharges in air at atmospheric pressure. MAX TOEPFLER. *Z. tech. Physik* 10, 73-81(1929).—Various types of discharges are reviewed as to their relation with time (discontinuous or continuous, hysteresis), their color, current d., active agents, spatial arrangement, etc. For d. c. the typical discharge forms on small cathodes with decreasing and increasing current are discussed and the spark distance is defined. Diagrams illustrate the different situations.

B. J. C. v. D. H.

Dissociation and the color of free radicals. CHARLES B. WOOSTER. *J. Am. Chem. Soc.* 51, 1163-5(1929).—The conclusion of Gomberg and Sullivan (cf. *C. A.* 16, 3479) that increase in color of diphenyl-β-naphthylmethyl in benzene, nitrobenzene, and cyclohexane is caused by increase in the proportion of the quinonoid tautomer upon diln. is incompatible with the evidence. For tautomeric equil.,  $C/C' = K$ . In ideal solns. the const. could not vary upon diln. Walden ("Chemie der freien Radikale, Leipzig 1924, 200, 294-7) found no satisfactory equil. const. on testing their cryoscopic data. The measurements do not give correct values for the dissocn. of ethane and so cannot be used as a basis for colorimetric comparison.

MARY E. LEAR

Ratio between the surface energies of different surfaces of rock-salt crystal. S. ARZYBISHEV. *Z. Physik* 48, 286-7(1928); *Science Abstracts* 31A, 600-1.—Remarks on papers by Kuznetsov and Bessonov (*C. A.* 21, 3543) are given. A. considers the assumption, that the work required to grind the different faces of the crystals is proportional to the surface energies of these faces, rests on a very uncertain basis, since in addn. to splitting off minute particles work is used in grinding up these particles; besides this it would be necessary to assume that the mean linear dimensions of the particles are inversely proportional to the surface energies. Some expts. are recorded in which the coeffs. of friction and the ratio between the work required to grind the (100) and (110) surfaces were detd. The values obtained differ greatly from those of Kuznetsov and Bessonov.

H. L. D.

Electrical conductivity as a criterion of the nature of chemical combination. G. v. HEYSEY. *Z. Elektrochem.* 34, 463-72(1928).—A review of recently published work on crystal structure and the nature of chem. combination. H. considers how much stress may be laid on kinetic processes and investigations of the velocity of the displacement of the particle groups of crystd. material as a means of explaining types of chem. combination. He also considers the conclusions which may be drawn from studies of the elec. cond. of molten substances. In the cryst. state, extreme types,

such as heteropolar compds., metals (ideal metallic mixed crystals), and mol. compds. are met with, and they are characterized by an extremely small displacement of the lattice groups. In the transition region between these types, very significant displacement velocities are observed. For example, in good heteropolar compds. of Ag on the one hand, and in metallic Ag on the other, there is a relatively small displacement velocity, whereas the effect in  $\alpha\text{AgI}$  and  $\alpha\text{AgS}$  attains an extraordinarily high value (over 1 cm.<sup>2</sup>/day). The same observation is made just before the ionic lattice is transformed into the hexagonal close-packed structure. The region of greatest lattice loosening, that is, the greatest displacement velocity of the  $\text{Ag}^+$ , occurs within the region of the polymorphic change since both of these effects are produced by a special favorable relation of ionic size and a greater polarizability of the anion. The disintegration curve of the  $\text{Ag}^+$ , which gives the displacement const. of the Ag as a function of the anion, shows a steeply rising and falling branch. The falling off of the curve may be understood more readily if the easier cleavage of the "loosened" ions is borne in mind. In the molten state, the decrease in the heteropolarity is not manifested immediately. The rising branch of the disintegration curve shows the same relationships as in the cryst. state. It emphasizes the 2 extreme groups of strong electrolytes on the one hand, and the isolated melts on the other, between which there exists a series of transition types.

L. L. QUILL

**Crystal structure and the types of chemical combination.** V. M. GOLDSCHMIDT. *Z. Elektrochem.* 34, 453-63(1928).—A review of recently published work on crystal structure and the nature of chem. combination. The crystal structure of a given substance is detd. by the properties of the individual atoms or ions which make up the crystal. Such properties are the no. of particles, which is given by the chem. formula; the size, which is given by the distance between atoms; and the polarizability of the atoms. Four classes of exply. detd. data on cryst. substances are discussed as being significant: (1) The geometrical arrangement of the atoms in the crystal, (2) the distance between at. centers in the crystal, (3) the solid properties of crystals, (4) the elec. and electro-optical properties of crystals. Coördination lattices and molecular lattices with the transition types are discussed under geometrical arrangement. In considering the distance between atoms, the method of measurement by x-ray means, the influence of neighboring particles, the size of the atoms or ions, coördination nos., etc. are mentioned. The hardness of chem. compds. of various types is given as an example of the solid properties of crystals. The nature and value of the elec. cond., the pyro- and piezo-elec. relations, refractivity, and dispersion as functions of the electrically charged particles in the crystal furnish data of significance for a knowledge of the various types of combination.

L. L. QUILL

**Electrical conductivity and diffusion in crystalline compounds.** ADOLF SMERKAL. *Z. Elektrochem.* 34, 472-83(1928).—A review of recently published work on crystal structure and the nature of chem. combination. The mechanism of elec. cond. and of the diffusion process in cryst. compds. is essentially bound up with the deviation of the actual crystal structure from that of the ideal lattice. From this idea may be formulated a relation showing the dependence of the cond. on the temp., and an insight gained into whether the cond. is ionic or electronic in nature. The accurate analysis of the temp. relations gives a quant. measure of the deviation of the actual from the ideal lattice, as well as a means of detg. the migration velocity and the degree to which the types of carriers of electricity concerned in the conductance are disocc. The migration velocity and the degree of disocc. are dependent primarily upon the deformation of the crystal structure described by Fajans. A direct conclusion on the nature of the cond. through solid substances is not possible because it is detd., in many cases, not only by the deformation relations of the "loosened" groups in the actual crystal, but also by each of its lattice groups.

L. L. QUILL

**The principles determining the structure of complex ionic crystals.** LINUS PAULING. Calif. Inst. Tech., Pasadena. *J. Am. Chem. Soc.* 51, 1010-26(1929).—Principles of structure of complex ionic crystals, a coördinated arrangement of anions being assumed about each cation, at the corners of an approx. regular polyhedron, are formulated with the aid also of considerations based upon the crystal energy. Only the crystals are considered which contain small cations with large valences, i. e., crystal radii not over 0.8 Å. U. and valence 3 or 4, and large anions (radii over 1.35 Å. U.) with small valences (1 and 2). Many complex crystals of known structures, particularly the complex silicates, satisfy the requirements of these principles. Some properties of the structures of the 3 forms of  $\text{Al}_2\text{SiO}_5$ , cyanite, and alusite, and sillimanite, are predicted, the use of the theory being illustrated. Structures of the Al silicates of bivalent metals should correspond to the formulas  $\text{R}_2^{++}\text{Al}_2\text{Si}_2\text{O}_7$  or  $\text{R}_2^{++}$ .

$\text{Al}_2\text{Si}_2\text{O}_7$ , a result in striking agreement with observation of the garnets and beryl, for example.

R. J. HAVIGHURST  
The space lattice of a monoclinic compound of the type of  $\text{MgWO}_4$ . EDGAR BROCH. *Z. physik. Chem.*, Abt. B, 1, 409-21 (1929).—X-ray data by the rotating crystal and powder methods have shown the space-lattice of  $\text{MgWO}_4$  to be simple monoclinic of the type ( $r_{11}$ ,  $r_{22}$ ,  $r_{33}$ ), according to Niggli's classification.  $\text{ZnWO}_4$ ,  $\text{FeWO}_4$ ,  $\text{MnWO}_4$ ,  $\text{NiWO}_4$ ,  $\text{CoWO}_4$ , and  $(\text{Mn}, \text{Fe})\text{WO}_4(\text{O} \text{ O } r_{12})$  have the same type of space lattice. The elementary cell of  $\text{MgWO}_4$  contains two mols. with a sp. gravity of 5.86. The lattice dimensions are  $a = 4.67$  A. U.,  $b = 5.66$  A. U.,  $c = 4.92$  A. U.  $B' = 89^\circ 35'$ ,  $B = 90^\circ 25'$ .

H. W. WALKER  
The preparation of large crystals of chrom-alum and interpretation of some etch-figures. FREDERICK A. ROHRMAN AND NELSON W. TAYLOR. Univ. of Minnesota. *J. Chem. Education* 6, 473-8 (1929).—Chrome-alum (violet  $\text{K}_2\text{SO}_4 \cdot \text{Cr}_2(\text{SO}_4)_3 \cdot 24\text{H}_2\text{O}$ ) was prepd. by bubbling  $\text{SO}_2$  through a concd. soln. of  $\text{K}_2\text{Cr}_2\text{O}_7$  below  $78^\circ$ . Small crystals were allowed to grow in satd. solns. of the alum, the crystals being transferred every day to fresh solns., and being turned over if their growth became unsymmetrical. A 16-months-old crystal weighs 700 g. When etched by an unsatd. aq. soln. of the alum at room temp., the crystals develop striations parallel to the bisectors of the angles of the equilateral triangles forming the octahedral faces (111). The striations possibly represent the appearance of pyritohedral planes (201) and (021).

R. J. H.  
The structure of diopside,  $\text{CaMg}(\text{SiO}_3)_2$ . B. WARREN AND W. L. BRAGG. *Z. Krist.* 69, 168-93 (1928). (English).—The space group and cell dimensions detd. by Wyckoff and Merwin (*C. A.* 19, 2007) are verified, the dimensions being  $a = 9.71$ ,  $b = 8.89$  and  $c = 5.24$ . There are 4 mols. in the unit cell, and definite positions for all of the atoms have been detd. A unique feature is the occurrence of chains of  $\text{SiO}_4$  groups running parallel to the  $c$  axis. Each Si atom is surrounded by 4 O atoms, nearly at the corners of a regular tetrahedron, the distances Si-O varying from 1.57 to 1.64 A. U. The distances between the O atoms vary from 2.48 to 2.66 A. U. The upper and the lower O atom of each  $\text{SiO}_4$  group is shared by the neighboring group, thus forming the chain. The 3 observed cleavages are all parallel to the chains, suggesting that the binding is strongest along the chain. The Ca and Mg atoms lie between the chains in such positions that each Ca is surrounded by 8 O atoms, and each Mg by 6 O atoms.

L. S. RAMSDELL  
Isodimorphism of sodium bromide and sodium chloride. Preparation of pure sodium bromide. A. V. RAKOVSKII AND V. V. POLYANSKII. *Trans. Inst. Pure Chem. Reagents* (Moscow) 1927, No. 6, 5-9.—By using aq. solns. of NaBr and NaCl, with the solute contg. less than 88% by wt. of NaBr, crystals are obtained at  $6^\circ$  to  $8^\circ$  which are of cubic system, contain less than 22% of NaBr and no water. With solns. contg. more than 88% of NaBr the pptd. crystals are monoclinic and they have the compn.  $\text{Na}(\text{Cl}, \text{Br})2\text{H}_2\text{O}$ . Conclusion: NaCl and NaBr are isodimorphs of the type of the 5th group of Roozeboom. The sepn. of NaBr from NaCl is possible by means of 99-100% MeOH. At  $15^\circ$  the solubilities are: 17.42 g. NaBr and 1.55 g. NaCl in 100 g. alc. From a mixt. of the 2 salts 17.04 g. are dissolved in 100 g. of alc. and the solute contains 99.68% NaBr.

G. B. KISTIAKOWSKY  
The crystal structure of anhydrous mesotartaric acid and of some mesotartarates. W. SCHNEIDER. *Z. Krist.* 69, 49-61 (1928).—Anhyd. mesotartaric acid could not be obtained in crystals good enough for crystallographic measurements, but the x-ray data indicate a triclinic cell, contg. 2 formula wts., with the dimensions  $a = 9.24$ ,  $b = 6.33$  and  $c = 5.45$  A. U.;  $\alpha = 70.5^\circ$ ,  $\beta = 78.0^\circ$  and  $\gamma = 79.5^\circ$ . There are 4 formula wts. of  $\text{Ti}_3\text{C}_2\text{H}_4\text{O}_4$  in the unit cell, occurring in pairs which are not equiv.—an unusual type of assocn. Partial dimensions of the cell are  $a = 1326$  and  $c = 7.63$  A. U.,  $\beta = 86^\circ 37'$ . For the direction and length of the third side there were several possibilities, with insufficient data for making a choice. Measurements on crystals of  $\text{K}_2\text{C}_4\text{H}_4\text{O}_6 \cdot 2\text{H}_2\text{O}$  gave  $a:b:c = 1.019:1:1.600$ ,  $\alpha = 95^\circ 44'$ ,  $\beta = 102^\circ 52'$ , and  $\gamma = 61^\circ 46'$ . The unit cell contains 2 formula wts., and partial dimensions are  $a = 7.02$  and  $c = 11.02$  A. U.,  $\beta = 102^\circ 52'$ .

L. S. RAMSDELL  
The crystal structure of pentaerythritol, pentaerythritol tetraacetate and dibenzal-pentaerythritol. F. A. VAN MELLE AND H. B. J. SCHURINK. *Z. Krist.* 69, 1-16.—The structure of pentaerythritol is discussed. The space group of the tetraacetate is  $C_{4h}$ , and  $a = 12.13$  and  $c = 5.55$  A. U. Dibenzal-pentaerythritol is hexagonal, occurring in plate-like crystals with good basal cleavage. It is optically neg., and may be either right- or left-handed, the optical rotation being  $2^\circ$  per mm. for Na light. The axial ratio varied from 6.08 to 6.11. A Bragg photograph gave  $d_{001} = 12.23$  A. U., but a rotation photograph gave  $d_{001} = 36.7$  and  $a = 6.03$  A. U., with  $c/a = 6.08$ .

There are 3 mols. in the unit cell, and the calcd. d. is 1.34; measured d. is 1.30. A Laue diagram showed a 6-fold axis of rotation and 6 planes of symmetry. The space group is  $D_6^4$ . The length of the mol. is about 12 A. U., while the value calcd. by the method used by Bragg, Mark, etc. would be at least 16 A. U. L. S. RAMSDELL.

**Crystal structure of solid mercury.** M. WOLF. *Z. Physik* 53, 72-9(1929).—See C. A. 22, 4288. GEORGE GLOCKLER

**The crystal structure of nickel.** L. MAZZA AND A. G. NASINI. *Phil. Mag.* [7], 7, 301-11(1929).—Ni obtained by electrodeposition, by decompn. of  $\text{Ni}(\text{CO})_4$ , and by reduction of the oxide crystallizes in face-centered cubes. Dimensions of crystal particles range from  $10^{-2}$  to  $10^{-3}$  cm. The edge of the elementary cell varies from 3.513 to  $3.515 \pm 0.001$  A. U., with a mean value  $3.514 \pm 0.001$  A. U. Pure cold-drawn Ni after various thermal treatments always crystd. in face-centered cubes. No confirmation was found of Hull's observation that Ni crystd. in body-centered cubes at ordinary temp. Pure cold-drawn Ni when annealed for a long time does not show recrystd. structures, detectable by x-ray analysis, for annealing temps. up to  $940^\circ$ . The appearance of characteristic recrystd. structures is only observed at  $1000^\circ$  and above. Annealing for 30 hrs. at  $1200^\circ$  produces recystn. in coarse grains which give rise to marked reduction in ductility and tensile strength. Quenching does not produce any change in the dimensions of the Ni lattice. The relative intensity of the lines is about the same in the photograms of all samples examd. and is in good agreement with the values deduced by the formula adopted in the investigation. L. H. REYERSON

**The preparation of single crystals of metals.** G. SACHS. *Metallwirtschaft* 7, 605-7(1928). A. J. KING

**Thermoelectric phenomena and electrical resistance in single metal crystals.** P. W. BRIDGMAN. Harvard Univ. *Proc. Am. Acad. Arts Sciences* 63, 351-99(1929); cf. C. A. 19, 425; 20, 326, 1939.—Single metal crystals were made by cooling the molten metal contained in a mold consisting of criss-cross arms of glass tubing coated on the inside with enamel. Crystn. starts at one point and proceeds throughout the tube, resulting in a single crystal which consists of a number of short crystal rods, each one differently oriented. The thermal e. m. f. of 16 rods could be measured simultaneously in the app. used, the only variable factor in the measurements being the crystal orientation. Thermal e. m. f. against Cu of single crystal Zn, Cd, Sb, Sn, and Bi was measured between  $20^\circ$  and  $88^\circ$ , and from the results the thermal e. m. f., Peltier heat, and difference of Thomson heats between rods of the same metal with different orientations were calcd. In the case of Sb and Bi the heat absorbed by an electron when its direction of motion changes from perpendicular to the crystal axis to parallel to the axis is very large, being resp. 0.2 and 0.4 of the energy of a gas mol. at the same temp. This is a difficult point for the recent Sommerfeld theory. The Kelvin-Voigt law that thermal e. m. f. is a linear function of  $\cos^2\theta$ ,  $\theta$  being the angle between the crystal axis and length of the rod, was verified for Zn, Cd, and Sb, but there were deviations for Sn and Bi. Within exptl. error the Thomson heat does satisfy the K.-V. law; it is only the contribution to the total e. m. f. made by the Peltier heat that fails to satisfy the law. In the case of Bi, it was found that the thermal e. m. f. shows rotational symmetry about the crystal axis. Sp. resistance of the metals was studied as a function of the orientation. The Kelvin-Voigt symmetry relation is satisfied. The previously found low value of the resistance perpendicular to the cleavage plane of Bi was verified. The pressure coeff. of resistance for Sb and Bi was obtained over the entire range of orientations. The third law of thermodynamics lends plausibility, though not certainty, to the theory that the symmetry of the Peltier heat and the Thomson heat must be the same. If this be true the apparent exptl. difference in the symmetry of the two heats is merely an effect of the much greater error in detn. of the Thomson heat. The author revises his previous discussion of Kelvin's axiom of the superposition of thermal effects of currents, concluding that the axiom is logically consistent, but pointing out that expt. seems to contradict it. The surface heat where a current leaves a metal crystal is a function both of the direction of flow with respect to the crystal axis within the crystal and of the orientation of the surface, contrary to the author's former statement. In the light of the present discussion, the crystal phenomena no longer offer a basis for a proof that the electrons move in the crystal along something analogous to fixed channels. R. J. HAVIGHURST

**Single crystals of silver.** E. W. R. STEACIE AND F. J. TOOLE. McGill Univ., Montreal. *J. Am. Chem. Soc.* 51, 1134-5(1929).—Single crystals of Ag were prepd. by slowly cooling a very pure sample of the metal from the molten state to  $940^\circ$ , which temp. was maintained for 48 hrs. There results a bar of Ag which, when treated with dil.  $\text{HNO}_3$ , develops prismatic faces. R. J. HAVIGHURST

**Elastic constants of monocrystalline aluminum and gold.** E. GOENS. Phys. tech. Reichsanstalt, Berlin-Charlottenburg. *Naturwissenschaften* 17, 180(1929).—From the modulus of elasticity  $E$  and of torsion  $G$  in various directions the Voigt moduli were found for monocryst. Al at room temp.  $E_{[111]}:E_{[100]} = 1.18:1$ ;  $G_{[111]}:G_{[100]} = 1:1.13$ ;  $s_{11} \cdot 10^{13} = 15.7$ ;  $s_{12} \cdot 10^{13} = -5.6$ ;  $s_{44} \cdot 10^{13} = 35.7$ . The corresponding values for Au are 2.7:1, 1:2.2, 24.5, —11.3, 25. The accuracy was 2% for Al, 5% for Au, the values are all in c. g. s. units. Bridgman's figures for the compressibility were used.

B. J. C. VAN DER HOEVEN

**The bending of an aluminum crystal plate.** YOICHI KIDANI AND SAKUTCHI TOGINO. *Bull. Inst. Phys. Chem. Research (Tokyo)* 8, 118–25(1929); *Abstract Ed.* 2, 18–9.—This is a description of the results of expts. on the form, slip-bands and Röntgen asterism when a plate of single crystals of Al is bent, as well as the method of detg. the direction of the crystal axis in the simplest manner, by using the radiograph together with a newly devised model. The results are as follows: (1) The form after bending, generally presents a saddle-shape whose curvatures depend upon the relation between the axes of the crystal and of the bending. As a special case, a right-circular cylinder may occur. These forms can be calcd. from the theory, by considering them to be due to slip in the cases of extension and compression. (2) The plane and direction of slip are common for the extension as well as compression sides, and these slips are oppositely directed in accordance with the results obtained by Taylor and Elam. (3) Röntgen asterism produced when single crystals of Al are bent, may be explained by the rotation of the crystal axis due to the extension of the inner and compression of the outer side. This may also be applied to the case of any other metal having a face-centered cubic lattice.

ALBERT L. HENNE

**Solubility in the gaseous phase, especially in the system:  $\text{NH}_3(1) \text{NH}_3(g), \text{H}_2(g), \text{N}_2(g)$ .** H. L. CUPPLES. *J. Am. Chem. Soc.* 51, 1026–33(1929).—Soly. effect in the gaseous phase is defined as a change in the activity of one component due to the presence of other components. Agreement between calcd. and exptl. concns. of  $\text{NH}_3$  in the gaseous phase shows the absence of such an effect in the above system.

J. FLEISCHER

**Stationary flow of very dilute gases.** P. CLAUSING. Nat. Lab., Philips Gloeilampenfabrieken, Eindhoven. *Physica* 9, 65–80(1929).—The Knudsen and the Smoluchowski general equation  $K = W \cdot S v_1$  for the no. of mols. flowing per sec. through a tube of cross section  $S$  to a bulb with pressure zero from a bulb where they exert  $v_1$  collisions per sq. cm. per sec. on the walls is surveyed for several cases using various values of  $W$  depending on the relative sizes of tube length and diameter. A partial soln. is offered for an integral equation including tubes of arbitrary form.

B. J. C. VAN DER HOEVEN

**Refractivity of gaseous compounds.** G. W. BRINDLEY. Univ. of Manchester. *Nature* 123, 165(1929).—Attention is called to certain simple numerical relations between the refractivities of several compds. in the gaseous state; e. g., the refractivity of  $\text{CCl}_4$  is 16/7 that of  $\text{Cl}_2$  and 4 times that of  $\text{HCl}$ ; and the refractivity of  $\text{CS}_2$  is 4/3 that of  $\text{S}_8$ . These same ratios hold for the nos. of loosely bound electrons, but this simple explanation seems applicable to only a few cases.

W. W. STIFLER

**The so-called sama-condition.** I. Previous work. E. A. HOLM. *Arkiv. Mat. Astron. Fysik* 19A, No. 34, 19 pp.(1927). (In German).—It has been suggested by Loschmidt (1876) and several later writers that a substance (especially a gas at low pressure) because of the influence of gravity should possess a temp. gradient (highest temp. at lowest pt. in substance) which does not cause a flow of heat. This condition has been called by v. Dallwitz-Wegner (*Z. Physik* 15, 280(1923)), the sama-condition. On theoretical grounds the existence of this phenomenon has been denied, since it would lead to a contradiction of the Second Law of Thermodynamics. The author attempted to measure the temp. diff. between the upper and lower ends of a long vertical column of air at 10–0.001 mm. pressures by means of a bolometer, but found that radiation between the parts of the bolometer masked any possible effect due to sama-condition. Only at very low temps. might this type of investigation succeed. However, there would be expected a flow of heat downward in a tube all parts of whose walls were originally at the same temp., and a vane placed perpendicular to this heat flow should experience a downward pressure. This downward pressure is called the *gravimolecular pressure*, different from the ordinary *thermomolecular pressure*. II. Investigations on gases. *Ibid* 20A, No. 1, 88 pp.—The gravimolecular pressures of air and  $\text{CO}_2$  at pressures of  $2 \times 10^{-4} - 15 \times 10^{-4}$  mm. Hg were measured with  $\text{H}_2$  at the same pressures as a comparison substance. In the middle of an 80-cm. brass tube was placed an Al vane, circular, of 4 cm. diameter and  $1 \times 10^{-3}$  cm. thickness. The vane was attached to a microbalance and its motion was measured as the tube was held at first vertical and then horizontal. Gravimolecular pressure should cause a greater deflection of the

vane when the tube is vertical, and this deflection should be greater for the heavier gas. The results show a gravimolecular pressure which increases with increasing gas pressure, and which cannot be explained as due to the thermomolecular pressure. In these expts. there was present an unknown gas with a pressure of  $6 \times 10^{-4}$  mm. Hg. III. Investigations on the vapor of diacetoneoxlyose. *Ibid* 21A, No. 12, 72 pp. (1928).—The saturation pressure of solid diacetoneoxlyose ( $C_{11}H_{18}O_8$ ) was detd. with a Knudsen manometer (C. A. 3, 1839; 8, 2831) to be  $1.0 \times 10^{-4}$  mm. Hg at  $15^\circ$ . Two different series of expts. were made with the vapor of diacetoneoxlyose, air at two diff. pressures being the comparison gas. In one case the air was at a higher pressure than the pressure of the diacetoneoxlyose vapor with air as impurity; in the other case the air was at a lower pressure. Values of the gravimolecular pressure obtained in the two sets of expts. agree well, and the pressure is 47% of the theoretical max., to be expected on the assumption that all mols. of the same kind have the same velocity (orientations haphazard). For air and  $CO_2$  the observed gravimolecular pressure was not more than 25% of the theoretical max. This difference is to be expected, because of the difference in wt. of the mols. The gravimolecular pressure of the diacetoneoxlyose is so great relative to its thermomolecular pressure, that its reality seems well substantiated. R. J. H.

Upper limit of energy density and the degradation of gas at high temperature. SEITARÔ SUZUKI. Kyushu Imp. Univ. *Proc. Imp. Acad. (Japan)* 5, 64-7 (1929).—Mathematical treatment. C. J. WEST

Method for determining vapor densities at room temperatures. ERWIN F. LINHORST. *J. Am. Chem. Soc.* 51, 1165-7 (1929).—The liquid is vaporized from a bulb inside one of two evacuated flasks of known vol. connected by an oil manometer. Calcd. values based on  $PV = WRT/M$  are given for  $C_6H_6$  and EtOH. The latter correspond closely to values by the Victor Meyer method. MARY E. LEAR

The gaseous state of low-boiling substances. KURT WOHL. Univ. Berlin. *Z. physik. Chem.*, Abt. B, 2, 77-114 (1929); cf. C. A. 22, 3074.—The calcn. of the van der Waals  $a$  and  $b$  for the permanent gases, He,  $H_2$ , Ne,  $N_2$ , A and  $O_2$  is discussed.  $CO_2$  is taken as representative of the normal substances. The corrected values for  $a$  and  $b$  are calcd. from equations deduced for the reduced second virial coeffs., with consideration of the temp. coeffs. of  $a$  and  $b$ . The second virial coeff. corresponds closely for Ne,  $N_2$  and  $O_2$  with reduced critical data; above the critical temp. there is a certain correspondence with normal substances. Below 1.6 times the reduced temp. the compressibility increases faster for permanent gases than for normal substances. Data for  $H_2$  and He do not agree well with A. Wohl's equation. This is due to the influence of the abs. zero energy on critical data. When this is taken into account in calcn. the reduced second virial coeff., good correspondence is shown. The old quantum theory leads to values of van der Waals  $a$  and  $b$  which do not agree with observed values. ARTHUR FLEISCHER

A new equation of state. HERBERT J. BRENNEN. Northwestern Univ. *Proc. Nat. Acad. Sci.* 15, 11-8 (1929).—The van der Waals' equation is of the 3rd degree in vol.  $V$  and therefore has 3 roots, 2 of which may be imaginary, at any given temp. and pressure. At the crit. point the 3 roots coincide. The equation must, therefore, contain 3 parameters. Apparently the equation satisfies this requirement since it has the 3 parameters  $a$ ,  $b$  and  $R$ . However, as  $V$  increases indefinitely it must reduce to the simple gas law  $PV = RT$ , where  $R$  is a natural const independent of the nature of the gas. Hence, van der Waals' equation, in reality, contains only 2 parameters  $a$  and  $b$  and must, in general, be mathematically absurd. The following modification of this equation is proposed  $[P + (ce^{A/T}/V^n)](V - b) = RT$ , where  $n$  is the missing parameter and  $ce^{A/T}$  replaces the van der Waals " $a$ ." Simple relationships between  $a_r$ ,  $b_r$  and  $n$  are shown to hold when the equation is written in the reduced state. E. R. SMITH

An equation of state for ethylene gas. LOUIS J. GILLESPIE. *J. Phys. Chem.* 33, 354-60 (1929).—The consts. in the equation of state of Beattie and Bridgeman (C. A. 21, 3146) have been detd. for ethylene gas from the data of Amagat. Using atms., l. per mol.,  $T = 273.13 + t^\circ C$ ,  $R = 0.08206$ , they are  $A_0 = 6.152$ ,  $a = 0.04964$ ,  $B_0 = 0.12156$ ,  $b = 0.03597$  and  $c = 22.68 \times 10^4$ . This equation is exact up to a d. of 7 moles per l. and approx. to 8, which is slightly above the crit. d., the av. deviation being 0.36 and 0.45%, resp. The normal d. calcd. from the equation agrees with the accepted value within 0.04%. A. WHITS

Vapor pressures of diethyl selenide, tetramethyl tin and tetramethyl lead. YOSHIO TANAKA AND YÔZABURÔ NAGAI. Tokyo Imp. Univ. *Proc. Imp. Acad. (Japan)* 5, 78-9 (1929).—V. p. detns. for  $SeEt_2$ ,  $SnMe_4$  and  $PbMe_4$  are given for  $25^\circ$  and  $35^\circ$  as follows: 28, —; 112, 168; 31, 51. The following equations are given for  $\log p$ :

SeEt<sub>2</sub>, 7.905 — 1924/T; SnMe<sub>4</sub>, 7.602 — 1655/T; PbMe<sub>4</sub>, 7.751 — 1865/T. These liquids are all normal. C. J. WEST

Condition for the equilibrium of a liquid with its vapor given by Boltzmann, and the relation between this condition and the thermodynamic potential. J. W. DEKKER. *Proc. Acad. Sci. Amsterdam* 31, 973-7(1928).—Boltzmann's expression for the condition of equil. between liquid and vapor of a simple substance, is shown to be incorrect. The expression  $e_{pot} - (\partial e_{pot}/\partial v)v - RT \log v$ , defines the condition correctly. In this expression,  $v$ , is the space available, per g. mol., for a last mol. center,  $e_{pot}$  is the potential energy of 1 mol. in relation to the others and the other symbols have their usual significance. ARTHUR GROLLMAN

The vapor density and pressure of ammonium iodide. RONALD H. PURCELL AND WILHELMUS DE LANGE. *J. Chem. Soc.* 1929, 275-9.—By the exptl. method employed by Smits and his co-workers (cf. *C. A.* 23, 1326), the vapor pressures and vapor ds. of NH<sub>4</sub>I were measured simultaneously between 300° and 436°. Log  $p$  is a linear function of  $1/T$ . It follows then, that the latent heat of evapn. between 300° and 436° is not a function of the temp. The mol. heat of evapn.  $(Q_{80})_{NH_4I} = 44 \times 10^3$  cal., was calcd. from the data. The vapor d. measurements based on observations of the pressure of the satd. and of the unsatd. vapor of a weighed quantity of salt in a known vol., indicated that the vapor was completely dissocd. at all temps. up to 400°. If the salt was perfectly dry there was hardly any decompn. of the HI. Furthermore, there was no tendency for the NH<sub>4</sub>I to be absorbed on the glass walls as was the case with NH<sub>4</sub>Br. W. C. FERNELIUS

The vapor pressures of binary systems; the aqueous solutions of orthophosphoric acid, sodium hydroxide and potassium hydroxide. UKITIRO NAKAYA. *Trans. Faraday Soc.* 24, 543-5(1928).—Empirical equations are constructed for vapor pressures of H<sub>3</sub>PO<sub>4</sub>, NaOH and KOH from Tammann's data in Landolt-Börnstein for a temp. of 100°. The mol. fractions at any concn. are represented by  $\mu_1$  for H<sub>2</sub>O and  $\mu_2$  for the solute. The H<sub>3</sub>PO<sub>4</sub> curve shows an inflection at  $\mu_1 = \mu_2 = 0.5$ , indicating a loose compd. of H<sub>3</sub>PO<sub>4</sub>. H<sub>2</sub>O in soln. For NaOH and KOH the curves indicate that beyond  $\mu_2 = 0.5$  all H<sub>2</sub>O mols. combine with the solute and show no sensible vapor pressure. H. R. MOORE

The vapor pressure and vapor density of intensively dried ammonium chloride. WORTH H. RODEBUSH AND JOHN C. MICHALEK. *J. Am. Chem. Soc.* 51, 748-59(1929); cf. *C. A.* 22, 1881.—The app. and exptl. methods used are discussed in detail as well as the conclusions drawn from the results obtained. A complete bibliography is included. W. C. FERNELIUS

The efficiency of liquefiers for hydrogen and helium. W. H. KEESOM. *Rapports et Comm. 5th Cong. intern. froid*, Apr., 1928; *Comm. Phys. Lab. Univ. Leiden*, Suppl. No. 65, 39-47.—The thermodynamic theory of liquefaction app. is discussed, and the efficiency is defined as the ratio of the wt. of gas leaving the app. (as liquid) to the total wt. of gas entering the app. The max. efficiency will be attained at pressures where  $(\partial T/\partial p)_H = 0$ , the subscript  $H$  denoting const. total heat. The efficiency will increase as the temp. of the entering gas decreases. Efficiencies of 0.171 for  $T_A = -193^\circ$  and 0.295 for  $T_A = -210^\circ$  are calcd. from the K.'s diagrams for H<sub>2</sub>.  $T_A$  is the temp. of entering gas. The pressure in both cases is 150 atm. Results are in agreement with those of Meissner (*C. A.* 18, 186). The Leiden app. gives 13 l. of H<sub>2</sub> per hr., as compared with 13.8 l. per hr. calcd. from the theoretical efficiency. For He liquefaction app. the agreement between actual and theoretical efficiencies is also satisfactory. C. Z. ROSECRANS

Raoult's law. WILDER D. BANCROFT AND H. L. DAVIS. *J. Phys. Chem.* 33, 381-70(1929).—The following modification of the Raoult equation was found to conform to exptl. data over a wide range of concn. for several pairs of liquids:  $(G_1/G_2)^a = K(p_1 - p'_1)/p'_1$ .  $G_1$  and  $G_2$  are the masses in grams of the 2 components in the soln.;  $p_1$  is the vapor pressure of the pure solvent;  $p'_1$  is the partial pressure of the solvent in the soln.;  $K$  is a const. and depends on the units used, the mol. wts. in the vapor phase, the soly., and perhaps on other factors; the exponent,  $a$ , is some function of the relative polymerization and is independent of the units. From the new equation it is possible to calc. the equation of the distribution of one liquid between 2 other liquids, each consolute with the first, provided these other 2 liquids are kept immiscible. Raoult's law is a special case under this equation for ideal solns. A. WHITE

Form and structure of sparks. T. TERADA AND U. NAKAYA. *Sci. Papers, Inst. Phys. Chem. Research (Tokyo)* 1928, 1-19, 65-82, 103-29(in English); *Science Abstracts* 31A, 715.—A description is given of an exhaustive exptl. investigation of the form and structure of sparks between electrodes of different shapes in various gases. The effects

of different circuit conditions, *e. g.*, introducing a series spark gap, varying the inductance and capacity, etc., are shown in a series of photographs. H. L. D.

**The kindling point of gaseous combustible mixtures.** M. PRETTRE AND P. LAFITTE. *Compt. rend.* **188**, 397-9(1929).—In his previous note, L. had emphasized the importance of a drastic evacuation of the reaction vessel after each run (*cf. C. A.* **23**, 1046). He now gives actual figures showing that the presence of small quantities of burned gases are capable of raising the kindling point by some 50°. A. L. H.

**Investigations of the kinetics of the combustion of carbon monoxide.** VLADIMIR S. FINKELSTEIN AND VADIM P. MASHOVETZ. Kiev. Polytechn. Inst. *J. Russ. Phys.-Chem. Soc.* **60**, 1601-28(1928); *Z. physik. Chem., Abt. A*, **138**, 369-78(1929).—The combination of CO with O in glass reaction bulbs was investigated at 500°. The progress of the reaction was followed by measuring the pressure at const. vol. The reaction was found to be of the 3rd order. Glass, considered as a catalyst, is poisoned by CO<sub>2</sub>. The mechanism of the catalytic action and of its poisoning is discussed from the standpoint of phys. and chem. adsorption. Preliminary expts. using Fe<sub>2</sub>O<sub>3</sub> as the catalyst at different temps. are mentioned. E. R. SMITH

**Equilibrium combustion of a mixture of carbon monoxide and hydrogen.** CLARK C. MINTER. *J. Soc. Chem. Ind.* **48**, 35T(1929).—Previous work has shown that at low temp. selective burning of the H<sub>2</sub> and CO in a mixt. of these gases with air takes place. The difference in rates depending on the catalyst used. At higher temp. this difference disappears and the rates of burning seem to become equal. Haslam (*C. A.* **17**, 2637) reports results obtained from data of Kreisinger, Augustine and Owitz (*C. A.* **12**, 1242). Gases giving these data were obtained by mixing air with the gas evolved from soft coal burning with insufficient air for complete combustion, and passing the gases through a 40-ft. flue arranged to take samples at four different places. H.'s conclusions are entirely at variance with the previous work. M. has taken the same data and plotted the percentages and the logarithms of the percentages against time for each of the points at which analyses were made, and shows that the equation for the compn. of the gas with time gives the same velocity coefficient for both H<sub>2</sub> and CO. As another proof that the reactions proceed at the same rate, M. takes the data and shows that the ratio of fractional changes in concn. are the same for both gases. H. in his calcs. has overlooked the fact that the water-gas equil. plays an important part in the reaction at high temps. M. C. ROGERS

**Binary solutions of consolute liquids.** WILDER D. BANCROFT AND H. L. DAVIS. Cornell Univ. *Proc. Nat. Acad. Sci.* **15**, 8-10(1929).—The empirical equation  $[(G_1/M_1)/(G_2/M_2)]^a = (N_1/N_2)^a = K(p_2 - p'_2)/p'_2$ , where  $M_1$  and  $M_2$  are the g. mol. wts. (in the vapor state) of the 2 components of a soln.,  $p_2$  and  $p'_2$  are the vapor pressure of the pure solvent and the partial pressure of the solvent in the soln., resp., and  $a$  and  $K$  are empirical const. obtained from the exptl. data, was found to represent the behavior of non-ideal solns. with unexpected precision. The equation was tested with data for mixts. of EtOH and H<sub>2</sub>O at 25° and mixts. of acetone and Et<sub>2</sub>O at 20° and 30°. The equation for the distribution of acetone between MeOH and H<sub>2</sub>O is stated to be  $G_1/G_2^{1.08} = \text{const.}$  The exponent  $a$  is some measure of the relative polymerizations. E. R. SMITH

**Derivation of the Einstein equations for Brownian motion by impulses of molecular collisions.** V. POSPIŠIL. *Physik. Z.* **30**, 82-3(1929). FRANK URBAN

**A critical consideration of some schemes of fractionation.** ARTHUR A. SUNIER. Univ. Rochester. *J. Phys. Chem.* **33**, 577-85(1929).—Four methods of fractionating in cuts of two are examd. from the point of view of yield, gs. evapd. per g. yield and quantity of original material needed to give the desired yield. These methods are designated (1) Zero included; (2) Zero not included; (3) Zero and L1 not included; (4) Zero, L1, and L2 not included. The terms, Zero, L1, etc., refer to columns in the scheme of fractionation and mean, resp.; material in the same column as the starting material, one arbitrary unit light, one arbitrary unit heavy, etc. To produce 100 g. of L8 and 100 g. of I/8, method 1 requires less starting material than 2, while method 2 requires less material to be evapd. than 1. The conclusions are that, in general (1) The fractionation should be carried in both directions as far as possible; (2) the number of rows worked should be large. The results should be applicable in fractional crystns. as well as distns. M. W. SEYMOUR

**Rapid dehydration of alcohol by means of barium oxide and metallic calcium.** G. FREDERICK SMITH. *Ind. Eng. Chem., Anal. Ed.* **1**, 72-4(1929).—Dehydration of alc. is accomplished with BaO in one-fifth the time required with CaO. The alc. may then be made abs. by further treatment with metallic Ca. J. FLEISCHER

**Alcoholometric tables.** A. V. RAKOVSKII. *Trans. Inst. Pure Chem. Reagents*

(Moscow) 1927, No. 5, 5-112.—R. calcs. new alcoholometric tables using critically the published data, mainly those of Mendelyev (St. Petersburg, 1865), Kreitling, and of Osborne, McKelvy and Bearce (C. A. 7, 2889). By comparing the data of Mendelyev and of Osborne, etc., smoothing out the differences by the method of least squares, R. arrives at an interpolation formula (a polynomial of the 8th order), which reproduces the d. of water-alc. mixts. at 15°. The calcn. of the ds. at other temps. is carried out by taking mean values from the data of Kreitling, of Osborne, etc., and of Mendelyev, assigning to the latter only half the statistical weight. The means are later smoothed out by 2 approximations and interpolated by means of higher-order polynomials. The final values for the d., reduced to water d. at 4° and using the H scale, are given in table I, in which the alc. concn. is in % by wt. The following tables

%	Density $\times 10^4$						
	0°	5°	10°	15°	20°	25°	30°

of d. are given also II, d. of the mixts. in steps of one % by wt. and 5°; III, the same as II, except reduced to water d. at 15°; IV, the same as III, but concn. in vol. %; V, the same as IV, but in steps of one % and 1°. These tables are calcd. partly for the temp. range 0 to 30°, partly for the range -20° to +30°. J. B. KISTIAKOWSKY

**New and simple method for the determination of indexes of refraction of the immersion substances, usually molten mixtures, used in the Becke method.** ALBERT GOOSSENS. Univ. Ghent. *Natuurw. Tijdschr.* 11, 1-5(1929).—A substance of known index of refraction (liquid or molten solid) is examd. under the microscope between two glass plates maintained at an unvariable distance from each other—the microscope is focused on the lower, then the upper surface of the substance under examn. and the difference between the two graduations of the instrument is recorded. The known substance is then replaced by the one whose index is to be detd., and the same operations are performed. The desired index of refraction is then calcd. by the formula:  $n' = en/e'$ , where  $e$  and  $e'$  represent the differences of graduations of the microscope.

ALBERT L. HENNE

**The electrical strength of liquid dielectrics.** A. GYEMANT. *Physik. Z.* 30, 33-58 (1929).—A critical review, with bibliography, of the breaking down of liquid dielectrics under high voltages.

LOUIS WALDBAUER

**Osmosis of ternary liquids, general considerations.** VIII. F. A. H. SCHREINEMAKERS. *Proc. Acad. Sci. Amsterdam* 32, 23-31(1929).—A mathematical discussion of the isotonic and isentonic  $W$ -curves of ternary liquids. Similar relationships obtain for the isotonic  $X$ - and  $Y$ -curves.

ARTHUR GROLLMAN

**Friction constants and wall layer.** J. TAUSS AND F. VON KÖRÖSY. *Z. physik. Chem., Abt. A*, 140, 263-72(1928).—The observation of J. Traube and Siar-Hong Whang (C. A. 23, 749) that there is a decrease in the time of effluence of water from a viscometer whose walls were covered with a thin layer of various substances, especially polar substances, was due not to changes in viscosity of the effluent water, but to a neglect of changes in the initial height of liquid in the viscometer caused by changes in surface tension. The authors have repeated several of Traube's expts. in the Traube-Magasinik

viscometer wetted with various polar substances. In each case the zero point of the viscometer was corrected, the time of effluence of the water noted, and the calcd. viscosity found to be substantially that of pure water.

F. E. WALSH

Aluminum and its formation of mixed crystals with silicon. L. ANASTASIADIS. *Z. anorg. allgem. Chem.* 179, 145-54(1929).—Alloys of Al with 0.53, 0.79, 1.01, 1.27, 1.6% Si were heated for 50-74 hrs. at 570° and then quenched in water at 5°. These alloys were subjected to thermal analysis (Saladin app.), each alloy being heated slowly for about 6 hrs. until a discontinuous heating effect showed that the solidus curve was reached, and then cooled just as slowly past the point of unmixing. Elec. resistance was measured for the quenched alloys at room temp., the resistance being a linear function of the Si content until the end of the mixed-crystal series was reached at 1.48% Si. To confirm the results of the thermal analysis, the quenched alloys were heated slowly to the solidus temp. and cooled slowly past the temp. of unmixing while discontinuous changes of resistance were noted. At room temp. Al can hold 0.18-0.31% of Si in stable solid soln. Further evidence that there is no polymorphic transformation in Al is the constancy of the elec. resistance at room temp. for 99.94% Al, no matter whether the Al be quenched or cooled slowly from 630°. The elec. cond. of the 99.94% Al is  $36.8 \times 10^{-4}$ .

R. J. HAVIGHURST

The metastability of the elements and compounds as a result of enantiotropy or monotropy. XIII. The differential gas dilatometer of C. J. Smith and its accuracy. ERNST COHEN AND H. L. BREDÉ. Univ. of Utrecht. *Z. physik. Chem., A*, 140, 199-222(1929); cf. *C. A.* 21, 3492.—The dilatometer described by S. was found to be sufficiently accurate to measure the vol. change accompanying polymorphic transformations. XIV. Examination of potassium nitrate by means of the differential gas dilatometer. *Ibid* 391-405.—Samples of chemically and physically pure rhombic ( $\alpha$ ) and rhombohedral ( $\beta$ )  $\text{KNO}_3$  were prepd. and the coeffs. of expansion obtained for each. The transition point at 1 atm. pressure lies at  $127^\circ \pm 1$ . The vol. change accompanying the transition from the  $\alpha$ - to the  $\beta$ -form is 0.0049 cc./g. A monotropic form ( $\gamma$ ) of  $\text{KNO}_3$  was obtained by slowly cooling the  $\beta$ -form to a temp. a few degrees below the transition point. The d. of this form is greater than that of either the  $\alpha$ - or  $\beta$ - $\text{KNO}_3$ .

H. F. JOHNSTONE

Convenient method for preparing sodium-potassium alloy. THOMAS MIDGLEY, JR. AND ALBERT L. HENNE. *Ind. Eng. Chem., Anal. Ed.* 1, 75(1929).—Na-K alloy is prepd. by agitating freshly cut Na and K under slightly wet ether.

ROBERT F. MEHL

The Hall effect and other properties of the copper-antimony series of alloys. EMLYN STEPHENS AND E. J. EVANS. *Phil. Mag.* [7], 7, 161-76(1929).—The elec. resistivity, temp. coeff. of resistance, thermoelec. power, Hall effect, sp. heat and d. of a Cu-Sb series of alloys was detd. Elec. resistivity and thermoelectric power were detd. for the alloys as chilled cast plates. The other properties were measured after annealing had been continued until the elec. properties showed no further change. Singular points were found in the curves corresponding to  $\text{Cu}_2\text{Sb}$  and  $\text{Cu}_3\text{Sb}$  except in the case of the temp. coeff. of resistance. The elec. properties of  $\text{Cu}_2\text{Sb}$  were greatly modified by annealing, while those of  $\text{Cu}_3\text{Sb}$  remained practically unchanged.

L. H. REYHERSON

The theoretical potential of the alkaline earth metals. G. DEVOTO. *Z. Elektrochem.* 34, 326-7(1928).—The criticism by Drossbach (*C. A.* 23, 42) is answered. A recalcn. of the value for Ca gave an av. of 2.895 v.

A. L. HENNE

Internal friction in metals. R. H. CANFIELD. Johns Hopkins Univ. *Phys. Rev.* 32, 520-30(1928).

BERNARD LEWIS

Electrocapillary phenomena. IV. Role of the physical factors. W. ARCISZEWSKI, E. CZARNECKI, W. KOPACZEWSKI AND W. SZUKIEWICZ. *Lab. Med. Physics Paris. Protoplasma* 3, 345-56(1928).—Strips of filter paper were suspended in colloidal solns. The results of the expts. demonstrated the importance of phys. factors such as concn., viscosity, purity, surface tension and periodical variations on the penetration of the substances into capillary spaces. The authors question the application of data obtained *in vitro* to vital processes.

M. H. SOULE

The influence of surface tension on viscosity measurements. S. EKK. *Z. physik. Chem., A*, 140, 309-15(1929).—Basing his calcs. upon the Hagen-Poiseuille equation, E. derives an expression showing the influence of capillarity upon viscosity measurements made with the ordinary type of capillary viscometer; in his argument E. corrects the  $p$  term of  $\eta = (F^2 p / 8\pi V l) t$  by  $p = h_m p - p'$ , wherein  $p' = h' p$ ,  $h'$  being the capillary rise and  $p$  the density. The data of Traube and Whang (cf. *C. A.* 23, 749) are discussed and E. shows that their observed changes in viscosity are not due to

decreased viscosity on the walls, as explained by them, but to change in the capillary rise. The argument is supported by exptl. confirmation of this effect by actual measurement of the quantities  $h'$  and  $h_m$ .

WILLIAM E. VAUGHAN

**Equilibrium and reactions in systems of large specific surface.** N. V. RASCHEVSKY. *Z. Physik* 53, 107-29(1929); cf. *C. A.* 23, 748.—The earlier discussions on the spontaneous division of microscopic drops are continued. In regard to the periodicity of the division process during continued growth of the drop the following results are obtained: The state of the drop is completely defined by its total mass, if the drop consists of one component only. In case it consists of more than one component, then its state still depends on its total mass, if there exist stoichiometrical relations between the increases in mass of the various components. In this case it is possible to speak of a certain periodicity because after partition each partial drop will have the same constitution that the original drop had at the time it had the mass of the partial drop. With systems of large surface energy and any shape, the ordinary phase-rule restrictions do not hold. Various general properties of such systems are discussed. A most remarkable case is that of a system having several possible equil. positions or constitutions, which therefore shows hysteresis effects (cf. preceding abstr.).

GEORGE GLOCKLER

**Surface tensions of several molten metals against molten salts.** RICHARD LORENZ AND HANS ADLER. *Phys. Chem. Inst., Univ. Frankfurt a. M. Z. anorg. allgem. Chem.* 173, 324-36(1928); cf. *C. A.* 7, 3340; 18, 612, 1334.—By means of the capillary-height method using a transparent quartz app. (calibrated with water, pyridine, and Hg), the surface tensions of molten  $\text{CdCl}_2$  and of a 68 mole-%  $\text{KCl}$ —32 mole-%  $\text{CdCl}_2$  molten mixt. in air over a temp. range of from 600° to 750° were measured. The Eötvös-Ramsay-Shields const. is 0.1053 for the  $\text{CdCl}_2$ , a very small figure. The variation of interfacial tension of molten Cd and the 68 mole-%  $\text{KCl}$ —32 mole-%  $\text{CdCl}_2$  mixt. with temp. over a range of 150° has been followed; and at const. temp. with increasing KCl content of the molten salt phase the interfacial tension rises very rapidly from 4.0 dynes/cm. with 0%  $\text{KCl}$  to 131.4 at 69.9% at about 600°. The surface tension against air of various  $\text{PbCl}_2$ - $\text{CdCl}_2$  melts at about 600° increases from 75.8 at 0%  $\text{PbCl}_2$  to 143.7 at 100 mole-%  $\text{PbCl}_2$ ; the interfacial tension of the equil.  $\text{Pb} + \text{CdCl}_2 \rightleftharpoons \text{Cd} + \text{PbCl}_2$  at about 600° over a range of 0 to 100 mole-%  $\text{PbCl}_2$  and 0 to 100 mole-%  $\text{Pb}$  varies from 3.9 to 171.8 dynes/cm.

WILLIAM E. VAUGHAN

**Reversion of Traube's rule in the adsorption of homologous series by sugar charcoal.** TH. SARALITSCHKA. *Univ. Berlin. Pharm. Ztg.* 74, 382-4(1929).—The reversion of Traube's rule with respect to sugar C shows that adsorption of org. materials in  $\text{H}_2\text{O}$  increases markedly and regularly in an homologous series, but cannot be generalized. Adsorption of various materials, including members of homologous series, in aq. soln. is not always synbatic with the surface tension of such materials in aq. soln. Even with respect to 2 closely related adsorbents, as 2 charcoals, members of homologous series may show different adsorption capacities. These facts are also of biol. importance, since a marked symbasis has been observed between surface tension, adsorption capacity of materials and their biol. behavior not only toward microorganisms but also toward human beings. Reference is had particularly to Traube's surface-tension theory of narcosis and to the relations of the phys. properties of materials to lethal and inhibitory action on microorganisms.

W. O. E.

**The hydrolytic adsorption by humic acid.** ASHUTASH GANGULI. *Phil. Mag.* [7], 7, 317-21(1929).—The adsorption of electrolytes from solns of  $\text{NaCl}$ ,  $\text{KCl}$ ,  $\text{BaCl}_2$ ,  $\text{AlCl}_3$  and  $\text{K}_2\text{SO}_4$  by humic acid was measured and the H-ion concn. was detd. by the electrometric method: Free acid was liberated in each case and the H-ion concn. was found to be a function of the concn. of electrolyte and the nature of the electrolyte. The effect of valency was marked and a regular order,  $\text{Al} > \text{Ba} > \text{K} > \text{Na}$ , was observed for cations with a common anion. For anions the order was  $\text{Cl} < \text{SO}_4$ . G. explains the acidity of soils on the basis of this hydrolytic adsorption of electrolytes by humic acid.

L. H. REYERSON

**The effect of electrolytes upon emulsions.** Preliminary paper. H. V. TARTAR, C. W. DUNCAN, T. F. SHEA AND W. K. FERRIER. *J. Phys. Chem.* 33, 435-46(1929).—Emulsions of 12 cc. of  $\text{C}_6\text{H}_6$  and 2 cc. of aq. soln. of Na oleate as emulsifying agent are destroyed upon addn. of different acids, e. g.,  $\text{HCl}$ ,  $\text{AcOH}$ , oxalic acid, when approx. enough acid is added to decompose the emulsifier. Oleic acid, which does not decompose the soap, causes an inversion of the usual oil-in-water emulsion into a mobile though unstable water-in-oil emulsion.  $\text{NaOH}$  when added to similar emulsions does not increase their stability; on the contrary their stability decreases with the increasing concn. of the  $\text{NaOH}$  soln. Emulsions of  $\text{C}_6\text{H}_6$ ,  $\text{C}_6\text{H}_5\text{CH}_3$  and xylene with  $\text{H}_2\text{O}$  and Na oleate turn into the water-in-oil type when univalent cations equal to those

of the soap are added. The inversion zone is for  $C_6H_6$  between 0.25 *N* and 0.45 *N* NaCl, for toluene between 0.25 *N* and 0.40 *N* NaCl and for xylene between 0.30 *N* and 0.45 *N* NaCl. The inversion point in the case of  $C_6H_6$  shifted somewhat when NaOH soln. together with the NaCl soln. was used, whereas in toluene and xylene emulsions the breaking point was not markedly influenced by the adding to NaOH. K stearate is a better emulsifying agent than Na oleate; all emulsions produced with K stearate were of oil-in-water type and no inversion took place upon adding KCl or KOH solns. From other "oils" aniline gave permanent emulsions with NaOH concn. from 0.0002 *N* to 0.05 *N* and KOH solns. up to 0.01 *N*, when emulsified with Na oleate or K stearate, resp., but even small amts. of NaCl or KCl prevented the formation of emulsions. *o*-Toluidine gave similar oil-in-water emulsions, when no electrolyte other than the soap was present. Nitrobenzene and dimethylaniline formed readily very stable oil-in-water emulsions. In both cases NaCl produced a breaking zone in lower concns. than the KCl. The results indicate that the nature of the "oil" has also an important influence upon the type of the emulsion.

J. WIERTLAK

Sedimentation period of small particles in a liquid. W. WEAVER. *Z. Physik* 49, 311-14(1928); *Science Abstracts* 31A, 729-30.—This paper continues previous work (*C. A.* 21, 3510) and supplements Fürth's investigations (*C. A.* 21, 844; 22, 1713) by again discussing the upper limits of the sedimentation period of small particles. The formula previously obtained (*loc. cit.*) is now confirmed.

H. L. D.

Variation of the electrical charge of colloidal particles. III. The influence of non-electrolytes on the cataphoretic speed of colloidal particles and on the adsorption of ions by colloidal particles as indicated by such measurements. JNANDRA N. MUKHERJEE, SATYA PRASAD RAICHODHURY AND A. NAGARAJA RAO. *J. Indian Chem. Soc.* 5, 697-713(1928); cf. 22, 898.— $As_2S_3$  sols. contg. non-electrolytes were studied with respect to their cataphoretic speed. After correction for viscosity it was found that cane sugar reduces the speed much more than other non-electrolytes. Others compared were EtOH, MeOH, iso-BuOH, acetone and urea. The speed decreases irrespective of change in dielec. const. The theory is advanced that both the thickness of the double layer and dielec. const. change, with the former as the main factor. With increased concn. of KCl the speed drops continuously, while with addn. of definite amts. of EtOH the speed passes through a min. at 0.02 *N* KCl. A similar min. is found for MeOH but at about 0.003 *N* KCl. For MeOH and HCl the speed may even rise above that of the original sol. No definite critical potential characteristic of the coagulation by an electrolyte exists. The complex manner of variation in cataphoretic speed is due mainly to surface density and to a simultaneous entrainment of the ions of opposite charge necessary at time of contact to produce stable aggregation. IV. The effect of dilution on the charge of colloidal particles in the presence and absence of electrolytes. JNANDRA N. MUKHERJEE, SATYA P. RAI-CHOUDHURY AND ARDHEYU S. BHATTACHARYA. *Ibid* 735-51.—A study of the cataphoretic speeds of  $Fe(OH)_3$  and  $As_2S_3$  sols. with various concns. of HCl shows that for the latter the speed decreases and for the former it increases with increasing concn. of HCl. The results for  $Fe(OH)_3$  are somewhat inaccurate since the conditions for exact measurement have not as yet been carefully studied.

R. H. LAMBERT

The scattering of light in colloidal solutions and gels. I. Agar-sol and gel. K. KRISHNAMURTI. *Proc. Roy. Soc. (London)* A122, 76-103(1929).—A study has been made of light scattering in agar sols and gels in which the effect of temp. on intensity and depolarization was measured. At the same temp. gels are distinctly more opalescent than sols, thus giving evidence that the former have larger micelles. The size and no. of micelles appear to increase with concn. of gels. The intensity of light scattered by agar gels increases continuously with time at 30° and 35°, the rate decreasing with increase of temp. This would indicate that micellar growth is independent of gelation. The formation of gel on sudden cooling of agar sols is accompanied by a marked increase in the Tyndall no. The depolarization factor ( $\theta$ ) of light scattered by agar sols and gels below 35° increases with decreasing temp. for concd. sols and decrease for dil. sols (0.2%). Conclusion: Gel formation is essentially union of micelles, which in itself is both necessary and sufficient.

RAYMOND H. LAMBERT

The change of precipitating concentrations of electrolytes with the purity and temperature of some hydroxide sols. N. R. DEAR AND V. GORE. *J. Indian Chem. Soc.* 6, 31-43(1929).—Sols of  $Fe_2O_3$ ,  $Cr_2O_3$ , and  $ZrO_2$  of different degrees of purity (ratio of metal oxide to Cl) were prepd. by hot dialysis of solns. of the metal chlorides. The pptg. concns. of uni-, bi-, and ter-valent cations were detd.; they are seldom in the ratio 1: $x$ : $x^2$  as demanded by Whetham's rule and they decrease markedly with the purity of the sol. With sols of  $SnO_2$ ,  $ZrO_2$ , and  $CeO_2$  the ratios of pptg. concns. of uni-

and bivalent cations are smaller at 60° than at 30°. Conclusion: As the charge on a colloid decreases, or the temp. increases, the ratios of the pptg. concns. of uni-, bi-, and ter-valent ions decrease, tending toward the ratios  $1:1/2:1/4$  for sols that are not hydrolyzed. This relation is also deduced from theory. The ratios of pptg. concns. are always smaller for those sols that can be obtained readily in the pure state than for those stable only in the presence of large amts. of peptizing electrolytes. The coagulating powers of different ions for the same sol may vary with the nature of peptizing electrolytes present, for instance, HCl increases enormously the pptg. concn. of KCl but increases that of  $K_2SO_4$  only slightly. Such differences are greater for uni- than for multi-valent ions. For sols that have been exposed to light the ratios of pptg. concns. of uni-, bi-, and ter-valent ions are smaller than for sols kept in the dark. The viscosity of sols increases with their purity.

F. L. BROWNE

**Sensitization of sols of mastic, gum dammar, and Odèn sulfur in the presence of gelatin and some carbohydrates.** L. S. BRATTIA, S. GHOSH, AND N. R. DHAR. *J. Indian Chem. Soc.* 6, 129-42(1929).—Addn. of gelatin in small quantities to sols of mastic, gum dammar and Odèn S at first sensitizes them toward pptn. with KCl and then stabilizes them. The 3 sols are acidic, and the addn. of gelatin also increases their  $p_H$  values to a max. and then decreases it. The max. of sensitization occurs at the max.  $p_H$ . Undialyzed sols and sols exposed to sunlight are more sensitized by gelatin and they are also more acidic than dialyzed or unexposed sols. Odèn S sol is sensitized by gelatin to a greater extent in the presence of an acid and to a less extent in the presence of an alkali. "We are of the opinion that the phenomenon of sensitization as observed with proteins and some negatively charged sols is due to charge neutralization of the negatively charged colloid particles by positively charged proteins formed by the adsorption of some H ions present in the sols. Carbohydrates in smaller quantities have sensitized mastic and gum dammar sols and increase their  $p_H$  values. This is because the carbohydrates depress the hydrolysis of mastic and gum dammar and thus decrease the amt. of the complex org. acid, which stabilizes the sol. Larger amts. of carbohydrates stabilize the sols of mastic and gum dammar and decrease their  $p_H$  values because of the increase in the disintegration of the colloid particles of mastic and gum dammar. Odèn S sol is neither sensitized nor protected by carbohydrates. Tannic acid stabilizes this sol."

F. L. BROWNE

**The protective effect and ultrafiltration of silicic acid hydrosol.** WALTER KRONSBELN. *Sprechsaal* 61, 279-81, 296-9(1928).—The results obtained in an investigation in which was detd. the protective effect of 3 different hydrosols of silicic acid and the use of a colorimetric method confirmed the results obtained by ultrafiltration. R. A. HEINDL

**The colloidal behavior of antimony pentoxide.** S. GHOSH AND N. R. DHAR. *J. Indian Chem. Soc.* 6, 17-25(1929).—A negatively charged hydrosol was made by pptg.  $Sb_2O_5$  by adding dil.  $HNO_3$  to  $KSbO_3$ , washing the ppt., and dialyzing the suspended ppt. until it dispersed as a sol. The sol conforms to the Schulze-Hardy law of pptn. by electrolytes. It behaves "normally" on diln., that is, less electrolyte is required for coagulation the greater the diln. Coagulation by mixts. of electrolytes is additive; there is no pos. acclimatization when coagulating electrolyte is added in successive small increments. The sol does not adsorb cations. Aging or boiling the sol changes only slightly its viscosity, elec. cond., acidity and stability toward electrolytes. A coagulum made by pptg. with univalent ions is readily peptized again on washing, but a coagulum with multivalent ions is reprecipitated only with difficulty. The hydrate,  $Sb_2O_5 \cdot 4.7H_2O$ , obtained on drying the sol at ordinary temp. peptizes again on adding  $H_2O$ ; in other words the sol is reversible. About 0.5% of the  $Sb_2O_5$  in the sol is in true soln. The colloidal  $Sb_2O_5$  is believed to be less highly polymerized than colloidal  $SiO_2$ ,  $V_2O_5$  or  $MoO_3$ .

F. L. BROWNE

**The influence of colloids on the precipitation of salts.** ROBERT DICKINSON. Univ. Liverpool. *J. Chem. Soc.* 1929, 358-9; cf. Williams and Mackenzie, *C. A.* 14, 3009; Bolam and Mackenzie, *C. A.* 20, 2772; Bolam, *C. A.* 22, 2305, 4308.—The soly. of the Pb salt of sozoiodol (3,5-diiodo-4-hydroxybenzenesulfonate) is found to be 0.512 g. per 100 cc. of aq. soln., and 1.116 g. per 100 cc. of a 2% gum acacia soln. In the former case a ppt. appears at the end of 10 sec.; in the latter, no ppt. appears for at least 2 hrs. Gelatin reacts with Na sozoiodolate. The examn. of many other Pb salts gave no other example of this phenomenon.

CORNELIA T. SNELL

**Silver sols.** SIMON KLOSKEY. *J. Phys. Chem.* 33, 621-6(1929).—A method of prepn. and some of the properties of the sol are described. Detns. were made of approx. compn. of the micelle, viscosity and d. in aq. EtOH solns., migration velocities, boundary potential, coagulation values of K, Ca, Al ions and sensitizing effect of EtOH.

L. F. MARK

**Colloidal behavior of the sulfides and hydroxides of cadmium and zinc.** WILHELMINA DAUS AND OLIN F. TOWER. *J. Phys. Chem.* **33**, 605-12(1929).—Conditions for the formation of *Liesegang rings* of CdS and ZnS in gels of gelatin and agar-agar were investigated. It was found that the S ion must be present in the gel and the metallic ion above the gel. Adsorption of S ions by the ppt. is more pronounced than that of metallic ions. Conditions for the formation of Cd(OH)<sub>2</sub> and Zn(OH)<sub>2</sub> sols were studied. Gels of Cd(OH)<sub>2</sub> and Zn(OH)<sub>2</sub> were prepd. in glycerol sols.

L. F. MAREK

**A new method of preparation of aluminum hydroxide sols.** K. I. SHEIDT. Scientific Research Inst. of Crimea. *J. Russ. Phys. Chem. Soc.* **60**, 617-21(1928).—Al strips (or fine wire) were left in contact with Hg under distd. H<sub>2</sub>O for 12-24 hrs. The resulting clear yellow sols contained up to 2.383 g./l. solid matter and could be concd. by evapn. to 3.17 g./l. The particles migrated to the cathode. They contained Cl but no Hg (Cl was originally present as an impurity in Al). According to Bechhold's ultrafiltration scale, their size must lie between 20 and 340 $\mu$ . The cardiod ultra-microscope reveals silvery particles in Brownian movement. The sols remain stable for at least 3 months. HCl and AlCl<sub>3</sub> act as stabilizing agents, OH and CO<sub>3</sub> ions as powerful coagulants. The liminal values, as tabulated by S., appear to be detd. by the valence of + ion.

B. SOVENKOFF

**Conductance-diffusion method for studying the coagulation of colloidal ferric oxide.** C. HARVEY SORUM. *J. Am. Chem. Soc.* **51**, 1154-62(1929). L. F. M.

**Further studies on the Donnan theory of "membrane equilibria" (analysis of the electromotive force-time curves).** K. SHINGI. *Acta Schol. Med. Univ. Imp. Kioto* **10**, 325-32(1928).—The best equations (exponential, parabolic or hyperbolic) fitting the curves previously published by S. (*C. A.* **23**, 398) were calcd. by the method of least squares.

DAVID DAVIDSON

**Distribution of acetone through a rubber membrane.** D. S. MORTON. Cornell Univ. *J. Phys. Chem.* **33**, 384-97(1929).—M. has investigated by direct analysis the distribution of acetone between water and MeOH, the 2 sols. being sepd. by a rubber diaphragm which is readily permeable to acetone and but slightly so to MeOH. The distribution over a range of 0-70% acetone in water soln. is described by the equation  $G_{Ac}/G_{Alc} = 2.24(G_{Ac}/G_w)^{1.09}$ , where  $G_{Ac}/G_{Alc}$  and  $G_{Ac}/G_w$  represent resp. g. of acetone per g. of alc. and g. of acetone per g. of water. The diffusion of alc. through the rubber introduces a small error. The partial vapor pressures of solns. of acetone and alc. and of acetone and water were measured by use of an interferometer and the curves are given. This method of detn. checks the above equation satisfactorily. The partial pressures of acetone over acetone-MeOH solns. at 20° are represented fairly well by the expression  $(G_{Alc}/G_{Ac})^{0.83} = 1.38 (179.2 - p')/p'$ . From both of the above equations may be derived the formula  $2.655 (179.2 - p')/p' = (G_w/G_{Ac})^{1.1}$ , which describes the exptl. facts for intermediate concns. but not for very dil. or very concd. solns. Discrepancy may be due to exptl. error.

WILLIAM E. VAUGHAN

**The formation of thin films of organic colloids on mercury surfaces.** R. L. KERNAN. *J. Phys. Chem.* **33**, 371-80(1929).—Spreading effects on the surface of purified Hg as medium were carried out with solns. of cellulose nitrates and acetates (in acetone and CHCl<sub>3</sub>), rubber (in petr. ether) and isolec. gelatin (in H<sub>2</sub>O). By dropping a known amt. of the analyzed material on the Hg surface and measuring the area of the resulting films their thickness has been calcd. Cellulose esters and gelatin gave very irregular and rigid films, whereas those of rubber were elastic. In increasing the diln. of the solns. a limit film thickness was obtained indicating a monomol. layer, which increased with the increasing complexity of the atom groups as follows: rubber (C, H) thickness 1.5 A. U.; cellulose (C, H, O) thickness 2.5-5.0 A. U.; gelatin (C, H, O, N) thickness 7.0 A. U. With cellulose nitrates the limit film thickness varied in an inverse relation with the viscosity of the solns. The results seem to indicate that the analyzed films are composed of ribbons or chains of an indefinite length lying flat upon the Hg surface, their thickness being that of the measured films. Also in *Kolloid-Z.* **47**, 289-94(1929).

J. WIERTELAK

**Adsorptive stratification in gels.** V. SAMUEL C. BRADFORD. *Chemistry and Industry* **48**, 78-81(1929).—Objection is taken to Hedges' statement (*C. A.* **22**, 4314) that no completely satisfactory explanation of the phenomena of *Liesegang rings* has yet been advanced. B. maintains that "no serious objection to the adsorption theory (*C. A.* **10**, 3075; **11**, 2746) has been made, and study of my papers will show that the adsorption theory is capable of explaining qualitatively all the known facts connected with the occurrence of banded ppts."

F. L. BROWNE

**Periodic structures in gels.** ERNEST S. HEDGES. *Chemistry and Industry* **48**,

233-4(1929); cf. preceding abstr.—"The chief objection to B.'s theory is the lack of exptl. evidence on the adsorption of the reactants by the ppts." A banded ppt. difficult to explain by B.'s theory occurs when concd. HCl diffuses into 30% NaCl soln. contained in a tube 0.5 mm. in diam., because the few large crystals present a small specific surface for adsorption.

F. L. BROWNE

**Mechanism of the swelling of gels.** K. KRISHNAMURTI. *Nature* 123, 242-3(1929).—Work on the changes in the scattering of light during the swelling of gelatin and other gels has indicated that these systems contain, to some extent at least, colloidal micelles which act as units. Existing theories do not take into account the changes in these micelles during swelling.

FRANK V. JOHNSON, JR.

**Application of some physicochemical methods for the characteristics of solid fatty emulsions.** L. PICK AND K. SANDERA. *Chem. obzor* 3, 199-202(1928).—The detn. of elec. cond. of emulsions is informative only of the type (water in fat or fat in water). The stability of emulsion is detd. by measuring the time in which the emulsion is broken (by means of a c. 100 v., 50 cycles) between 2 electrodes and the cond. is changed (cf. *C. A.* 23, 2051). To det. the dispersion of an emulsion an objective photometer was used.

**Liquid ammonia as a solvent and the ammonia system of compounds.** IV. Experimental procedures involved in the manipulation of liquid-ammonia solutions. WARREN C. JOHNSON AND W. CONRAD FERNELIUS. *J. Chem. Education* 6, 441-50(1929); cf. *C. A.* 22, 3082, 3365; 23, 2090.—A short review of the technic employed by Franklin, Kraus and co-workers in their work with liquid  $\text{NH}_3$ .

W. C. F.

**The solubilities of lead phosphates.** HORACE MILLET AND MAURICE JOWETT. Univ. of Liverpool. *J. Am. Chem. Soc.* 51, 997-1004(1929).—Detns. of Pb-ion activities by means of a Pb electrode were made on solns. satd. with  $\text{PbHPO}_4$  and with  $\text{Pb}_2(\text{PO}_4)_2$ . These values are used together with  $p_H$  values on the same solns., and the ionization consts. of  $\text{H}_2\text{PO}_4$  (cf. succeeding abstract) to calc. the soly. products for the two salts. It is shown that  $\text{Pb}_2(\text{PO}_4)_2$  is the stable salt under body conditions.

T. H. CHILTON

**The ionization constants of phosphoric acid.** MAURICE JOWETT AND HORACE MILLET. Univ. of Liverpool. *J. Am. Chem. Soc.* 51, 1004-10(1929).—Detns. were made of  $p_H$  values in mixts. of primary and secondary phosphates. These were calcd. on the basis of the activity concept, giving the following values for the first two ionization consts. at 25° and 37.5°, resp.:  $pK_1$ , 2.10, 2.16;  $pK_2$ , 7.13, 7.06. Calcs. from previous data give for the third const. at 20°,  $pK_3 = 12.1$ , approx.

T. H. C.

**The solubility of galena and a study of some lead concentration cells.** LESLIE F. NIMS AND WALTER D. BONNER. Univ. Utah. *J. Phys. Chem.* 33, 586-90(1929).—The e. m. fs. of 25 cells formed by 3.3% Pb amalgam electrodes in satd. solns. of pairs of Pb salts were found to be: (1)  $\text{PbCl}_2$ ,  $\text{PbBr}_2$ , 0.0077; (2)  $\text{PbCl}_2$ ,  $\text{PbI}_2$ , 0.0495; (3)  $\text{PbBr}_2$ ,  $\text{PbI}_2$ , 0.0420; (4)  $\text{PbCl}_2$ ,  $\text{PbSO}_4$ , 0.1030; (5)  $\text{PbBr}_2$ ,  $\text{PbSO}_4$ , 0.0955; (6)  $\text{PbI}_2$ ,  $\text{PbSO}_4$ , 0.0530; (7)  $\text{PbSO}_4$ ,  $\text{PbS}$ , 0.0670. The e. m. fs. of 1, 2 and 3 were calcd. from the formulas: (1)  $E_o = RT/2F \ln a_2/a_1$ ; (2)  $E_L = \Delta_c/V_c - \Delta_d/V_d - \Delta_e + \Delta_d RT/F \ln a_2/a_1$ . Formula 2 was modified by replacing  $\Delta_d$  by  $\Delta_{d1} + \Delta_{d2}/2$ . Since the calcd. and observed values agreed well, such a modification is permissible where the valence of the anion is the same on both sides of the liquid junction. The e. m. fs. of 4, 5 and 6 could not be so calcd. The activity of PbS in satd. water soln. was calcd. from the e. m. f. of 7 by means of equations 1 and 2 (modified). The activity coeff. being assumed to be nearly unity, the soly. of PbS is  $0.94 \times 10^{-6}$  moles per 1000 g.  $\text{H}_2\text{O}$  at 25°. The error is probably not over 30%.

M. W. SEYMOUR

**The effect of one salt on the solubility of another in ethyl alcohol solution.** III. F. S. HAWKINS AND J. R. PARTINGTON. Univ. London. *Trans. Faraday Soc.* 24, 518-30(1928).—The solubilities of KI in alc. solns. of NaI and MgI of various concns. were measured. At concns. below 0.5 N the soly. in NaI + alc. solns. can be represented by the equation:  $-1/\log A. P. R. = 3\alpha(\sqrt{2\mu} - \sqrt{2\mu_0}) + \beta c$ . The symbols A. P. R. denote activity product ratio,  $\mu$  the ionic strength of a soln. of 2 salts,  $\alpha$  and  $\beta$  consts. For MgI + alc. solns. evidence for the formation in soln. of the complex  $\text{MgI}_2 \cdot \text{KI}$  is given, and the values of the "ionic radius" for each series of solns. are calcd. Cond. measurements were made for KI and  $\text{MgI}_2$  solns.

H. R. MOORE

**Concentration cells in ethyl alcohol: sodium and potassium iodides.** G. F. ISAACS AND J. R. PARTINGTON. *Trans. Faraday Soc.* 25, 53-9(1929).—The e. m. fs. of the cells,  $\text{Ag} | \text{AgI NaI}(c_1) | \text{NaI}(c_2) \text{AgI} | \text{Ag}$  and  $\text{Ag} | \text{AgI KI}(c_1) | \text{KI}(c_2) \text{AgI} | \text{Ag}$ , with ethyl alc. as solvent, were measured over the concn. ranges 0.5 N to 0.001 N for NaI and 0.05 N to 0.001 N for KI. The e. m. f. values satisfied Nernst's equation,  $E = 2(1 - n_a)RT/F \log_e \lambda_1 c_1 / \lambda_2 c_2$ .  $n_a$  was const. for all the cells involving concns. not greater than 0.1 N. Cells with 0.5 N NaI solns. gave abnormal results due to the

soly. of AgI in concd. NaI. The electrodes were strips of pure Ag foil cleaned with emery paper. These were used in preference to electrodes made by electrodeposition of Ag on Pt foil, either with or without electrolytic coating of AgI, since these failed to give const. potentials. The conds. for NaI were read from curves obtained by plotting the values of  $\lambda$  obtained by Robertson and Acree (*C. A.* 9, 2018) and by Goldschmidt and Dahll (*C. A.* 19, 922) against  $\sqrt{c}$ . Conds. for KI were obtained from the results of Hawkins and Partington (cf. preceding abstract). The mean values at 25° for  $n_a$  in NaI and KI are 0.5815 and 0.550, resp. M. W. SEYMOUR

The solubility of magnesium hydroxide at elevated temperatures. A. TRAVERS AND NOUVEL. *Compt. rend.* 188, 499-501(1929).—The soly. of  $Mg(OH)_2$  seems to diminish with temp., becoming inappreciable at 178°. Solubilities at various temps., from 35° to 200°, are recorded. FRANK V. JOHNSON, JR.

Solubility of carbon dioxide in water. KURT BUCH. III. *Nord. Kemistmötet.* (Finland) 1928, 184-92; cf. *Soc. Sci. Fennica Commentationes Phys.-Math.* II, 16, (1924).—The object of the investigation was to test the validity of Henry's law at low concns. and to det. whether the manner of mixing  $CO_2$ ,  $H_2O$  and air influence the soly. of  $CO_2$ . Conclusions: (a) Henry's law is valid from a  $CO_2$  pressure of 1 or more atm. down to approx.  $1/20,000$  atm. The absorption coeff. of  $CO_2$  is 0.83 at 20.8°. (b) The manner of mixing constituents does not influence the soly. of  $CO_2$ . O. A. NELSON

The solubility of carbon dioxide in vulcanized rubber. TAKEMARO YAMAMOTO. *Bull. Inst. Phys. Chem. Research (Tokyo)* 7, 999-1001(1928); *Abstr. Sect. 1*, 96-7 (In Esperanto).—The fact that rubber tubing through which  $CO_2$  flows is often seen to flatten soon after the gas stops flowing is ascribed to the soly. of  $CO_2$  in the rubber and its consequent escape. Specimens of tubing, cut into bits, dried, and tested for increase of wt. in 1 atm. of  $CO_2$  at 25°, show that black tubing,  $d_4^{25}$  0.9300, dissolved 0.146 g.  $CO_2$  per 100 g. (equiv. to 68.8 cc. per 100 cc. at 0° and 760 mm.) and bright brown tubing,  $d_4^{25}$  0.9380, 0.166 g.  $CO_2$  per 100 g. (78.5 cc. per 100 cc.). A. M. P.

Molecular structure in solution. IV. The densities, viscosities, and electrical conductivities of aqueous solutions of cobalt chloride and hydrochloric acid at different temperatures. OWEN R. HOWELL. Univ. of Manchester. *J. Chem. Soc.* 1929, 162-72; cf. *C. A.* 22, 712.—The curves obtained by plotting the ds., viscosities, and elec. conds. of solns. of  $CoCl_2 \cdot 6H_2O$  contg. HCl and of HCl alone against temp. show no irregularity between 0° and 80°. The 3 differences curves, unlike those obtained on addn. of HCl to  $CoCl_2$  soln. at const. temp., are also smooth. The change in color from red to blue with increasing temp., therefore, cannot be caused by a change in the no. of oppositely charged Co ions, as was the case with the increasing acid concn. On the other hand, it is probably due to the dehydration of the Co atom, leaving the charge of the ion unaltered. This change may be represented by,  $Co(H_2O)_6^{++} \rightleftharpoons Co(H_2O)_4^{++} + 2H_2O$  for the cation, and  $CoCl_4(H_2O)_2^{--} \rightleftharpoons CoCl_4^{--} + 2H_2O$  for the anion. The no. of groups surrounding the atom is 6 when red and 4 when blue. H. F. JOHNSTONE

The diffusion of substances in hydrotrope solutions. H. FREUNDLICH AND D. KRÜGER. Kaiser Wilhelm-Inst. für Physik. Chem., Berlin-Dahlem. *Biochem. Z.* 205, 186-93(1929).—The phenomenon described as "hydrotrope soln." is seen in the great increase (even a hundred-fold) in the soly. of a great variety of substances in the alkali salts of certain org. acids. The diffusion of BzOH was studied both in pure water and in hydrotropic solns. (Na benzenesulfonate, Na *p*-toluenesulfonate). In the latter the concn. of the BzOH is much greater than the satn. in pure water, but the diffusion coeffs. were not const., though of practically the same magnitude in both instances. Brucine studied under the same exptl. conditions gave sufficiently const. values for the diffusion coeff. S. MORGULIS

Activity coeffs. of ions in very dil. methanol solutions. JOHN W. WILLIAMS. *J. Am. Chem. Soc.* 51, 1112-19(1929).—The activity coeffs. of 3 complex cobaltammines in MeOH were detd. by the soly. method. The Debye and Hückel equation holds in very dil. soln. J. FLEISCHER

Partition coefficients of ions, their determination, theory and application. NIELS BJERRUM. III. *Nord. Kemistmötet* (Finland) 1928, 92-105; cf. *C. A.* 22, 1263.—The partition coeff. is defined as the relation between the concns. of a solute in different solns. in which it has the same activity, e. g., satd. solns. in different solvents. Each ion of an electrolyte has its sp. partition coeff. and the partition coeff. of the electrolyte lies between the coeffs. for the ions. The coeff. for a binary electrolyte is equal to the square root of the product of the coeffs. for the 2 ions. The sums of the partition exponents ( $P = \log V$ ), of a no. of electrolytes in alc. and  $H_2O$  are tabulated. The formula

for calcg. partition coeffs. at infinite diln. is  $V_0 = V(F_{H_2O}/F_{alc.})$ , where  $F_{H_2O}$  and  $F_{alc.}$  are the activity coeffs. of the electrolyte in  $H_2O$  and in alc. KCl has a partition exponent of 6.6. An aq. soln. of this salt must be  $10^{4.6/2} = 2000$  times as concd. as an alc. soln. before the 2 solns. are in equil. Li stearate (partition exponent = -1.2) must be 4 times as concd. in alc. as in  $H_2O$ . By measuring the e. m. f. of the cell  $H_2 | HCl$  aq.  $AgCl | Ag-Ag | AgCl, HCl$  alc.  $| H_2$ , the sums of partition coeff. of ions can be detd. The sum of the partition exponents for  $H^+$  and  $Cl^-$  is 4.8. For a weak acid the sum of ion partition exponents can be calcd. from the dissocn. const.  $K$  in the 2 media; thus  $p_H + P_{anion} - P_{undiss.} = \log K_{H_2O} - \log K_{alc.} = \Delta \log K$ . Partition exponents for a no. of acids are tabulated. Attempts at detg. partition exponents of individual ions were made on the assumption that a satd. soln. of KCl, which as is known has a very small diffusion potential with reference to dil. aq. solns. or dil. alc. solns., gives a potential approaching zero. From measurements of the potential of the cell  $H_2 | HCl$  aq.  $| 3.5 M KCl$  aq.  $| HCl$  alc.  $| H_2$ , the partition exponent of  $H^+$  was calcd. as 2.52;  $Ag^+ = 2.06$ ;  $Cl^- = 2.51$ , etc. Ions prefer  $H_2O$  because of this medium's high dielec. const. Born has shown that the work required to transfer a spherical  $z$ -valent ion of radius  $r$  from a dielectric to a vacuum is  $(ze)^2/2r[1 - (1/D)]$  ( $\xi$  = elec. charge and  $D$  = the dielec. const. of the liq.) The elec. work required to transfer a  $z$ -valent ion of radius  $r$  from  $H_2O$  to alc. ( $D_{aq.} = 81$ ,  $D_{alc.} = 26$ ) is  $(ze)^2/2r[(1/26) - (1/80)]$ . In the partition exponent between  $H_2O$  and alc. this work introduces an elec. factor  $P_0 = 3.15 (z^2/r)$ ; ( $z$  = valence,  $r$  = radius in A. U.). If the partition coeff. for the same atom group uncharged is expressed as  $P_u$ , one may express the partition exponent  $P$ , as  $P_0 + P_u = 3.15(z^2/r) + P_u$ . (1). For a large org. ion, e. g., benzoate, one may assume that the uncharged portion is about the same as the alc. itself, or  $P_{benzoate} = P_0 + P_{benzoic acid}$ . But  $P_H + P_{benzoate} = P_{benzoic acid} = \Delta \log K$ . Combining this with expression (1),  $P_H + P_0 = \Delta \log K$ .  $\Delta \log K$  for org. carboxylic acids is const. at about 6.0. For phenol it is smaller. When one considers that the elec. part of the partition exponent for carboxylate ion is about 3.5 while the whole of the stearate ion is only -3.9 one can well understand why paraffin shuns water. The contact potential between 2 immiscible liquids, and the diffusion potential are discussed from the point of view of partition coeff. O. A. NELSON

Activity coefficient of diacetone alcohol in aqueous salt solutions. GÖSTA ÅKERLÖF. *J. Am. Chem. Soc.* 51, 984-97(1929).—Measurements of the relative activity coeffs. of diacetone alc. in salt solns. were made by detg. the partition coeff. between the solns. and bromobenzene or cymene interferometrically. The results are discussed in relation to the decompn. velocity of diacetone alc. in hydroxide-salt solns. and to Brönsted's theory of velocity of reactions catalyzed by solns. of strong electrolytes. J. F.

The distribution law. I. The ideal distribution law in the form of molecular fractions. RICHARD LORENZ. *Univ. Frankfurt, a.M. Z. anorg. allgem. Chem.* 172, 346-52(1929).—Since the molar potentials (fugacities) of a substance distributed between 2 phases must be the same for each phase at equil., it follows by simple thermodynamic reasoning, that the ratio of the mol. fractions,  $x/y$ , of the substance in the 2 phases must be a const. for any given temp. If the substance exists in the 2 phases in unequal mol. size, the relation becomes  $x^{v_1}/y^{v_2} = \text{const.}$   $v_1$  and  $v_2$  represent the no. of simple mols. forming the mol. magnitude. These relations are independent of the ds. of the 2 phases and they are more exact than the more familiar forms of the distribution law in which a constancy of the ratio of concns. is expressed. II. The distribution law for condensed systems. *Ibid* 366-70.—For condensed systems the distribution law becomes  $x/y e^{\omega} = \text{const.}$   $x$  and  $y$  are the mol. fractions of the substance in the 2 phases, resp., and  $\omega$  is a function of  $x$  and  $y$  and the van der Waals consts.,  $a$  and  $b$ . This function is derived from the molar potentials of the solute and solvents.

H. F. JOHNSTONE

The nature of electrolytic dissociation. M. A. RABINOVICH. *Ukrainskii Khim. Zhurnal* 3, 237-434(1928).—The older and the modern theories of electrolytic dissocn. in aq. and non-aq. solns. are reviewed. The conductivities of the molten salts, of the pure liquids and of the solid electrolytes—crystals and cryst. aggregates—as well as the modern electronic theories of valency and of the structure of mols., are also discussed. R. outlines a theory of electrolytic dissocn. to account for both weak and strong electrolytes without assuming that the latter are completely dissoed. It is suggested instead that the observed deviations from the diln. law are due to solvation and to polymerization of electrolytes. Numerous exptl. data recorded in the literature are cited in support of this theory; it is able to account, qualitatively at least, for such exptl. facts as the presence of a min. in the concn.-mol. cond. curves and its position in relation to the dielec. const. of the solvent. G. B. KISTIAKOWSKY

**Hydrogen-ion concentration. Nature and estimation of  $p_H$ .** HANNS WILL. *Apoth. Ztg.* **44**, 400-2(1929). W. O. E.

The "natural" potential difference in the limit—cell-electrolyte. G. ERTSCH. *Z. physik. Chem., Abt. A*, **139**, 516-28(1928).—Measurements are made of concn. chain c. m. fs. for cells of the type Hg, HgCl, 0.1 N KCl | physiol. KCl || ameba cells | Hg, HgCl, 0.1 N KCl. The following facts are established: (1) The e. m. f. of cells in equil. is zero. (2) The addn. of a single NaCl crystal sets up a p. d. of 100 milli-v. in the chain. (3) If cells are not living, the e. m. f. due to change in outer concn. only decreases slightly. (4) Nonelectrolytes exert no influence on the same e. m. f. *Conclusion*.—Living amebae are in equil. state with electrolytic media, and this equil. is very quickly restored when disturbed by local changes in KCl concn. H. R. M.

The potential difference of dilute solutions. MAX PLANCK. *Sitzb. preuss. Akad. Wiss.* **1929**, 9 11; cf. *C. A.* **22**, 1717.—The formulas of Henderson and of Planck for the p. d. across a liquid junction are compared briefly. If a soln.  $c$  is prepd. by mixing 2 other solns.  $a$  and  $b$ , the p. d. of the chain  $a | b | c | a$  is zero according to Henderson's formula but is not zero, in general, according to Planck's formula. Expts. are in progress to det. which equation is correct. E. R. SMITH

Electroosmosis of mixtures of electrolytes. A. BOUTARIC AND M. DOLADILHA. *Compt. rend.* **187**, 1142-4(1928).—Through a porous vessel a soln. of  $\text{CuSO}_4$  undergoes an elec. transfer toward the cathode;  $\text{Cu}(\text{NO}_3)_2$  toward the anode. This transference has been studied for a soln. contg. both. The mixt. follows the same laws as the single solns. L. D. ROBERTS

The effect of diffusion at a moving boundary between two solutions of electrolytes. DUNCAN A. MACINNES AND IRVING A. COWPERTHWAIT. Rockefeller Inst. for Med. Research. *Proc. Natl. Acad. Sci.* **15**, 18-21(1929).—In the detn. of the transference no. of an electrolyte by the moving-boundary method, a sharp boundary is formed between the soln. to be studied and another "indicator" soln. contg. an electrolyte with a common ion and an ion of lower mobility. Such a boundary will move when current is passed. Since the plane of contact between solns. of 2 electrolytes is not, under usual conditions, either permanent or definite, the question arises as to whether the movement of the boundary is affected by diffusion of one electrolyte into the soln. of the other and *vice versa*. To obtain data upon the effect of such a diffusion, expts. were made of stopping the motion of the boundary, by stopping the current, during the progress of transference detns. Upon stopping the current, the boundary gradually faded out and at the end of about a min. no evidence of discontinuity between the 2 solns. could be observed. However, upon starting the current again the boundary slowly reformed and recovered its original sharpness even after an interruption of 30 min. The transference results showed that the diffuse zone moved at the same rate as the sharp boundary. The mechanism of the process tending to restore a boundary to its original condition if diffusion has been allowed to take place is discussed. The visibility of a boundary is probably detd. by the change of potential gradient at the plane of contact. *E. g.*, the  $\text{AgNO}_3$ ,  $\text{LiNO}_3$  boundary is readily observed but if the  $\text{LiNO}_3$  is replaced by  $\text{NaNO}_3$  the resulting boundary is very difficult to follow. The relatively slight difference in the  $n_s$  of the 2 indicator solns. is hardly sufficient to account for the large difference in visibility. The difference between the potential gradients in the leading and indicator soln. is, however, cut to less than half by the substitution of Na for Li in the latter soln. E. R. SMITH

The transference number of barium chloride as a function of the concentration. GRINNELL JONES AND MALCOLM DOLE. Harvard Univ. *J. Am. Chem. Soc.* **51**, 1073-91(1929).—Measurements were made of the transference no. of the Ba ion in  $\text{BaCl}_2$  solns. at  $25^\circ$  by the analytical method from 0.01 to 1.035  $M$  and by the e. m. f. method from 0.001 to 1.0  $M$ . By a new and more accurate method of calcn. the results of the e. m. f. method were shown to be the same as the data from the analytical method and a new relationship between the transference no. and the concn. is given, namely  $(t + 1)(\sqrt{c} + A) = B$ , where  $A$  and  $B$  are consts. MALCOLM DOLE

The deposition of radium and other alkaline earth metals at the dropping mercury cathode. J. HEYROVSKY AND S. BEREZICKY. Charles' Univ., Prague. *Collection Czechoslov. Chem. Comm.* **1**, 19-46(1929).—The "deposition potentials" from normal ionic concns. are estd. for Ra —1.718, Ba —1.761, Sr —1.964, Mg —1.996 and Ca —2.047 v. from the normal calomel zero. From the magnitude of the diffusion currents, Ra may be followed quant. in mixts. with Ba from the ratio Ra:Ba = 1:10 to 25:1, in concns.  $10^{-4}$   $M$ , 2 cc. being necessary for the detn. Traces down to  $10^{-8}$  g. equiv. per l. of Ra or Ba are detd. in the same way in any amt. of alkalies or alk. earths; Sr is detd. only in mixts. with alk. earths or Li. The applicability of the polarographic

method for the detn. of solubilities of sparingly sol. salts is tested and found comparable to the conduction method. The deposition of Mg and Be even from very small concns. is accompanied by an evolution of  $H_2$ . By means of this action small amts. of Mg may be roughly estd. "Adsorption currents" with well-defined max. are best shown on current-voltage curves of solns. of the heavy alk. earths. Examples are given of polarographic titrations of Ba, Sr and Ca ions. ALBERT L. HENNE

The effect of the addition of iodine on the conductance of the halogen salts of sodium, lithium and potassium in mixtures of alcohol and acetone. FR. NIES. Münster, Physik. Inst. *Z. physik. Chem.*, Abt. A, 138, 447-58(1928).—The addn. of I increases the cond. of solns. of NaI in alc.-acetone mixts. The increase in cond. becomes smaller with increasing proportion of alc. in the solvent. The cond. of LiBr in pure acetone is increased by the addn. of I. With solns. of KI and LiCl in pure alc. an increase of cond. after the addn. of I occurs only at the higher concns. while at lower concns. a decrease occurs. This decrease becomes larger with increasing content of I. These results are explained by the dissocg. effect of the I not only on complex but also on simple mols. Conclusion: Strong electrolytes cannot be completely dissocd. in all solvents. F. R. SMITH

The oxido-reduction potential of glucides. RENE WURMSER AND JEAN GELOS. *J. chim. phys.* 25, 743-4(1928).—See C. A. 22, 3343. FREDERICK C. HAHN

Theory of passivity. III. Current density-time curve in case of deposition passivity. W. J. MÜLLER AND K. KONOPICKY. Tech. Hochschule, Vienna. *Monatsh.* 50, 385-91(1928); cf. C. A. 22, 4346.—Further investigation of the c. d.-time curve shows that the pure deposition only occurs to about 99% according to the formula given earlier. The layer then grows in depth and a formula is developed which is proved for Cu and Pb, but only partly so for Al. E. SCHOTTE

Displacement of copper from neutral and acid copper sulfate solutions by hydrogen under pressure. V. IPAT'EV AND V. IPAT'EV, JR. Acad. Science, Leningrad. *Ber.* 62B, 386-90(1929); cf. C. A. 22, 4287.—Expts. on 1.0 and 0.5 N solns. of  $CuSO_4$  with  $H_2SO_4$  acidity 1.0 N show that the replacement of Cu is independent of the length of time of heating and of the same order, namely 10-25%. The concns. of  $Cu^{++}$  and  $Cu^+$  are practically const. There must be an equil. between those ions and the compressed  $H_2$ . The Cu must be dissolved by the  $CuSO_4$  and the velocity of replacing equal to that of dissolving. With increasing acidity the conditions become favorable for a high  $Cu^+$  concn. With the same acid concn. the replacement of Cu increases out of proportion with higher  $CuSO_4$  concn. and the influence of the increase of acidity diminishes. E. SCHOTTE

Displacement of metals and their oxides by hydrogen under pressure at high temperatures. Action on solutions of ruthenium salts. V. N. IPAT'EV AND O. E. SVYAGIN-ZEV. Academy of Science, Leningrad. *Ber.* 62B, 708-10(1929); cf. preceding abs.—The solns. of the salts  $(NH_4)_2RuCl_6$ ,  $K_2RuCl_6$ ,  $Na_2RuCl_6$  and  $H_2Ru(OH)_2Cl_4$  give the same reaction products with  $H_2$  under pressure. With increase of the pressure and of the temp. the hydrates first formed change to  $Ru(OH)_3 + H_2O$ . The following stages are  $Ru(OH)_3$ ,  $Ru_2O_3$  and Ru. The last stage occurs with a pressure of 125 atm. and 350° for 6 hrs. E. SCHOTTE

Influence of sucrose on the dissociation constant of weak acids in aqueous solution. I. M. KOLTHOFF. *Rec. trav. chim.* 48, 220-6(1929).—From potentiometric (by the  $H_2$  electrode) and cond. measurements, it is concluded that sucrose up to 40% has practically no influence on the dissocn. const. of weak acids in aq. soln., if the concn. of the acids is expressed as the mol. fraction with regard to the free  $H_2O$  and if in a 20% sucrose soln. a hydration of 1 mol. of sugar with 8 mols.  $H_2O$  is accepted. C. Z. R.

The effect of the position of substitution on the apparent dissociation constants of certain amino acids. CARL L. A. SCHMIDT, W. K. APPLEMAN AND PAUL L. KIRK. Univ. of Cal. Med. School. *J. Biol. Chem.* 81, 723-6(1929).—The apparent acid and basic dissocn. consts. of  $\alpha$ -aminovaleric acid,  $\beta$ -alanine,  $\gamma$ -aminovaleric acid and  $\delta$ -aminovaleric acid have been detd. If the logs of the apparent dissocn. const. of these amino acids are plotted against the reciprocal of distance of the amino groups the curves are straight lines. Similar results were obtained by MacInnes (C. A. 22, 4315) with certain hydroxyl- and halogen-substituted acids. A. P. LOTHEP

The influence of a high-potential direct current on the conductivity of an electrolyte. J. A. H. LEECH-PORTER. *Phil. Mag.* [7], 7, 153-9(1929).—The cond. of very dil. electrolytic solns. varied greatly when the electrolyte was subjected to a high-potential d. c. This variation occurs only in a limited range of cond. and is absent when the cond. is either too low or too high. It is most pronounced with HCl when the sp. cond. is about  $2 \times 10^{-4}$  ohm $^{-1}$ , in which case the cond. may vary as much as 600%. L.-P.

suggests that the high p. d. draws the ions toward the electrodes, where they remain. If the d. c. is reversed the concd. groups of ions moves across the cell as a unit. It is suggested that ionic mobility may be detd. by this method. L. H. REVERSON

The relation between the stationary state and equilibrium. EMIL BAUER. *Z. physik. Chem., Abt. A*, 140, 194-8(1929).—Dienger (*C. A.* 23, 1337) observed that with respect to the equil. point the velocity of transformation of tertiary butyl bromide into isobutyl bromide is much too small. B. shows that such breaks in the  $\Delta v$  curves are in harmony with the Guldberg relation,  $K = f_1/f_2$ , between the equil. const. and the velocity coeffs. H. F. JOHNSTONE

An ebullioscopic method for determining the equilibrium constant. W. SWIENOT-LAWSKI, Z. BLASZKOWSKA AND E. JÓZEFOWICZ. *Roczniki Chem.* 9, 1-17, 17-18(1929) (French).—Simultaneous observation is made of the changes in b. p. of 2 mixts. in each of which the same reaction is taking place, but in one of which the equil. is being approached from the direction of esterification while in the other it is being approached from the side of hydrolysis. For the reaction  $\text{AcOH} + \text{EtOH} \rightleftharpoons \text{AcOEt} + \text{H}_2\text{O}$  the equil. const. is 3.76. The b. p. of the equil. mixt. is 76.32°. The coeff.  $dp/dt$  is 27.21 and the heat of vaporization is 8.76 cal. per g. mol. for mixts. contg. the reactants in equiv. amts. JAROSLAV KUČERA

Rapid method for calculation of homogeneous dissociations. Application to carbon dioxide. PIERRE JOLIBOIS AND PIERRE MONTAGNE. *Compt. rend.* 187, 1145-7(1928).—By graphic means on a triangular figure equations  $f(Ldt/RT^2) + \log p + \log K = \text{const.}$ ,  $K = (y^2z/x^2)$ , and  $K = \alpha^2/(1 - \alpha)^2(2 + \alpha)$ , ( $\alpha$  = coeff. of disson.) can be quickly solved. L. D. ROBERTS

Decomposition of persulfates in aqueous solutions. A. KAILAN AND E. LEISEK. *Univ. Wien. Monatsh.* 50, 403-28(1928).—The velocity of the decompn. of  $\text{Na}_2\text{S}_2\text{O}_8$  alone and with the addn. of  $\text{NaHSO}_4$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{NaNO}_3$ ,  $\text{NaOH}$ ,  $\text{H}_3\text{PO}_4$ ,  $\text{Na}_2\text{HPO}_4$  and  $\text{Na}_2\text{PO}_4$  was investigated as well as the decompn. velocity of  $\text{K}_2\text{S}_2\text{O}_8$  with the addn. of  $\text{KNO}_3$  and  $\text{KOH}$ . Expts. were done at 99.4°. With increasing concn. of the persulfates the monomol. velocity coeff. decreases.  $\text{Na}_2\text{S}_2\text{O}_8$  decomposes more rapidly than the K salt.  $\text{H}$ ,  $\text{NO}_3$ ,  $\text{OH}$  and  $\text{HPO}_4$  ions accelerate the reaction.  $\text{K}$ ,  $\text{Na}$  and  $\text{SO}_4$  ions have a retarding effect,  $\text{K}$  more than  $\text{Na}$ .  $\text{H}_3\text{PO}_4$  and  $\text{H}_2\text{PO}_4$  ion have no effect. The decompn. of  $\text{H}_2\text{S}_2\text{O}_8$  to Caro's acid in solns. contg. 0.1 *N*  $\text{K}_2\text{S}_2\text{O}_8$  and 0.6 to 14 *N*  $\text{H}_2\text{SO}_4$  increases with increase of the acidity. E. SCHOTTE

The decomposition of nitrogen pentoxide. H. J. SCHUMACHER AND G. SPRENGER. *Phys. Chem. Inst., Univ. of Berlin. Z. physik. Chem., Abt. A*, 140, 281-90(1929); cf. following abs.—S. and S. have investigated the decompn. of  $\text{N}_2\text{O}_5$  and find that ozone exhibits no inhibitory effect, contrary to the work reported by Daniels, Wulf and Karrer (*C. A.* 17, 13). The velocity of reaction for the change of  $\text{N}_2\text{O}_5$  in the presence of small quantities of  $\text{O}_3$  was studied; also  $\text{NO}_2$  (or  $\text{N}_2\text{O}_4$ ) was slowly mixed with ozone; these reactions were investigated photometrically and manometrically. The reaction velocity const. is about  $8.4 \times 10^{-3}$  as compared to the  $9.1 \times 10^{-3}$  of Daniels and Johnson (*C. A.* 15, 976). Various mechanisms for the reaction are discussed. S. and S. favor  $\text{NO}_2 + \text{O}_3 \rightarrow \text{NO}_3 + \text{O}_2$  followed by  $\text{NO}_3 + \text{NO}_2 \rightarrow \text{N}_2\text{O}_5$  for the formation. They are strongly against a decompn. giving  $\text{NO}_3$ . WILLIAM E. VAUGHAN

Decomposition of nitrogen pentoxide. I. The monomolecular reaction and its cessation at low pressures. GERHARD SPRENGER. *Univ. Berlin. Z. physik. Chem.* 136, 49-76(1928).—The reaction of  $\text{N}_2\text{O}_5$  with  $\text{NO}$  or  $\text{N}_2\text{O}_4$  is practically instantaneous. In agreement with the results of Daniels and Busse (*C. A.* 21, 2212), the gross reaction is found to consist of the following chain reactions: (1)  $\text{N}_2\text{O}_5 \rightarrow \text{N}_2\text{O}_4 + \text{O}_2$  (slow); (2)  $\text{N}_2\text{O}_4 + \text{N}_2\text{O}_5 \rightarrow 4\text{NO}_2 \rightleftharpoons 2\text{N}_2\text{O}_4$  (fast), or  $\text{NO} + \text{N}_2\text{O}_5 \rightarrow 3\text{NO}_2 \rightleftharpoons 1\frac{1}{2}\text{N}_2\text{O}_4$  (fast). The speed of the gross reaction is therefore detd. by (1). At pressures between 0.001 and 0.005 mm., the reaction fades out. The results of Hirst and Rideal (*C. A.* 20, 536) are interpreted as indicating a similar cessation of reaction at low pressures. J. H. REEDY

The reaction between nitrogen pentoxide and ozone. HANS J. SCHUMACHER AND G. SPRENGER. *Univ. Berlin. Z. physik. Chem.* 136, 77-92(1928).—The reaction between  $\text{N}_2\text{O}_5$  and  $\text{O}_3$  is apparently bimol., though it probably consists of a chain of reactions. The speed may be represented:  $dC/dt = 8.7 \times 10^{11} e^{-2900/RT} \times C_1 \times C_3$ . Spectroscopic examn. shows that a new N oxide,  $\text{N}_2\text{O}_4$  or  $\text{NO}_3$ , is formed during the reaction, as reported by Warburg and Leithäuser (*C. A.* 1, 2673). Several schemes to explain the role of this higher oxide in the chain of reactions were discussed. J. H. REEDY

Kinetics of the thermal decomposition of sodium hypochlorite. FRANCESCO GIORDANI AND ELIODORO MATTIAS. *Rend. accad. sci. (Napoli)* [3], 34, 137-41(1928).—

The thermal decompn. of  $\text{NaOCl}$  is expressed by the reaction  $\text{NaOCl} + 2\text{HOCl} = \text{NaClO}_2 + 2\text{HCl}$  and by Foerster was considered independent of the alkyl. (*J. prakt. Chem.* [2], 63, 141-66(1901)). B. and M. have detd.  $K$  for the reaction at  $t = 31^\circ$  and  $t = 46^\circ$ , using 0.30 and 0.381  $N$   $\text{NaOH}$  soln. With the 0.3  $N$  soln.  $K_{t=31^\circ} = 0.0000$  and  $K_{t=46^\circ} = 0.0042$ ; with 0.381  $N$  soln.,  $K_{t=31^\circ} = 0.00035$ ,  $K_{t=46^\circ} = 0.0042$ . The rate of reaction with the more dil.  $\text{NaOH}$  does not increase as much with the same increase in temp.; also at the higher temp.  $K$  is independent of the alkyl. Foerster's work was carried out at  $50^\circ$ .

A. W. CONTIERI

The decomposition of triphenylacetic acid by sulfuric acid. HARRY R. DITTMAR. Univ. of Wis. *J. Phys. Chem.* 33, 533-56(1929).—The decompn. of triphenylacetic acid in concd.  $\text{H}_2\text{SO}_4$  was studied quantitatively to det. the mechanism of the reaction and its relation to the decompn. of oxalic, formic and malic acids. The rate of the reaction was detd. at  $12^\circ$  and at  $22^\circ$  by measuring the vol. of  $\text{CO}$  evolved. The decompn. is quant. and apparently is a first-order reaction. The inhibiting effect of a number of solutes that form addn. compds. with  $\text{H}_2\text{SO}_4$  was studied. The velocity const. fell off with the log of the concn. of the following inhibitors:  $\text{H}_2\text{O}$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{K}_2\text{SO}_4$ ,  $\text{AcH}$ , dimethylpyrone, phenol, acetone,  $p$ -cresol. The inhibiting effect of the following was demonstrated at one or two concns.:  $\text{EtOH}$ , benzoic acid, acetophenone, benzophenone, crotonic acid, coumarin,  $m$ -nitrophenol,  $o$ -toluic acid, triphenylcarbinol.  $\text{HCl}$  was without effect on the velocity, and  $\text{H}_3\text{PO}_4$  had less effect than the above inhibitors.  $\text{H}_3\text{PO}_4$  is not known to form addn. compds. with  $\text{H}_2\text{SO}_4$ , but all of the inhibitors are known to do so excepting  $\text{EtOH}$  and acetone. These substances form compds. with other acids, however. M. p. curves of the system, triphenylcarbinol and  $\text{H}_2\text{SO}_4$ , indicate a compd.,  $(\text{C}_6\text{H}_5)_3\text{COH} \cdot 4\text{H}_2\text{SO}_4$ , hygroscopic, orange-colored needles, m.  $39.0^\circ$ . On account of the low soly. of triphenylacetic acid in less than 70%  $\text{H}_2\text{SO}_4$ , and the decompn. in more than 70%, no direct evidence of compd. formation between these 2 substances could be found. Indirect evidence is adduced, however, and it is believed that the decompn. of triphenylacetic acid is a result of the formation of unstable addn. compds. The similarity of the decompns. of oxalic, malic, formic, and triphenylacetic acids suggests the same mechanism for each. The ease of decompn. of these substances is in the order expected from their critical increments. The fact that the inhibitors form compds. with  $\text{H}_2\text{SO}_4$  supports Taylor's theory of negative catalysis.

M. W. SEYMOUR

The effect of concentrated electrolytes on the course of chemical processes. Experiments with potassium permanganate.\* M. BOBELSKY AND D. KAPLAN. Hebräische Univ. of Jerusalem. *Z. anorg. allgem. Chem.* 177, 323-36(1928); cf. *C. A.* 22, 3816.—The velocity of decolorization of a small known amt. of  $\text{KMnO}_4$  in a large known excess of  $\text{H}_2\text{C}_2\text{O}_4$ - $\text{H}_2\text{SO}_4$  soln. was measured in the presence of various salts. The alkali chlorides exert a stronger accelerating effect than the nitrates or sulfates. Among the sulfates the order of decreasing acceleration is  $\text{Li} > \text{Mg} > \text{NH}_4 > \text{Na} > \text{K}$ . Of the nitrates,  $\text{NH}_4\text{NO}_3$  is markedly accelerating,  $\text{NaNO}_3$  is ineffective and  $\text{KNO}_3$  is retarding. The ratios of the acceleration or retardation of the sep. salts at  $5^\circ$ ,  $15^\circ$  and  $25^\circ$  are tabulated. Chlorides show the greatest temp. sensitivity and are arranged in the following order:  $\text{NH}_4\text{Cl} < \text{KCl} < \text{MgCl}_2 < \text{AlCl}_3$ . The nitrates are weakly sensitive towards temp. change while the sulfates seem to be partly weak and partly intermediate in temp. sensitivity. In this connection the character of the anion appears to be the chief factor. The salt effect almost without exception increases with rise in temp. above  $5^\circ$  and shows a max. between  $5^\circ$  and  $25^\circ$ . Salts which are very sensitive to temp. change also react markedly to concn. change.  $\text{NH}_4\text{NO}_3$  is an exception to this rule and is sensitive to concn. but only weakly so to temp. The following series is arranged in the order of decreasing concn. sensitivity:  $\text{AlCl}_3 > \text{CdSO}_4 > \text{MgCl}_2 > \text{ZnCl}_2 > \text{ZnSO}_4 > \text{KCl} > \text{NH}_4\text{Cl} > \text{NH}_4\text{NO}_3 > \text{NaCl} > (\text{NH}_4)_2\text{HPO}_4$ . The weakly concn.-sensitive salts can be put in the following series:  $\text{Li}_2\text{SO}_4 > \text{MgSO}_4 > \text{K}_2\text{SO}_4 > (\text{NH}_4)_2\text{SO}_4 > \text{Na}_2\text{SO}_4 > \text{KNO}_3 > \text{NaNO}_3$ . The alk. earth chlorides in  $\text{HCl}$  soln. show the order:  $\text{CaCl}_2 > \text{SrCl}_2 > \text{BaCl}_2$  and are intermediate between  $\text{MgCl}_2$  and  $\text{KCl}$  in the 2nd preceding series.

E. R. SMITH

The equilibrium in aqueous solution between ammonium acetate, acetamide, and water. EDGAR B. LINEKEN AND GEORGE H. BURROWS. Univ. of Vermont. *J. Am. Chem. Soc.* 51, 1106-12(1929).—The above equil. was measured at different concns. and temps. and it was concluded that the amide is formed through the ions of the salt.

MALCOLM DOLE

Velocity of saponification of mono- and dichloroacetic acid esters. A. SKRABAL AND M. RÜCKERT. Univ. of Graz. *Monatsh.* 50, 369-84(1928).—Velocity consts. for water ( $k_w$ ), acid soln. ( $k_a$ ) and basic soln. ( $k_b$ ) were detd. for  $\text{CH}_3\text{ClCOOCH}_3$ .  $k_w =$

0.0000123,  $k_a = 0.00507$ ,  $k_b = 8170$  and for  $\text{CHCl}_2\text{COOCH}_3$ ,  $k_w = 0.00092$ ,  $k_s = 0.0140$ ,  $k_a = 170,000$ . Consts. were detd. at  $25^\circ$  in aq. solns. Of the mono ester 0.1 *N* solns. were used. At a HCl concn. of 0.1 *N* and higher  $\text{CH}_2\text{ClCOOH}$ , that comes free, does not increase the velocity as it does at the lower concns. and the acid sapon. runs isolated. The basic sapon. is isolated by using a buffer of 0.2 *N*  $\text{NH}_4\text{Cl}$  and 0.1 *N*  $\text{NH}_3$ . To isolate the neutral sapon. a soln. of 0.2 mol. of ester and 0.1 of NaOH was prepd. For titration HCl or  $\text{NH}_4\text{OH}$  was used with alizarin as indicator. The values given for the dichloro ester are preliminary.

E. SCHOTTE

**The dialuric acid-alloxan equilibrium.** GEORGE M. RICHARDSON AND ROBERT K. CANNAN. Dept. of Biochemistry, Univ. Col., London. *Biochem. J.* **23**, 68-77(1929).—The equil. potentials of the reversible oxidation-reduction system dialuric acid-alloxan have been detd. for the  $pH$  range 1-6 and related to the equil. potentials of alloxantin (see *Ann. Chim.* [9], **19**, 137(1923)). The first acidic const. of dialuric acid and of alloxan have been detd.; the second const. for alloxan is inferred from the electrode behavior of the system.

BENJAMIN HARROW

**The hydrolysis of solutions of zinc sulfate and the presence of univalent zinc ions.** H. G. DENHAM AND N. A. MARRIS. Canterbury College, New Zealand. *Trans. Faraday Soc.* **24**, 510-5(1928).—The quinhydrone gives steady and reproducible values for the hydrolysis of  $\text{ZnSO}_4$  solns. With the H electrode the values of the e. m. f. are not const., because of the reduction of bivalent to univalent ions. The % hydrolysis of  $\text{ZnSO}_4$  solns. over the diln. range 16-256 was found to vary between 0.0042 and 0.169. In one expt a far-reaching reduction of  $\text{ZnSO}_4$  was accomplished with Pt black. It was then possible, with the quinhydrone electrode, to detect an increase in acid concn. to the extent of 500 times by the reduction of  $\text{Zn}^{++}$  ions in accordance with the equation  $\text{Zn}^{++} + \text{H} \rightarrow \text{Zn}^+ + \text{H}^+$ .

H. R. MOORE

**The hydrolysis of certain easily reducible metallic salts.** H. G. DENHAM AND N. A. MARRIS. *Trans. Faraday Soc.* **24**, 515-8(1928); cf. preceding abstr.—The quinhydrone electrode was used for detg. the hydrolysis of the solns  $\text{CdSO}_4$ ,  $\text{PbCl}_2$ ,  $\text{Pb(NO}_3)_2$ ,  $\text{Ti(SO}_4)_2$ . It is much more suitable for such work than the H electrode, which favors partial reduction of the salts. Thus with the H electrode one obtains 4.9%  $\text{H}_2$  as a consequence of the reduction of the thalious ion to the subvalent state.

H. R. MOORE

**Reduction of dichromates to basic chromic salts.** GEORGE GRATHER AND TOSHIO NAGAHAMA. Hokkaido Imp. Univ. *Hokkaido J. Agr.* **24**, 25-38(1928).—The authors previously showed that  $\text{K}_2\text{Cr}_2\text{O}_7$  is reduced by the addn. of  $\text{H}_2\text{SO}_4$  and glycerol. They next proceeded to find out if the reduction occurs in the absence of  $\text{H}_2\text{SO}_4$ , and whether HCl,  $\text{HCO}_2\text{H}$  or  $\text{AcOH}$  can be used instead of  $\text{H}_2\text{SO}_4$ , and also to find out the min. quantity of  $\text{H}_2\text{SO}_4$  necessary for reduction. All reducing agents tested except MeOH have a reducing action, the strength of the reducing action decreasing in the order lactic acid, tartaric acid, glucose, dextrose, tannin, glycerol,  $\text{CH}_2\text{O}$ ,  $\text{Na}_2\text{S}_2\text{O}_3$ ,  $\text{Na}_2\text{SO}_3$ ,  $\text{Na}_2\text{S}$ . HCl can be used in place of  $\text{H}_2\text{SO}_4$  in all cases. Lactic and tartaric acids are suitable as reducing agents when org. acids are used.

K. SOMEYA

**The rate of oxidation of hydrobromic acid by chromic acid in the presence of salts.** M. BOBELSKY AND A. ROSENBERG. Hebrew Univ., Jerusalem. *Z. anorg. allgem. Chem.* **177**, 137-44(1928).—The rate of removal of Br from a dil. soln. of alk. bromide by a stream of  $\text{CO}_2$  in the presence of alk. chromates and  $\text{H}_2\text{SO}_4$  is a function of the H-ion concn. and the concn. of other ions. Solns. of 5 cc. KBr (0.24 *N*), 5 cc.  $\text{K}_2\text{CrO}_4$  (1 *N*), 6.5 cc. concd.  $\text{H}_2\text{SO}_4$  + 15 cc. water, or various sulfate solns., were treated with  $\text{CO}_2$  at const. temp. ( $20^\circ$ ) and const. gas flow. The rate of Br removal was measured with 31 solns. of various concns. of the sulfates of Fe, Cr, Al, Mn, Zn, Ni, Cu, Mg, Cd,  $\text{NH}_4$ , K, and Na. The last four salts retarded the Br evolution, while varying degrees of acceleration were observed with other sulfates. The acceleration increased with increasing concn. A sp. effect was observed with Mn and Cr. The investigation bears upon the recovery of Br from the Dead Sea salt deposits.

R. L. DODGE

**Oxidation of stannous chloride in sulfuric acid solution by air, and the solution velocity of oxygen in sulfuric acid solution.** S. MRYAMORO. *Sci. Papers Inst. Phys. Chem. Research* **10**, 7-17(1929).— $\text{SnCl}_2$  in  $\text{H}_2\text{SO}_4$  soln. was oxidized by bubbling air through the soln. The rate of oxidation increased with increase in acidity until the acid concn. reached 0.8 *N*. Above this concn. the oxidation velocity became equal to the velocity of soln. of  $\text{O}_2$ . Under these conditions, change of temp. had little influence on the oxidation velocity. The rate of soln. of  $\text{O}_2$  in  $\text{H}_2\text{SO}_4$  soln. is approx. the same as that in HCl soln. under the same conditions. Also in *Bull. Chem. Soc. Japan* **4**, 48-56(1929).

C. L. READ

**The activation of chemical reactions by neutral salts. III. The activation of the**

reaction attending the solution of nickel. N. IZGARISHEV AND SOPHIE SHAPIRO. Moskau, Techn. Hochschule. *Z. physik. Chem.*, Abt. A, **140**, 223-6(1929); cf. *C. A.* **22**, 1519.—Sheets of pure Ni, 1.4 mm. thick and 400 sq. mm. in area, were immersed in solns. 3 *N* in  $H_2SO_4$  and *N* in various salts, at 70°, for 60, 90 and 120 min. The quantities of Ni dissolved were detd. and the velocity const. were calcd. for the rate of soln. The order of increasing accelerating effect of anions was found to be:  $Br < F < Cl < I < ClO_3 < IO_3 < BrO_3$ . For chlorides the order obtained was:  $NH_4 < Na < Li < K < Mg < Fe^{II} < Zn < Al < Cu < Fe^{III}$ . IV. The effect of neutral salts on the potential of oxidation-reduction systems. N. IZGARISHEV AND A. TURKOVSKII. *Ibid* 227-34.—The oxidation-reduction potentials of the system  $Fe^{++}-Fe^{+++}$  were measured in the presence of chlorides and nitrates with different cations and in the presence of Na salts with different anions. Curves were plotted showing the dependence of the potential on the concn. of the added salt. The results obtained lead to the conclusion that the effect of the salt cannot be due to a change in acidity. It is improbable that complex formation with  $Fe^{++}$  and  $Fe^{+++}$  takes part in the effect. A parallelism was found between the effect of a series of cations on this potential and on the oxidation of  $SnCl_2$  by  $FeCl_3$ . V. The effect of neutral salts on cathodic polarization. N. IZGARISHEV AND H. RAVIKOVICH. *Ibid* 235-40.—The effect of the addn. of salts to  $NiCl_2$  soln. was investigated with reference to the c. d.-voltage curves for the electro-deposition and current yield of Ni. Characteristic effects of different cations were noted.

E. R. SMITH

The decomposition of hydrogen peroxide at surfaces. W. M. WRIGHT AND E. K. RIDEAL. *Trans. Faraday Soc.* **24**, 530-8(1928); cf. *C. A.* **22**, 3568.—The rate of surface decompn. of  $H_2O_2$  was studied for a no. of surfaces. The addn. of alkalis and acids affects the rate of decompn. and the max. rates of decompn. are coincident with  $p_H$  values theoretically necessary to bring the surface to its isoelec. point. The abnormalities with tungstic acid are probably assocd. with the formation of a sol. per-tungstic acid. Alterations in reaction rate can be effected by multivalent ions such as  $AlCl_3$ . At high concns. the effect of poisoning by the absorbed salt can be observed.

H. R. MOORE

The thermal decomposition of hydrogen peroxide. W. M. WRIGHT. *Trans. Faraday Soc.* **24**, 539-42(1928); cf. preceding abstr.—It is shown that pure silica gel has only a slight catalytic activity for the decompn. of  $H_2O_2$ , but this activity is greatly increased in the presence of  $AgNO_3$ . The addn. of a trace of alkali increases the activity of the Ag salt several hundred times. Clean sheet Ag is a very feeble catalyst but if previously treated with  $HNO_3$  becomes very active because of the formation of an oxide of Ag.

H. R. MOORE

Acid catalysis in hydrolytic reactions. J. N. BRÖNSTED AND W. F. K. WYNN-JONES. Polytech. Inst., Copenhagen. *Trans. Faraday Soc.* **25**, 59-76(1929).—The extended theory of acid and basic catalysis was tested by means of the hydrolysis of the following substances: ethyl orthoformate,  $HC(OC_2H_5)_3$ ; ethyl orthoacetate,  $CH_3C(OC_2H_5)_2$ ; ethyl orthopropionate,  $CH_3CH_2C(OC_2H_5)_2$ ; ethyl orthocarbonate,  $C(OC_2H_5)_4$ ; acetal,  $CH_3CH(OC_2H_5)_2$ ; and ketal,  $(CH_3)_2C(OC_2H_5)_2$ . These hydrolyze, in the presence of minute amts. of acids, according to the typical equation,  $HC(OC_2H_5)_3 + H_2O \rightarrow HCOOC_2H_5 + 2C_2H_5OH$ . According to the extended theory, an *acid* is any substance that tends to split off protons, and a *base* is any substance that tends to add protons. The above reactions are suitable for testing this theory, because of (1) their great sensitivity to H ions, (2) their indifference to OH ions, and (3) the neutrality of the original substances and of the reaction products. Although the theory predicts the catalytic activity of acid mols. other than H ions, the effects of these mols. will be detectable only if  $x$  for the particular reaction is not too close to the limits 1 and 0 in the equation,  $k_A = GK_A$ , where  $k_A$  and  $K_A$  are the catalytic and dissocn. const. of the acid catalyst, resp., and  $G$  is a const. dependent only upon temp., pressure, medium, and the reacting substance, or "substrate." The following rule is laid down: "If in a reaction catalyzed by H or OH ions there is a detectable but not too large 'spontaneous' reaction, then the conditions are favorable for the detection of effects by acids and bases in general." Since the reactions studied are accompanied by considerable vol. changes, the rates were detd. by means of the dilatometer. The use of pressure, instead of suction, for filling the dilatometer enabled readings to be made within 5 mins. from the time of mixing the solns. Expts. showed that the velocity const.,  $k = -d \log c/dt$ , were independent of the concn. of the substrate. Buffers were made from nitrophenols, and cacodylic, acetic, and formic acids to maintain the desired concn. of H ion or uncharged acid mols. The "secondary salt effect" was minimized by maintaining const. total salt concn., necessary dilns. of buffer solns. being made

with NaCl or other uni-univalent salt soln. OH-ion catalysis was shown to be absent. For  $\text{HC}(\text{OC}_2\text{H}_5)_3$  and  $\text{CH}_3\text{CH}(\text{OC}_2\text{H}_5)_2$ , neither a "spontaneous" or water reaction nor the catalytic effect of mols. other than H ion was detectable. These substances are therefore suitable for the detn. of H ion and the study of salt effects. For  $\text{CH}_3\text{C}(\text{OC}_2\text{H}_5)_3$ ,  $\text{CH}_3\text{CH}_2\text{C}(\text{OC}_2\text{H}_5)_2$ , and  $\text{C}(\text{OC}_2\text{H}_5)_4$ , evidence for the catalytic activity of mols. of  $\text{H}_2\text{O}$ , *m*- and *p*-nitrophenols, and cacodylic and acetic acids was found in a decrease of the velocity const. with decrease of the concn. of the buffer soln. at const. H-ion concn. *E. g.*, with a salt concn. of 0.025 *N*, kept const. by the addn. of Na picrate, a decrease of 30% in the velocity const. for  $\text{CH}_3\text{C}(\text{OC}_2\text{H}_5)_3$  occurred when the *m*-nitrophenol buffer concn. was decreased to  $1/10$  its former value. From the data for the reaction velocities in different buffer solns., the dissocn. consts. of the buffer acids were calcd.

M. W. SEYMOUR

Decomposition of nitric oxide by platinum at elevated temperatures and its retardation by oxygen. PAUL W. BACHMAN AND GUY B. TAYLOR. *J. Phys. Chem.* 33, 447-55(1929).—From calcn. of the results of Green and Hinshelwood (*C. A.* 20, 3375) and from exptl. results with improved app. it is found that the decompn. of NO (on Pt and Pt-10% Rh wires above 1000° is bimol. with respect to NO and is retarded in proportion to the  $\text{O}_2$  concn. The heat of adsorption of NO on Pt is predicted to be a large positive value. It is indicated that bimol. reactions, when retarded by a product of the reaction, are similar to unretarded unimol. reactions in that the fraction reacting in any time is independent of the initial pressure.

COLIN W. WHITTAKER

The nature of the time-dilution curves in some hemolytic systems. K. C. SEW AND NARENDRA NATH MITRA. *J. Indian Chem. Soc.* 5, 683-95(1928).—Time-diln. curves of hemolysis of sheep erythrocytes have been obtained with HCl, NaOH, saponin, K oleate and Na taurocholate. Taurocholate gives an abnormal time-diln. curve. Contrary results reported by others are probably due to the use of lower concns. of both hemolyte and corpuscles. The first stage in hemolysis appears to be an autocatalytic reaction. At low concn. of oleate, alkali accelerates hemolysis while the reverse occurs at high concn. Alkali always has a retarding action in saponin hemolysis. Glycocholate appears to be a stronger hemolytic agent than taurocholate if compared at suitable concns.

RAYMOND H. LAMBERT

Hysteresis phenomena in physical-chemical systems. N. V. RASCHEVSKY. *Z. Physik* 53, 102-6(1929).—It is pointed out that the state of every system which may have several possible equil. positions for the same external conditions is dependent on its previous history. With this hysteresis effect there is further connected another property of such systems, namely, the fact that the state of such a system depends not only on the path taken by the detg. external conditions, but also on the velocity with which such external conditions change.

GEORGE GLOCKLER

The triple point of water as a fixed point. H. MOSER. *Phys. Tech. Reichsanstalt. Ann. Physik* [5], 1, 341-60(1929).—A thermostat is described which makes it possible to obtain the temp. of the triple point of water in a vol. of 10 ml. and to maintain it for some time. The factors governing max. temp. constancy are discussed. The temp. was kept const. for several hrs. to  $\pm 0.045^\circ$ . The lowering of the m. p. of ice in equil. with air-free water was experimentally detd. for a pressure increase from 0 to 1 atm. It was  $0.00748^\circ \approx 0.045^\circ$ . The temp. of the triple point is  $0.0098^\circ$ , if the water is satd. with air.

FRANK URBAN

The melting point of potassium chromate. DAVID F. SMITH AND F. A. HARTGEN. *Bur. Mines. Repts. of Investigations* No. 2017, 3 pp.(1929).—Exptl. results on 2 c. p. samples of  $\text{K}_2\text{CrO}_4$  as received and after several recrystns. are tabulated. High transition, low transition and m. ps. are indicated. Five or six recrystns. are necessary to secure a pure product. The m. p. of pure  $\text{K}_2\text{CrO}_4$  is  $968.3^\circ$  with a probable accuracy of  $0.5^\circ$ . Ordinary com. samples require considerable purification before their m. p. can be used as an accurate temp. indicator, such as the temp. to which a coal sample should be heated in the standard method of analysis to det. its content of volatile matter.

W. H. BOYNTON

Remarks on the fusion-pressure curve. FRANZ SIMON AND GUNTHER GLATZEL. *Univ. Berlin. Z. anorg. allgem. Chem.* 178, 309-16(1929).—The usual Traumann interpolation formula for representing the variation of the m. p. with pressure ( $T_p = T_0 + ap - bp^2$ , where  $T_0 = \text{m. p. at zero pressure}$ ,  $T_p = \text{m. p. at pressure } p$ , and  $a$  and  $b$  are consts.) reproduces exptl. results with only fair approximation, and also indicates a decrease in m. p. with increasing pressure at high pressures, a phenomenon which has never been observed. A new formula is proposed (developed from van der Waals' vapor-pressure formula)  $\log(a + p) = c \log T + b$ , in which  $a$ ,  $c$  and  $b$  are consts.,  $p$  is the pressure and  $T$  the temp. It is shown that the order of agreement of

this formula and exptl. results is higher than that of Tammann's. The consts. are evaluated for 19 substances measured by Tammann. The course of the melting curve at high pressures is discussed and views of various authorities are criticized.

ROBERT F. MEHL

**Solutions. II. The freezing-point diagrams and latent heats of evaporation of binary mixtures of volatile liquids.** WILFRED F. WYATT. Univ. Sheffield. *Trans. Faraday Soc.* 25, 43-8(1929); cf. *C. A.* 23, 24.—F.-p. diagrams and curves of the internal molal latent heats at the b. ps. were detd. for the following systems: (I) MeOH-CHCl<sub>3</sub>, (II) Et<sub>2</sub>O-CCl<sub>4</sub>, (III) EtOAc-CCl<sub>4</sub> and (IV) C<sub>6</sub>H<sub>6</sub>-EtBr. Systems with irregular molal latent heat curves have also complex f.-p. curves, but regular molal latent heat curves do not preclude the possibility of compd. formation, since compds. formed at low temps. may not be stable at the b. p. The latent heat curve for the system MeOH-CHCl<sub>3</sub> has 2 max. and 2 min., but the latent heat curves for the other systems are regular. The pos. deviations of the MeOH-CHCl<sub>3</sub> latent heat curve from the additive law indicate strong attractive forces between the 2 kinds of mols. at elevated temps. Cryoscopic evidence for the existence of the following compds. was obtained: MeOH.CHCl<sub>3</sub>, Et<sub>2</sub>O.CCl<sub>4</sub>, 2Et<sub>2</sub>O.CCl<sub>4</sub> and 2EtAc.CCl<sub>4</sub>. The latent heat curves for mixts. contg. CCl<sub>4</sub> indicate that the above compds. of CCl<sub>4</sub> are unstable at the b. p. A transition point at -48° was found in the CCl<sub>4</sub> systems. **III. The transition point of carbon tetrachloride, and compounds of carbon tetrachloride or chloroform with acetone, ether and benzene.** *Ibid* 48-53.—To study the transition pt. at about -48° in systems contg. CCl<sub>4</sub>, and to compare compds. of CHCl<sub>3</sub> and CCl<sub>4</sub> with (CH<sub>3</sub>)<sub>2</sub>CO, Et<sub>2</sub>O and C<sub>6</sub>H<sub>6</sub>, the f.-p. curves of the following systems were investigated: (I) (CH<sub>3</sub>)<sub>2</sub>CO-CCl<sub>4</sub>; (II) CS<sub>2</sub>-CCl<sub>4</sub>; (III) C<sub>6</sub>H<sub>6</sub>-CCl<sub>4</sub>; (IV) Et<sub>2</sub>O-CHCl<sub>3</sub>. A transition point having a mean value of -48.4°, and found in all systems contg. CCl<sub>4</sub> that freeze below this temp., represents an equil. between 2 cryst. forms of CCl<sub>4</sub>. It is suggested that binary mixts. of CCl<sub>4</sub> be used as a fixed pt. in thermometry. Evidence is found for the following compds. in addn. to those reported in parts I and II: C<sub>6</sub>H<sub>6</sub>.CCl<sub>4</sub>, C<sub>6</sub>H<sub>6</sub>.2CCl<sub>4</sub>, (CH<sub>3</sub>)<sub>2</sub>CO.CCl<sub>4</sub>, 3Et<sub>2</sub>O.CHCl<sub>3</sub>, 2Et<sub>2</sub>O.CHCl<sub>3</sub>, Et<sub>2</sub>O.CHCl<sub>3</sub>, Et<sub>2</sub>O.2CHCl<sub>3</sub>. The compds. of CHCl<sub>3</sub> and CCl<sub>4</sub> with (CH<sub>3</sub>)<sub>2</sub>CO, Et<sub>2</sub>O and C<sub>6</sub>H<sub>6</sub> are tabulated and the relative stabilities of these substances pointed out. CHCl<sub>3</sub> is more reactive than CCl<sub>4</sub> toward (CH<sub>3</sub>)<sub>2</sub>CO and Et<sub>2</sub>O. The compds. are assumed to result from a coördinate link formed by the O atom of the one substance donating a lone pair of electrons to the Cl atom of the other substance. Etheric O is a more powerful donor than ketonic. All 3 Cl atoms of CHCl<sub>3</sub> but only 2 of CCl<sub>4</sub> may act as acceptors. CCl<sub>4</sub> forms compds. with C<sub>6</sub>H<sub>6</sub>, but CHCl<sub>3</sub> does not. CS<sub>2</sub> forms no compds. with CCl<sub>4</sub>.

M. W. SEYMOUR

**Equilibrium studies in the systems cobalt-sulfur-oxygen and nickel-sulfur-oxygen.** RUDOLF SCHENCK AND ERNST RAUB. Univ. Münster, i. W. *Z. anorg. allgem. Chem.* 178, 225-51(1929); cf. *C. A.* 21, 3865.—In the system Co-S-O the reaction  $2\text{CoO} + \text{CoS} \rightleftharpoons 3\text{Co} + \text{SO}_2$  is found to be irreversible and proceeds quant. to the left. The equil.  $3\text{CoSO}_4 + \text{CoS} \rightleftharpoons 4\text{CoO} + 4\text{SO}_2$  is studied between 230° and 540°; the vapor pressure reached 1 atm. at 540°, the rise in pressure being very steep above 500°. The thermal dissocn. of CoSO<sub>4</sub> according to the equation  $2\text{CoSO}_4 \rightleftharpoons 2\text{CoO} + 2\text{SO}_2 + \text{O}_2$  is also measured between 700° and 1000°, the vapor pressure rising very rapidly above 900°. In the system Ni-S-O, the reactions  $2\text{NiO} + \text{NiS} \rightleftharpoons 3\text{Ni} + \text{SO}_2$  and  $3\text{NiSO}_4 + \text{NiS} \rightleftharpoons 4\text{NiO} + 4\text{SO}_2$  are studied. In the second the vapor pressure becomes appreciable only above 600°, reaching 1 atm. at about 660°. In the reaction between NiO and NiS, fine capillary crystals are formed, particularly when the S content is about 32%; they are probably  $\gamma$ -mixed crystals of Ni<sub>3</sub>S<sub>2</sub> and NiS. A complete phase diagram is shown. The heat of formation of the sulfates is calcd. to be: for CoSO<sub>4</sub>—228,800 cal.; for NiSO<sub>4</sub>—232,000 cal. The heat of the reaction  $2\text{NiO} + \text{NiS} = 3\text{Ni} + \text{SO}_2$  is found to be 61,700 cal.

H. STROETZ

**Equilibrium of sulfides and silicates in melts.** WILHELM JANDER. *Metallwirtschaft* 7, 580-5(1928).—Melts were heated by a Tammann carbon-tube short-circuit furnace. An empty graphite crucible was heated in a stream of N above the m. p. of the highest-melting component of the melt, and the charge added rapidly in small quantities to avoid chilling the crucible. The melt was stirred continually with a MgO rod until equil. was reached. In order to keep the rod from dissolving, it was periodically withdrawn and the adhering melt allowed to solidify. While the melt was still being heated, the rod was removed and the melt allowed to sep. into sulfide and silicate layers. The crucible was then chilled and shattered, and the layers sep'd. The results are expressed in terms of C and K for a given a. The following 3 equations define these symbols. (1):  $([\text{Fe}_s].[\text{Ni}_{300}])/([\text{Ni}_s].[\text{Fe}_{600}]) = C$ , where the brack-

The 3-component system  $(\text{NH}_4)_2\text{SO}_4$ ,  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{H}_2\text{O}$  was thoroughly studied at 15° and 30°, and the results are reported in figures and diagrams; it was shown that neither a double salt nor a solid soln. exists between the 2 salts. At other temps., only the univariant systems consisting of 2 solid salts, satd. soln., and vapor were examd. The comps. of the satd. solns. are given below: temp.: —21.5, —21.2, —11.52, 0, 15, 30, 50, 70, 80, 90, 100; compn. of soln. in g. %:  $(\text{NH}_4)_2\text{SO}_4$ : 10.89, 10.95, 12.88, 15.41, 19.72, 24.64, 32.75, 42.28, 48.26, 49.14, 50.53;  $(\text{NH}_4)_2\text{SO}_4$ : 30.57, 30.55, 29.85, 29.05, 27.20, 25.21, 21.89, 17.71, 15.13, 15.01, 14.80;  $\text{H}_2\text{O}$ : 58.54, 58.50, 57.27, 55.54, 53.08, 50.15, 45.36, 40.01, 36.61, 35.85, 34.67. The cryohydric point is at —21.5°. By combining these results with the ones listed above, a complete diagram was constructed.

ALBERT L. HENNE

The relationship between the various forms of calcium sulfate at high temperatures. P. N. LASHCHENKO AND D. I. KOMPANSKII. Physicochem. Lab. of Don Polytechnicum. *J. Russ. Phys.-Chem. Soc.* 60, 579-616(1928).—Samples of the anhydride and of the different hydrates were heated for 1 hr. in a Pt or Ag tube and allowed to cool in a Berthelot calorimeter, direct contact with the water being avoided. Other samples were cooled rapidly and ds. detd. in mixts. of EtOH, ligroin and  $\text{PhNO}_2$ . The sp.-heat curve of the mineral anhydride (total heat given off in cooling plotted against the initial temp.) shows a break at 958-984°, which corresponds to the beginning of dissocn. A zone of polymorphic transformation lies between 2 abrupt changes of slope, at 140° and 270°. The d. increases up to 140°, then declines in an irregular manner to the dissociation pt. The hemihydrate prepd. according to Armstrong (*Z. physik. Chem.* 45, 258, 274(1903)) contained 0.6% dissolved water, which it gave off below 164°. The sp.-heat curve changes slope at about 150°; the individual deviations are abnormally large between 150° and 260°. Above 260° the curve coincides with that of the anhydride. The conclusion is drawn that between 150° and 260° the hemihydrate loses water of crystn. and simultaneously undergoes a mol. transformation. The d. increases between 100° and 164° while between 164° and 260° it shows an irregular decrease and from there on a rapid increase to that of the anhydride. Sol. anhydride was prepd. according to van't Hoff; the sp.-heat curve is close to rectilinear to 440°, at which temp. a break occurs followed by an almost horizontal portion extending to 496°. Between 100° and 160° the curve coincides with that for the hemihydrate. Above 164° the hemihydrate is apparently transformed into a mixt. of the 2 anhydrides, while above 250° the sol. anhydride disappears. Starting with the sol. anhydride only (dry or moist) the transformation into the insol. form occurs at about 500°. Gypsum loses practically no water between 92° and 108°. At 108° (a max. on the sp.-heat curve) the loss of water becomes rapid until at 140° (a min.) the compn. of  $\text{CaSO}_4 \cdot \text{H}_2\text{O}$  is reached. From there on, a linear increase in the "heat of cooling" takes place until another nearly horizontal portion is reached at 640-700°. The dissocn. of the anhyd.  $\text{CaSO}_4$  is represented by a cusp at 985°. The d. rapidly increases up to 140° and remains fairly const. during the decompn. of hemihydrate, which is followed by another rise. The dehydration is probably accompanied by the polymerization of the labile monohydrate to hemihydrate and, eventually, soluble anhydride. The change in the slope between 640° and 700° is attributed to a mol. transformation.

B. S.

Indirect analysis of a chemical compound present as solid phase in a two-phase system. ERNST WEITZ. *Z. anorg. allgem. Chem.* 179, 193-210(1929).—The fact that certain unstable  $\text{NH}_3$  compds. could not be isolated necessitated the application of a method of indirect analysis. The methods of Bunge and Schreinemakers were less suitable for the systems studied by W. and Stamm ( $\text{AgNO}_3\text{-NH}_3\text{-H}_2\text{O}$ ,  $\text{Ag}_2\text{C}_2\text{O}_4\text{-NH}_3\text{-H}_2\text{O}$ ,  $\text{AgClO}_4\text{-NH}_3\text{-H}_2\text{O}$ ,  $\text{ZnCl}_2\text{-HCl-H}_2\text{O}$ ). When the compd. is present as a solid phase (I) in a liquid phase (II) consisting of at least 3 components A, B and C the compn. of the compd.  $A_pB_qC_r$  can be detd. by analyzing phase (II) and any mixt. of (I) and (II). Expressing the relative amts. of A, B and C in g.-atoms (or g.-mols. in case A, B and C are compds.) by  $a'$ ,  $b'$  and  $c'$  for the given mixt. and by  $a$ ,  $b$  and  $c$  for the soln. it is clear that  $(a' - \lambda a):(b' - \lambda b):(c' - \lambda c) = p:q:r$ , where  $\lambda$  is an unknown proportionality factor and  $p$ ,  $q$  and  $r$  are small whole nos. whose values are to be found. Elimination of  $\lambda$  gives the equation  $p(b'c - bc') + q(ac' - a'c) + r(a'b - ab') = 0$ . W. shows how the values of  $p$ ,  $q$  and  $r$  can be obtained geometrically from  $a$ ,  $b$ ,  $c$ ,  $a'$ ,  $b'$  and  $c'$  and illustrates his method for the systems mentioned above.

H. S. V. KLOOSTER

Action of air-carbon tetrachloride vapor mixtures on certain natural and artificial sulfides, selenides, and a telluride. K. BRADDOCK-ROGERS. Univ. of Penn. *Chem. News* 138, 147-52(1929).— $\text{CCl}_4$  is purified from S compds. by shaking with 2 vols. of

1:1  $\text{NH}_3\text{-H}_2\text{O}_2$  soln. It is tested for the absence of S by heating a  $\text{CCl}_4$ -air mixt. to  $750\text{--}800^\circ$ , absorbing the product in  $\text{NH}_3\text{-H}_2\text{O}_2$  and testing for  $\text{SO}_4$ . Sulfides are analyzed by heating in a current of  $\text{CCl}_4$ -air, and absorbing the products in a train of  $\text{HCl}$  and  $\text{Br}_2$  followed by  $\text{NH}_3\text{-H}_2\text{O}_2$ . The temp. and time of heating vary somewhat with the sulfide: sphalerite, 15 mins. at  $400^\circ$ , then 25 mins. at  $500\text{--}550^\circ$ ; pyrites, 40 mins. at  $450\text{--}500^\circ$ ; chalcopyrites or Cu mat, 15 mins. without heat, then 15 mins. at  $150\text{--}170^\circ$ , then 15 mins. at  $420\text{--}430^\circ$ ; cinnabar, 10–15 mins. at  $250\text{--}300^\circ$ , then  $400\text{--}450^\circ$ ; bismuthinite 10 mins. at  $200\text{--}250^\circ$ , then  $450\text{--}500^\circ$ ; Ni mat, 15 mins. at  $300\text{--}350^\circ$ , then 20 mins. at  $480\text{--}510^\circ$ ;  $\text{PdS}$ , 80 mins. at  $550^\circ$ , then 20 mins. at  $575\text{--}600^\circ$ . Selenides are analyzed in the same manner, the 2 absorbers being replaced by one with 1:1  $\text{HCl}$ . The  $\text{H}_2\text{SeO}_4$  formed is reduced by boiling to  $\text{H}_2\text{SeO}_3$ , and Se is pptd. by  $\text{SO}_2$ , filtered off and weighed. Berzeliantite in calcite, 10 mins. without heat, 10 mins. at  $250\text{--}300^\circ$ , then 20 mins.  $375\text{--}425^\circ$ ; zorgite, 10 mins. at  $200^\circ$ , then 20 mins. at  $400\text{--}450^\circ$ . A telluride (altaite in calcite) was analyzed in the same manner, 1:4  $\text{HCl}$  being used in the absorber. Heat: 30 mins. at  $250\text{--}275^\circ$ . Decompn. was observed but no quant. data were taken on several other S-, Se- and Te-bearing minerals. G. CALINGAERT

The dehydration of  $\text{CdSO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ . L. CONIGLIO. *Rend. accad. sci. (Napoli)* **34**, [3], 119–22 (1928).—The hydrated salt was gradually dehydrated by holding it in an oven at increasing temps., a current of dry air ( $\text{CaCl}_2$ ,  $\text{H}_2\text{SO}_4$  tubes to dry it) being drawn over it by means of a suction pump, and the compn. of the equil. product at each temp. detd. At  $74^\circ$ ,  $80^\circ$ ,  $90^\circ$ ,  $100^\circ$  and  $115^\circ$  the loss of  $\text{H}_2\text{O}$  was resp., 11.38, 11.39, 11.43, 11.49 and 11.54%. The reaction at  $74^\circ$  is, therefore  $3\text{CdSO}_4 \cdot 8\text{H}_2\text{O} = 3\text{CdSO}_4 \cdot 3\text{H}_2\text{O} + 5\text{H}_2\text{O}$ . At  $122^\circ$  the loss is 13.8% and the reaction  $3\text{CdSO}_4 \cdot 3\text{H}_2\text{O} = 3\text{CdSO}_4 \cdot 2\text{H}_2\text{O} + \text{H}_2\text{O}$ . At  $138^\circ$  the loss is 16.2% so that the reaction is  $3\text{CdSO}_4 \cdot 2\text{H}_2\text{O} = 3\text{CdSO}_4 \cdot \text{H}_2\text{O} + \text{H}_2\text{O}$ . At  $150\text{--}170^\circ$  the loss is 18.40% corresponding to complete dehydration. A. W. CONTIERI

Specific heats of sodium and potassium hydroxide solutions. THEODORE W. RICHARDS AND LAWRENCE P. HALL. Harvard Univ. *J. Am. Chem. Soc.* **51**, 707–12 (1929).—Improvements were made in the differential method for detg. sp. heats. The following values were found for sp. heats at  $18^\circ$ .  $\text{NaOH} \cdot 25\text{H}_2\text{O}$ , 0.9127;  $\text{NaOH} \cdot 50\text{H}_2\text{O}$ , 0.946;  $\text{NaOH} \cdot 100\text{H}_2\text{O}$ , 0.9690 and  $\text{KOH} \cdot 100\text{H}_2\text{O}$ , 0.9567. E. R. S.

Heats of dilution and heat capacities of hydrochloric acid solutions. T. W. RICHARDS, B. J. MAIR AND L. P. HALL. Harvard Univ. *J. Am. Chem. Soc.* **51**, 727–30 (1929).—The sp. heats of  $\text{HCl}$  solns. at  $18^\circ$  (referred to  $\text{H}_2\text{O}$  at the same temp.) were measured by the twin calorimeter method and found to be:  $\text{HCl} \cdot 25\text{H}_2\text{O}$ , 0.8766;  $\text{HCl} \cdot 50\text{H}_2\text{O}$ , 0.9337;  $\text{HCl} \cdot 100\text{H}_2\text{O}$ , 0.9651. Heats of diln. of  $\text{HCl}$  solns. were measured over the range  $\text{HCl} \cdot 25\text{H}_2\text{O}$  to  $\text{HCl} \cdot 800\text{H}_2\text{O}$  at  $16^\circ$  and  $20^\circ$ . The sp. heats of the dil. solns. were calcd. E. R. SMITH

The heats of dilution and specific heats of barium and calcium chloride solutions. THEODORE W. RICHARDS AND MALCOLM DOLE. Harvard Univ. *J. Am. Chem. Soc.* **51**, 794–802 (1929).—The sp. heat of  $\text{BaCl}_2 \cdot 99.97\text{H}_2\text{O}$  was found to be 0.8705 at  $20^\circ$  and 0.8721 at  $25^\circ$ . The sp. heat of  $\text{CaCl}_2 \cdot 100.13\text{H}_2\text{O}$  was found to be 0.9157 at  $20^\circ$  and 0.9173 at  $25^\circ$ . By the indirect method the sp. heats and heat capacities of  $\text{BaCl}_2$  and  $\text{CaCl}_2$  solns. were detd. over the range  $\text{BaCl}_2 \cdot 50\text{H}_2\text{O}$  to  $\text{BaCl}_2 \cdot 6400\text{H}_2\text{O}$  and  $\text{CaCl}_2 \cdot 50\text{H}_2\text{O}$  to  $\text{CaCl}_2 \cdot 3200\text{H}_2\text{O}$ . The heats of diln. and loss in heat capacity on diln. were calcd. from the observations. Qual. agreement with the Debye-Hückel theory was found in dil. solns. E. R. SMITH

Thermodynamics of mixtures. V. FISCHER. Frankfurt-a. M. *Z. Physik* **53**, 138–47 (1929); cf. *C. A.* **22**, 1892; **23**, 327.—F. discusses the heat of fusion and evapn. of binary mixts. and their relation to these quantities of the constituents. The change of m. p. of Hg with pressure is calcd. and compared with data by Bridgman (*C. A.* **6**, 1083). GEORGE GLOCKLER

The specific heat of manganese phosphide. B. G. WHITMORE. *Phil. Mag.* [7], **7**, 125–9 (1929).—W. measured the variation of the heat of Mn phosphide (probably a mixt.) in the neighborhood of its magnetic crit. temp. A small increase in sp. heat, of the order expected on the Weiss theory, was observed near the temp. at which the value of  $\partial I / \partial T$  was a max.  $I$  is the satn. magnetic intensity. The accuracy of expt. was not sufficient to decide whether the max. value of sp. heat coincided with the max. value of  $\partial I / \partial T$  or with that of  $\partial I / \partial T$ . L. H. REYNERSON

Thermal qualities of carbon dioxide in gaseous, liquid and solid state. R. PLANK AND J. KUPRIANOFF. Tech. Hochschule, Karlsruhe. *Z. tech. Physik* **10**, 93–101 (1929); cf. *Beihfte Z. ges. Kalte-Ind.* **1**, 1 (1929).—The behavior of  $\text{CO}_2$  is compiled from data of various authors. The liquid-vapor  $p$ - $T$  curve is given as  $p = a[(T/100) - b]^n$  in kg. per sq. cm. for  $a = 8.494$ ,  $b = 1.281$ ,  $n = 3.852$ , so that the crit. point is  $t =$

31.0°,  $p = 74.96$ , and the triple point  $t = -56.6^\circ$ ,  $p = 5.28$ . The solid vapor pressure from  $-100^\circ$  up is given as  $\log p = a - (C/T) - c \log T + dT$  with  $a = 58.36, 100, b = 2206.455, c = 21.431, d = 0.02527$  and with  $p$  in mm. Hg. The solid-liquid  $p$ - $T$  curve is given with tabulated values for  $p = 1000$  atm.,  $t = -37.3^\circ$  up to  $p = 12,000$  atm.,  $t = 93.5^\circ$ , i. e., a  $dp/dT$  of 52 kg. per sq. cm. per degree near the triple point. The sp. vol. of the dry satd. and superheated vapor is representable by  $v = (RT/P) - (0.0825 + 1.225 \cdot 10^{-7}P)/(T/100)^{10/3}$ , with  $R = 19.273$ ,  $P$  in kg. per sq. m. The crit. value of the sp. vol.  $v_k = 2.156$  l. per kg. The values for  $v$  liquid and solid are tabulated; also the thermal expansion coeff. of the liquid. From the thermal data the values of latent heat of vaporization can be calcd.; for  $r$  is given  $15.2 (304.1 - T)^{0.22}$ . The sublimation heat is calcd. in the same manner. At the triple point it is 46.76 kg.-cal. per kg. The "enthalpy" (internal energy) of the vapor is given as  $i = 169.34 + (0.1965 + 0.000115t)t - 8.3724[P/(T/100)^{1/3}](1 + 0.007424p)$  kg. cal. per kg. The entropy is  $s = 0.59100 + 0.30788 \log T + 0.00023T - 0.1039478 \log p - 6.44028 [P/T(T/100)^{10/3}](1 + 0.007424p)$ . All values are compiled in vapor tables for  $\text{CO}_2$ , including the equilibria of solid and liquid phases from  $+31^\circ$  down to  $-100^\circ$  by  $5^\circ$  steps with values for  $p, v, \gamma$  (sp. gr.),  $i$  and  $s$  for all phases and of  $r$  and  $r/T$ . In addn. to this a large-scale temp.-entropy ( $-100^\circ$  to  $+140^\circ$ ) diagram is given for  $\text{CO}_2$  with isobars, isochores, isenthalps and curves of const. vapor compn. B. J. C. v. D. H.

The heat of dilution of salts at very low concentrations. W. NERNST AND W. ORTMANN. *Z. physik. Chem.* 135, 199-208(1928); cf. *C. A.* 21, 3304.—With an extremely sensitive differential calorimeter the heats of diln. of  $\text{LiCl}$ ,  $\text{KCl}$ ,  $\text{CaCl}_2$ ,  $\text{Ca}(\text{NO}_3)_2$ , and  $\text{ZnSO}_4$  at low concns. deviated appreciably from the values calcd. according to Bjerrum and Debye. In some cases neg. values were obtained instead of the pos. ones postulated by the theory of Debye. H. S. v. KLOOSTER

The heat of dilution of dilute solutions. S. MEIRING NAUDÉ. *Z. physik. Chem.* 135, 209-36(1928); cf. preceding abstr., also *C. A.* 22, 717.—By means of the calorimeter of Nernst and Orthmann the heats of diln. of cane sugar, chloral hydrate, glycolcol, urea,  $\text{Hg}(\text{CN})_2$ ,  $\text{HCl}$ ,  $\text{HNO}_3$ ,  $\text{H}_2\text{SO}_4$ , salicylic acid, benzoic acid,  $\text{LiCl}$ ,  $\text{NaCl}$  and  $\text{NaNO}_3$  were detd. Whereas the heat of diln. of  $\text{HCl}$  approx. agrees with Debye's  $\sqrt{c}$ -laws,  $\text{H}_2\text{SO}_4$  gives values that are too high and  $\text{HNO}_3$  gives values that follow the theory only at low concns. The best agreement is obtained from  $\text{LiCl}$ . The heats of diln. of  $\text{NaCl}$  and  $\text{NaNO}_3$  are neg. at higher concns. and agree with the theory only when the concns. are below 0.01  $N$ . For  $\text{LiCl}$  at  $18^\circ$  the data obtained agreed with the theory on using the expression  $320\sqrt{c}$  instead of Bjerrum's value  $418\sqrt{c}$ . The factor 320 decreases 8 units per degree for  $\text{LiCl}$  when the temp. is lowered. The exptl. data confirm the theory of Nernst, which states that the heat of diln. results from the heat absorption accompanying the dissocn. of previously undissocd. mols. and the heat evolution caused by interionic forces (Debye effect, modified by using the factor 320). H. S. v. KLOOSTER

The heat capacities of isopropyl alcohol and acetone from  $16^\circ$  to  $298^\circ\text{K}$ . and the corresponding entropies and free energies. KENNETH K. KELLEY. Univ. of California. *J. Am. Chem. Soc.* 51, 1145-50(1929).—For 1 mol. of liquid at  $298.1^\circ\text{K}$ ., the entropies are, resp.:  $47.9 (\pm 0.3)$  and  $43.0 (\pm 0.3)$  cal. per degree. The free energies of formation at  $298.1^\circ\text{K}$ . are, resp.:  $-48,100$  and  $-36,700$  cal. per mol. The free energy change in the reaction,  $\text{CH}_3\text{CHOHCH}_3(\text{liq.}) = \text{CH}_3\text{COCH}_3(\text{liq.}) + \text{H}_2(\text{g.})$ , is recalcd. to be about 7000 cal. F. D. ROSSINI

The Majorana thermal effect. A. L. TH. MOESVELD. *Z. physik. Chem.*, Abt. A, 140, 423-8(1929); cf. *C. A.* 21, 851; 23, 1561.—Evidence is given to show that the Majorana thermal effect is due to the heat of transformation when the substance from a metastable to a stable form. F. D. ROSSINI

### 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

The modern conception of matter. CHARLES A. KRAUS. *Am. Dyestuff Repr.* 17, 839(1928).—A general review.

Nuclear motion associated with electron transitions in diatomic molecules. EDWARD U. CONDON. Princeton Univ. *Phys. Rev.* 32, 858-72(1928).—The question of nuclear motions assoc. with electron transitions is discussed from the standpoint of quantum mechanics. It appears that Heisenberg's indeterminate principle gives the clue to the inexactness of the earlier method based on Franck's postulate since its strict application calls for a violation of the principle. The existence of an entirely new type of band spectrum due to the wave nature of matter is predicted and the interpretation of Rayleigh's (C. A. 22, 2886) Hg band at 2476-2482 Å. U. as of this type is suggested. It is shown that while Franck's postulate is also true for electron jumps in atoms it is of but little interest because its inexactness is much greater for electrons than for heavy nuclei.

The theory of the Stark effect in hydrogenic atoms. VLADIMIR ROJANSKY. Washington Univ., St. Louis, Mo. *Phys. Rev.* 33, 1-15(1929).—The Stark effect of the fine structure of H atoms is discussed in the light of the quantum mechanics. Explicit formulas are given for the energy levels in either a weak or a strong elec. field including in each case both the relativity corrections and the Stark effect. The results are, except in form, similar to those recently given by Schlapp (C. A. 22, 2886). In the new

mechanics, in contradistinction to the old Bohr theory, there is a linear Stark effect even in weak fields, because of the identity of energy for the  $ns$  and  $np$ , levels in the absence of external fields. This degeneracy is shown to account for the results of the expts. of Ornstein, Zernike and Snoek (*C. A.* 22, 2109), who found that the  $2s$  level in H is not metastable. The coeffs. are found for the development of the "parabolic" eigenfunctions in terms of the "polar" ones, and a set of numerical values of these coeffs. is tabulated. Methods are given for the calcn. of the relative intensities in the Stark effect in terms of the already available theoretical fine-structure intensities in the absence of fields.

BERNARD LEWIS

**The existence of metastable molecules in active nitrogen.** JOSEPH KAPLAN. Univ. of Calif. *Phys. Rev.* 33, 189-94(1929).—It has been shown in the present expts. that active  $N_2$  contains, among other things, metastable mols. of N possessing about 8 v. of energy. The evidence that is presented to prove this statement is the excitation of the fourth pos. group of  $N_2$  simultaneously with the quenching of the afterglow by a mild elec. discharge. The main spectroscopic characteristics of a condensed discharge have been reproduced by simply introducing active N into a weak discharge. The mild discharge is unable to excite the  $D$  level of the N mol. except when active N is introduced. It is believed that the metastable N mols. present in active N are raised to the  $D$  level. Since these metastable mols. are entities involved in the emission of the  $\alpha$  bands or afterglow, the latter is thus weakened in such a discharge. The relation of these phenomena to the structure of the N mol. is discussed. B. L.

**Transmutation of elements.** L. THOMASSEN. Calif. Inst. of Tech. *Metallwirtschaft* 7, 703-8(1928); *Phys. Rev.* 33, 229-38(1929).—X-ray spectrograms of the W target of a deep-therapy x-ray tube were taken before and after it operated for 80 hrs. at 2-3 ma. and 207 kv. peak voltage. No lines other than those due to W were found before or after. The expts. of Smits and Karsen (*C. A.* 21, 855) with the Pb arc were duplicated as nearly as possible. Under no conditions of c. d. was there any spectroscopic evidence of a transmutation of Pb to Hg. The expts. of Smits and Karsen using a high potential discharge between Pb electrodes in  $CS_2$  were carefully repeated. Some evidence of Hg in the residue from the electrodes was found. The indications are, however, that the Hg comes from the electrodes, the  $CS_2$  or dust particles rather than from a transmutation of Pb.

BERNARD LEWIS

**Some recent developments of statistical mechanics.** J. E. LENNARD-JONES. *Proc. Phys. Soc. London* 40, 320-37(1928).—A new departure has been given to the statistical theory since the work of Bose in 1924. It is now possible to derive certain av. properties of the atom by statistical methods. Comparison is made of the new statistics, including the work of Bose-Einstein and the more recent work of Fermi-Dirac, with classical statistics. Interesting applications of the new ideas are shown in the work of Thomas and Fermi on the distribution of electrons in heavy atoms, and in the work of Pauli and Sommerfeld on the electron theory of metals. L.-J. and Woods (*C. A.* 23, 1346) have attempted to find the av. distribution of electrons in a metal. The statistics of gaseous mixts. have been studied by Jordon (*C. A.* 22, 1900) and others.

FRANK V. JOHNSON, JR.

**Quantum mechanics and radioactive disintegration.** R. W. GURNEY AND E. U. CONDON. Princeton Univ. *Phys. Rev.* 33, 127-40(1929); cf. *C. A.* 23, 329-30.—Application of quantum mechanics to a simple model of the nucleus gives the phenomenon of radioactive disintegration. The statistical nature of the quantum mechanics gives directly disintegration as a chance phenomenon without any special hypothesis. A presentation is given of those features of quantum mechanics which are used and also a simple calcn. of the disintegration const. The qual. application of the model to the nucleus is discussed and quant. calcns. are made amounting to a theoretical interpretation of the Geiger-Nuttall relation between the rate of disintegration and the energy of the emitted  $\alpha$ -particle. In obtaining this relation one arrives at the remarkable conclusion that the law of force between emitted  $\alpha$ -particle and the rest of the nucleus is substantially the same in all the atoms even where the decay rates stand in the ratio  $10^{22}$ . The model here used explains the paradoxical results of Rutherford and Chadwick (*Phil. Mag.* 50, 889(1925)) on the scattering of fast  $\alpha$ -particles by U. Limitations in the methods employed are discussed.

BERNARD LEWIS

**Adsorption of radon.** A. BECKER AND K. H. STEHBERGER. *Radiol. Inst., Heidelberg. Ann. Physik* [5], 1, 529-55(1929).—By using charcoal and silica gel as adsorbents, and employing a static method, it is shown that adsorption reaches a concn. equil. between the gaseous and the solid or liquid phase. The equil. coeff. is independent of the nature and pressure of the surrounding gases, the amount of adsorbent, vol. of container, and partial pressure of Rn, and dependent only on the character of

the adsorbent and the temp. The temp. coeff. follows the reaction isochore. It is concluded that dynamic methods are for the most part inaccurate. GREGG M. EVANS

Measurement of the short wave end of penetrating cosmic radiation. E. REGENER. *Naturwissenschaften* 17, 183-5(1929).—Measurement of ionization in a closed vessel 230 m. below the water level of the Bodensee (Lake Constance) by recording devices is described. The ionization chamber was a 39-l. steel bomb of 1-cm. wall filled with  $\text{CO}_2$  at 39 atm. The discharge curve of an electrometer initially charged to 600 v. was recorded hourly on a photographic plate by means of an elec. lamp inside the bomb. At 32.4 m. depth the uncorrected hourly decrease was 4.33 v., at 231 m. 0.83 v. The expt. lasted two days. Special precautions were taken by anchoring the bomb to the lake bottom and a float to hold it in position against mech. disturbances. It follows from the results obtained that even at 230 m. some radiation penetrates; the discharge rate decreases at 186 to 231 m. from 0.106 to 0.051 v. per hour (corrected). From the logarithmic curve follows a const. absorption coeff. of  $1.8 \times 10^{-4}$  per cm. for that depth, showing the homogeneous character of the radiation. From 79-m. depth upward the coeff. increases and approaches known values, calcd. for vertical incidence. The wave length corresponding to the deep absorption would be  $4.6 \times 10^{-13}$  cm. from the Compton equation; a lower value of  $0.6 \times 10^{-13}$  cm. follows from the recent equation of Klein and Nishina (*Z. Physik* 52, 853(1929)). It is comparable with that of the proton—electron radiation of  $1.3 \times 10^{-13}$  cm. Several influences of surroundings, etc., are discussed. B. J. C. VAN DER HOEVEN

The efficiency of electron impact leading to resonance in helium. GEORGE GLOCKLER. Univ. of Minnesota. *Phys. Rev.* 33, 175-88(1929).—The efficiency of resonance impact between electrons and He atoms has been studied as a function of the energies of the impinging electrons. The transition studied is  $1^1\text{S} \rightarrow 2^3\text{S}$  at 19.77 v. The range of energies is 0.8 v., i. e., from 19.77 to 20.55 v. The efficiency with which electrons make inelastic impacts rises to a max. 0.18 v. beyond the resonance potential of 19.77 v. and then decreases. The max. av. efficiency for electrons of 19.95 v. energy is estd. to be 0.002. The measurements were carried out by comparing the velocity distribution of the electrons leaving an equipotential surface with the drop in current as observed in the inelastic impact method of Franck, and similarly by comparing the velocity distribution of the electrons with the distribution of the positive current caused by them in a Lenard expt. Both types of measurements yield similar results. B. L.

Ion mobilities using the Erikson method on gases of controlled purity. J. J. MAHONEY. Univ. of Calif. *Phys. Rev.* 33, 217-28(1929).—Measurements of mobilities of ions in air and air mixed with known quantities of other gases were made with the Erikson blast method under conditions in which the nature of the purity of the gas could be reasonably controlled. The results do not show the aging effect observed by Erikson in air dried over  $\text{P}_2\text{O}_5$  and liquid air, or even in air passed slowly over  $\text{CaCl}_2$ . In these 2 cases the normal pos. and neg. ionic mobilities are observed. If air from the room at 60% or 90% relative humidity at  $20^\circ$  is used the aging effects of Erikson are observed. With mixts. of 5% and 25%  $\text{HCl}$  no aging effects are observed and the mobilities show the same general behavior observed by Loeb (*C. A.* 20, 1174) with the a. c. method. With 5%  $\text{NH}_3$  the pos. ion has the same mobility as the neg. ion, but at ages over about 0.01 sec. both pos. and neg. ions show an apparent aging, the pos. ion going over to the usual value observed while the neg. ion forms an ion having a mobility between the old and new pos. ions. In pure  $\text{C}_2\text{H}_2$  pos. and neg. mobilities were observed, while in dry air with 5%  $\text{C}_2\text{H}_2$  normal air mobilities were observed with no aging effect. Conclusion: The aging of pos. ions in dry air in general proceeds very much more rapidly than Erikson assumes and possibly consists in the attachment of the initial pos. ion to a bulky mol. of some impurity present. Water vapor and  $\text{NH}_3$  inhibit this action either by forming groups which delay attachment to mols. of impurities present or by removing the latter. Thus M. believes Erikson's aging effects not to be true aging effects but rather retarded aging effects due to the action of water vapor or other substances. BERNARD LEWIS

The mobility of positive ions in flames. H. E. BANTA. Rice Inst., Houston, Texas. *Phys. Rev.* 33, 211-16(1929).—Mobility of positive ions of K, Rb and Cs in the Bunsen flame.—The mobility was calcd. from measured values of the c. d., cathode drop of potential, and the thickness of the layer at the cathode in which the potential varies rapidly. The excess of ionization over recombination in the layer was assumed to be proportional to  $(1 - x/x_1)^m$ , where  $x$  is the distance from the cathode,  $x_1$  the thickness of the layer at the cathode, and  $m$  is a const. The value calcd. for the mobility depends on the value assumed for  $m$ . The results give, with  $m = 2$ , a value of 1.8; with  $m = 3$ , a value of 1.07 cm./sec. per v./cm. for the mobility. The mobility is the

same for salts of Rb, Cs and K and it does not depend on the concn. of the salt. A small increase of mobility with elec. intensity is indicated by the results. B. L.

**Oscillations in ionized gases.** LEWIS TONES AND IRVING LANGMUIR. General Elec. Co., Schenectady, N. Y. *Phys. Rev.* 33, 195-210(1929).—A simple theory of electronic and ionic oscillations in an ionized gas has been developed. The electronic oscillations are so rapid (about  $10^6$  cycles) that the heavier pos. ions are unaffected. They have a natural frequency  $\nu_e = (n_e^2/\pi m)^{1/2}$  and, except for secondary factors, do not transmit energy. The ionic oscillations are so slow that the electron d. has its equil. value at all times. They vary in type according to their wave length. The oscillations of shorter wave length are similar to the electron vibrations, approaching the natural frequency  $\nu_p = \nu_e(m_e/m_p)^{1/2}$  as upper limit. The oscillations of longer wave length are similar to sound waves, the velocity approaching the value  $v = (kT/m_p)^{1/2}$ . The transition occurs roughly (i. e., to 5% of limiting values) within a 10-fold wave-length range centering around  $2(2)^{1/2}/\pi \lambda_D$  where  $\lambda_D$  is the "Debye distance." While the theory offers no explanation of the cause of the observed oscillations, the frequency range of the most rapid oscillations, namely, from 300 to 1000 megacycles, agrees with that predicted for the oscillations of the ultimate electrons. Another observed frequency of 50 to 60 megacycles may correspond to oscillations of the beam electrons. Frequencies from 1.5 megacycles down can be attributed to pos.-ion oscillations. The correlation between theory and observed oscillations is to be considered tentative until simpler exptl. conditions can be attained. BERNARD LEWIS

**Electron diffraction by thin mica foils.** E. RUPP. A. E. G., Berlin. *Naturwissenschaften* 17, 174-5(1929).—A review of recent expts. of Kikuchi (C. A. 23, 1808) in which the diffraction patterns of electron streams through mica foils of varying thickness were studied. Much in the same manner as from the results of x-ray diffraction by crystals it is here conclusively shown that electrons have wave qualities and can be used for the study of crystal structure. Two types of interference occur (photographs are reproduced): for electrons of uniform speed and very thin mica ( $10^{-6}$  cm.) the pattern consists of points in a net of equilateral triangles; the second type of pattern is of the type of a Laue diagram, elliptic tracks and straight dark and light lines; it is obtained for elec. rays of variable speed and thicker foils ( $10^{-4}$  cm.) B. J. C. v. d. H.

**The ionization by slow electron impact of ammonia and hydrogen sulfides.** JAMES H. BARTLETT, JR. Inst. Theoretische Physik, Leipzig, *Phys. Rev.* 33, 169-74(1928).—The mols. of  $\text{NH}_3$  and  $\text{H}_2\text{S}$  have been studied by the usual method of pos.-ray analysis. With  $\text{NH}_3$ , 3 principal types of ion at  $m/e = 15, 16$  and  $17$ , resp., occurred. These are attributed to  $(\text{NH})^+$ ,  $(\text{NH}_2)^+$  and  $(\text{NH}_3)^+$  with ionization potentials of  $11.2 \pm 1.5$  v.,  $12.0 \pm 1.5$  v. and  $11.2 \pm 1.5$  v., resp. Since with increasing pressure, the  $(\text{NH})^+$  ion increases, the  $(\text{NH}_2)^+$  ion remains sensibly const. and the  $(\text{NH}_3)^+$  ion decreases, it is concluded that the  $(\text{NH})^+$  and  $(\text{NH}_2)^+$  ions result directly from the electron impact with the natural  $\text{NH}_3$  mol., while  $(\text{NH})^+$  ion is probably produced by breakdown of the  $(\text{NH}_3)^+$  ion by a reaction such as  $(\text{NH}_3)^+ + \text{NH}_3 = (\text{NH})^+ + \text{H}_2 + \text{NH}_3$ . For both  $\text{NH}_3$  and  $\text{H}_2\text{S}$ , very few, if any, H ions and no neg. ions were observed, showing that thermal dissocn. was of little importance in affecting the results. For  $\text{NH}_3$ , very small peaks at  $m/e = 14$  and  $18$ , resp., were observed. Their compns. are probably  $(\text{N})^+$  and either  $(\text{NH}_4)^+$  or  $(\text{H}_2\text{O})^+$ , and their origin is either secondary (from collisions of ions with neutral mols.) or they result from impurities. With  $\text{H}_2\text{S}$ , 3 principal types of ion were likewise observed. They occur at  $m/e = 32, 33$  and  $34$  and are interpreted as having the compns.  $(\text{S})^+$ ,  $(\text{HS})^+$  and  $(\text{H}_2\text{S})^+$ , resp. With Mackay's (*Phys. Rev.* 24, 319(1924); cf. C. A. 18, 352) value of the lowest ionization potential as a standard for the calibration of the voltage scale, the ionization potentials are approx.  $10.4$  v.,  $16.9$  v. and  $15.8$  v., resp. Variation of the pressure, at low pressures, indicates that no secondary processes occur, i. e., that the ions above named are all formed by the initial process of the electron colliding with the gas mol. No  $\text{S}_2^+$  ions were observed, nor any which could be due to isotopes of S. BERNARD LEWIS

**The effect of corona current on the cooling of a hot wire.** SAMUEL R. PARSONS. Univ. of Arkansas. *Phys. Rev.* 33, 75-80(1929).—An exptl. study is described of the cooling of a hot wire in air when the air is disturbed by a corona discharge to the wire. With Cu wire No. 30 B. and S. gage, in still air, no effect was found with corona current less than 3 microamps. per cm. of wire; but beginning with this value the cooling power of the wire increases, at first rapidly, and then more slowly, possibly passing through a weak max. A corona current as great as 12 microamps. per cm. is sufficient to give nearly the max. effect. With small currents of air past the wire, a gradual increase of corona current starting with zero, often shows first a heating retarded by the cross-

flow of the ions carrying the corona current. The no. of ions required for appreciable cooling is estd. to be considerably less than one ion per million mols. of the gas. B. L.

The behavior of glass as a dielectric in alternating current circuits: II. The effect of frequency and of temperature upon the power loss. LOUISE S. McDOWELL AND HILDA L. BEGEMAN. Wellesley College, Wellesley, Mass. *Phys. Rev.* 33, 55-65(1929); cf. C. A. 22, 1717. BERNARD LEWIS

The chemical interaction of ions and the "clean up" of gases at glass surfaces under the influence of the electrical discharge. JAMES TAYLOR. *Proc. Roy. Soc. (London)* A123, 252-7(1929); cf. C. A. 22, 2877, 4377. H. W. WALKER

Groups of electrons in Geissler discharge. K. G. EMELÉUS AND W. L. BROWN. Queen's Univ. of Belfast. *Phil. Mag.* [7], 7, 17-31(1929); cf. C. A. 21, 2221, 2425, 3553.—Measurements of collector characteristics were made in Geissler discharges from a cold cathode in A, Ne, H<sub>2</sub> and O<sub>2</sub>, at pressures of about 0.1 cm. Hg, for conditions not far from those at normal cathode fall of potential. Conclusion.—There is present in the neg. glow, and at low pressures in the Faraday dark space, a group of fast electrons with a distribution of velocities that is approx. Maxwellian. These electrons have an av. energy of 25 electron v. It is suggested that they are produced initially by electrons passing into the neg. glow from the cathode dark space, and that they are maintained by a process which is the reverse of ionization by collision. A possible effect of the Ramsauer min. of free paths of electrons is pointed out in the persistence of 2 groups of slow electrons in the discharge. L. H. REYERSON

Free and bound electrons in metals. RICHARD RUEDY. Univ. of Toronto. *Phys. Rev.* 32, 974-8(1928).—When the theory of dispersion in an absorbing medium is applied to the values published in recent years for the optical properties of different metals, it follows that bound electrons exist inside the metal comparable in no. with that of the free electrons. BERNARD LEWIS

Magnetic properties of complex compounds and their electronic constitution. PRIYADARANJAN RAY AND HARIGOPAL BIHAR. *J. Indian Chem. Soc.* 5, 497-511(1928).—The mass susceptibilities of 47 complex compds. were measured by means of a Curie's balance. The Weiss magneton no. and Bohr's magneton no. were found and Bohr's magneton no. was calcd. by means of Welo and Bose's rule for each of the 47 compds. The compds. were nearly all of the cobaltamine type and included 19 compds. of Co, 10 of Ni, 5 of Fe, 2 of Mn, 3 of Cu, 2 of Cr, 3 of Mo and 3 of W. Cabrera's scheme and Ray's scheme for explaining diamagnetism and paramagnetism are also discussed. Ray's view appears to explain satisfactorily the magnetic character of the largest no. of these 47 complexes. The carbonyls of Ni, Fe, Co and Mo are diamagnetic. Ordinary conductivity water must be further purified by fractional solidification before it is a sure standard for susceptibility measurement. F. E. BROWN

The ionization processes in methane interpreted by the mass spectrograph. T. R. HOGNESS AND H. M. KVALNES. Univ. of Calif. *Phys. Rev.* 32, 943-9(1928).—The ionization processes occurring when CH<sub>4</sub> mols. are ionized by controlled electron impact have been detd. with the aid of the mass spectrograph. CH<sub>4</sub><sup>+</sup> and CH<sub>3</sub><sup>+</sup> are the only ions formed and by a study of their relative intensities under different conditions of pressure and voltage, it was found that both these ions are formed directly by electron impact. The processes are: CH<sub>4</sub><sup>+</sup> = CH<sub>4</sub><sup>+</sup> + E<sup>-</sup> (14.5 v.); CH<sub>3</sub><sup>+</sup> = CH<sub>3</sub><sup>+</sup> + H + E<sup>-</sup> (15.5 v.). *Isotopes of Ne.*—It has been definitely detd. that besides the 2 isotopes of Ne, Ne<sub>20</sub> and Ne<sub>22</sub>, there exists a third, Ne<sub>21</sub>. BERNARD LEWIS

The ionization of carbon monoxide by controlled electron impact, interpreted by the mass spectrograph. T. R. HOGNESS AND R. W. HARKNESS. Univ. of Calif. *Phys. Rev.* 32, 936-41(1928).—By the use of a mass spectrograph, a study was made of the ionization processes occurring when CO mols. are ionized by electrons of definite energy. The variation of the relative intensities of the ions CO<sup>+</sup>, C<sup>+</sup> and O<sup>+</sup> with changes of pressure and with changes of the elec. fields has led to the conclusion that the principal processes occurring are: (1) CO = CO<sup>+</sup> + E<sup>-</sup>; (2) CO = O<sup>+</sup> + C + E<sup>-</sup>; (3) CO = C<sup>+</sup> + O + E<sup>-</sup>; (4) CO + CO<sup>+</sup> = CO<sub>2</sub> + C<sup>+</sup>. No neg. nor doubly charged pos. ions were found. BERNARD LEWIS

Secondary electron emission from molybdenum. J. M. HYATT AND H. A. SMITH. General Elec. Co., Schenectady, N. Y. *Phys. Rev.* 32, 929-35(1928).—The secondary electron emission from a very clean Mo plate in a simple 3-electrode tube has been studied. The no. of primary electrons striking the plate was calcd. by means of the pos.-ion calibration method previously reported. The no. of secondary electrons per primary reaches a max. of 1.15 at 600 v. and then decreases to 1.00 at 2000 v. One definite discontinuity in the secondary emission curve occurs at 13.5 v.; the others are very small and not reproducible. The emission increases about 3% within a few

mins. after heating if the gas pressure is very low and then remains quite const. for a long period of time. The emission decreases with time when there is more gas present. The secondary emission appears to increase by about 4% when the temp. of the target increases from the normal operating temp. to 1600° K. BERNARD LEWIS

**Secondary electron emission produced by positive cesium ions.** J. M. HYATT. General Elec. Co., Schenectady, N. Y. *Phys. Rev.* 32, 922-8(1928); cf. *C. A.* 22, 4054.—The source of the pos. Cs ions, a short W filament maintained at about 1200° K. in the presence of Cs vapor, was mounted on the axis of a long cylindrical grid and plate. The plate current and the total pos.-ion emission current were observed for each of several neg. grid potentials as the plate potential was varied from +50 to -650 v. From these observations the no. of electrons that were emitted from the Cs-covered grid and plate per pos. ion was calcd. This no. increased uniformly from 0.01 at approx. 100 v. to 0.15 at 600 v. After corrections for the emission of secondary electrons were made, the ratio of the pos. ion current to the plate to the total emission current was found to be independent of the plate and grid potentials for plate potentials greater than 0.2 of the grid potential. This ratio 0.72 is the same as the ratio between the total area of the plate less the projected area of the grid, and the total plate area. Assuming the same distribution of electrons as pos. ions, the ratio of the plate current to the grid current in this type of tube can be calcd. BERNARD LEWIS

**Experimental studies on form and character of sparks.** V. TORAHIKO TERADA, UKITIRŌ NAKAYA and RYŪZŌ YAMAMOTO. *Sci. Papers Inst. of Phys. and Chem. Research* (Tokyo) 10, 43-68(1929).—Very detailed descriptions and both stationary and moving-plate photographs are given of long sparks in SO<sub>2</sub>, C<sub>2</sub>H<sub>2</sub>, coal gas, O<sub>2</sub>, N<sub>2</sub>, CO<sub>2</sub> and air. The influence of pressure change, insertion of needle-point leakages and high resistances in the circuit is pointed out. The authors conclude that (a) a long spark is generally built up in definite steps, each requiring a definite time for completion; (b) only the middle part of a three-part spark is truly disruptive, the positive and negative parts being gradually built up; (c) with high resistance in circuit, a fine spark due to electrode capacity preps. the track for the slower discharge of the main capacity; (d) this initial track is analogous to a wire of conducting gas, and the following discharge to an electrically exploded wire. G. M. EVANS

**Luminous discharge in gases at low pressure.** HANS PETTERSSON. Lunds Fysiska Inst. *Nature* 123, 346(1929).—By using frequencies of 10<sup>8</sup> cycles per second, luminous discharges were obtained in transparent silica electrodeless discharge tubes only 5 mm. wide, and at pressures much below 10<sup>-5</sup> mm. Fluorescence and afterglow of silica were observed. A pressure increase in the excited tube when disconnected from the pump was found to be due to O<sub>2</sub> from decompn. of the silica. The band spectrum of O<sub>3</sub>, with some elementary O<sub>2</sub> lines, was observed. GREGG M. EVANS

**The thermionic emission from clean platinum.** LEE A. DUBRIDGE. Calif. Inst. of Tech. *Phys. Rev.* 32, 961-6(1928).—The thermionic emission from thoroughly outgassed Pt in high vacuum has been measured to 1/3% over the temp. range 1360° to 1750° K., the temps. being measured by careful optical pyrometry. The values obtained for the thermionic consts. of the T<sup>2</sup> law arc, when corrected for the Schottky effect,  $b = 72, 820^\circ \text{K.}$ ,  $\phi = 6.27 \text{ v.}$ ,  $A = 17,000 \text{ amp./cm.}^2 \text{ deg.}^2$ . The value of  $\phi$  is possibly in error by not more than 1% because of uncertainties in the temp. scale, and agrees within 1/2% of the value of the photoelec. work function. The data confirm the previous announcement that for clean Pt  $A$  is 250 times greater than the theoretical value of 60.2 amp./cm.<sup>2</sup> deg.<sup>2</sup> BERNARD LEWIS

**Critical photoelectric potential of clean mercury and the influence of gases and of the circulation of the mercury upon it.** WAYNE B. HALES. Calif. Inst. of Tech. *Phys. Rev.* 32, 950-60(1928).—In an app. in which precautions were taken against contaminations the long wave-length limit for running Hg was found to be 2735 Å. U. The crit. frequency for stationary Hg was found to be  $2735 \pm 10 \text{ Å. U.}$ , which is in agreement with Kazda (*C. A.* 20, 333) for flowing Hg. Certain results are noted in the present app. which are different from that of older app. (constructed with greased stopcocks). The long wave-length limit in the older app. at the max. sensitivity was 2850 Å. U.; in the present app. it is 2910 Å. U., which, once reached, remains const. H<sub>2</sub>, He, A, N<sub>2</sub> and H<sub>2</sub>O in extremely small quantities in contact with the surface and also, except with H<sub>2</sub>O, dissolved in the body of Hg, had no influence whatever upon the photoelec. behavior of the Hg or upon the rate of rise of sensitivity upon turning off the Hg still except that each had a marked cleansing effect in reducing the concn. of the impurity which slowly contaminates the surface. O<sub>2</sub> had a decided reducing effect upon the threshold value, reducing it to 2555 Å. U. in 18 hrs. BERNARD LEWIS

**Chemical analysis with x-rays.** P. GÜNTHER. *Metall. wirtschaft* 7, 437-40(1928);

cf. C. A. 22, 538; 23, 1572.—An outline of the application of x-ray emission and absorption spectra methods to chem. analysis.

Methods of study of the crystal lattice by means of x-rays. H. MARK. Ludwigshafen a. Rh. *Metallwirtschaft* 7, 370-3(1928); cf. C. A. 23, 1051.—A brief résumé of the various methods of detg. crystal structure.

\* The translation lattice of hydrated cellulose. KARL WEISSENBERG. Kaiser Wilhelm Inst. Faserstoffchemie, Berlin Dahlem. *Naturwissenschaften* 17, 181(1929).—By improvements on previous methods the lattice of hydrated cellulose can now be detd. quite accurately. Preps. of Herzog and Jancke were used (C. A. 23, 1790) with parallel orientation of the crystallites which allows a definite assignment of indices to the x-ray pattern; a focus method was employed for the x-ray photography consisting mainly of lengthening the prepn. in the direction of the incident rays to 15 mm. In this method the interferences close to the spot of the directly transmitted ray are amplified one to two orders of magnitude relative to the other parts of the pattern. Except for a few as yet unexplained effects, the most probable results are for hydrated cellulose a quadratic form of unit cell with  $a = 14.66$ ,  $b = 8.89$ ,  $c = 10.35$  A. U. (all  $\pm 2\%$ ) and  $\alpha = 90^\circ$ ,  $\beta = 90^\circ$ ,  $\gamma = 85^\circ \pm 5^\circ$ . This unit cell holds  $b$   $C_6H_{10}O_5$  units for a  $d$ . of 1.60. The same lattice type is assumed for true cellulose.

Absolute x-ray wave-length measurements. A. P. R. WADLUND. Univ. of Chicago. *Phys. Rev.* 32, 841-9(1928); cf. C. A. 22, 3831.—By means of a speculum metal grating, 50 lines to the mm. ruled over a length of 5 mm., the wave lengths of the  $K_\alpha$  line of Cu, Fe and Mo were detd. as  $1.5373 \pm 0.0008$ ,  $1.937$  (6)  $\pm 0.002$  (3) and  $0.708$  (3)  $\pm 0.001$  (1) A. U., resp. From the  $K_\alpha$  line of Cu the following consts. were calcd.: the grating space of calcite  $3.0290 \pm 0.0016$  A. U.; Avogadro's no.  $(6.061 \pm 0.009) \times 10^{23}$  mols. per g. mol. and the electronic charge  $(4.774 \pm 0.007) \times 10^{-10}$  e. s. u. A discussion is given of the sources of error involved of which the most important are those due to the settings on the lines of the diffraction pattern and those due to the inexact setting of the grating.

Dispersion of x-rays by single molecules. P. DEBYE, L. BEWILOGUA AND F. EHRLHARDT. Univ. Leipzig. *Physik. Z.* 30, 84-7(1929).—The dispersion of a beam of x-rays in air,  $CCl_4$ , and  $CHCl_3$  was studied and interference rings were detd. The distance between two Cl atoms was found to be 3.3 A. U.

Reflection of soft x-rays. S. D. GEHMAN. Univ. of Penn. *Phys. Rev.* 33, 141-4(1929).—Reflecting power of Al, C and Pt for non-characteristic soft x-rays (40-500 v.) as function of angle and voltage.—Non-characteristic soft x-rays of voltage range 40-500 were passed through a slit system and then reflected from the polished surfaces of various mirrors in a high vacuum. The reflecting power of the mirror was measured by a photoelec. method, as a function of the voltage for a given angle of incidence and as a function of the angle for a given voltage. The reflecting power-voltage curve for Al, angle of beam and mirror  $13^\circ$ , shows a broad max. between 68 and 140 v. and falls off rapidly as the voltage increases. The same curve for C, angle  $14^\circ$ , has a similar max. between 250 and 350 v. For a Pt mirror, same angle, the curve rises for voltages up to about 100, and then the reflecting power decreases very slowly for higher voltages. The reflecting power-angle of incidence curve shows a rapid decrease of the reflecting power as the angle of incidence decreases; its form appears to be practically independent of the voltage for the range used. The results appear to justify the conclusion that for Al and C, light elements, the reflecting power-plate voltage curve shows a max. related to a crit. potential but the resolving power of the method, as used here, is inadequate to locate these potentials with useful precision.

The duration of elementary light emission. J. STARK. *Ann. Physik* [5], 1, 323-40(1929).—Observations of von Traubenberg and Gebauer (C. A. 22, 18) were repeated. The effect of the elec. field on the  $H_\alpha$ ,  $H_\beta$  and  $H_\gamma$  of the moving particles is carried forward less than 0.1 mm. at a velocity of about  $7 \times 10^7$  cm. sec.<sup>-1</sup>. The time in which the H electron drops from equil. positions 3, 4 and 5 into position 1, during emission of  $H_\alpha$ ,  $H_\beta$  and  $H_\gamma$  lines, is less than  $10^{-10}$  sec. During their motion through a gas, the canal ray atoms of an element are not in the lowest energy state. Their upper electrons are distributed in the highest possible equil. positions.

The spectrographic detection of beryllium. H. FISERFELDT. *Z. physik. Chem.* Abt. A, 140, 254-62(1929).—The spectrographic detection of Be in C arcs was studied with a Hilger E 1 quartz spectrograph. The relative sensitiveness of different lines was detd. by examg. the spectra of ammoniacal soln. of  $Al_2O_3 + BeO$  in different concns. and the influence of foreign materials on the sensitivity was investigated by mixing the original substance with  $SiO_2$ ,  $Fe_2O_3$ ,  $CaO$ , or  $Na_2CO_3$ . The most sensitive Be line is at 2348.62 A. U.; the next are at 3130.42 A. U. and 3131.06 A. U. It appears that

0.00001 wt. % of BeO in  $Al_2O_3$  may be readily detected by this method. The addn. of large amts. of alkali reduces the sensitivity considerably. Ca addns., either in large or in small quantities, show about the same Be sensitivity; it is smaller than with the original material but not so low as with alkali addns. W. F. MEGGERS

**Measurement of the life of the metastable mercury atom.** M. L. POOL, Ohio State Univ., Columbus, Ohio. *Phys. Rev.* 33, 22-6(1929).—*Half value time for the  $2^1P_1$  state of Hg for various pressures of admixed  $N_2$ .*—A high-speed rotating disk has been used to interrupt the total radiation from a water-cooled and magnetically controlled quartz Hg arc before a quartz tube at room temp. contg. optically excited Hg vapor. In the neighborhood of  $10^{-4}$  sec. after the optical excitation a flash of visible radiation from another water-cooled and magnetically controlled Hg arc was passed through the quartz tube and the absorption spectrum photographed. The line 4047 ( $2^1P_1$ — $2^1S_1$ ) showed strong absorption when a few mm. of  $N_2$  was introduced into the tube. The lines 4077, 4358, 5461, 5770 and 5790 showed no measurable absorption under similar conditions. The rate of decay of the amt. of 4047 absorbed with respect to time elapsed after excitation of the Hg vapor was taken as the rate of decay of the metastable  $2^1P_1$  state. The life or half value time of the state varied markedly with the pressure of admixed  $N_2$ . The max. life  $4.2 \times 10^{-4}$  sec. occurred for 6.8 mm. of  $N_2$ . No absorption of 4047 was observed upon the introduction of  $H_2$ , A, Ne or He into the tube. BERNARD LEWIS

**Relation between doublets of stripped atoms in five periods of the periodic table.** R. C. GIBBS AND H. E. WHITE. Cornell Univ., Ithaca, N. Y. *Phys. Rev.* 33, 157-62 (1929); cf. *C. A.* 22, 4060.—*Principal and diffuse doublets of stripped atoms in five periods of the periodic table from Li I to O VI, Na I to Cl VII, KI to Mn VII, Rb I to Zr IV and Cs I to Pr V.* By combining the data now available for the one-electron systems of the 2nd, 3rd, 4th, 5th and 6th periods certain regularities are found to exist between successive elements in each period and between corresponding elements in successive periods. These regularities are found by the application of the regular and irregular doublet laws. For the long periods which involve more penetrating orbits extrapolations of  $Z_i$  and  $s_i$  (Lande's formula) prove to be better guides in identifying doublets of the higher members of a sequence although extrapolation of  $s$  (Sommerfeld's formula) is entirely satisfactory for the sequences in the short periods. Using the former G. and W. were led to correct their previous identifications of the principal doublet of Ce IV. The tighter binding of the  $d$  electron over both the  $s$  and  $p$  electrons starting with Sc III, Yt III and La III in the 3 long periods is especially well brought out by the Moseley type of diagram. Evidence is presented to indicate that the unexcited state of Ce IV involves a  $5d$  rather than a  $4f$  electron. New data are given for V V, Cr VI and La III. BERNARD LEWIS

**The origin of the aurora polaris.** S. CHAPMAN. Imp. Coll. of Science and Tech., London. *Phys. Rev.* 32, 993-5(1928).—Hulbert's new theory of the aurora polaris (*C. A.* 22, 2707) is criticized on the ground, principally, that free high-atm. ions in middle and low altitudes cannot travel far toward the poles along the earth's lines of magnetic force because they must at the same time descend into the lower levels where their motion is interrupted by collisions. Upward moving ions will travel toward the equator. BERNARD LEWIS

**Reply to S. Chapman's foregoing criticism.** E. O. HULBERT. (Naval Research Lab., Washington, D. C.) *Phys. Rev.* 32, 996(1928). BERNARD LEWIS

**Measurement of the intensity ratio of two lines (1 S-3 P and 2 S-3 P) emitted from the same initial state of the sodium atom, in respect to the ratio of the corresponding transition probabilities.** CARL FRIEDRICH WEISS. *Ann. Physik* [5], 1, 565-612 (1929). W. F. MEGGERS

**The furnace spectrum of beryllium.** R. F. PATON AND G. M. RASSWEILER. Univ. of Illinois, Urbana, Ill. *Phys. Rev.* 33, 16-21(1929).—A high-temp. vacuum furnace using W for container and heating elements has been designed to study the furnace spectra of high m. p. substances. The furnace spectrum of Be in both absorption and emission has been observed from  $\lambda$ 2150-7000 A. U. and over a range of temp. up to  $2500^\circ$  K. The prediction that the Be line 2348.62 A. U. is the first line of the principal series of singlets for the neutral atom has been confirmed and the diffuse and sharp series of singlets of this element discovered and tabulated. BERNARD LEWIS

**Quantum analysis of the beryllium oxide bands.** JENNY E. ROSENTHAL AND F. A. JENKINS. New York Univ., Univ. Heights, N. Y. *Phys. Rev.* 33, 163-8(1929).—New measurements of the structure lines in the (0,0), (1,1), (1,2), (1,0) and (2,1) bands of the visible BeO system are reported. Each band has P and R branches of almost equal intensity, the lines of which are strictly single. There is probably but

one missing line at the origin. This structure characterizes the system as  $S\ S$ , the odd multiplicity agreeing with the even no. of electrons in neutral BeO. The rotation terms are investigated by the combination principle, and can be represented by  $F(j) = B_j(j+1) + D[j(j+1)] + \dots$  with  $j$  integral as required for  $S$  states. One perturbation is found, consisting of a displacement of the line  $R$  (49) in the (1,0) band by  $0.45\text{ cm}^{-1}$  toward lower frequencies, with no sign of doubling. The following equation is obtained for the null lines:  $\nu_0 = 21,254.05 + 1370.81(n' + \frac{1}{2}) - 7.76(n' + \frac{1}{2})^2 - 1487.45(n'' + \frac{1}{2}) + 11.87(n'' + \frac{1}{2})^2$ . The principal mol. consts., evaluated from rotational term-differences, using the quantum mechanics energy formula, are:  $B_0' = 1.5771$ ,  $B_0'' = 1.6514$ ,  $\alpha' = -0.0160$ ,  $\alpha'' = -0.0186$ ,  $D_0' = -8.44 \times 10^{-6}$ ,  $D_0'' = -8.26 \times 10^{-6}$ ,  $\beta' = +0.03 \times 10^{-6}$ ,  $F_0' = 22 \times 10^{-12}$ ,  $F_0'' = 12 \times 10^{-12}$ . The zero subscripts refer to the vibrationless state. The nuclear sepn. in the final state is:  $r_0'' = 1.327 \times 10^{-8}\text{ cm}$ . BERNARD LEWIS

The excitation of the aurora green line in active nitrogen. JOSEPH KAPLAN. Univ. of Cal. at Los Angeles. *Phys. Rev.* 33, 154-6(1929); cf. *C. A.* 22, 2887.—The aurora green line has been excited in the N afterglow when O was present in the discharge in which the active N was produced and observed. The interpretation of the phenomenon is based on the recent analysis as to the nature of active N as presented by Kaplan and Cario (*C. A.* 22, 4036). BERNARD LEWIS

Absorption in excited krypton and xenon and the spectra of the inert gas type I. J. C. McLENNAN AND R. RUEDY. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], 22, III, 15-26(1928).—Absorption spectra from 20 exposures with Kr tubes and 60 with Xe tubes ranging in exposure from 20 to 180 sec were mapped and compared with the known absorption lines of He, Ne, Sr, Na and K. With Kr the component of shorter wave length of pairs of const. frequency representing the transition  $^3P_1 - h$  is absorbed while the unabsorbed component originates in the  $^1P_1$  level. A few lines indicate sepn. between the  $^3P_1$  and  $^1P_1$  levels, while for the ultra-violet the  $^3P_2/1P_1$  sepn. was shown for the strongest lines. All of the inert gases except He give intercombination lines between triplet and singlet systems, the distance between the systems decreasing as the deviation of the higher terms from the H terms decreases. The energy levels of Kr and Xe correspond to the higher energy levels in Ne and Ar. The Na<sup>+</sup> spark lines in the violet correspond to the red Ne lines  $2p_1 - S_1$ . J. W. SHIPLEY

Color temperature of burning magnesium. W. DRIEBEK. *Z. wiss. Phot.* 25, 287-90(1928).—The spectrum temp. of burning Mg is  $3700 \pm 75^\circ\text{K}$ . A. P. H. T.

Spectrum temperature of magnesium and flashlight. H. ARENS AND J. EGGERT. *Z. wiss. Phot.* 25, 95-6(1928).—The spectrum temp. of the Mg flame is  $3700^\circ\text{K}$ . and the spectrum temp. of flashlight,  $2900^\circ\text{K}$ . A. P. H. TRIVELLI

Arc spectrum of iron under reduced pressure over the range 2270-3900 A. U. P. MARING. *Z. wiss. Phot.* 26, 47-86(1928). The arc spectrum of Fe between 2370 and 3935 A. U. was measured and the pressure shifts were detd. The results of grouping of the lines of special interest, as the lines of Gale, the lines of Adams, and the multiples (the regularities of which were tested) A. P. H. TRIVELLI

Spectral excitation by recombination in the electric arc. JANE M. DEWEY. Princeton Univ. *Phys. Rev.* 32, 918-21(1928).—Recent measurements of electron velocities in arcs have made it probable that most of the light in the neg. glow is emitted as a result of recombination of pos. ions and electrons. Since the velocities of the pos. ions are high, spectral lines emitted in this way should show Doppler broadening. This broadening was measured photometrically for a hot cathode arc in He in which measurements of electron velocities were also made and results were obtained which can be explained by assuming that all of the light in the neg. glow is the result of recombination of ions having a temp. about  $1/10$  that of the electrons. BERNARD LEWIS

The arc spectrum of samarium. Measurements made at normal pressure between  $\lambda = 3100\text{ A. U.}$  and  $\lambda = 2750\text{ A. U.}$  PIÑA DE RUBIES. *Compt. rend.* 188, 780-1(1929).—The arc spectrum of Sm is obtained with pure oxide prep'd. by Urbain. In addn. to the lines first reported by Exner and Haschek, 120 new lines undoubtedly belonging to Sm are measured between 2750-45 A. U. and 3102.30 A. U. W. F. M.

Arcs with small cathode current density. J. SLEPIAN AND E. J. HAVERSTICK. W. E. & M. Co., East Pittsburgh, Pa. *Phys. Rev.* 33, 52-4(1929).—Arcs with cathode c. ds. of less than 100 amps. per sq. cm., have been found to exist at gas pressures of 10-50 mm. The theory that electrons are drawn from the cathode by intense elec. fields maintained by space charges cannot apply to these arcs. BERNARD LEWIS

Arc spectrum of nitrogen in the extreme ultra-violet. K. T. COMPTON AND J. C. BOYCE. Princeton Univ. *Phys. Rev.* 33, 145-53(1929).—Excitation of N by controlled electron impact was found to bring out many lines in the arc spectrum of N.

These were observed with a vacuum spectrograph in the region from 500 to 1200 Å. U. The lines thus found, together with the material of other workers in the extreme ultra-violet, in the visible and the multiplets, have led to a fairly complete analysis of the spectrum, in good agreement with the predictions of the Hund theory. The ionization potential is 14.48 v. and the at. metastable levels  $^2D$  and  $^2P$  have energies corresponding to 2.37 and 3.56 v., resp., in good agreement with the predicted values of Kaplan and Cario (*C. A.* 22, 4066) from a study of active N.

BERNARD LEWIS

**First spark spectrum of gold, Au II.** J. C. McLENNAN and A. B. McLAY. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], 22, III, 103–15 (1928).—Measurement of the first spark spectrum of Au was made between 2225 Å. U. and 1390 Å. U. The terms  $^2, ^1D$  ( $d^9s$ ),  $^3, ^1F$ ,  $\bar{D}$ ,  $P$  ( $d^9p$ ) and  $^3, ^1D$  ( $d^9s$ ) of Au II, were identified and compared with those most easily recognized in Cu II and Ag II. Tables of wave lengths accompany the paper.

J. W. SHIPLEY

**Second spark spectrum of cadmium, Cd III.** J. C. McLENNAN, A. B. McLAY and M. F. CRAWFORD. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], 22, III, 45–54 (1928).—The spark spectrum of Cd in air and in H was photographed and compared with the standard lines in Cu, Al and Zn spectra. The principal wave lengths result from an electronic transition in the  $Cd^{++}$  ion represented by  $d^9p - d^9s$ . A new multiplet,  $^2P(d^1s) - ^2D(d^9s^2)$ , has been discovered.

J. W. SHIPLEY

**Influence of argon on the spectrum of sulfur.** J. C. McLENNAN, R. RUEDY and L. HOWLETT. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], 22, III, 79–86 (1928).—The influence of A on the spark spectrum of S using  $SO_2$  gas was investigated. At low pressures the spark spectra of S was suppressed and the arc lines were brought out. Increase of current increased the intensity of the S lines, while those of A reached a max. at about 15 amps. An electrodeless discharge gave similar results but the arc lines were less intense.

J. W. SHIPLEY

**Structure of the first spark spectrum of silver, Ag II.** J. C. McLENNAN and A. B. McLAY. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 1–13 (1928); cf. *C. A.* 20, 2456.—The structure of the spark spectrum of Ag is characterized by terms built on the  $d^9$  ion type of  $Ag^{++}$ . This term system corresponds to that predicted by the Hund theory. The deep-lying  $^2D$  ( $d^9s^2$ ) term of AgI was sepd. and identified. Calcs. of the screening consts. from optical data were made for orbits of the  $4s$  type.

J. W. SHIPLEY

**The first spark spectrum of mercury, Hg II.** F. PASCHEN. *Sitzb. preuss. Akad. Wiss.* 1928, 536–46.—The negative glow light of a discharge in pure Hg or in He mixed with Hg was investigated for the purpose of extending the description and analysis of the Hg II spectrum, concerning which very little is known. The wave lengths of 287 lines have been measured; they range from 893.107 Å. U. in the extreme ultra-violet to 8198 Å. U. in the infra-red. About half of these lines are classified as combinations of doublet-system terms. The largest term is  $1^3S = 151280 \text{ cm.}^{-1}$ , corresponding to an ionization potential of 18.672 v.

W. F. MEGGERS

**The spark spectra of iodine.** LÉON BLOCH and EUGÈNE BLOCH. *Ann. phys.* 11, 141–66 (1929).—The spectra of I have been among the least well known, partly on account of their complexity and partly on account of their sensitiveness to variations in the method of exciting them. By employing an oscillating discharge in a tube without electrodes the spectra of I have been photographed between 2220 Å. U. and 7350 Å. U. The wave lengths of more than 1800 lines, many of which are new, have been measured. Four successive stages of excitation are easily recognized; these are identified as the arc spectrum  $I_1$  and the successive spark spectra  $I_{II}$ ,  $I_{III}$  and  $I_{IV}$ .

W. F. MEGGERS

**The first spectrum of xenon.** WILLIAM F. MEGGERS, T. L. DE BRUIN and C. J. HUMPHREYS. *Science* 69, 406 (1929).—A new list of estd. intensities and measured wave lengths has been obtained for about 300 lines (3442.7 Å. U. to 9923.10 Å. U.) of the Xe I spectrum. Spectral terms which account for practically all of the lines have been identified. The largest term is  $^1S_0$  representing the normal state of the neutral atom; its value is 97835 and from it an ionization potential of 12.078 volts is derived.

W. F. MEGGERS

**The spectrum of ionized rubidium.** RAMES MAJUMDER. *Phys. Lab., Allahabad. Naturwissenschaften* 17, 198–9 (1929) (in English).—The spectrum of  $Rb^+$  was largely classified by comparison with spectra of the group  $Ge^+$  to  $Sr^+$ . The following lines served as a clue to the 5  $N_2$  lines ( $O_1 \leftarrow O_2$ ): 3  $P_2D_2$  with  $\nu = 23553$ , 3  $P_2P_1$   $\nu = 25370$ , 3  $P_2S_1$   $\nu = 20232$ . The 5  $N_2$  ( $O_4 \leftarrow P_1$ ) was traced, the 5  $N_2$  ( $N_3 \leftarrow O_2$ ) is in the infra-red. Lines of 5  $N_2$  ( $O_4 \leftarrow O_2$ ) were found. The fundamental differences 3  $P_2$ ,  $P_1$ ,  $P_0$  are 1528, 3925, 3  $P_1 - P_1 = 5740$ . B. J. C. VAN DER HOEVEN

**New results of the theory of band spectra.** R. DE L. KRONIG. *Physica* 9, 81-94 (1929).—A review with 22 literature references. B. J. C. VAN DER HOEVEN

**Revision of the value of  $e/m$  derived from measurements of the Zeeman effect.** HAROLD D. BABCOCK. Mt. Wilson Obs. *Astrophys. J.* 69, 43-8(1929).—Revision of the former calcn. (*C. A.* 18, 16) includes elimination of uncertain lines, the use of more recent analyses of Cr and Ti spectra, and the use of the latest value for the velocity of light. The weighted mean of 48 detns. is  $(1.7606 \pm 0.0012) \times 10^7$  e. m. u./g.

GREGG M. EVANS

**Spectrographic investigation of 2-ketogluconic acid in the ultra-violet.** P. NIEDERHOFF. Univ. Berlin. *Z. physiol. Chem.* 181, 83-7(1929).—The ultra-violet absorption curve for the K salt of 2-ketogluconic acid does not correspond to that expected for a substance of the formula  $\text{HO}_2\text{CCO}(\text{CHOH})_2\text{CH}_2\text{OH}$ , where 2 adjacent chromophore groups,  $\text{CO}_2\text{H}$  and  $\text{CO}$ , are present. Instead of the  $\text{CO}$  group there is probably a non-chromophoric O-bridge, such as is known to occur in various sugars. In alk. soln. the selective absorption of the so-called 2-ketogluconic acid indicates an opening of the ring structure with probable formation of an ethylene linkage, thus,  $\text{HO}_2\text{CC}(\text{OH})\text{:C}(\text{OH})(\text{CHOH})_2\text{CH}_2\text{OH}$ . For the acid soln. the curve is practically the same as that for the neutral soln. A. W. DOX

**The absorption of ultra-violet light by some albuminous substances.** LEON MARCHLEWSKI AND JADWIGA WIERZUCHOWSKA. *Bull. intern. de l'acad. Pol. Sci.* 1928A, 471-8; cf. *C. A.* 20, 2147.—Expts. are carried out by using Hilger's method and Jones' electrodes as a source of light. The results are: for egg albumin (in  $\text{H}_2\text{O}$ ) absorption band between  $\lambda$  3109 and  $\lambda$  2415, blood serum albumin ( $\text{H}_2\text{O}$ )  $\lambda$  2960-2411, egg globulin ( $\text{H}_2\text{O}$ )  $\lambda$  2975-2407, serum globulin ( $\text{H}_2\text{O}$ )  $\lambda$  3071-2434; caseinogen (in 0.02 N NaOH)  $\lambda$  3176-2628 and vitelin (in 0.04 N NaOH)  $\lambda$  3441-2645. Liver nucleoprotein (in 0.1 N NaOH) causing a faint band at  $\lambda$  3122-2295 differs considerably in this regard from proteins. J. WIERTELAK

**Band spectra in the extreme ultra-violet excited by active nitrogen.** HAROLD P. KNAUSS. Univ. of California. *Phys. Rev.* 32, 417-26(1928).—To det. the amt. of energy available in active N for the excitation of spectra, a vacuum grating spectrograph was used to observe spectra between 2500 A. U. and 1000 A. U. excited in certain gases in the after-glow. The gases were mixed with glowing N through a discharge tube contg. an oscillatory discharge.  $\text{H}_2$ ,  $\text{O}_2$ ,  $\text{N}_2$ , CO and NO were studied, of which only CO and NO showed bands in the region mentioned. In addn. to the  $\alpha$  and  $\beta$  bands of NO characteristic of the after-glow, a progression was found belonging to another system with the same final levels, i. e., levels assocd. with the normal electronic state of the mol. The initial level, identified from published absorption data as an electronic state with zero vibration, designated as level C, and the new system is the  $\delta$  band system of NO. The O-O  $\delta$ -band is at 1915.7 A. U. corresponding to 6.44 v. A few bands of the 4th positive group of CO were obtained in the after-glow corresponding to the excitation of vibration states  $n' = 1$  to 6 of electronic level A. The total energy of these levels is from 8.2 to 9.0 v. The results are discussed in the light of a possible mechanism proposed by Birge. It is assumed that atoms of  $\text{N}_2$  can combine to form an excited diatomic mol. if the encounter is such that the energy of formation and the relative kinetic energy of the atoms go over into electronic vibrational, and rotational energy of the mols. Such encounters will be rare, because both energy and momentum must be conserved in the recombination; therefore the active modification will have a relatively long life. On formation, the mols. have  $11.4 \pm 0.3$  v. of energy; part of this is lost immediately by radiation of the  $\alpha$  group bands leaving from 9 to 10 v. in a configuration which is strongly metastable with respect to the normal electronic state. This metastable mol. is considered responsible for the excitation of spectra in the after-glow. BERNARD LEWIS

**Visible absorption bands of colorless liquids and their relation to infra-red bands.** JOSEPH W. ELLIS. Univ. of California. *Phys. Rev.* 32, 906-12(1928).—The absorption of 10 representative org. liquids, hexane, cyclohexane, benzene, toluene, *m*-xylene, chlorobenzene, chloroform, acetone, ethyl acetate and aniline, has been studied in the visible region by photographic means. Cell lengths up to 6.5 m. were employed. The near infra-red spectra of these same substances have been obtained. A good correlation of the bands of the two regions is shown: the bands of the visible region seem to be higher members of series previously detected in the infra-red. BERNARD LEWIS

**Heats of linkage of C-H and N-H bonds from vibration spectra.** JOSEPH W. ELLIS. Univ. of Calif. *Phys. Rev.* 33, 27-36(1929).—The visible and near infra-red absorption data for several representative mols. are taken from a previous work (cf. preceding abstract) and fitted to the formula of an anharmonic vibrator  $\nu = \omega^n - b\nu^2$ .

The mech. frequencies,  $\omega^* = \omega - 2bn$  are evaluated and plotted. By assuming that these frequencies originate in oscillations between a H atom and the remainder of the mol., the restoring force residing in the C-H and N-H bonds, the heats of linkage of these bonds are calcd. The heats of linkage for a hexane C-H bond is calcd. to be 97,000 cal./mol. in fair agreement with value 92,500 cal./mol. obtained thermochemically for its homolog, methane. The values for the heat of linkage vary among the different types of mols., having the relatively high value of 117,000 cal./mol. for benzene C-H bonds. It evaluates as 113,000 cal./mol. and is believed to agree with the 101,000 cal./mol. obtained thermochemically for an ammonia N-H bond within the limits of detn. of the former value. A possible explanation of the doubleness of the absorption bands observed in the spectra of several substances, notably hexane and cyclohexane, is sought in 2 types of C valence. This doubleness indicates a slight inequivalence in the energy content of 2 types of C-H bond.

BERNARD LEWIS

The infra-red absorption spectra of the methyl halides. WILLARD H. BENNETT AND CHARLES F. MEYER. Univ. of Michigan. *Phys. Rev.* 32, 888-905(1928).—The mols. are symmetrical types having one low moment of inertia. Two types of bands are expected, one arising from vibration parallel to the axis of symmetry,  $\parallel$  bands, and the other from vibration perpendicular to the axis of symmetry,  $\perp$  bands; the appearance of each type is described. There are 7 bands for each of the 4 compds. The 28 bands fall into 7 series, A to G inclusive. 2 of the 4 bands of series A lie beyond the range of observation. Series A, C, E and F are made up of bands of the  $\parallel$  type, and series B, D and G, of bands of the  $\perp$  type. The series converge toward the known bands of methane with decrease in the at. wt. of the halogen in the halide. The envelopes of the  $\parallel$  type demonstrate the existence of P, Q and R branches. The doublet sepns. for the various bands of the same compd. appear to be the same; the chloride may present an exception to this rule. In passing from compd. to compd. the doublet sepns. increase with decrease in the at. wt. of the halogen in the halide. The band of series A for  $\text{CH}_3\text{F}$  has been resolved and it is revealed that the P and R branches consist of a single series of lines. Strong convergence in the spacing is present. The bands of the  $\perp$  type have all been resolved. Every third line is more intense than the others. The spacing converges in series B toward lower frequencies and in D and G toward higher frequencies. The mean frequency intervals from band to band of the same compd. are found to vary markedly. The explanation of this variation presents a theoretical problem of interest.

BERNARD LEWIS

Interpretation of the atmospheric absorption bands of oxygen. ROBERT S. MULLIKEN. New York Univ. *Phys. Rev.* 32, 880-7(1928); cf. C. A. 23, 32.—The atm.  $\text{O}_2$  absorption bands can be attributed to a  $^3\text{S} \rightarrow ^1\text{S}$  transition from the normal ( $^3\text{S}$ ) to a metastable  $^1\text{S}$  excited state of  $\text{O}_2$ . This accounts for all the strong lines, and explains missing lines without conflict with existing theory. Certain very weak lines such as the  $\text{A}^1$  bands are however not yet explained. Of the 3 rotational levels for each value of  $j_k$  in the  $^3\text{S}$  normal state, the 2 for which  $j = j_k \pm 1$  show only a very small sep., which increases slowly with  $j_k$ , while the third is sep. from the other two by an interval of about 2 wave nos., which does not change with  $j_k$ . The  $^3\text{S}$  and  $^1\text{S}$  states involved in the atm. bands may perhaps be attributed both to the same electron configuration. If this is the case it is likely that a metastable  $^1\text{D}$  state derived from the same configuration also exists, and that infra-red atm. bands corresponding to the transition  $^3\text{S} \rightarrow ^1\text{D}$  should be found.

BERNARD LEWIS

New features of the red band system of sodium. F. W. LOOMIS AND S. W. NILE, JR. New York Univ. *Phys. Rev.* 32, 873-9(1928).—The occurrence of an infra-edge to the red band system of Na is reported and is explained in terms of the Franck-Condon theory of intensity distribution when account is taken of the shape of the potential-energy curves as disson. is approached. The same theory explains a head of the red system in the yellow-green, the reappearance of the orange "cathode-ray fluorescence" series in the infra-red, and the observed asymmetry in the two branches of the Condon "parabola" (C. A. 21, 1062).

BERNARD LEWIS

Intensity measurements in the helium spectrum. CLARENCE HODGES AND W. C. MICHELS. Calif. Inst. of Tech. *Phys. Rev.* 32, 913-17(1928).—The abs. and relative intensities of 13 lines of the He spectrum, extending through the visible region, have been measured by a modification of the method developed by Ornstein (C. A. 20, 15) and Dorgelo (*Physik. Z.* 26, 1-39 (1925)). The change in the method consists in comparing each line directly with the known emission from a W filament, operated under const. conditions. The results for a discharge in a capillary tube with pressures from 1.92 to 34.3 mm. show that the abs. intensities increase rapidly to a max. for pressures in the neighborhood of 2 to 4 mm., below which they tend toward zero. The relative

intensities of the singlet system are favored by lower pressures, and the higher members of the triplet system are likewise favored over the lower members, while the relative intensities within the singlet series show little effect of pressure. BERNARD LEWIS

The ultra-violet absorption spectrum of nitrogen peroxide. MAURICE LAMBREY. *Compt. rend.* 188, 251-2(1929).—Gaseous N peroxide shows two absorption spectra, one attributable to  $N_2O_4$  and the other to  $NO_2$ . The first consists of two wide bands without apparent structure. The second is a band spectrum possessing complex structure extending from the yellow to 2000 A. U. and from 2490 A. U. to the limit of the spectrum near 2000 A. U. Wave lengths of 78 bands (4009 A. U. to 2881 A. U.) in the first group and 17 (2495 A. U. to 2083 A. U.) in the second are measured with a precision of about 1 A. U.

Diffuse bands and predissociation of iodine monochloride. G. E. GIBSON AND O. K. RICE. *Nature* 123, 347-8(1929); cf. *C. A.* 22, 354. W. F. MEGGERS

Combination frequencies of the infra-red bands of quartz. E. K. PLYLER. Univ. of N. Carolina. *Phys. Rev.* 33, 48-51(1929).—Previous observers have studied the infra-red absorption bands of quartz and have found regions of intense absorption at  $9\mu$ ,  $12.5\mu$ ,  $20\mu$  and  $26\mu$ . These regions of absorption are assumed to be the fundamental frequencies of quartz. By combining these assumed fundamental frequencies 6 bands in the region from  $3\mu$  to  $9\mu$  are accounted for. Also P. has exptly. located 2 bands at  $2.72\mu$  and  $3.18\mu$  which have not been observed previously. The frequencies of these 2 bands agree with 2 combinations of the fundamental frequencies. This gives a total of 11 absorption bands for the ordinary ray of quartz, extending from  $2.72\mu$  to  $26\mu$  whose frequencies agree with the calcd. values. BERNARD LEWIS

The absorption spectra of certain organic liquids in the near infra-red. JAMES W. SAPPENFIELD. Ohio State Univ. *Phys. Rev.* 33, 37-47(1929).—Absorption spectra have been studied in the region from 0.8 to  $2.5\mu$  with an accuracy of  $0.002\mu$  for 24 org. liquids, including 9 alcs., 6 esters, 2 ethers, 2 aldehydes and 5 miscellaneous compds. The C-H linkage and other similar ones are discussed as a probable source of absorption. Certain inconsistencies are pointed out but there appears to be no other explanation available. The relative intensities of the various bands are discussed. The bands at 1.4 and  $1.0\mu$  and the two bands at 1.2 and  $0.9\mu$  evidently arise from different sources. The effect of homology is slight. An attempt was made to obtain a relation between different band heads of a particular compd. The anharmonic series suggested by Ellis and the relation  $\nu_n = \nu_0(n)^{1/2}$  suggested by Capon (*C. A.* 21, 3829) were both used with moderate success. The latter equation was modified so as to read  $\nu_n = \nu_0/(n)^{1/2}$  and applied to part of the data of Weniger (*C. A.* 5, 21) with moderate success. BERNARD LEWIS

Incoherent scattering. R. M. LANGER. Bur. Standards. *Nature* 123, 345 (1929).—Use is made of Suckals' idea that a mol. can subtract from, or add to an incident quantum one of its characteristic energy quanta, and scatter the resultant sum or difference as a single quantum. An energy diagram is given showing infra-red wave nos. and the calcd. differences between certain of these. It is shown that lines corresponding to these differences, which have not been otherwise accounted for, have been observed. GREGG M. EVANS

Anomalous dispersion, absorption and Kerr effect in viscous dielectrics. DONALD W. KITCHIN AND HANS MÜLLER. Simplex Wire and Cable Co. Cambridge, Mass. *Phys. Rev.* 32, 979-87(1928).—The temp. variation of the dielec. const. and power factor of castor oil and rosin, measured at different frequencies from  $10^7$  to 60 cycles, shows that, in accordance with the Debye's theory of polar mols., the origin of anomalous dispersion of these very viscous liquids shifts with decreasing temps. into the long-wave radio region and even down to audio frequencies. The measurements qualitatively verify the theory. The influence of viscosity in solns. of rosin in different oils which have no polar mols. is found in agreement with the theory. The existence of anomalous dispersion in the audio and radio frequency region explains the complicated dielec. behavior of many insulated materials and makes it possible to observe an anomalous behavior of the Kerr effect, or elec. double refraction. According to Debye, this effect is due to the orientation of the mols. and should disappear at temps. and frequencies where the orientation of the dipoles is impossible. The regions of the anomalous Kerr effect and of anomalous dispersion coincide. BERNARD LEWIS

Secondary radiations observed in the molecular diffusion of light by fluids (Raman effect). PIERRE LAURE. *Compt. rend.* 187, 826-8(1928).—In the Raman effect, the frequencies of the neg. lines are designated by  $N - n_1$ , where  $N$  is the frequency of the excitation light, and  $n_1$  the characteristic frequency of the investigated compd. The corresponding pos. lines are designated by  $N + n_1$ . D. uses the Hg line 4358 A. U. as

excitation source and compares the intensities of the corresponding neg. and pos. Raman lines. The neg. line is always the brighter. For  $\text{AsCl}_3$  and  $n_1 = 15$ , the intensity ratio  $r = 41/100$ ; for  $\text{PCl}_3$  and  $n_1 = 19$ ,  $r = 30/100$ ; for  $\text{AsCl}_3$  and  $n_1 = 39.5$ ,  $r = 15/100$ ; for  $\text{PCl}_3$  and  $n_1 = 50$ ,  $r = 10/100$ . The 2 last results are in accord with the relation  $r = e^{-n_1/2.7}$  but the 2 first ones are too low. The secondary rays  $n_1 = 39.5$  of  $\text{AsCl}_3$  have been excited by means of 5460 and also 4358, and their intensities have been compared. If  $I_1$  and  $I_2$  represent the intensities of the exciting radiations,  $D_1$  and  $D_2$  the intensities of the radiations normally diffused by the fluid and  $S_1$  and  $S_2$  the intensities of the corresponding Raman rays, the following relations hold:  $D_2/D_1 : I_2/I_1 = 2.5$  and  $S_2/S_1 : I_2/I_1 = 1.5$ .

ALBERT L. HENNE

Secondary radiations observed in the molecular diffusion of light (Raman effect). PIERRE DAURE. *Compt. rend.* 188, 61-2(1929); cf. *C. A.* 23, 2104.—Sols. of halogenated compds. of metals and metalloids, and liquefied  $\text{NH}_3$  and  $\text{CH}_4$  are studied. Pure  $\text{SbCl}_3$  gives a spectrum with 4 lines,  $a$ ,  $b$ ,  $c$  and  $d$ , but its  $\text{HCl}$  soln. shows only  $a$ ,  $c$  and  $d$ . By increasing diln., the ray progressively broadens. From a 50% soln. down,  $a$  completely covers  $b$ . The resulting spectrum is thus comparable to the spectrum previously reported for  $\text{HCl}$  solns. of  $\text{BiCl}_3$ . Solns. of  $\text{MgCl}_2$ ,  $\text{AlCl}_3$  and  $\text{CaBr}_2$  did not exhibit any detectable Raman effect. Liquid  $\text{NH}_3$  exhibits a spectrum composed of broad bands: for  $n_1$  (characteristic frequencies in wave lengths per mm.)  $107 \approx 2$ ,  $158 \approx 1$ ,  $321 \approx 1$ ,  $330 \approx 1$ , and  $338 \approx 1$ , the corresponding intensities are: 1, 1, 10, 10 and 10. With liquid  $\text{CH}_4$ , only one ray ( $n_1 = 290.8$ ) appears. With liquid  $\text{O}$ , no Raman effect was detected.

ALBERT L. HENNE

Some experiments on fluorescence. A. C. S. VAN HEEL. *Comm. Phys. Lab., Univ. Leiden* No. 187, 3-14.—The fluorescence and absorption spectra of autunite and potassium uranyl sulfate have been observed at liquid-air and liquid- $\text{H}_2$  temps. A cryostat for use in obtaining low-temp. spectra is described.

J. B. AUSTIN

Fluorescence of benzene and its infra-red absorption. V. POSEPAL. *Compt. rend.* 187, 1046-8(1928).—An effect analogous to that of Raman exists in the domain of fluorescence spectra. From spectra of fluorescence of benzene result the same bands of infra-red absorption as of those spectra of Raman.

L. D. ROBERTS

Polarization of light emitted by fluorescence. PAUL SOLEILLET. *Compt. rend.* 187, 976-8(1929).—The quantities chosen for characteristics of a beam studied have been the 4 parameters used by Stokes. First the direction of the beam is varied without modification of the excitation. With certain hypotheses it has been shown that the characteristic parameters of emission in a direction can be expressed as a function of 9 quantities,  $L_1, L_2, L_3, C_1, C_2, C_3, S_1, S_2, S_3$ . Varying excitation can be characterized by 9 parameters.

L. D. ROBERTS

Theory of the polarization of light emitted by fluorescence. PAUL SOLEILLET. *Compt. rend.* 187, 1136-8(1928); cf. preceding abstract.—By using the parameters previously suggested results are obtained in certain problems. Formulas uniting the 2 groups of parameters are given. The study of anisotropic absorption has led to the introduction of 9 characteristic quantities.

L. D. ROBERTS

Luminescence of hydrogen canal rays. BALEBAIL DASANNACHARYA. Univ. of Chicago. *Ann. Physik* [5], 1, 74-92(1929).—A simplified derivation of the Wien equation (*C. A.* 17, 2391; *Ann. Physik* 76, 109) is given. The energy  $\sigma$  radiated by a neutral atom per sec. was detd. for  $\text{H}_\alpha$ . The mean free path of the total decay of the luminescence  $c^0$  was introduced and calcd. for  $\text{H}_\alpha, \text{H}_\beta$  and  $\text{H}_\gamma$ . An empirical decay equation was introduced.  $c^0 v_d(h\nu)^3 = C^0 = 0.994 \times 10^{-26}$ . ( $v_d$  = velocity of canal ray.) Values for  $1_1^0$ , the mean free path of excitation, were calcd. for  $\text{H}_\alpha, \text{H}_\beta$  and  $\text{H}_\gamma$ . An empirical excitation equation was developed,  $1_2^0(h\nu)/(n-2)^4 = A.U. = 8.58 \cdot 10^{-9}$  where  $n$  is the main quantum no. of the initial orbit of the electron in the emitting atom. By combining the decay and excitation equations, an emission equation was obtained. According to this equation, the ratio of intensities  $\text{H}_\alpha/\text{H}_\beta$  may lie between 8.4 and 21.5, of  $\text{H}_\beta/\text{H}_\gamma$  between 4 and 5.8, and of  $\text{H}_\gamma/\text{H}_\delta$  between 2.8 and 3.4. F. U.

Permanent luminescence of certain crystalline uranium salts. R. COUSTAL. *Compt. rend.* 187, 1139-40(1928).—The phenomenon is independent of previous exposure to sun and temp. Calcn. shows that the energy of radioactivity is more than sufficient to account for the phenomenon. The radioactivity excites the fluorescence.

L. D. ROBERTS

Determination of the role of light in thermal chemical reactions. JEAN PERRIN. *Compt. rend.* 187, 913-6(1928).—When a color is practically non-existent in the isothermal radiation, the mol. impacts capable of furnishing the same quantum are themselves practically non-existent. The yield of fluorescence is defined as equal to the quotient of the luminescent deactivations by the no. of quanta absorbed. The part which re-

ceives the light in a purely thermal reaction is, for each reactant, equal to the yield of fluorescence of that reactant under the conditions where it is found. L. D. R.

A further test of the radiation hypothesis. LOUIS S. KASSEL. Calif. Inst. Tech. *J. Am. Chem. Soc.* 51, 54-61(1929).—An expt. is carried out to test the idea that the rate of decompn. of  $N_2O_5$  at low pressures may be due to the supplementary action of radiation. A neg. result was obtained with radiation  $< 5\mu$ . There still remains the question of accounting for the 100-fold deficiency of collisions to maintain the rate. A possible resolution of the dilemma may consist in the adoption of  $10^{-4}$  cm. for the diam. of collisional deactivation, in spite of the inherent objection of using diams. for  $N_2O_5$  decompn. 15-20 times greater than for other substances showing unimol. decompn. H. R. MOORE

The reaction of ketones with alcohols under the influence of light. IV. The photoelectric effect of benzophenone. J. BÖESKEN AND G. H. VISSER. *Rec. trav. chim.* 47, 1037-41(1928); cf. *C. A.* 22, 761.—A detn. of the photoelec. threshold of  $(C_6H_5)_2CO$  was expected to throw light on the nature of the primary reaction involved in the photo-catalytic oxidation of alcs. in the presence of aromatic ketones. The threshold was found to lie between  $\lambda$  3025 and 2537 Å. U. An EtOH soln. gave the same result. The absorption band at  $\lambda$  2600 would seem, therefore, to correspond to ionization of the mol., while in most cases light changes are stimulated merely by removal of electrons to higher quantum states. No absorption bands were found in the spectral region 4070-3800 Å. U., the region of excitation. An ingenious application of the Geiger-point counter to photoelec. emission is described. It is necessary only to measure the ionization produced by a single electron. This is an ideal condition for insulators, whose increasing pos. charge would gradually prevent the escape of electrons. H. R. MOORE

Ozone formed by ultra-violet rays. M. J. DADLEZ. *L'Union pharm.* 69, 17(1928); *Quart. J. Pharm.* 1, 99-100.—In addn. to the well-known formation of  $O_3$  by elec. action, a notable proportion of atm.  $O_3$  is formed by the ultra-violet rays of the sun. The amt. present in the atm. varies at different times and places, ranging generally from 0.01 to 0.02 mg. per cu. m. This quantity is notably increased in the vicinity of a source of ultra-violet rays, so that its characteristic odor is soon apparent. Although a min. quantity of  $O_3$  is harmless to the human organism, a larger amt. occasions irritation of the respiratory organs. The presence of 4 mg. ozone per cu. m. of air renders the atm. insupportable. This fact indicates a possible source of danger in a confined space contg. an ultra-violet ray quartz lamp. In a recent investigation of the subject D'Arsonval has found that the av. amt. of  $O_3$  produced under ordinary conditions in the working of the Hg-quartz lamp in ultra-violet therapy does not exceed from 0.03 to 0.5 mg. per cu. m. This amt. presents no danger, but when the amt. rises to 1 mg. and more, discomfort and irritation will result. It is essential that rooms in which the ultra-violet installation is working should be well ventilated, especially when not spacious.  $O_3$  is very easily removed by efficient ventilation. When the amt. of  $O_3$  reaches 1 to 1.5 mg. per cu. m., symptoms of respiratory irritation will be apparent in about 30 mins. W. O. E.

The Budde effect in bromine. ERNEST MATTHEWS. *Trans. Faraday Soc.* 25, 41-3(1929).—Observations of the Budde effect were made on dry  $Br_2$  vapor + air, dry  $Br_2$  vapor only, and moist  $Br_2$  vapor + air. The gases were contained in pairs of glass bulbs connected by capillary tubes contg. liquid  $Br_2$ , the movement of which showed the vol. changes. The walls of the dry bulbs were coated with  $P_2O_5$  by sublimation, and the  $Br_2$ , dried over  $P_2O_5$ , was allowed to stand in these for as long as 8 weeks. One bulb of each pair was completely blackened, while the other was illuminated through a small aperture by a 100-c. p. "pointolite" lamp. Drying diminished the Budde effect but did not cause it to disappear over the period investigated. A greater effect was found in  $Br_2$  vapor + air than in  $Br_2$  vapor alone. M. W. SEYMOUR

The action of ionizing radiations on colloids. J. A. CROWTHER. Univ. of Reading. *Phil. Mag.* [7], 7, 86-97(1929); cf. *C. A.* 21, 3827; 22, 3422, 4057-8.— $\beta$ -Rays from Rn are compared with x-rays as to their action on a ceric hydroxide sol and a Bredig Cu sol. Measurements of viscosity changes up to 60% change show that a const. ratio exists between the quantity of  $\beta$ -rays and the quantity of x-rays required to produce a given decrease in the viscosity of the sol. A similar ratio of effectiveness of the two ionizing agents was found in the pptn. of Bredig Cu sols. Studies on these two sols showed that the ratio of the  $\beta$ -ray to the x-ray effects is independent of the nature of the sol. The changes are believed to be due to a discharge of the colloidal particles by the ions produced in the solvent by the ionizing agents. If the energy spent in producing a pair of ions in air is the same for both types of radiation the energy which must

be absorbed in a given vol. of sol to produce a given loss of charge by the colloidal particles is independent of the nature of the ionizing radiation. Only sols with positively charged particles are coagulated by ionizing agents. The negative ion (electron) produced by the ionizing agent appears to be the only effective agent in the process and the effect is therefore independent of the agent producing the ions. L. H. REYERSON

**Superdispersion.** T. TAKEUCHI, Göttingen. *Z. Physik* 53, 148-50 (1929).—Mass and size of photons are calcd. on the basis of wave-mechanics and a certain crit. frequency is discussed. GEORGE GLOCKLER

**The photosynthesis of hydrochloric acid at low pressures.** GERHARD K. ROLLEFSON. Univ. of Calif. *J. Am. Chem. Soc.* 51, 770-8 (1929).—Cl<sub>2</sub> (at either 1.4 or 13.7 mm.) and H<sub>2</sub> (at about 0.1 mm.) were exposed to the white light from a 100-watt tungsten-filament lamp; the HCl and Cl<sub>2</sub> were frozen out with liquid air periodically during a run and the residual pressure of H<sub>2</sub> measured. The rate of reaction follows the law  $d(\text{HCl})/dt = KI_0(\text{H}_2)(\text{Cl}_2)$ . R. postulates a chain mechanism wherein the primary step is the disson. of Cl<sub>2</sub> into a normal atom and one in the <sup>2</sup>P state; it is this latter atom that is supposed to actuate the reaction by formation of a complex with water, which in turn reacts with mol. H<sub>2</sub> to give HCl, H<sub>2</sub>O, and H, the H combining with a Cl<sub>2</sub> mol. to produce another mol. of HCl and another activated Cl atom. Reactions which may terminate the chain are also given. WILLIAM E. VAUGHAN

#### 4—ELECTROCHEMISTRY

COLIN G. FINK

**Electric resistance furnaces for factory use.** H. TAMELE. *Siemens Z.* 9, 101-8 (1929); cf. *C. A.* 22, 2114.—The advantages of elec. furnace heating as compared with fuel furnaces are outlined. Numerous types of elec. furnaces are described and illustrated: muffle types for hardening and enameling in automobile industry, crucible furnaces, and melting furnaces for low m.-p. metals and alloys. M. MCMAHON

**Electric furnaces for metals.** M. TAMA. *Z. Metallkunde* 21, 77-88 (1929).—The use of elec. furnaces in metal industries is rapidly increasing because of their economical and efficient operation. Numerous types of industrial furnaces are described and illustrated: tube furnaces, ribbon, plate, etc. In the discussion addnl. special types are illustrated. M. MCMAHON

**Electric furnace for the treatment of gases.** O. SCARPA. *Chimie et industrie* Special No., 192 (May, 1927); cf. *C. A.* 21, 706.—The positive main is connected to a vertical electrode in the center of the furnace, the negative main to 4 horizontal electrodes in the same plane directed toward the center of the furnace and spaced 90° apart. The operation of the arc is similar to that of the previously described furnace. A voltage of 80-100 can be used. A. PAPINHAU-COUTURE

**Melting steel in the high-frequency furnace.** HEINZ NEUBAUSS. *Foundry* 57,

146-50(1929).—N. discusses the com. application of the high-frequency furnace to the melting of steel and stresses the importance of the violent stirring action which is obtained in this type of furnace. When the deoxidizers are added they are immediately distributed throughout the charge and the deoxidation products leave the bath quickly. In the steel baths of an open-hearth or arc furnace it is necessary to use a surplus of deoxidizers to secure the desired reactions. (Cf. Herty and Gaines, *C. A.* 22, 1562.) Up to the present only low-C steels have been studied in the Ajax furnace. An induction furnace of 5 tons' capacity, supplied from a 400-600 kw. generator, is capable of deoxidizing 4 charges of molten metal per hr. Data on a 240-lb. melt, in a 150 kw. unit, of low-C red-short-free Fe are given. The av. power consumption during a 15-minute deoxidizing period = 8.85 kw.-hrs. to furnace, or  $8.85/0.74 = 11.95$  kw.-hr. input to generator, or 111. kw.-hrs. per gross ton. For coppered iron the consumption is 140 kw.-hrs. per gross ton, and for commercially pure iron 224 kw.-hrs. per gross ton. Further expts. show that a stainless steel melt was decarburized from 1.15% C to 0.05% C in 59 mins. The 188 lbs. of commercially pure iron used required 108 kw.-hr. to melt, and the adds., including 52-lb. ferrochrome, required 35.7 kw.-hr. The result is 327 kw.-hrs. per gross ton. Addnl. data on corrosion-resisting irons are included. A. D. SPILLMAN

**Melting steel in the high-frequency induction furnace.** HEINZ NEUHAUS. *Fourdry* 57, 192-4, 218(1929); cf. preceding abstract.—The high-frequency furnace offers three possible methods for decreasing the cost of stainless steel. High-carbon ferrochrome, much cheaper than low-carbon ferrochrome, can be added to the Fe and the C oxidized; high-carbon ferrochrome can be decarburized; high-chromium pig can be made in the blast furnace and then decarburized; the essential point is that the temp. can be kept high enough so that C rather than Cr will be oxidized. Iron oxide or air blast or both may be used for decarburization. Preheated air is the preferred medium. In one experiment a pig containing 3.74% C and 12.89% Cr was blown down to .88% C and 11.33% Cr in 52 minutes. If chromium is absent, the time is much reduced; in 18 min. the carbon content of a charge was reduced from 3.25% to 0.04%, using air at approx. 400°. A duplex process is proposed in which steel scrap would be melted in the cupola, and the liquid metal contg. about 3% C would be transferred to the induction furnace for decarburization. The estd. energy consumption is 350-400 kw.-hrs. per ton. BENJAMIN MILLER

**The formation at relatively low temperatures of carbides yielding acetylene.** F. FISCHER. *Brennstoff-Chem.* 9, 328-33(1928).— $BaC_2$  is prepd. from BaO by heating with C in an elec. porcelain-tube furnace in a stream of  $CH_4$ , with or without the addn. of a small quantity of  $Fe_2O_3$  and CaO.  $BaC_2$  yielding 60% of the theoretical of  $C_2H_2$  was obtained by heating a mixt. of 2 g. BaO + 1 g. CaO + 0.2 g.  $Fe_2O_3$  for 30 min. at 1150° in  $CH_4$  at 35 mm. pressure. Carbides were not formed below 850° and yields fell off sharply above 1150°. The highest yields were obtained in an atm. of  $CH_4$ . The carbide formed at these low temps. yields both  $H_2$  and  $C_2H_2$  with  $H_2O$ . F. believes that free Ba is first formed by reduction and this is partly converted into  $BaC_2$  and partly into  $BaH_4$ . J. D. DAVIS

**Electrolysis with fluorine.** WILDER D. BANCROFT AND NEWTON C. JONES. *Trans. Am. Electrochem. Soc.* (preprint) 55(1929).—F was prepd. by electrolysis of fused  $KHF_2$  in the Mathers cell, with a Mg metal pot as cathode and a graphite rod as anode. About 250 cc. F is obtained per amp. hr. with a current efficiency of about 30%. Reactions of F with a variety of substances were studied. F oxidizes solns. of cobaltous, chromic, manganous and plumbic salts; it may be used in many cases of poorly conducting solns. and where it is not desired to deal with the cathode reaction products. F reacts explosively with  $C_6H_6$  vapor after an induction period. When this can be eliminated, F should react satisfactorily with org. substances. W. H. BOYNTON

**The use of a magnetic field in the measurement of the forces tending to orient an anisotropic liquid in a thin homogeneous layer.** V. FREDERICKSZ AND V. ZOLINA. *Trans. Am. Electrochem. Soc.* (preprint) 55, 8 pp.(1929).—Forces arising in a thin layer of the surface of an anisotropic liquid and to which the orientation of the drops in the form of a homogeneous layer is due, may be equilibrated by the effect of a magnetic field. It has been established that these forces do not depend on the kind of material on which the liquid is placed, that they are not subject to great variations with temp. changes and that they decrease with the distance of the orientated drops from the surface of the liquid. Expts. with *p*-azoxyphenetole and *anisaldazine* yielded similar results. W. H. B.

**Theory and practice in electroplating.** ANON. *Metalwaren-Ind. Galvano-Tech.* 25, 27-8, 47-8(1927).—The author shows how such theoretical considerations as the  $pH$  have been of great practical value to the nickel plater. Interfacial tension

is not something with which the practical plater is familiar and yet it explains why such a small amount of org. matter as one part in a million will cause pitting and rough deposits. The use of  $H_2O_2$  to destroy the org. matter is suggested. J. H. HOFFER

**Nickel solutions.** GEORGE B. HOGABOOM. *Metal Ind.* (N. Y.) 27, 172-5(1929).—An addn. agent giving a high-anode and a low-cathode efficiency is of little value. Exptl. data establish that the actual anode efficiency is low and that with either NaF or  $Na_2SO_4$  present, the character of the corrosion is affected. With neither salt present, the coating that forms on the anode is very adherent. When either salt is added to the soln., the anode coating becomes loosely adherent and when the cathode is removed, fine particles readily sep. from the anode and become suspended in the soln. Subsequent cathode deposits are covered with these fine metallic particles rendering it quite rough. Expts. show the beneficial effects of chlorides in Ni-plating solns. Several runs show that the rate of corrosion of the anode is not increased but that the character of the anode corrosion is materially changed with higher chloride content. A study of the effect of boric acid shows that the corrosion of a high-purity Ni anode in a Ni-soln. is different from that when no boric acid is used. In both cold and warm solns., without boric acid, the anode becomes covered with grooves extending from top to bottom. The effect is less evident in hot solns. With low chloride content the changes in metal concn. and  $p_H$  values are much less. W. H. BOYNTON

The causes and prevention of pitting in electrodeposited nickel. D. J. MACNAUGHTAN AND A. W. HOTHERSALL. *Trans. Faraday Soc.* 24, 497-509(1928).—A crit. survey and exptl. study are made of the various factors bearing on the formation of pits in Ni, Fe, Co, Zn and Cu deposits. Pits are due to the partial screening of the surface from the depositing current by solid particles and gas bubbles. H gas is one of the chief causes, and consequently the nature of the cathode surface as well as capillary and surface tension effects operative at the cathode have an important effect. An ingenious optical device is used to exam. the progress of growth of circular and tailed pits. The latter are due to the upward flow of electrolyte over the cathode surface. A sure way of avoiding pits is by the replacement of anodes and cathodes of com. purity by highly purified materials. A low acidity of soln., or high  $p_H$ , is also helpful. With Ni a good procedure is the plating of Cu over a preliminary Ni coating. The Cu eliminates areas of low over-voltage. The work is completed by a final coating of Ni. H. R. MOORE

The prevention of corrosion by electrodeposition. VI. Nickel plating as a corrosion preventative. S. WERNICK. *Ind. Chemist* 5, 106-10(1929).—A general review of expts. and improvements of recent years in Ni-plating. W. H. BOYNTON

Penetration of hydrogen into metal cathodes and its effect upon the tensile properties of metals and their resistance to repeated stresses; with a note on the effect of nonelectrolytic baths and nickel plating on these properties. F. C. LEE. *Proc. Roy. Soc. (London)* A123, 371-85(1929).—The expts. include static tensile tests, single-blow tests, repeated-stress tests and direct-stress tests of mild steel, Ni, brass, and stainless steel in alk. and acid baths, both when the current was and was not flowing. Examn. of the fractures seem to indicate that the cathodic H penetrates the crystal boundaries of the steels and Ni. The H effect and presence is only temporary. The cathodic H does not affect the tensile strength or the resistance to repeated stresses, but affects the elongation of the mild-steel specimen. Polishing the specimens prevents the H penetration and modifies its action. Acid corrosion affects the surface considerably and reduces accordingly the resistance to torsional stresses. NaOH soln., with or without the presence of H, protects the specimen and raises the fatigue range. Ni plating does not affect the tensile strength of the steel but it reduces the resistance to repeated stress considerably. L. describes his set-up for making these tests during the electrolysis and plating. F. A. ROHRMAN

Chromium plating. A survey of the published information. G. E. GARDAM. *Metal Ind.* (London) 34, 299-301(1929). E. H.

The chromium situation. A. KENNETH GRAHAM. Univ. of Penn. *Am. Metal Market* 35, No. 216, 18-22(1928).—A review of present technic in com. Cr plating. A curve is given on an enlarged scale of the density of  $CrO_3$  solns. up to 550 g/l. The maintenance of Cr plating baths in continuous operation is discussed along with the importance of anode material and anode area. Further details are given of the use of a porous cup and a sep. cathode compartment for re-oxidizing  $Cr^{+++}$ , as suggested by Lukens (C. A. 22, 1283, 3358). A table of Cr plating variables and their interdependence is given, in addn. to the detailed discussion of these matters. G. D.

Electrolytic deposition of chromium. D. T. EWING AND A. M. MALLOY. East Lansing, Michigan. Mich. Eng. Expt. Sta., *Bull.* No. 7 (Sept., 1926).—A brief review

is given of the historical development of Cr deposition and of the properties of Cr. Benzine and paraffin had a decided effect on the surface tension of  $\text{CrO}_3$  solns. and a decided improvement in the smoothness of deposits resulted. A soln. of 5%  $\text{H}_3\text{PO}_4$  and 20%  $\text{CrO}_3$  gave very smooth deposits at 65 amps./sq. dm. and  $27^\circ$ . Results are given of expts. with a soln. contg.  $\text{CrO}_3$ , 300 g./l.;  $\text{Cr}_2(\text{SO}_4)_3$ , 3 g./l.; Hg, 1 g./l. The best c. d. was found to be 20–27 amp./sq. dm. in this case. Benzene was added to a bath contg.  $\text{Hg}_2\text{SO}_4$ , but the effect of the benzene could not be definitely decided. Two g. of  $\text{CrCl}_3 \cdot 6\text{H}_2\text{O}$  and 3 g. of  $\text{Hg}_2\text{SO}_4$  were added to a bath of 300 g./l. of  $\text{CrO}_3$  and 3 g./l.  $\text{Cr}_2(\text{SO}_4)_3$ ; the best deposits were obtained at 20–24 amps./sq. dm., especially after the bath had been "worked" for a time. The soln. was first made up without the  $\text{Cr}_2(\text{SO}_4)_3$ , but the deposits were poor. Another bath contg.  $\text{CrO}_3$ , chrome alum and  $\text{Hg}_2\text{SO}_4$  gave good deposits at around 21 amps./sq. dm. but had a strong tendency to give dendritic deposits with peeling at the edge. A soln. contg. Cr acetate,  $\text{CrO}_3$  and com.  $\text{H}_2\text{O}_2$  gave erratic results and many deposits peeled badly. Addn. of PbO and of colloidal  $\text{MoO}_3$  to solns. of  $\text{CrO}_3$  and  $\text{Cr}_2(\text{SO}_4)_3$  gave good deposits. G. DUBPERNELL

**Chromium plating progress.** W. M. PHILLIPS AND M. F. MACAULAY. General Motors Corp. *J. Soc. Automotive Eng.* 24, 397–400; *Iron Age* 123, 269–71 (1929).—Progress in Cr and Ni deposition in recent years is reviewed in relation to Cr plating. In early test work it was found that  $\text{CrO}_3$  solns. to which a small quantity of  $\text{Cr}_2(\text{SO}_4)_3$  was added worked only for a short time; this was caused by impurities, for the most part by  $\text{Cr}_2(\text{SO}_4)_3$ , and it was decided to use c. p.  $\text{CrO}_3$ . The % of  $\text{SO}_4$  in the bath plays a very important part, and as a  $\text{SO}_4$  detn. takes 12 hrs., production is controlled by the trial-and-error method. The various difficulties encountered in putting Cr plating on a com. basis are described. Ni plating must be properly carried out in slightly acid soln. in order to be sufficiently adherent to withstand the pull exerted by the Cr plate and not to peel with the use of even very thin Cr deposits, which do not exert much pull. Ni must be more highly polished than ever before as the Cr plating brings out even the slightest irregularities. Tests have shown that Cr plate of more than 500 amp. min./sq. ft. at about 12% efficiency weakens rather than improves resistance to rusting. Expts. were tried with various anode materials such as Cr, Fe, steel, Pb and Al; low-carbon steel, fully annealed, is considered best. Methods of inspecting Cr-plated parts are discussed and some mech. applications are reviewed. G. DUBPERNELL

**Mechanical applications of chromium plating.** W. BLUM. *Mech. Eng.* 50, 927–30 (1928).—After giving particulars regarding the phys. properties of Cr such as hardness, thermal expansivity, density, m. p., elec. cond., and adherence, B. gives the results of a survey of the uses to which Cr plating, by reason of its wear-resisting qualities, has been more or less successfully put; namely, its application to gages and other measuring devices; to drawing, forming, stamping and molding dies; to rolls for forming metals; to tools for cutting metal; to bearing surfaces in machinery, etc. He shows how, in addn. to savings due to the longer life of Cr-plated tools and parts, there are savings much greater in amt. resulting from reducing the no. of times that machines must be stopped for their replacement. G. DUBPERNELL

**The bent cathode test for determining the optimum ratio of chromic acid to sulfate in chromium plating baths.** WALTER L. PINNER AND EDWIN M. BAKER. *Trans. Am. Electrochem. Soc.* (preprint) 55 (1929).— $\text{CrO}_3$  Cr-plating baths require strict adjustment of all operating conditions. A simple, rapid method for detg. the proper quantity of  $\text{H}_2\text{SO}_4$  or of  $\text{CrO}_3$  without quant. analysis is outlined. The bent cathode presents recesses and protruding sections, affording a good study of throwing power. The best results are obtained in a 2.5 M  $\text{CrO}_3$  bath with 0.05 N sulfate and no impurities. The temp. was  $48^\circ$ , current 5 amp., and c. d. 15.5 amp./sq. dm. over the entire piece. The bent cathode takes into consideration other acid radicals as well as  $\text{H}_2\text{SO}_4$ . A soln. contg. 6 g./l. of Fe possesses the widest range of  $\text{SO}_4$  ratio variation—70. Increasing amts. of  $\text{Cr}^{+++}$  increase the required  $\text{SO}_4$  ratio. Concns. of  $\text{CrO}_3$  of 1–3 increases the ratio, beyond 3 it decreases at the same rate. Increasing  $\text{Cr}^{+++}$  greatly decreases the throwing power as do amts. of Fe greater than 9 g./l. Bath resistance increases in direct ratio to the Fe in soln. W. H. BOYNTON

**The electroplating of cadmium from cyanide baths.** L. R. WESTBROOK. *Trans. Am. Electrochem. Soc.* (preprint) 55, 13 pp. (1929).—The compn. and operation of cyanide baths for Cd plating on a com. scale are outlined. The baths have been judged by the deposit produced by the elec. properties of the soln. and by the behavior of the bath under conditions of continuous or intermittent operation over an extended time. The baths contain varying amts. of  $\text{NaCd}(\text{CN})_2$ ,  $\text{NaCN}$ ,  $\text{NaOH}$ ,  $\text{Na}_2\text{SO}_4$  and  $\text{Na}_2\text{CO}_3$ —the latter in small quantities, which increases in concn. as the bath is operated. The functions and effects of variations in each constituent are considered. The effects of small quan-

ties of other metals in the bath are considered. A few hundredths of a percent of Ni, or larger amts. of Co or Cu, in the bath produces marked improvement in the deposit. Several org. addn. agents and two typical bath formulas are listed. W. H. BOYNTON

Cadmium plating in quantity production. CLAYTON M. HOFF. *Grasselli Chemical Co. Metal Ind.* (N. Y.) 26, 475-6(1928).—Polemic with Loven (C. A. 22, 3587). Loven's methods for the detn. of total cyanide and total alkali are satisfactory for Zn-(CN)<sub>2</sub> solns. but give only the free CN and an inaccurate result for total alkali in Cd baths. The method for Cd will give both Cd and Zn if Zn is present. The variations in corrosion resistance shown by Loven's curves are probably due to variations in the thickness of deposits. Higher cathode current efficiencies should be obtained, rather than using steel anodes to lower the av. anode current efficiency, as the latter may have a deleterious effect on the soln. Loven's production figures are rather low. Reply. OTTO H. LOVEN. *Ibid* 476-7.—AgNO<sub>3</sub> gives only a very slight ppt. of Cd hydrate after all the free cyanide has been used up, and the true end point for total cyanide is the appearance of the slightly yellowish AgI. Another method with a sharper end point is: Pipet 5 cc. of the Cd-plating soln. into a 100-cc. volumetric flask, dil. to the mark and pipet a 25-cc. aliquot into a 300-cc. Erlenmeyer flask. Add 50 cc. H<sub>2</sub>O, 3 cc. of 28% NH<sub>4</sub>OH and about 10 drops of KI soln. Titrate with AgNO<sub>3</sub> to the appearance of a turbidity due to AgI. The method for total alkali is sufficiently accurate for control work. Addn. agents give brittle Cd deposits and flaking, and better results are obtained without them. The need for using some steel anodes is pointed out; they have very little effect on the soln. The production figures given were low because the plant was not operating at full capacity. G. DUBERNELL

Copper-coated steel wires. E. SCHULZE. *Elektrotech. Z.* 49, 48-50; *Science Abstracts* 31B, 352-3(1929).—Results are recorded of tests upon Cu-coated wires for cond., self-induction and losses. They show that the losses are greater than with pure Cu wires, that cost of an overhead line is reduced because of cheaper metal and the possibility of using larger spans. Cu-coated wire has proved more suitable for long-span crossings and lightly loaded lines. W. H. BOYNTON

Improvements in accumulators and dry batteries. E. LIEDEL. *Z. angew. Chem.* 42, 301-7(1929).—A comprehensive review of literature and patents on developments and improvements in dry batteries. M. MCMAHON

Electric boilers and steam accumulators. C. J. WHARTON. *World Power* 9, 256-60(1928); *Science Abstracts* 31B, 411.—Conditions advantageous to the use of steam for steam generation and 2 types of elec. boiler are discussed. In the Swedish type, the electrodes enter the base of the vertical cylinder shell; the steam output and elec. input are controlled by raising or lowering vertical tubes round the electrodes. There is a const. water level. In the German type, the circuit leads at the top connect with hanging electrodes, with poled insulating disks surrounding them. Steam output is controlled by raising and lowering of the water level; 96% efficiency is guaranteed. Losses are confined to radiation and blow down. With feed water at 19° 1 kw. hr. will produce 2.75 lbs. (1.25 kg.) steam at 114 lbs. (51.7 kg.) gage pressure. In one instance an elec. boiler occupying 7 ft. (2.13 m.) square floor space, including switch-gear and accessories, did the same work as 3 Lancashire boilers. Repairs and maintenance costs are trifling, and no pitting or scale formation occurs. Ruth's steam accumulator and its use are outlined. W. H. BOYNTON

The electrical equipment of x-ray apparatus. L. G. H. SANSFIELD. *J. (Brit.) Inst. Elec. Eng.* 67, 437-74(1929).—A comprehensive exposition. C. G. F.

The operation of the cathodophone. ERWIN MEYER. *Elek. Nachr. Tech.* 6, 17-21 (1929).—The cathodophone is used in talking films and as pick-up transmitter in German broadcasting. The hot cathode of alk. earth oxides is heated from the inside by a Pt spiral; this cathode is fixed close to a perforated anode, which forms the small end of a horn. Current flows from cathode to anode corresponding with the direction of the sound. Current oscillations under the influence of sound are led to an amplifier in the cathodophone circuit through a high ohmic resistance. App. and circuits are illustrated. M. MCMAHON

The part played by Pitt in the invention of the carbon incandescent electric lamp. A. A. CAMPBELL SWINTON. *J. (Brit.) Inst. Elec. Eng.* 67, 551(1929). C. G. F.

The formation of ozone in the electrical discharge at pressures below three millimeters. JAMES K. HUNT. Univ. Wisconsin. *J. Am. Chem. Soc.* 51, 30-8(1929).—A study is made of the low-pressure synthesis of O<sub>3</sub> from O<sub>2</sub> within the range 0.2-2.8 mm. A more uniform distribution of ionization is obtained at low pressures, in spite of the fact that the p.-d. drop is greatest at the cathode and ionization is consequently more intense. Equil. is reached after 30 sec. operation. The O<sub>3</sub> yield is independent of the

electrode material. The  $M/N$  ratio is 1, suggesting the reaction mechanism  $O^+ + O_2 \longrightarrow O_3^+$ .

Storage batteries. AKTIENGESSELLSCHAFT KUMMLER & MATTER. Fr. 648,927, Feb. 9, 1928. The interior heater for warm water elec. storage batteries are made of rustless steel or are Cr plated.

Storage battery with a window and specific gravity float. T. R. PALMER. Brit. 298,054, April 16, 1928. Structural features.

Alkaline storage batteries. J. F. MONNOT. Brit. 297,996, Nov. 4, 1927. Electrodes for alk. storage batteries comprise perforated steel tubes filled with layers of Ni hydroxide sepd. by disks of perforated Ni foil.

Storage-battery plates. WALTER HADDON and JAMES M. BURNETT. U. S. 1,710,617, April 23. A pasted plate is coated with a mixt. comprising rubber latex in admixture with a sol. salt; it is allowed to dry and the sol. salt is then washed out to leave an elastic and porous structure.

Contact plate for multiple storage batteries. CONCORDIA ELEKTRIZITÄTS-A.-G. Fr. 648,691, Feb. 13, 1928.

Composition for preventing corrosion of storage-battery terminal connectors. JOHN L. LANGE. U. S. 1,710,227, April 23. A mixt. of  $Na_2CO_3$ , 88 and  $(NH_4)_2SO_4$ , 12% is mixed with a heavy petroleum oil or product to form a pasty mixt.

Electrodeposition of metals such as iron in tubular form. THOMAS W. S. HUTCHINS. U. S. 1,709,268, April 16. Deposition of a metal such as Fe is effected on a tubular polished tapered cathode made of an alloy, which contains Fe and Cr (suitably in the proportions of 86-88 and 12-14%, resp.); the cathode and deposited metal are heated and then quickly chilled to effect sepn. of the electrodeposited tube from the cathode.

Apparatus for electrolytic deposition of chromium. F. LAUTERBACH (to W. G. Poetzsch). Brit. 298,226, Oct. 6, 1927. A centrifugal device is used to recover vapors from the gas passing off from the bath. Various structural details are described.

**Glass-lined metal tank for chromium-plating baths.** LEO D. JANSEN (to United Chromium, Inc.). U. S. 1,709,022, April 16. Structural features.

**Electroplating.** CHARLES H. R. GOWER and STAFFORD O'BRIEN and PARTNERS, LTD. Fr. 648,941, Feb. 14, 1928. See Brit. 290,903 (*C. A.* 23, 778).

**Anode for use in electroplating.** FRANK J. DELAVIE and HOWARD H. BLOUCH (to Grasselli Chemical Co.). U. S. 1,709,523, April 16. Anodes are formed of steel or other inert cond. material having a hook at one end and an eyelet at the other end; the main portion of the core is surrounded by a body of cast anodic metal such as Cd.

**Barrel apparatus for plating small articles with chromium.** F. LAUTERBACH (to W. G. Poetzsch). Brit. 298,225, Oct. 6, 1927. Undue rise of temp. is prevented by circulation of the electrolyte or by the use of an anode cooled by passage of liquid or of an anode formed in star shape to provide a large surface. Various structural features of app. are described.

**Electrolytic baths.** FRANZ VON WURSTEMBERGER. Swiss 129,293, Nov. 25, 1927. Small particles of metal, especially in Ni baths, are kept clear of the cathode by magnetic means. The anode may be made magnetic to attract the particles.

**Apparatus for conveying articles through electrolytic baths.** SIEMENS & HALSKE A.-G. Brit. 298,184, Oct. 5, 1927.

**Electrolytic process for detinning tin plate, etc.** F. RÉMY. Belg. 353,234, Aug. 31, 1928. The electrolytic soln. is regenerated by means of a current at a d. of the order of 1-1.2 amp. per cu. dm. of soln. under a potential of 32 v. The properties of the soln. can be kept const. by continuously passing an elec. current of 0.1 amp. per sq. dm. of the area of the vat contg. the soln. under 32 v. A small amt. of Hg bisulfide is added periodically to the bath. An Fe silicide tank is used.

**Electrolytic condenser.** SAMUEL RUBEN. U. S. 1,710,073, April 23. A paste electrolyte for condensers with film-forming electrodes comprises glycerol and a film-forming compn. of  $H_2BO_3$  and Na borate in such proportions that the mixt. has a comparatively high viscosity at ordinary temps. Various structural details are described.

**Preparing maleic and succinic acids by electrolysis of an acid solution of furfural.** TEIJIRO YABUTA (to Zaidan Hojin Rikagaku Kenkyujo). U. S. 1,709,297, April 16.

**Refining metals.** PAUL L. HULIN. Fr. 649,014, July 4, 1927. In an app. for refining metals such as Al, in which 3 fusion layers are superposed in known manner, the lining is divided into 3 distinct layers, (1) a horizontal frame in refractory material or C, contg. the anode, (2) a horizontal frame in insulating material contg. the electrolyte, and (3) a frame in C, insulated from the metallic envelope and contg. the cathode.

**Aluminum refining.** JULIUS WEBER and HANS HAUSER (to Aluminum Industrie A.-G.). U. S. 1,709,759, April 16; Swiss 128,513, Jan. 24, 1927. In the electrolytic purification of aluminum, an elec. current is passed from a solid anode of the metal to be purified through a molten electrolyte of material such as chlorides of Al and Na or K having a m. p. lower than that of either electrode and capable during electrolysis of dissolving the Al of the anode, while maintaining a temp. above the m. p. of the electrolyte but below the m. p. of either electrode. An app. is described. Cf. *C. A.* 22, 3359.

**Alumina.** ELEKTIZITÄTWERK LONZA. Swiss 129,878, Aug. 4, 1927. See Fr. 640,057 (*C. A.* 23, 779).

**Hydrogen peroxide.** I. G. FARBERIND. A.-G. Brit. 297,880, June 30, 1927. Water is satd. with O under superatm. pressure (suitably a pressure of 25 atm.) and the soln. is electrolyzed with the pressure released. A cathode of amalgamated Au and an anode of Pt may be used with a c. d. of 4 amps. per sq. dcm.

**Phosphorus from ferrophosphorus.** I. G. FARBERIND. A.-G. (Ernst Pokorny, inventor). Ger. 466,438, May 22, 1927. Fe-P is melted in an elec. furnace and  $SiO_2$  and C are added to produce P and Fe-Si.

**Weed killer.** JEAN SCHNEEBELI. Swiss 129,209, June 1, 1928. A weed killer is prepd. by the electrolysis and neutralization of a high percentage aq. soln. of  $NaClO_2$ .

**Treating gases.** OSKAR ARENDT. Fr. 649,272, Feb. 20, 1928. To bring about reactions between gases or vapors and solids by high-frequency currents a cloud of dust particles is produced between the high-frequency electrodes; these dust particles produce spark fields for the current. Examples of app. are described in detail.

**Electric furnace.** AKT.-GES. BROWN, BOVERI & CIE. Swiss 128,846, Sept. 2, 1927. Details of operation and construction.

**Regulating electric furnaces.** SOC. ÉLECTROMÉTALLURGIQUE DE MONTECHER (SOC. ANON.). Fr. 648,473, Feb. 7, 1928.

Electric furnace suitable for dental uses. E. C. GLITZER. Brit. 298,001, Nov. 21, 1927. Various details are described of a muffle furnace provided with a fusible cut-out operating at 1260-1405° and which may be formed from alloys of Cu and Co, Ni, Si, or Fe; Ni and Sn or Pb; or Co and Cr. Use of Mn or Si is also mentioned.

Electric resistance furnace suitable for heat treatments in a non-oxidizing gas. ORA A. COLBY (to Westinghouse Elec. & Mfg. Co.). U. S. 1,709,658, April 16.

Electric resistance-heated furnace for heat treatment of metals or other materials. V. SORREL and L. A. LAFONT (to Infra Soc. Anon.). Brit. 297,826, Sept. 29, 1927. Devices are provided for checking or regulating the heating after a crit. temp. is reached.

Electric-resistance heated apparatus suitable for pot or crucible furnaces. PERCIVAL B. CROCKER (to Sentry Co.). U. S. 1,709,340, April 16. Structural features.

Electric resistance heater. FREDERICK D. PITT (to Anderson-Pitt Corp.). U. S. 1,710,512, April 23. Structural features.

Electric resistance heating unit. DAVID G. PETRIE (to Young, Osmond & Young). U. S. 1,710,511, April 23. Structural features.

Crucibles for electric induction furnaces. COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 649,371, Oct. 29, 1927. Crucibles are made by molding a refractory substance, such as refractory clay, and a powd. substance, such as charcoal or graphite, which will form an elec. heating resistance, baking in a reducing atm. and finally heating in air to burn the outer layer of graphite.

Furnace electrodes. JOSIAS REES. Ger. 473,142, Nov. 26, 1924. Addn. to 420,801. A freely hanging electrode of the kind comprising a hard core within a softer mass is surrounded by 2 wire gauzes with an interposed casing of fireproof porous material.

Carbon electrodes. BERTHOLD REDLICH. Ger. 473,143, April 7, 1925. Segmental pieces of C are arranged around a central core.

Incandescent cathodes. NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Fr. 649,264, Feb. 18, 1928. In the manuf. of incandescent cathodes having on their surface one or more alk. earth oxides they are heated, e. g., to 1000°, in an oxidizing atm.

Hammer device for cleaning gas-purifier electrodes. SIEMENS-SCHUCKERTWERKE A.-G. (Heinrich Riedel, inventor). Ger. 473,030, Jan. 9, 1926.

Use of steel wool in electrodes of electrical condensers. VANNEVAR BUSH (to Raytheon, Inc.). U. S. 1,709,427, April 16.

Electric rectifier elements. DONALD G. ACKERLY (to Union Switch & Signal Co.). U. S. 1,709,830, April 23. A pair of flat Cu blanks are supported parallel to each other, the space between them is filled with C, and the blanks are then oxidized. Cf. C. A. 23, 1826.

Contact rectifiers for alternating current. PATENT-TREUHAND-GES. FÜR ELEKTRISCHE GLÜHLAMPEN. Brit. 297,822, Sept. 30, 1927. Dry rectifiers are formed by placing in contact 2 plates of dissimilar cond. materials which may be caused to react, or which naturally react, to produce an intermediate layer of poorly cond. material; e. g., a layer of Pb iodide may be formed between plates of Pb and Cu<sub>2</sub>I, contg. excess I; or, PbO<sub>2</sub> may be placed in contact with one of the lower W oxides (W<sub>2</sub>O<sub>3</sub> or WO<sub>3</sub>) so that the compds. PbO and WO<sub>3</sub> are formed, which further react to produce a poor conducting layer of PbWO<sub>4</sub>. Heat, pressure, or use of an elec. current may be utilized to promote the desired reaction.

Electrical discharge tube. NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. (Gustav L. Hertz, inventor.) Ger. 473,141, Feb. 8, 1925. An elec. discharge tube giving illumination from the pos. column has a filling comprising A and the vapor of Hg and (or) Cd.

Production of an insulating layer on parts for electrical equipment. P. BRABANT. Belg. 352,931, Aug. 31, 1928. Metal parts are coated with Al<sub>2</sub>O<sub>3</sub>, MgO, etc., by immersing cold in an oxidizing bath and passing an elec. current through the parts.

Electric cables. H. C. ANSTEV and T. BOLTON. Brit. 297,594, Nov. 15, 1927. The core of a cable is formed of seamed hollow tubes, which may be formed of Cu alloy of high tensile strength and which are stranded; the core may be formed of phosphor bronze or Al bronze, and solid wires of good cond. material such as Cu or Cd-Cu may surround the core.

Electric relays. O. MUCK. Brit. 297,882, July 1, 1927. In a-c. elec. relays, a permanent magnet of Co-Fe alloy is used to prevent any weakening by stray alternating flux. Various structural features are described.

Luminescent tube having a filling of neon, argon and mercury vapor. PAUL F. J. LEBRUN. U. S. 1,709,858, April 23.

## 5—PHOTOGRAPHY

C. E. K. MEES

**Photography in the infra-red.** M. CZERNY. *Z. Physik* 53, 1-12(1929).—The methods of photography used to date are only applicable to about  $2\mu$ . It does not seem possible to extend these processes because room-temp. radiation becomes noticeable in this region. C. develops a new method: On a thin celluloid membrane an extremely thin layer of naphthalene is deposited. This film is placed inside of a closed region. Infra-red radiation falling on certain portions of the film will by absorption be transformed into heat, causing the evapn. of the naphthalene layer. The limits and possibilities of the method are discussed.

GEORGE GLOCKLER

**Photochemistry of the silver halides. III. Relation between the gravimetrically determined silver and the lowering of sensitivity caused by dichromate-sulfuric acid reagent with subsequent chemical and primary and secondary physical development.** H. H. SCHMIDT. *Z. wiss. Phot.* 26, 86-95(1928).—The action of dichromate- $H_2SO_4$  on non-sensitized plates, before exposure to different light sources, is not a function of the analytically detd. Ag values, but it is a direct function of the sensitivity. Photographic plates sensitized with acid dyes act as high-sensitive plates. The sensitivity of plates sensitized with basic dyes is destroyed by the dichromate- $H_2SO_4$  action. In all these investigations different development methods are applied. IV. New method for determining excess of silver in unexposed photographic layers and the process of exposure. H. H. SCHMIDT AND F. PRETSCHNER. *Ibid* 259-74.—A new method of centrifuging in neutral soln. for the detn. of free Ag in photographic emulsions has been worked out. The Ag is considered present in several forms: (a) highly dispersed form in the gelatin; (b) adsorbed to the Ag halide grain and sol. in dichromate and  $H_2SO_4$  and (c) adsorbed to the AgBr grain and not sol. in dichromate and  $H_2SO_4$ . During exposure of AgCl emulsion the Cl ion moves in the gelatin. The photochemically formed Ag is strongly adsorbed in the AgCl and cannot be removed from it with  $HNO_3$  or with dichromate and  $H_2SO_4$ . There is no connection between the amt. of the free Ag in a photographic emulsion and its sensitivity.

A. P. H. TRIVELLI

**Sensitivity of photographic emulsions and the theory of the formation of the latent image.** S. E. SHEPPARD AND A. P. H. TRIVELLI. *Phot. Korrr.* 64, 145-9, 173-7, 242-6, 273-7(1928).—Methods used for measuring sensitivity are described briefly. The differences between the total sensitivity and the grain sensitivity are noted. Various theories of sensitivity, of L. Silberstein, W. Clark, F. C. Toy, The Svedberg, and others, are discussed. The original theory of sensitivity of Eder and Lüppo-Cramer (ripening-specks) is supported by the recent investigations. The nature of these specks was discovered by S. E. S. to be  $Ag_2S$ . A new theory of the formation of the latent image (photochem. orientation theory) is developed on the basis of these investigations. This theory is discussed in relation to many other photographic phenomena such as color sensitivity and the failure of the reciprocity law.

A. P. H. TRIVELLI

**Photographic applications of diazo compounds.** D. A. SPENCER. *Phot. J.* 68, 490-6(1928).—Green discovered that diazoprimumine was sensitive to light and was incapable of coupling to produce a dyestuff after exposure. Diazo compds. more stable to heat, time and shock, which are also more light-sensitive, have been described by Cross and Bevan, and by Kalle. Later workers have prepd. printing papers in which both sensitive material and coupler are combined but are kept apart by incorporation of acid. Development after exposure is secured by alk. soln. or by  $NH_3$ .

K. C. D. HICKMAN

**Photomicrographs taken directly on sensitive papers.** MASAO KURODA. *Bull. Inst. Phys. Chem. Research* (Tokyo) 8, 94-5(1929); *Abstract Ed.* 2, 12.—The method of directly printing the sensitive papers in the photomicrographic camera is recommended. The papers are treated by reversal development, using a dichromate soln. as the oxidizing agent.

ALBERT L. HENNE

**Green spots in toned bromide prints.** ANON. *Camera* 38, 51-2(1929).—Small green spots on sulfide-toned prints are usually attributed to particles of Fe in the  $H_2O$  used in the bleach bath. Local treatment with a soln. of 1 part of pure HCl to 3 parts of  $H_2O$  followed by thorough washing will usually remove such spots. Gray spots of various shapes and sizes are usually results of imperfect fixation. Toning renders such spots visible. (Fe spots may usually be avoided by adding 10%  $K_2C_2O_4$  and about 0.56% AcOH to the usual  $K_3Fe(CN)_6$ -KBr bleach bath.—*Abstr.*)

G. E. M.

**Poisoning action of dyes on specks.** LÜPPO-CRAMER. *Z. wiss. Phot.* 26, 45-6(1928).—Controversy between L.-C. and A. Steigmann concerning the priority of the discovery of the poisoning action of dyes on the activity of Ag specks.

A. P. H. T.

Coating composition containing celluloid in solution (U. S. pat. 1,709,056) 18.

VIAL, H.: *Manuel de photographie*. Paris: J.-Baillière et Fils. 276 pp. F. 16  
Reviewed in *Nature* 123, 524(1929).

**Photography.** FRIEDRICH BÜRKI. Swiss 120,610, April 1, 1928. Prints are toned with a soln. of Se in aq. soln. of Rongalite; viz. 1000 cc. of 20% Rongalite soln. contains 10 g. Se.

**Photography.** OTTO PILNY and ALEX PILNY. Swiss 129,321, Sept. 1, 1927. A pos. color film for cinematographic uses is prepd. by causing a pair of negatives to run side by side past a single light source, with prisms which project the light passing through the negatives on to the back and front of a sensitive film running in a plane at right angles to the negatives.

**Color photography.** SOC. CIVILE POUR L'ÉTUDE DE LA PHOTOGRAPHIE ET DE LA CINÉMATOGRAPHIE EN COULEURS. Fr. 648,997, July 2, 1927. See Brit. 293,306 (C. A. 23, 1579).

**Color photography on lenticular films.** SOC. FRANÇAISE DE CINÉMATOGRAPHIE ET DE PHOTOGRAPHIE FILMS EN COULEURS KELLER-DORIAN. Brit. 297,773, Sept. 27, 1927. Various optical features are specified.

**Apparatus for preparing lenticular films for color photography and cinematography.** SOC. FRANÇAISE CINÉCHROMATIQUE (procédés R. Berthon). Brit. 298,242, Oct. 6, 1927.

**Combined cinematograph and sound films.** SOC. DES ÉTABLISSEMENTS GAUMONT. Brit. 297,733, Sept. 26, 1927. In forming superposed sound and picture record films, it is stated that gelatin dichromated before exposure may be used for the sound record and after exposure may be treated with salts which are opaque to particular rays and impregnate only those parts of the film which are unaffected by sound, so that the sound reproduction from the film may be effected by use of suitably selected rays.

**Photographs in natural colors.** WERNER LANGGUTH and CHARLES HUMMEL. U. S. 1,710,455, April 23. Various details are specified of a system in which 3 component pictures in the fundamental colors are successively printed on the same support, azo-dye components being used as substances sensitive to light.

**Photographic diazotype process.** KALLE & Co. A.-G. Brit. 297,363, Sept. 19, 1927. A light-sensitive layer which yields a positive directly from a positive original is produced by employing a diazo compd. which is stable in neutral or acid condition but which is capable in alk. soln. of coupling directly with itself in the dark to form a dye; the compd. is applied in acid or neutral condition upon a base. Various examples are given. Cf. C. A. 23, 2380.

**Photographic-process screens.** HERMAN EWALD. U. S. 1,710,303, April 23. A glass plate is coated with a sensitized gelatin compn. which hardens on exposure to light, the coating is dried and exposed to light to harden it and is subjected to a 25% HOAc bath to cause the surface of the coating to become irregularly corrugated.

**Photographic copies.** HENRY M. BAKER. U. S. 1,709,600, April 16. A silver print is made from a negative and fixed so that it will be practically permanent; a suitable bleaching agent such as HgCl<sub>2</sub> soln. is applied which will not destroy the impregnating image so that the original white surface is practically restored to the silver print paper but the image is potentially retained; an image is then applied to the surface, as by ink drawing, and the potential image or desired parts of it are then redeveloped to give a desired background or shading effect.

**Photographic paper.** SOC. INDUSTRIELLE D'APPLICATIONS PHOTOGRAPHIQUES (Soc. anon.). Fr. 649,135, July 7, 1927. Photographic papers are developed by means of an atm. consisting of NH<sub>3</sub> alone, obtained from a suitable source such as a liquid NH<sub>3</sub> cylinder.

**Printing blocks.** K. H. SCHWIMMER and H. PAWECK. Brit. 297,806, Sept. 30, 1927. In a process such as described in Brit. 273,688 (C. A. 22, 1918), the photographic relief is rendered conductive before galvanization by electrode disintegration (suitably by a process such as described in Brit. 252,710 (C. A. 21, 2228)).

**Photomechanical printing plate.** AMOS H. SPALDING and JAMES M. CHANKALIAN (to Powers Photo-Engraving Co.). U. S. 1,709,327, April 16. A plate coated with a light-sensitive layer is exposed through a half-tone screen-figure negative and developed; an acid resist such as a resinous compn. is applied to the developed surface of the plate and it is preliminarily etched with dil. acid, and, subsequently, a strong etching acid is directly applied by friction on the surface of the plate.

**Photomechanical printing plates.** FRANK T. POWERS (to Powers Photo-Engraving Co.). U. S. 1,709,320, April 16. A wet, undried negative and a light-sensitized plate

are very slightly spaced apart by a thin spacing frame while exposing the plate in order to avoid necessity of drying the negative.

**Insoluble gelatin-relief images.** SERGE DE PROCOUDINE-GORSKY and NICOLAS POZNIAKOW (to Société de Photochimie "Elka"). U. S. 1,709,569, April 16. A prepriated Ag halide substantially free from colloidal substances is mixed with dissolved pure gelatin to form a light sensitive emulsion, the latter is exposed and is treated with a developer to reduce the exposed Ag halide, and the undeveloped portions of emulsion and halide are washed out.

**Heliographs.** I. G. FARBERIND. A.-G. Fr. 648,659, Feb. 11, 1928. 1,2-Naphthoquinone-4-sulfonates are used as sensitive material in the production of heliographs and photocopies, the image being developed with org. compds. contg. free amino groups such as 1-methyl-2,4-diaminobenzene or 1-amino-4-hydroxybenzene, or  $\text{PhNH}_2\cdot\text{HCl}$ .

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

**Thallium. I. Double halides.** A. BENRATH and G. AMMER. Tech. Hochschule, Aachen. *Z. anorg. allgem. Chem.* 177, 129-36(1929).—The states of heterogeneous equil. with varying conditions of concn. of the components were detd. for the systems:  $\text{TlCl}-\text{H}_2\text{O}$ —and a third substance, e. g.,  $\text{CdCl}_2$ ,  $\text{HgCl}_2$ ,  $\text{ZnCl}_2$ ,  $\text{MgCl}_2$ ,  $\text{CaCl}_2$ ,  $\text{SrCl}_2$  or  $\text{BaCl}_2$ . In the presence of  $\text{H}_2\text{O}$  chlorides of the alkali earth metals do not form double salts with  $\text{TlCl}$ , but the following double salts formed with other chlorides could be detd.:  $\text{CdCl}_2\cdot\text{TlCl}$ ,  $\text{HgCl}_2\cdot\text{TlCl}$ ,  $\text{ZnCl}_2\cdot 2\text{TlCl}$ ,  $\text{ZnCl}_2\cdot 3\text{TlCl}$ ,  $\text{MgCl}_2\cdot 3\text{TlCl}$ . In addn. the double salts  $\text{CdBr}_2\cdot\text{TlBr}$ ,  $\text{ZnBr}_2\cdot 2\text{TlBr}$  and  $\text{ZnI}_2\cdot 3\text{TlI}$  have been proved to come from mixing solns. of their constituents.

W. C. EBAUGH

**The crystalline alumina hydrate of v. Bonsdorff.** II. R. FRICKE. Univ. Münster. *Z. anorg. allgem. Chem.* 179, 287-92(1929); cf. C. A. 23, 350.—Of several com. preps. of alumina made by the Bayer process, none gave exclusively the x-ray spectrogram identified in the previous article as that of "bayerite," and only one showed it at all. The pattern was that of the hydrargyllite which is the result of slow pptn., due to the long time actually allowed in practice, the high concn. of the solns., and the relatively high temp. Bayerite is metastable with respect to hydrargyllite. T. H. CHILTON

**New green compounds of cobalt.** II. A. BERNARDI. (In collaboration with GIUSEPPINA PAGANI and PIA ZAMBELLI.) Reale Univ. Bologna. *Gazz. chim. ital.* 58, 743-57(1928).—An elaboration of a previous paper (cf. C. A. 21, 1938), with extensive quant. exptl. data in tabular and graphical form, and a discussion of the possible mechanism of the formation of the green compds.

C. C. DAVIS

**A basic phosphate of calcium and of strontium and the adsorption of calcium hydroxide by basic calcium phosphate and by tricalcium phosphate.** JAMES R. LORAH, HERMAN V. TARTAR and LILLIAN WOOD. Univ. of Wash. *J. Am. Chem. Soc.* 51, 1097-106(1929).—The hydrolysis of  $\text{Ca}_3(\text{PO}_4)_2$  by  $\text{H}_2\text{O}$  yields a basic compd., the analysis of which corresponds to  $3\text{Ca}_3(\text{PO}_4)_2\cdot\text{Ca}(\text{OH})_2$ . The hydrolysis of  $\text{Sr}_3(\text{PO}_4)_2$  by  $\text{NaOH}$  soln. yields the analogous basic Sr compd. No evidence for the existence of a Ba phosphate more basic than  $\text{Ba}_3(\text{PO}_4)_2$  has been found.  $\text{Ca}(\text{OH})_2$  is slowly adsorbed by the basic phosphate to the extent of  $1/3$  mol. of the hydroxide to 1 mol. of phosphate in the most concd. solns. The adsorption of  $\text{Ca}(\text{OH})_2$  by  $\text{Ca}_3(\text{PO}_4)_2$  is greater than that by the basic phosphate. The adsorption affords a basis of explanation for the many conflicting statements in the literature regarding the basic phosphates of Ca.

H. F. JOHNSTONE

**The recovery of concentrated rubidium preparations from carnallite.** GERHART JANDER and HERMANN FABER. Univ. Göttingen. *Z. anorg. allgem. Chem.* 179, 321-31(1929).—Older methods for the recovery of Rb from carnallite, in which it is present in small quantities, included successive recrystns. depending on the smaller soly. of  $\text{RbCl}\cdot\text{MgCl}_2\cdot 6\text{H}_2\text{O}$  than of the corresponding K salt; recrystn. of the Rb alum; and continued pptn. of the chlorostannate. All these methods gave low yields. The method investigated and found to give good results embodies the following steps. (1) A single recrystn. of the technical carnallite. (2) Pptn. of the Rb as a silicomolybdate,  $\text{Rb}_4\text{H}_4(\text{Si}(\text{Mo}_2\text{O}_7)_4)_4$ , from a soln. satd. with KCl and 2 N in  $\text{HCl}$ . (3) Decompn. of the dried ppt. by sublimation of the Mo as oxychloride in a current of  $\text{HCl}$  gas. The chlorides dissolved from the residue may be further purified by a second pptn. Less satisfactorily, the ppt. may be treated successively with  $\text{NH}_3$  and  $\text{HCl}$  before decompn. A yield of 0.11%  $\text{RbCl}$  was obtained, 82% pure. Directions are given for prepn. of the Na silicomolybdate reagent.

T. H. CHILTON

**The action of phosphorus trichloride on formic acid and on acetic anhydride.** ALA. VAN DRUTEN. Univ. Leiden. *Rec. trav. chim.* 48, 312-23 (1929); cf. following abstr.—The expts. were designed to show which of the following equations represents the reaction between  $\text{PCl}_3$  and fatty acids: (1)  $3\text{RCOOH} + \text{PCl}_3 = \text{H}_3\text{PO}_3 + 3\text{RCOCl}$ . (2)  $3\text{RCOOH} + 2\text{PCl}_3 = \text{P}_2\text{O}_3 + 3\text{RCOCl}$ . For formic acid, the yields correspond to 2. For  $\text{Ac}_2\text{O}$ , 88% of the calcd. quantity of  $\text{AcCl}$  was formed, but no  $\text{P}_2\text{O}_3$ , the residue being a solid mixt. of complex compds.

LOUIS WALDBAUER  
Attempts to prepare phosphorus trioxide by another method than by burning phosphorus. W. P. JORISSEN AND A. TASMAN. Univ. Leiden. *Rec. trav. chim.* 48, 324 (1929); cf. preceding abstr.—Attempts to prepare  $\text{P}_2\text{O}_3$  by the action of  $\text{PCl}_3$  on  $\text{H}_3\text{PO}_3$ ,  $\text{AcOH}$ ,  $\text{BuOH}$  and trichloroacetic acid and on Na formate gave neg. results.

LOUIS WALDBAUER  
**The boric acids.** LIONEL F. GILBERT AND MIRIAM LEVI. Univ. Coll., Lond. *J. Chem. Soc.* 1929, 527-35.—Evidence is adduced for the existence of eight boric  $\text{nB}_2\text{O}_3 \cdot \text{H}_2\text{O}$ , where  $\text{n} = 1, 2, \dots$ . The heat of hydration of boric anhydride to  $\text{c}$  boric acid is 26,700 cal. An app. for the examn. of water of hydration equil. is scribed.

GERALD M. PETTY  
**The formation of hydrogen polysulfides.** ORTWIN VON DEINES. Univ. Berlin. *Z. anorg. allgem. Chem.* 177, 124-8 (1929).—On acidifying 100 cc. of a 3 *M*  $\text{Na}_2\text{S}_2\text{O}_4$  soln. with 100 cc. 3 *N*  $\text{HCl}$  a lemon-colored ppt. appears, coalescing into an oil drop in 30 mins. (3 to 4 g.). The oil becomes clear yellow on warming carefully and decomposes into a solid and  $\text{H}_2\text{S}$  after a day in air; boiling in water causes it to develop abundant  $\text{H}_2\text{S}$  and to leave S. With  $\text{NaOH}$  it gives yellow polysulfides. The oil is considered to be H persulfide and has up to 99% S. Lower persulfides (up to  $\text{H}_2\text{S}_8$ ) were formed by decompn. with soda; an ether ext. leaves monoclinic S crystals from the partial decompn. Concns. of thiosulfate and acid different from the ones here used give either  $\text{H}_2\text{S}$  (which with  $\text{SO}_2$  may form pentathionic acid) and S, or a sticky S mass which may contain some persulfide. A second method of prepn. is acidification of 13 g.  $\text{Na}_2\text{S}_2\text{O}_4 + 10$  cc.  $\text{H}_2\text{O}$  with a mixt. of 10 cc. concd.  $\text{HCl} + 5$  cc.  $\text{H}_2\text{O}$ . A deep-red color appears and  $\text{SO}_2$  is evolved; after decoloration of the soln. and cooling the yellow turbidity appears and a deposit of hyposulfite. After decantation and heating to  $40^\circ$  the turbidity again coalesces into oil drops of persulfide.

B. J. C. VAN DER HOEVEN  
A new isomorphous series of fluorine compounds. H. CARON AND L. VANBOCK-STAEL. *Compt. rend.* 188, 869-71 (1929).—Com. HF diluted with water left standing in a test tube formed a deposit contg. octahedra of the cubic system. An attempt to prep. these crystals to establish their compn. resulted in finding that silica and Ca or Sr salts could replace the glass, Al or ferric sulfate the  $\text{H}_2\text{SO}_4$ , and Na selenate and Al or ferric chloride the Al sulfate. E. g., 50 cc. pure  $10^\circ \text{Bé. H}_2\text{SiF}_6$  was added to 100 cc. 10%  $\text{Al}_2(\text{SO}_4)_3$  soln. 100 cc. 15%  $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$  soln. and 200 cc. alc. at  $60^\circ$ . Microscopic examn. of the product revealed octahedra of the cubic system which were insol. in alc. and ether, very slightly sol. in water, but dissolved easily in dil. acids. Water was given off by heating and sili. deposited. With hot concd.  $\text{H}_2\text{SO}_4$ , HF and  $\text{SiF}_4$  were formed. The product is a triple salt whose formula, based on analysis and a study of the isomorphous substances, is,  $4\text{SiF}_6 \cdot \text{Ca}_3 \cdot 8\text{CaF}_2 \cdot \text{Al}_2(\text{SO}_4)_3 \cdot 45\text{H}_2\text{O}$ . Similarly,  $4\text{SiF}_6 \cdot \text{Sr}_3 \cdot 8\text{SrF}_2 \cdot \text{Al}_2(\text{SO}_4)_3 \cdot 45\text{H}_2\text{O}$ ;  $4\text{SiF}_6 \cdot \text{Ca}_3 \cdot 8\text{CaF}_2 \cdot \text{Al}_2(\text{SeO}_4)_3 \cdot 45\text{H}_2\text{O}$ ; and  $4\text{SiF}_6 \cdot \text{Sr}_3 \cdot 8\text{SrF}_2 \cdot \text{Fe}_2(\text{SeO}_4)_3 \cdot 45\text{H}_2\text{O}$ . Limited soly. of the salts of Ba and Cr prevents their substitution for Ca and Sr and Al and Fe, resp. The formation of these compds. may be used in micro-analysis and for detection of  $\text{H}_2\text{SO}_4$  and Al in com. HF and  $\text{H}_2\text{SiF}_6$ .

H. W. WALKER  
A new class of fluoroborates. A. TRAVERS AND MALAPRADE. *Compt. rend.* 187, 891-2 (1928); cf. *C. A.* 23, 1584.—When a warm concd. soln. of boric acid is treated with HF and KF, the soln. becomes alk. to methyl orange. The reaction is  $\text{H}_3\text{BO}_3 + 3\text{HF} + \text{n KF} \rightarrow \text{nKF} \cdot \text{BF}_3 + 3\text{H}_2\text{O}$ . No immediate ppt. of  $\text{KBF}_4$  is observable. If the soln. is strongly acidified  $\text{KBF}_4$  ppts. immediately. The reaction is reversible and is decreased by diln. The treatment of  $\text{KBF}_4$  with acids yields  $\text{HBF}_4$ , in which F cannot be detd. as  $\text{K}_2\text{SiF}_6$ . It is necessary to have an alk. fusion on a fluoroborate if the F is to be detd. by the fluosilicate method. The fact that  $\text{K}_2\text{SiF}_6$  can be pptd. from an acidified soln. of HF and  $\text{H}_3\text{BO}_3$  proves that the F does not exist as the stable fluoroborate,  $\text{BF}_4$ , but as some other fluoroborate less stable and sol. in water.

A. F.  
Attempts to isolate new fluoroborates. A. TRAVERS AND MALAPRADE. *Compt. rend.* 187, 982-4 (1928).—When  $\text{KBF}_4$  is heated to  $580^\circ$  a sol. salt is formed that reacts with  $\text{KOH}$ . Titration with  $\text{KOH}$  in presence of mannitol indicates the formula as  $\text{BF}_3 \cdot 2\text{KF}$ . Boric acid and KF react in cold concd. aq. soln. to form crystals with the ratios  $\text{B/K} = 1$  and  $\text{F/K} = 3$ .

AMY LEVESCONTE  
**Double sulfates and their components. III. A study of chromium<sup>III</sup> sulfates.**

F. KRAUSS, H. QUERENGÄSSER AND P. WEYER. Tech. Hochschule, Braunschweig. *Z. anorg. allgem. Chem.* 179, 413-7 (1929); cf. *C. A.* 22, 737.—The violet  $\text{Cr}^{\text{III}}$  sulfate is prepd. by dissolving 6 g. Cr alum in 45 g.  $\text{H}_2\text{O}$ , cooling and adding 45 g. concd.  $\text{H}_2\text{SO}_4$  and evapg. in a vacuum desiccator. Analysis showed it to have the compn.  $\text{Cr}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$ , and decompn. at const. pressure (10 mm.) showed the existence of 4 hydrates contg. 18, 9, 3 and 0 mols. of  $\text{H}_2\text{O}$ . Between  $30^\circ$  and  $100^\circ$  the 9-hydrate is stable, while the 3-hydrate has only a small range of existence. The residual 3 mols. of  $\text{H}_2\text{O}$  are combined as in zeolites, and are therefore given up slowly; complete dehydration does not occur until about  $325^\circ$  is reached. At  $100^\circ$  the violet color changes to green.  $\text{BaCl}_2$  ppts.  $\text{SO}_4$  completely from a cold soln., but if the soln. is warmed,  $\text{SO}_4$  is incompletely pptd. On boiling, however, complete pptn. with  $\text{BaCl}_2$  is obtained. The green, cryst. sulfate is prepd. by conducting  $\text{SO}_2$  into a concd. soln. of  $\text{CrO}_3$  in  $\text{H}_2\text{O}$  between  $0^\circ$  and  $5^\circ$  and crystg. in a vacuum. Analysis gives the compn.  $\text{Cr}_2(\text{SO}_4)_3 \cdot 12\text{H}_2\text{O}$ , and heating at const. pressure gives zeolitic decompn. down to 10 mols. of  $\text{H}_2\text{O}$ . The temp. then was const. down to 6 mols. of  $\text{H}_2\text{O}$ , after which zeolitic decompn. again prevailed down to the anhyd. condition at about  $400^\circ$ .  $\text{BaCl}_2$  ppts. the bulk of the  $\text{SO}_4$  immediately from a cold neutral soln., the remainder by heating to  $100^\circ$ . The green amorphous sulfate has the compn.  $\text{Cr}_2(\text{SO}_4)_3 \cdot 15\text{H}_2\text{O}$ , all the  $\text{H}_2\text{O}$  being held as in zeolites. Complete dehydration is attained at a const. pressure of 100 mm. by heating to about  $400^\circ$ . In a cold neutral soln.  $\text{BaCl}_2$  gives no ppt. After long standing at room temp. or after short boiling the sulfate is pptd. H. STOERTZ

A new series of double sulfates of the copper-magnesium group and the phosphonium bases. I. PRAFULLA C. RAY AND NIRMALENDUNATH RAY. Univ. College of Science, Calcutta. *J. Indian Chem. Soc.* 6, 27-30 (1929); cf. *C. A.* 21, 2622; 22, 3853.— $\text{Et}_4\text{PI}$  was rubbed with  $\text{Ag}_2\text{O}$  and  $\text{H}_2\text{O}$  to form  $\text{Et}_4\text{POH}$ , which on treatment with dil.  $\text{H}_2\text{SO}_4$  gave  $(\text{Et}_4\text{P})_2\text{SO}_4$  (I). By treating the soln. of I with solns. of other sulfates the following double salts were obtained:  $\text{CoSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$ ,  $\text{ZnSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$ ,  $\text{NiSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$ ,  $\text{MgSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot 8\text{H}_2\text{O}$ ,  $2\text{MgSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot \text{H}_2\text{SO}_4 \cdot 2\text{MgSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot 2\text{H}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$ ,  $2\text{MgSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot \text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ ,  $2\text{MgSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot \text{H}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$ ,  $2\text{CuSO}_4 \cdot (\text{Et}_4\text{P})_2\text{SO}_4 \cdot \text{H}_2\text{SO}_4 \cdot 4\text{H}_2\text{O}$ . The Cu salt is light blue; the Ni salt green. LOUISE KELLEY

Combinations of salts of quadrivalent cerium and of thorium salts with sodium carbonate (sodium cericarbonate and thorcarbonate). LÉON LORTIE. *Compt. rend.* 188, 915-6 (1929).—L. has obtained a cericarbonate of Na corresponding to the formula  $\text{Na}_4\text{Ce}(\text{CO}_3)_3 \cdot 12\text{H}_2\text{O}$ . Fifteen g. of  $\text{NH}_4$  cerinitrate was dissolved in 25 cc. of cold  $\text{H}_2\text{O}$ . This soln. was poured drop, by drop, with const. stirring into a cold 25% soln. of  $\text{Na}_2\text{CO}_3$ . A ppt. was formed, nearly all of which redissolved in the excess of reagent. After filtering and evapg., yellow prismatic crystals of Na cericarbonate were obtained. These were washed with ice water. The crystals analyzed as follows:  $\text{CeO}_2$  21.75,  $\text{CO}_2$  27.85,  $\text{Na}_2\text{O}$  23.71,  $\text{H}_2\text{O}$  27.19%, which is very close to the theoretical compn. of the formula given above. By drying at  $100$ – $110^\circ$  the salt shows a loss in wt. of 24.5% which corresponds to the disappearance of 10 mols. of  $\text{H}_2\text{O}$ . The remaining 2 mols. of  $\text{H}_2\text{O}$  are not driven off until a temp. of  $200^\circ$  is reached. Treatment with  $\text{H}_2\text{O}_2$  showed that the salt was one of quadrivalent Ce. The ppt. obtained above in the  $\text{Na}_2\text{CO}_3$  soln. seems to correspond to  $\text{CeCO}_3(\text{OH})$ . Na cericarbonate decomposes rapidly in  $\text{H}_2\text{O}$ , losing all of its  $\text{Na}_2\text{CO}_3$  and becoming again Ce hydroxycarbonate. The cericarbonate is sol. in  $\text{Na}_2\text{CO}_3$  solns.  $\text{K}_2\text{SO}_4$  and  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  do not react with it in  $\text{Na}_2\text{CO}_3$  soln. while  $\text{Na}_3\text{PO}_4$  and  $(\text{NH}_4)_3\text{PO}_4$  slowly ppt. it. It is pptd. instantly by soda in such solns. It is decompd. by acids, more or less stable Ce salts being formed. Na cericarbonate dissolves in liquids contg. one or several alc. OH groups, such as glycerol, glucose and mannitol. The cericarbonate is then completely resistant to pptn. by common reagents. Any tendency to hydrolyze in such solns. is retarded by adding  $\text{NaOH}$ . Na thorcarbonate has the formula  $\text{Na}_4\text{Th}(\text{CO}_3)_3 \cdot 12\text{H}_2\text{O}$ . At  $100$ – $110^\circ$  it also loses 10 mols. of  $\text{H}_2\text{O}$  and 12 mols. at  $300^\circ$ . The cericarbonate and thorcarbonate of Na are shown by L. to form isomorphous mixts. A. J. MONACK

Cyanogen compounds of the platinum metals. V. The cyanides and thiocyanates of rhodium. F. KRAUSS AND H. UMBACH. Tech. Hochschule, Braunschweig. *Z. anorg. allgem. Chem.* 179, 357-68 (1929); cf. *C. A.* 22, 3367, 4076, 4476.—The double cyanide  $\text{K}_3[\text{Rh}(\text{CN})_5]$ , (I), is prepd. by melting  $[\text{Rh}(\text{NH}_3)_5\text{Cl}]\text{Cl}$  with an excess of KCN in an Ag crucible. After the bright red mass is taken up in  $\text{H}_2\text{O}$ , the insol. residue is filtered out and the excess cyanide is destroyed by digestion with dil.  $\text{HCl}$ . Red crystals of I sep. on evapg., are recrystd. and dried in a vacuum. If I is warmed with concd.  $\text{H}_2\text{SO}_4$  it first goes into soln. with a yellow color, but on further heating a voluminous, yellowish brown compd. seps., which is filtered, washed with  $\text{NH}_4\text{Cl}$  soln., dil.

$\text{H}_2\text{SO}_4$ , and hot  $\text{H}_2\text{O}$ , and on analysis is found to be  $2\text{Rh}(\text{CN})_3 \cdot 7\text{H}_2\text{O}$ , (II). Decompn. at const. pressure shows the  $\text{H}_2\text{O}$  to be held as in zeolites. If II, while still moist, is digested with concd.  $\text{NH}_4\text{OH}$ , a bright yellow compd. is formed on evapn. which has the compn.  $4\text{Rh}(\text{CN})_3 \cdot 7\text{NH}_3 \cdot 7\text{H}_2\text{O}$ , (III). If a weakly acidified soln. of I is slowly added to a hot soln. of  $\text{CuSO}_4$ , a bright blue ppt. is formed having the following compn.  $\text{Cu}_3[\text{Rh}(\text{CN})_6]_2 \cdot 10\text{H}_2\text{O}$  (IV). This goes into soln. in  $\text{NH}_4\text{OH}$  with a deep blue color, and if  $\text{NH}_3$  gas is conducted into this soln. until crystn. occurs, the blue powder obtained by evapn. over  $\text{KOH}$  has the compn.  $\text{Cu}_3[\text{Rh}(\text{CN})_6]_2 \cdot 5\text{NH}_3 \cdot 5\text{H}_2\text{O}$  (V). This compd. cannot be completely dehydrated without decompn. If IV, freshly pptd., is treated with pyridine, or if I is added to a soln. of  $\text{CuSO}_4$  which has been treated with pyridine, a blue ppt. is formed which has the formula  $\text{Cu}_3[\text{Rh}(\text{CN})_6]_2 \cdot 5\text{Pyr} \cdot 5\text{H}_2\text{O}$  (VI). Analogous to the Cu compd.,  $\text{Ni}_3[\text{Rh}(\text{CN})_6]_2 \cdot x\text{H}_2\text{O}$  (green) is prepd. as well as the bright violet  $\text{NH}_3$  compd.  $\text{Ni}_3[\text{Rh}(\text{CN})_6]_2 \cdot 4\text{NH}_3 \cdot 10\text{H}_2\text{O}$ . With thiocyanates, in addn. to a few complex and poorly defined compds.,  $\text{Rh}(\text{SCN})_3 \cdot 2\text{H}_2\text{O}$  was prepd. It is sol. in hot concd. solns. of  $\text{KCN}$ ,  $\text{KSCN}$  and thiourea. It is decompd. by digestion with concd.  $\text{HCl}$ .

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

**Oxidation-reduction indicators.** J. GILLIS. *Naturw. Tijdschr.* 11, 15-20(1929).—A general article. ALBERT L. HENNE

**Diphenylamine as oxidation-reduction indicator in the indirect titration of cobalt.** J. GILLIS AND V. CUVELIER. Univ. Ghent. *Naturw. Tijdschr.* 11, 20-4(1929).—This is a modification of the method described by Willard and Hall (*C. A.* 16, 3827). Co is oxidized with Na perborate, the excess of which is decompd. by boiling. The soln. is treated in a  $\text{CO}_2$  atm. with a known excess of  $\text{SnCl}_2$ , which is titrated back with 0.05 N  $\text{K}_2\text{Cr}_2\text{O}_7$ , using diphenylamine as inside indicator. Only 0.2 cc. of the indicator is to be used, and it is to be added only when the end point is being reached, which is determined by a preliminary assay. The potentiometric titration is also satisfactory.

ALBERT L. HENNE

**Methods of analysis of ferrocyanides.** G. ZIMMER. *Rev. chim. ind.* 38, 37-8 (1929).—Details are given for an industrial method of analysis using  $\text{ZnSO}_4$  as precipitant. P. THOMASSET

**Method for the quantitative determination of cyanide in small amounts.** RALPH G. SMITH. Univs. of Chicago and Michigan. *J. Am. Chem. Soc.* 51, 1171-4(1929).—The method depends upon the formation of a reddish brown color which occurs when  $\text{CN}^-$  is added to an alk. picrate soln.; it is sensitive within 1% for 0.1 mg. The effects of time and temp. on the development of the color are discussed. The presence of certain reducing substances which cause the development of a red color in alk. picrate solns. may invalidate the method. Among these are sulfides, hydrosulfides, aldehydes and ketones, including the reducing sugars; the following percentages of substance necessary to give color comparable with the standard (0.011% KCN) are reported:  $(\text{NH}_4)_2\text{S}$ , 0.4; dextrose, 0.4;  $\text{AcH}$ , 15.0;  $\text{Me}_2\text{CO}$ , 20; furfural, 10-15; 40%  $\text{HCHO}$  does not interfere. Used qualitatively, the test is sensitive to 1 part CN in 50 million. C. J. W.

**A note on the determination of minute amounts of iodine according to the Dupré-Winkler method.** J. AXEL HÖJER. Med.-chem. Inst., Lund. *Biochem. Z.* 205, 273-96(1929).—In water analysis, take 500 cc., add 0.5 cc. of concd.  $\text{KOH}$  and evap. to dryness. Transfer the residue to a porcelain crucible or combustion boat if the amt. of org. matter is large, and ignite in air till the ash is white. Ext. the ash with 4 two cc. portions of alc. and evap. the ext. to dryness. Add 0.5 cc. of water, boil a few mins. and make acid to litmus with 0.5 N  $\text{H}_2\text{SO}_4$ , adding 0.1 cc. in excess. Add 1 drop of satd. Br water and evap. to 0.1 cc. Add 0.2 cc. of 2% starch soln. and 0.03

cc. of 0.4 N  $\text{H}_2\text{SO}_4$  and sat. with  $\text{CO}_2$ . Add 0.1 cc. of 5% KI and titrate with 0.008 N  $\text{Na}_2\text{S}_2\text{O}_3$ . The method is applicable to other materials besides water. S. M.

**Iodometric determination of chromic oxide in potash chrome alum.** JOHN E. S. HAN. *J. Am. Leather Chem. Assoc.* 24, 124-9(1929).—The soln. must be filtered after treatment with  $\text{Na}_2\text{O}_2$  and boiling, but before acidifying, to remove iron and insol. peroxides, which would otherwise cause the results to be high. To correct for small quantities of undecompd.  $\text{H}_2\text{O}_2$ , the  $\text{Na}_2\text{S}_2\text{O}_3$  soln. should be standardized by treating a sample of  $\text{K}_2\text{Cr}_2\text{O}_7$  exactly like the sample of chrome alum, i. e., treating with  $\text{Na}_2\text{O}_2$ , boiling and acidifying. H. B. MERRILL

**Volumetric determination of sulfur in pyrite residues.** V. ZEMLYANITZIN. *J. Chem. Ind. (Moscow)* 5, 1178-9(1928).—The procedure described is the well-known Eschka method except that the  $\text{SO}_4^{--}$  is pptd. by benzidine hydrochloride and the ppt. titrated alkalimetrically. BERNARD NELSON

**Differential potentiometric titration. III. An improved apparatus and its application to precision measurements.** DUNCAN A. MACINNIS and MALCOLM DOLE. Rockefeller Inst. for Med. Research, N. Y. *J. Am. Chem. Soc.* 51, 1119-27(1928); cf. *C. A.* 21, 367; 22, 740.—With an improved app. titrations of  $\text{FeSO}_4$  solns. with  $\text{K}_2\text{Cr}_2\text{O}_7$  and of KCl with  $\text{AgNO}_3$  were carried out with av. errors less than 0.01%. An analysis of const.-boiling HCl is also given. MALCOLM DOLE

**Sugar titration.** N. SCHOORL. *Chem. Weekblad* 26, 130-4(1929).—Using Luff's alk.  $\text{CuSO}_4$  soln. S. has worked out a table for the detn. of glucose, fructose, invert sugar, lactose and maltose. Luff's soln. was made up as follows: 25 g.  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ , 50 g.  $\text{C}_6\text{H}_5\text{O}_7 \cdot \text{H}_2\text{O}$ , 388 g.  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ . The cc. 0.1 N  $\text{Na}_2\text{S}_2\text{O}_3$  used for titration of the reduced Cu give the mg. of the above sugars directly, using 25 cc. Luff soln. and 10 mins. boiling. J. C. JURRIJENS

**Microchemical determination of iodine in organic materials.** J. F. REITH. Centraal Lab. Volksgezondheid, Utrecht. *Rec. trav. chim.* 48, 254-62(1929) (in German); cf. *C. A.* 23, 2122.—To eliminate the almost explosive combustion in the McClelland method of destroying org. material by  $\text{O}_2$  (*C. A.* 18, 2726), R. modified this procedure. A pyrex tube  $40 \times 3.5$  cm. is joined to a  $40 \times 1.5$ -cm. tube, which is bent around into a KOH absorption tube (2 cc. 1:1 KOH soln. + 50 mg.  $\text{NaHSO}_3$  in 80 cc. water). The two tubes lie in a gas furnace. A Ni boat in the first part of the wide one contains the material; the second part is heated.  $\text{O}_2$  is passed into it directed to the far side of the boat, the material is ignited by an alcohol flame. The gases are sucked off by a water-jet pump after passing the KOH absorption flask, a cotton wool filter, a filter-paper gas filter and a ten-bulb inclined absorption tube filled with KOH-bisulfite mixt. The  $\text{O}_2$  stream is regulated so as to prevent smoke from coming out of the open end of the tube. After complete combustion, the cotton wool and the paper filter are burned in the boat, the absorption liquids are evapd. in a Pt dish, and the ashes mixed with hot dil.  $\text{K}_2\text{CO}_3$  (ground and filtered) are added to it. After slight ignition to burn the C, the dry mass is extd. with EtOH 3 times, dissolved in water, evapd. and extd. with EtOH a fourth time; the total ext. is evapd. with water and 10 drops  $\text{K}_2\text{CO}_3$  soln. and ignited. Again the salt is extd. 4 times with EtOH, and the ext. evapd. and treated either by titration or colorimetry. For the colorimetric detn. the ext. is dissolved in 10 cc. water, 5 mg.  $\text{NaN}_3$  added, acidified with bisulfite-sulfuric acid to a noticeable odor of  $\text{HN}_3$ , then made alk. with  $\text{K}_2\text{CO}_3$ , evapd., ignited and extd. as before and evapd. The residue is dissolved in 0.50 cc. water; 0.20 cc. of the soln. is taken up in a pipet  $65 \times 3.2$  mm.,  $\text{I}_2$  is liberated by a drop of nitrite- $\text{H}_2\text{SO}_4$  and shaken with 0.01 cc.  $\text{CS}_2$ . The resultant color is compared with that of standards with O up to 0.5  $\gamma$  iodine prepd. in similar way. From a no. of analyses the accuracy of the method is shown; in milk, milk powder and flour the iodine addns. could be detected to about 95% and better. B. J. C. v. d. H.

**Method for the quantitative analysis of tin in organic compounds.** HENRY GILMAN and W. BERNARD KING. Iowa State Coll. *J. Am. Chem. Soc.* 51, 1213-5(1929).—The organo-tin compd. is treated with a 4%  $\text{Br-CCl}_4$  soln. with cooling and the decompn. product is then oxidized with  $\text{HNO}_3$ - $\text{H}_2\text{SO}_4$  to stannic acid. C. J. WEST

**Problems in the estimation of unsaturated hydrocarbons in gases.** HAROLD S. DAVIS. M. I. T. *Ind. Eng. Chem., Anal. Ed.* 1, 61-4(1929).—A chart is shown giving the atm. b. ps. of all of the known hydrocarbons which are gaseous at ordinary temps. A fractionating column is described which is composed of a narrow glass spiral surrounded by a silvered vacuum jacket in which liquefied gases can be fractionated almost as easily as ordinary liquids. M. C. ROGERS

**A rapid method for the precise estimation of alcohol.** WM. L. O. WHALEY. *Planter & Sugar Mfr.* 81, 321-3(1928).—Alc. is detd. by the lowering of the b. p. of its aq. soln. with the Juerst ebulliometer. Analysis of samples before and after addn. of known

ordinary analytical skill and cleanliness the b.-p. method is desirable. J. F. BREWSTER  
ples can be analyzed in about 3 hrs.

The iodometric determination of thiosemicarbazide. A. GAFFRE, Faculté de pharm. de Paris. *Ann. fals.* 22, 90-3(1929).—In iodometric detn. thiosemicarbazide was found to react like its two associated components, HCNS and  $(\text{NH}_2)_2$ . In the presence of  $\text{NaHCO}_3$ , after allowing to react for a sufficient length of time (at least 8 hrs.), on acidification each mol. of thiosemicarbazide requires 10 atoms of I; before acidification ICN is formed, but it is decomposed in acid soln. with regeneration of 2 atoms of I. In the presence of NaOH, after allowing to react for a sufficient length of time (at least 30 mins.), on titrating after acidification each mol. of thiosemicarbazide requires 12 atoms of I.

Note on the determination of tryptophan by means of *p*-dimethylaminobenzaldehyde. WILLIAM J. BOYD. *Biochem. J.* 23, 78-82(1929).—The method for tryptophan proposed by May and Rose (*C. A.* 17, 116) may give rise to errors because of unequal illumination of the reacting mixts., and because of the presence of reducing substances, such as  $\text{H}_2\text{S}$  or aldehydes.

Detection of lignified membranes by means of cobalthiocyanate. W. FEYER. *Apoth. Ztg.* 44, 334(1929).—This reagent (prepd. by the addn. of 9 g.  $\text{Co}(\text{NO}_3)_2$  crystals in 6 g.  $\text{H}_2\text{O}$  to 2.5 g. KSCN in 2.5 g.  $\text{H}_2\text{O}$ ) is more sensitive in testing cellular membranes for woody fiber than phloroglucinol-HCl.

Visual conductance titration of protocatechuic aldehyde and its monoalkyl ethers. O. PFUNDT AND C. JUNGE, Univ. Göttingen. *Ber.* 62B, 515-8(1929); cf. *C. A.* 23, 1363. —The Wheatstone bridge and telephone were replaced by a vacuum thermocouple and a mirror galvanometer. Protocatechuic aldehyde, vanillin, isovanillin, bourbonal and isobourbonal were titrated conductometrically. LiOH was used in place of NaOH.

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

Magnetic properties of some Swedish magnetites. GUST. G. BRING. *Jernkontorets Ann.* 82, 415-38(1927).—Magnetization curves are given. A. DROGNETH

Studies on hydrated aluminum silicates. I. The rehydration of metakaolin and the synthesis of kaolin. C. J. VAN NIEUWENBURG AND H. A. J. PIETRS. *Tech. Univ. Lab. for Analytical Chem. Delft. Rec. trav. chim.* 48, 27-36(1929).—A very pure sample of unburnt Zettlitz clay whose analysis was very close to the theoretical,  $2\text{SiO}_2 \cdot \text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$ , showed a loss in wt. when subjected to steam pressures of 50-125 atm. The rehydration of this clay after burning at various temps. was detd. in an autoclave. The real break in the curve occurs between  $1000^\circ$  and  $1050^\circ$ , the water content dropping from 11.0 to 3.0%. N. and P. claim a slight and sudden decrease at  $550^\circ$ - $600^\circ$  which continues from  $800^\circ$  to  $1300^\circ$ . Other clays showed similar results, with the exception of Neurode "pholerite" which when dehydrated below  $900^\circ$  took up 16.3% moisture. Alumina made by ignition of  $\text{Al}(\text{NO}_3)_3$  at  $1000^\circ$  absorbed 16.7-17.4%  $\text{H}_2\text{O}$ ; pptd. alumina ignited at  $950^\circ$  absorbed 16-17% moisture. Cryst.  $\text{SiO}_2$  absorbed no  $\text{H}_2\text{O}$ ; ignited silicas from silicates and from  $\text{SiCl}_4$  absorbed a max. of 5%  $\text{H}_2\text{O}$ . Artificial mixts. of  $\text{SiO}_2$  and  $\text{Al}_2\text{O}_3$  in the ratio of 2:1 absorbed only 10.5-11%  $\text{H}_2\text{O}$ . Metakaolin can thus not be considered as a mixture of alumina and silica. Kaolin was synthesized by heating under pressures of 200-260 atm. and the product pptd. from soln.; it contained silica and alumina in the ratio of 2:1. The phys. properties including the  $n$  agreed with the data for kaolin.

A pink kaolin, and ruthenium as a minor constituent of the Tanokami kaolins. SATOYASU IMORI AND JUN YOSHIMURA. *Inst. Phys. and Chem. Research, Tokyo. Bull. Chem. Soc. Japan* 4, 1-15(1929).—A description of a pink clay found in weathered granite. The rare earth content was 0.67% and included chiefly Yt. while traces of La, Dy, Nd, Sc, Ce, Yb and Tm were also present. The analysis agreed with a compn.

ARTHUR FLEISCHER

$2\text{Al}_2\text{O}_3 \cdot 7\text{SiO}_2 \cdot 7\text{H}_2\text{O}$ . The mineral is considered as a new species and is named *takisolite*. The x-ray absorption corresponds to the presence of an element 44 or 43 as minor constituent: in general pink kaolin gave results closer to 44 (Ru) than did green kaolin. The arc spectrum gave lines corresponding to Ru and Rh. A faint rhodanate reaction for Ru was obtained. Also in *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 10, 224-8 (1929).  
ALBERT L. HEWNE

The structure of crystalline uraninite from Belgian Congo. ASSAR HADDING AND RENÉ VAN AUBEL. *Compt. rend.* 188, 716-7(1929).—The specimens of uraninite were studied by the x-ray powder method and found to possess a face-centered cubic lattice, with  $a_0 = 4.67$  Å. U.  
H. W. WALKER

The significance of phosphorus content in explaining the formation of fusain. F. BÜCHLER. *Glückauf* 65, 161-4(1929).—B. reviews the most important previous results of research on the fusain question and gives original detns. of the P content of fusain. According to these the occurrence of phosphates in products of "coalification" is not due to accidental later deposits, but to the process and extent of "coalification." B. concludes that the P content is also significant for the explanation of the origin of coal. Phosphates are absent if (1) the "incoaling" process has led to the formation of humic acids (durain and vitrain), and (2) sufficient  $\text{H}_2\text{SO}_4$  has been liberated to dissolve the phosphates. The presence of phosphoric acid in fusain indicates a condition of equil. during its formation, whereby the  $\text{H}_2\text{S}$  was sufficient to prevent humic acid formation. From the association of fusain with primarily formed pyrite it may be concluded that the formation of fusain does not depend on outer conditions but results from the reducing medium created by the decompn. of the org. material itself.  
J. B. SHOHAN

Fushun coal and its geological significance. CHOZO IWASAKI. *Tech. Repts. Tohoku Imp. Univ.* 8, 99-126(1928); *Fuel in Science & Practice* 8, 133-43(1929).—The Fushun coal bed extends 13.5 km. east and west near Mukden, Manchuria. Its deposition probably occurred in the Eocene. This coal thickens from 9 m. at the eastern end to 100 m. at the western end of the bed. A higher fuel ratio and coking properties characterize the eastern coal. The western coal is non-coking. Kabary, belonging to the cannel coal series, and amber rock, coal rich in resin, ash and fusain, both occur in layers. Bright coal predominates in the east, dull coal increasing towards the west. Plant tissues are well preserved. Spores, arc-structure, cork, seed coat, cuticle, reticulated bodies and fusain are clearly observed in the coal of the central divisions.  
D. A. REYNOLDS

The microstructure of New Zealand lignites. W. P. EVANS. *Fuel in Science & Practice* 8, 54-8(1929); cf. *C. A.* 22, 1305, 4767.—E. concludes that the lignite-forming debris was not deposited *in situ*, and that the greater portion of it consisted of fragments of forest trees together with a few spores. The slight change in the org. S content of the coal as noted on passing through the seams towards the dolerite appears to indicate that the processes of coal formation were already far advanced before the intrusion of the dike folded and squeezed out the seams.  
D. A. REYNOLDS

The theory of petroleum formation. II. Composition of primary tars of Mata-y boghead coal. G. L. STADN'KOV AND Z. VOZZHINSKA. *Brennstoff-Chem.* 9, 100-1(1928).—Acids formed by oxidation of the individual fractions of a boghead coal-tar with  $\text{KMnO}_4$  were studied. They were found to be members of the fatty acid series from  $\text{C}_4$  to  $\text{C}_{21}$ . The original tar oils are, therefore, mainly of the paraffin series. The high-boiling tar fractions contain appreciable amts. of free acids and saponifiable anhydrides. On distn. of boghead coal acids and anhydrides are first formed and these then mostly decompose, forming oils, but part of them volatilize with the gases and vapors without decompn. It is concluded that boghead coal consists mainly of highly polymerized fatty acids, their esters and anhydrides.  
J. D. DAVIS

The presence of a variety of jumillite in the neighborhood of Calasparra, Province of Murcia. E. JÉRÉMINE AND P. FALLOT. *Compt. rend.* 188, 800-2(1929).—Chem. and mineralogical examn. of a rock from this locality classes it with jumillite, hitherto found only in the Spanish peninsula. The structure of the rock is described. J. F.

Lithology of the Carboniferous limestones of the Donetz basin. V. A. ZILBERMINTZ AND V. P. MASLOV. *Trans. Inst. Econ. Mineral. Met.* (Moscow) No. 35, 212 pp. (1928).—Chem. and microscopical examn. was made of Carboniferous limestones collected in different localities of the Donetz basin. The limestones were divided into the following types according to the percentage of org. remains as detd. by the microscope: detrital, muddy, algal and foraminiferal. The distribution of these types of org. remains in the basin is characteristic. The fact that the latter prevail in the northwest part of the basin is taken to be connected with a shallow bottom of this part of the Carboniferous sea. The first two types of limestone are distributed equally throughout

the basin; the third is present chiefly in the central region; and the fourth is found exclusively in the northern part. The presence of the muddy limestone is taken to indicate a shallow sea bottom, while the algal type, with very little insol. residue and small % of org. remains, indicates a deeper sea. Quant. analysis of 90 samples showed uniform chem. compn. of the limestones, with some running high in Mg. High content of  $P_2O_5$  was found to be associated with high insol. residue. J. FLEISCHER

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, R. H. ABORN

The function and organization of the metallurgical research department in large iron and steel plants. J. WELTER. *Rev. métal.* 26, 119-30(1929).—A general discussion of the considerations which should be taken into account in organizing a truly scientific research department and of its operation and function in a large modern plant, based on W.'s experience in such a department of a large plant in Lorraine. A. P.-C.

Present status of the metallurgy of lead. M. FOURMENT. *Rev. métal.* 26, 154-67 (1929).—A review. A. PAPINEAU-COUTURE

History and metallurgy of platinum. C. A. ACKERMAN. *The Mining J. (Arizona)* 12, 9, 57-8(1929).—Recent reports of the discovery of Pt have created greater interest in the history, mineralogy and metallurgy of Pt. E. M. SYMMES

Recent processes in the metallurgy of lead-tin and lead-antimony alloys. FRIEDRICH VOGEL. *Metallbörse* 18, 2161-2, 2273-4(1928).—Making Pb-Sn and Pb-Sb alloys often involves the working up of wastes and intermediate products from other industries rather than the direct smelting of ores to produce them. In processes for the recovery of these metals Cu may be looked upon as a valuable product, but As and Zn are considered as waste. Reduction in a blast or reverberatory furnace is used to give an alloy free from most impurities; attempts to effect a direct sepn. of Pb and Cu from Sn and Sb by a fusion with soda and S, or with  $Na_2SO_4$  and C, have not been successful commercially. The conversion of Sn and Sb into sol. stannates and antimonates by fusion with NaOH, etc., has not worked out well. But by smelting carefully, especially with attention to temps. maintained in the furnace and to "impregnating" with the eutectic desired, valuable alloys of Pb-Sn or Pb-Sb can be sepd. from the charge. If S be stirred into a bath of the metals Cu and Sn change quickly into sulfides, while Pb and Sb remain as an alloy. The Cu-Sn mat is roasted, the Cu changed to  $CuSO_4$ , which is then sepd. from the Sn residue, and the latter briquetted and smelted for pure Sn. Vaporization of the various metals as such, as oxides, sulfides or chlorides, perhaps with the aid of the elec. furnace, is suggested as a means of sepg. them. Cu contg. Sn, Pb or Sb can be added to the charge of a Cu converter; the fume is collected by the Cottrell process, but the method is not very successful commercially. More promising are electrolytic processes employing suitable electrolytes. The whole field still requires intensive investigation to develop really satisfactory methods of operation. W. C. E.

Coarse sand flotation classification and table concentration. A. W. FAHRENWALD AND CLARENCE THOM. *Bur. Mines, Repts. of Investigations* No. 2921, 7 pp.(1929).—The process described is applicable to simple ores comprising a single mineral to be recovered which is liberated wholly or to a large degree from the gang minerals at relatively coarse comminution. Flotation removes the fine and intermediate-sized mineral grains and the flotation tail is subjected to classification. The classifier sand is tailed with products of coarse mineral, middling and a coarse tail. The coarse mineral is generally cleaned on a second table and the middling is ground and returned to the

flotation machine. Tables show some metallurgical data on the treatment of Michigan amygdaloid Cu ores, also data on unclassified table feed from a Missouri plant treating a Pb ore. Comparison in the latter case with the conventional process favors the new treatment. The paper emphasizes the effectiveness of the new process in making low tailings at coarse grinds.

W. H. BOYNTON

**The microscopic composition and structure of different pretreated Thomas slags and their relation to citric acid solubility.** HANS SCHNEIDERHÖHN. Mineral. Inst. Univ. Freiburg. *Mitt. Kaiser-Wilhelm Inst. Eisenforsch. Düsseldorf* 10, 213-23 (1928).—Thomas slag was examd. in 3 different states of cooling, both with and without the addn. of silicic acid. The microscopically recognizable constituents of the mixt. were ascertained and noted. The structure and the texture of the individual samples were described and genetically explained. Tempering investigations showed that no decompn. occurred and that the existing parts of the mixt. are conceived as states of equil. which correspond to the concn. of substances concerned. Only the grain size of the samples without the addn. of silicic acid was essentially increased by the temper. In order to establish the nature of the parts of the mixt. suitable, soly. expts. were conducted and the sol. constituents analyzed. In the samples investigated the following parts of the mixt. were ascertained: *silicocarnotite*,  $5 \text{ CaO} \cdot \text{P}_2\text{O}_5 \cdot \text{SiO}_2$ , crystd. oxide of Ca, Mg,  $\text{Fe}^{++}$ ,  $\text{Fe}^{+++}$  and Al, as well as compds. and mixed crystals of these oxides, and finally (but only in samples without silicic acid added) *hilgenstockite*,  $4 \text{ CaO} \cdot \text{P}_2\text{O}_5$ . As the cause of the unequal citric acid soly. of the slags with and without silicic acid added is recognized first of all the presence of sol. Ca compds. in the samples without addn., whereby the soly. of silicocarnotite was repressed, while the dissimilar ions going into soln. in the sample with addn. increased the soly. of the silicocarnotite. The subsequent process for the detn. of the so-called free Ca in Thomas slag produced questionable results and is useless. A sepn. of the Ca combined with the various constituents of the mixt. from one another by chem. means is not possible. The decompn. phenomena are shown in the most rapidly cooled samples without addn. of silicic acid. Since carbonates can be detected in appreciable amts. with the microscope, the decompn. is due to the hydration and carbonization of the crystallized lime. Fifteen illustrations are given.

E. F. SNYDER

**Fusibilities of iron oxide-calcium oxide mixtures.** L. JACQUÉ. *Compt. rend.* 188, 917-9 (1929).—The methods used by previous investigators for establishing the equil. diagram for the system  $\text{CaO} \cdot \text{Fe}_2\text{O}_3$  are open to criticism when applied to the formation of slags in industrial processes because they attempted to prevent the formation of FeO and thus deviated from actual conditions of slag formation. The tests were carried out in a gas-fired furnace, heating 2 concentric tubes; this permitted a very regular temp. distribution along the interior tube and control of the furnace atm. The temp. of the sample could be controlled to within  $10^\circ$  at any temp. between  $1200^\circ$  and  $1500^\circ$ . When temp. equil. was reached the sample was introduced into the central zone of the tube very close to the junction of a well calibrated thermocouple. An optical pyrometer was used at the same time. The temp. was recorded when the first clear signs of fusion were found. The following data were obtained.

CaO, %	0	5	10	20	26	30	40	50	60	70
$\text{Fe}_2\text{O}_3$ , %	100	95	90	80	74	70	60	50	40	30
Temp. $> 1500^\circ$	1455'	1290	1230'	1220'	1220'	1245'	1370'	1430'	$> 1500^\circ$	

By holding at the temps. where fusion begins the sample is totally fused because a portion of the  $\text{Fe}_2\text{O}_3$  is dissocd. to form FeO and the fusion point is lowered. The lowering of the temp. of incipient fusion is directly related to the content of FeO found in the resulting slag. The following data were obtained:

Initial mixt.	30% CaO-70% $\text{Fe}_2\text{O}_3$			50% CaO-50% $\text{Fe}_2\text{O}_3$		
	(a)	(b)	(c)	(a)	(b)	(c)
% FeO after fusion	2.08	13.6	21.8	0.7	6.0	13.6
$\text{Fe}_2\text{O}_3:\text{FeO}$	33	4.8	2.15	70	7	2.7
Temp.	1230°	1220°	1170°	1415°	1370°	1350°

(a) oxidizing atm., (b) neutral atm., (c) prolonged heating. The ratio of  $\text{Fe}_2\text{O}_3$  to FeO seems to approach a value of 2.22 upon prolonged heating and the ratio of 2.22 corresponds to  $\text{Fe}_3\text{O}_4$ .

**The reduction of fused silicates by oxides of carbon; the silicates of copper.** B. BOGRTCH. *Compt. rend.* 188, 633-5 (1929); cf. C. A. 22, 3118.—Mixts. of Cu and Na silicates, fused at  $1350\text{--}1400^\circ$ , change color on increasing the CO content of an imping-

ing gas from blue to green at 2.5%, to pale green at 4%, to opaque brick red at 11.5%, to transparent blood red at 21.5%, and finally to practically complete reduction at 26% CO. F. O. A.

The reduction of steel-works' costs by means of waste-heat boilers. J. ADAMSON AND F. JONES. *Proc. Inst. Mech. Eng.* (London) 1928, 453-63.—Details of various types of boilers are discussed. To enable the evaporative duty of any waste-heat boiler to be approx. estd., the following formula may be used:  $E = W/4080 (1 + 180/P) (t_1 - t_2)$ , where  $E$  = evapn. in lbs. per hr. from and at 212°F.,  $W$  = coal burnt per hr. per lb.,  $P$  = percentage of CO<sub>2</sub> by vol. in waste gases,  $t_1$  = temp. of gases entering waste-heat boiler, °F.,  $t_2$  = temp. of gases leaving waste-heat boiler, °F., usually 420° to 450°F. Three typical boilers installed on open-hearth furnaces, soaking pits and reheating furnaces, resp., show net annual returns of 58.5%, 74.6% and 85% on capital outlay. D. GORDON.

Evaluation of silver-containing wastes. HERBERT KURREIN. *Metallwirtschaft* 8, 205-8(1929).—Much information is given about wastes contg. Ag and methods for recovering Ag from these wastes. Ag wastes may be divided into two classes: (1) waste contg. metallic Ag (from silverware manuf., electroplating, gold and silversmiths); (2) wastes contg. Ag as insol. or sol. Ag salts (from photographic, chemical, pharmaceutical, film and mirror-making industries). E. G. R. ARDAGH.

The physics of charging zinc furnaces. A. ROITZHEIM. *Metallbörse* 18, 1993-4, 2049-50(1928).—Since Zn furnaces of the muffle or retort variety have their charges in a state of rest, rather than in motion as is the case with blast, reverberatory and other types of furnaces; have relatively small vols. of ore and fuel per charge; and have their rates of operation detd. by the conditions of the reaction  $n \text{ CO} + \text{CO}_2 + \text{C} = (n + 2) \text{ CO}$  and the equil. of the phase Zn·CO·CO<sub>2</sub>, it follows that briquetting or compressing the charge is not favorable, nor is the use of large particles of ore or fuel recommended, if max. efficiency is desired. There is needed a charge of fine-grained material, porous, yet with min. spaces between the particles; as the fuel tends to fill the spaces between the ore itself such porosity must be gained in another way, the simplest being by having the charge sufficiently moist in the first place so that the expulsion of steam leaves passages for the reducing gases to penetrate the mass. Ordinarily 10-12% by vol. of H<sub>2</sub>O added is enough. The amt. of fuel added is always more than that required for the reduction of the ore, and this excess also makes the mass remain porous, even though partial sintering may take place at the temps. used, i. e., up to 1300°. W. C. EBAUGH.

Mechanical strength and plasticity of metal crystals. E. SCHMID. *Metallwirtschaft* 7, 1011-5(1928); cf. C. A. 23, 1375.—The mech. properties of metal crystals are discussed, with particular reference to Zn, Cd, Bi and Te. The significance of mech. twin formation is considered. H. STORITZ.

The fatigue of metals. D. HANSON. *Proc. Staffordshire Iron and Steel Inst.* 42, 13-22(1926-27).—A lecture in which the theories of fatigue are discussed and a theory of fracture is formulated. DOWNS SCHAAF.

Recrystallization of metals. ULRICH DEHLINGER. Stuttgart. *Metallwirtschaft* 7, 1172-6(1928).—The mechanism and the theory of recrystn. are discussed. H. S.

Recrystallization of metals. G. SACHS. *Metallwirtschaft* 7, 1295-7(1928).—Recrystn. in metals and alloys is discussed with some attention to theoretical aspects. H. STORITZ.

The thermal improvement of heavy metals (copper, nickel, iron). P. SCHWERBER. *Metallwirtschaft* 7, 340-4(1928).—This is a brief survey of structural changes produced in steel by heat treatment; improvement in the phys. properties of Al by the addn. of alloying constituents; the hardening of steel compared to the age hardening of Al; the effect of small quantities of Ni<sub>2</sub>Si, Cr<sub>2</sub>Si, CoSi and FeSi in Cu; the effect of Mg in Cu alloys; and increasing the hardness of Be-Ni and Be-Co alloys by heat treatment. Sixteen references are cited. J. W. W. S.

High-speed cutting metals. G. J. WEISSENBERG. Berlin. *Metallwirtschaft* 7, 1031-6(1928); cf. C. A. 19, 2020; 20, 3149.—A review of the developments and properties of steels and non-ferrous alloys for use in high-speed cutting tools. *Stellite* and similar alloys such as *akrit*, *celsit* and *tizite*, as well as metallic carbides of the type of *volumit* and *widia* are discussed. H. STORITZ.

Testing of metals with x-rays. R. GLOCKER. *Metallwirtschaft* 7, 373-9(1928).—A review of the various methods by which x-rays are applied to the study of metals. Radiography, spectrum analysis and diffraction methods are discussed. A. J. KING.

The spectroscopic examination of the solution of metallic alloys and Tammann's

resistance boundaries. WALTHER GERLACH. *Z. anorg. allgem. Chem.* 179, 111-2 (1929).—In etching Au with  $\text{HNO}_3$  impurities of Pb, Cu and Ag were revealed at the grain boundaries. Hot concd.  $\text{HNO}_3$  dissolves out the Cu and Pb from the boundaries, but does not attack the Ag, which is "protected" by the Au. Further tests show that Ag and Cu, when alloyed with Au, are unattacked by  $\text{HNO}_3$ , except when Pb is present to alloy with the Cu. It seems that the spectroscopic examn. is a suitable exptl. method for the investigation of alloys.

FRANK V. JOHNSON JR.

Application of Herbert's hardness pendulum to the determination of surface hardness on the inside of cylindrical borings. O. SCHLIPPE. Berlin. *Metallwirtschaft* 7, 1130-4 (1928).—S. modifies Herbert's hardness pendulum so that the hardness of the inner surface of cylindrical borings can be detd. The app. is calibrated against standards, the hardness of which had been previously detd. in the usual form of Herbert's pendulum by the Kaiser Wilhelm Inst. for Iron Research. Fairly good agreement is obtained. Thus, the time hardness no. obtained on glass by the usual method is 100 and by the modified method 100.6. These values are as follows on various materials, the time hardness no. detd. by the usual method being given first: Al, 9.1, 9.0; Zn, 13.3, 11.0; brass, 20.8, 19.4; C steel, 23.1, 24.9; C steel, 27.6, 29.9; Mn steel, 38.2, 40.6; razor blade, 75, 78. By the time hardness no. is understood the time in secs. for 10 oscillations of the pendulum. Some measurements on cylindrical borings are given and show that as the diam. of the ball is increased the value obtained for hardness increases. H. S.

Causes of shaft failures in cane mills. N. A. HELMER. *Facts About Sugar* 24, 113 (1929).—H. criticises Scharnberg's article (*C. A.* 23, 1089).

M. J. PROFFITT

More about mill roll shaft failures. H. J. B. SCHARNBERG. *Facts About Sugar* 24, 326-31 (1929); cf. *C. A.* 23, 1089 and preceding abstract.—S. replies to Helmer's criticism of his previous article on cane mill roll shaft failures and presents some further data, illustrated with 3 figures, on the mech. details involved.

M. J. PROFFITT

Sulfur in electrolytic iron and its removal. KAZU-HIKO OMA. *Bull. Inst. Phys. Chem. Research Tokyo* 8, 126-30 (1929); *Abstract Ed.* 2, 19-20.—Electrolytic Fe deposited from a ferrous  $\text{NH}_4$  sulfate bath contains 0.001% S as sulfide and 0.02-0.03% S as sulfate. The former is derived from the anodic material and the latter from the electrolyte. When the Fe is treated at high temp., annealed or fused, most of the sulfate is reduced to the sulfide state or even to  $\text{H}_2\text{S}$ . The S removal is accomplished by heating above  $800^\circ$  in a H atm. The rate of desulfurization is a function of time, temp. and grain size. By heating Fe powder (50 mesh) 2 hrs. at  $800^\circ$ , 0.013% of the S was removed, and 0.028% at  $950^\circ$ . Heating the same powder at  $900^\circ$  removes 0.027% S after 2 hrs. and 0.030% after 4 hrs. By heating 50-mesh powder at  $950^\circ$  for 2 hrs., 0.028% S was removed; the same treatment on 30-mesh powder removes only 0.020%, and 0.012% with 5 mm. blocks.

ALBERT L. HENNE

Heat treatment and properties of cast iron. P. SCHOENMAKER. *Heat Treating and Forging* 15, 170-3 (1929).—See *C. A.* 23, 1852.

J. BALOZIAN

Contributions to the growth of gray cast iron with regard to the elements nickel and chromium. F. PIWOWARSKY AND WALTER FREYTAG. Tech. Hochschule, Aachen. *Die Giesserei* 15, 1193-1200 (1928); cf. *C. A.* 23, 1852.—The influence of Ni and Cr on the growth of gray cast Fe (I) was investigated. Both Ni and Cr favor growth. Ni hardens the ground mass by sorbite formation, this action being less pronounced with 2% or over Si content and with decreasing  $\text{Fe}_3\text{C}$ . Only in fusions with 5-6% Ni could a slight coarsening of the graphite be detected. A satisfactory influence of overheating (graphite refinement) on growth could be detected only when the melt is held at the highest temp. for a period of time. Shaking causes no marked lessening of growth. The length and wt. changes of specimens (even with high Cr) contg. fine flaky to eutectic graphite are considerably greater than those having graphite similar to fine temper C. Specimens prepd. in a vacuum (because of higher d. and lower gas content) show a smaller increase in wt. than those prepd. in a moderate amt. of air. Ni (or Ni and Cr) favorably influences the increase in wt. of cast Fe, while specimens contg. graphite of the character of temper C show the least. Growth in a steam current is very small at  $450^\circ$ , but is considerable at  $550^\circ$  (here all specimens show an increase in length). The expts. in the steam show clearly the favorable influence of overheating on the vol. sta-

J. BALOZIAN

the Si content is steeper than that calcd. from Köttschke and Piwowarsky (*Arch. Eisenhüttenw.*, 2, 333(1928)). The action of  $\text{HNO}_3$  (1%) is not as great as that of  $\text{AcOH}$ , probably because of passivity. In cast Fe, Cu is a difficultly sol. substance. J. B.

The present status of electric-furnace irons. W. SCHRECK. *Gießerei Ztg.* 26, 29-36(1929).—An "A E G" elec. furnace is used (a) to heat-treat cupola cast irons, and (b) to remelt cast iron and steel scrap under a basic carbide slag. The furnace and auxiliary app. are described in detail and illustrated. Four micrographs show the structure of 2 cast irons before and after heat treatment. One set of 24 remelted elec.-furnace irons has the following range of compn.: 2.5-4.0% C, 1.0-3.6 Si, 0.35-0.87 Mn, and in 1 case 2.0 Ni, and in 2 cases 2.0 and 4.0 Cr. The transverse breaking loads of these irons in bar form, 20 millimeters in diam. and 400 millimeters between supports, vary from 186 to 631 kg. A second set of 10 irons has the following compn.: 2.9-3.2% C, 0.9-1.8 Si, 0.50-0.95 Mn. The transverse breaking loads of these irons for the same size of specimen vary from 414 to 648 kg. The first set is designated as "worked" and the second as "unworked." A third set of 20 irons designated as "worked" has the following compn.: 2.8-3.2% C, 0.95-1.2 Si, 0.48-0.81 Mn. The transverse breaking loads of this set, for specimens 30 millimeters in diam. and 600 millimeters between supports, vary from 961 to 1295 kg. The influence of C plus Si content on the strength of cast irons of Mn contents of 0.35-0.45 and 0.5-0.95% is presented in graphical form. The log of 15 elec. furnace heats is given. The log includes cold cast iron and steel addns., hot addns., initial analysis of the heat, time of working the heat, furnace addns., type of slag, power consumption, transverse strength, and deflection at ultimate load.

JOHN W. W. SULLIVAN

Investigations on the pickling of steel sheets of low carbon content. PETER BARDEHEUER AND GUSTAV THANHEISER. *Mitt. Kaiser-Wilhelm-Inst. Eisenforsch., Düsseldorf* 10, 323-42(1928).—The blisters formed on sheet steel during pickling are due to the diffusion of H into the metal, where it tends to collect around included materials, such as slag until it develops very high pressures. Thus when H is evolved electrolytically on the outside of a heavy steel cylinder, it may diffuse through the wall and develop pressures up to 300 atms. The app. used in these investigations consisted of two steel bell jars pressed together over a piece of sheet steel. H was evolved by HCl and  $\text{H}_2\text{SO}_4$  poured in over the sheet and the rate of diffusion through the sheet measured by the displacement of mercury on the other side of the sheet. With increased temp. the amt. of H diffused per hr. increased but the proportion diffused became smaller. With increasing concn. of  $\text{H}_2\text{SO}_4$  up to 700 g. per l. the amt. of diffusion per hr. increased and then fell rapidly. In the concn. range ordinarily used for pickling the proportion of H diffused to that evolved decreases with increase in concn. With HCl the amt. of diffused and evolved H is considerably less than with  $\text{H}_2\text{SO}_4$ . Sheets of metal contg. gas bubbles before pickling are particularly prone to develop blisters during pickling. Consequently a high rolling temp. is desirable in preventing blisters. It is also desirable to pickle sensitive material in such a way as to permit only small quantities of H to come in contact with the metal. Heat, concd. acids, and acid inhibitors bring about this condition.

HANS C. DUUS

Influence of the rolling and annealing temperature on the hardness and structure of cold-rolled low-carbon ingot steel. ANTON POMP AND SIEGFRIED WEICHERT. *Mitt. Kaiser-Wilhelm-Inst. Eisenforsch., Düsseldorf* 10, 301-16(1928).—Samples of steel bands  $28 \times 2$  mm. with 0.08% C were rolled at temps. varying from  $-70^\circ$  to  $500^\circ$ . The samples were then heated for 3 hrs. at temps. varying from 100 to  $900^\circ$ . With increased rolling the tensile strength and hardness increased, while the dilatation and depth decreased. The structure likewise appeared more stretched. The structure was not influenced by heating but the hardness and tensile strength increased as the rolling temp. was increased. No change in the grain was noted below annealing temp. of  $600^\circ$ , but the mech. properties changed markedly before any change in grain was noticed. Numerous charts and photomicrographs are given.

HANS C. DUUS

Stability of steels at high temperatures. CLAUDE E. CLARKE AND ALBERT E. WHITE. Univ. of Mich. Dept. of Eng. Research, *Bull.* 11; *Heat Treating and Forging* 15, 190-5(1929).—No math. relation could be detd. between long-time creep and short-time tensile tests (made on 0.13% and 0.38% C steels) above the eutectic ( $e-c$ ) temp., while at or below it a limiting creep stress exists which lies either at or above the proportional limit. In detg. the factors affecting the stability of metals at elevated temps., the temps. above and below the  $e-c$  temp. must be considered. Below this, stability may be attained by the formation of a substance which (1) does not enter into solid soln. with the matrix, but interferes with the cryst. slippage, (2) tends to increase the amorphous material between the grains; (3) strengthens the amorphous

boundaries by interfering with plastic flow. The most accurate relation which could be detd. between the stress and time in long-time tests is  $v = ax^b$ , where  $x$  = duration in hrs.,  $v$  = stress in lb./sq. in.,  $a$  and  $b$  = const. J. BALOZIAN

**Mechanical characteristics of soft steel at elevated temperatures.** S. SHISHCHENKO. *Azerbejdj. Neftyanoe Khozyaistvo* No. 10, 71-6(1928).—Investigations conducted in connection with the explosion in the cracking plant built by Vickers, Ltd., indicated that the coil made from soft steel was weakened by high temp., decreasing the safety margin to 1.76 at a temp. of 620° and a pressure of 47.7 atm. The inner lining of metallic Al did not stand the stress and became cracked in the course of the operation. Analysis of the tube gave: C, 0.156%, Mn 0.47%, Si traces, P 0.026%, and S 0.026%. The outer diam. of the tubes was 43 mm. and the inner, 32.4 mm. Various tests were made on new tubes, as well as analyses of the coke deposited in the damaged tube.

A. A. BOERTLINGK

**The tempering of austenitic steels.** ANDRÉ MICHEL and PIERRE BENAZET. *Compt. rend.* 188, 912-5(1929).—Special steels retained in the austenitic state by quenching may show two different types of effect on tempering: (1) A strong dilation and large recalcence at a certain temp., giving the properties of alpha Fe on cooling; or (2) a gradual contraction, followed on cooling by a strong dilation at a relatively low temp., bringing the steel back to the magnetic state. The second type is caused by the pptn. of carbides during heating, so that on cooling the transformation is not restrained by so much of the dissolved compds. in the gamma Fe. A steel contg. 0.5% C, 0.27% Si, 0.45% Mn, 19% Cr, and 0.8% Ni was austenitic after an air quench from 1250°, and on heating between 680° and 700° for 11 hrs., a contraction occurred at first, followed by a strong dilation. When the tempering was at 520° to 550°, only a part of the contraction was obtained in 14 hrs., and on cooling a slight transformation occurred at 150°. Another steel contg. 0.94% C, 0.18% Si, 0.95% Mn, 5.8% Cr, 5.6% W and 2.5% Co was air-quenched from 1250°, and on heating to 700° showed a violent dilation. On tempering at 620° to 660°, the transformation did not occur in 17 hrs., but appeared on cooling at about 350°. The two tempering effects are thus not of different natures, but differ only in the passive resistance to the transformation, the presence of Cr being very effective in increasing this resistance. GEO. F. COMSTOCK

**Relation of nitrogen to blue heat phenomena in iron and dispersion hardening in the system iron-nitrogen.** R. S. DEAN, R. O. DAY and J. L. GREGG. *Am. Inst. Mining Met. Eng. Tech. Pub.* No. 193, 10 pp.(1929).—Forged bars of different kinds of iron, annealed at 980° in vacuum, were reduced 30% in thickness by cold rolling, reheated from 100° to 500° and the Rockwell hardness measured after each treatment. Under this treatment vacuum-melted electrolytic iron showed no increase in hardness upon reheating. Electrolytic iron melted in air showed a distinct increase in hardness at 250° to 350°. Armco iron hardened but not as much as electrolytic iron. A microscopic examn. showed that the electrolytic iron melted in air, contained nitride-like needles (analysis showed 0.07% N). This indicates that the hardening is due to nitrogen and that it might be due to soln. of pptd. nitride during low-temp. annealing. In order to check this soln. theory, Armco iron rod (0.25 in. diam.) was nitrided in  $NH_3$ , drawn to 16 gage, annealed in a vacuum and cold-drawn to 18 gage. Tensile tests after cold-drawing, and heating to 200° and to 300° for 2 hrs. gave, resp.: 69,000, 76,000 and 78,000 lbs. per sq. in.; resistance ohms per cc. 22.9°,  $10.93 \times 10^6$ ,  $11.06 \times 10^6$  and  $11.10 \times 10^6$ . An Armco iron wire freed from nitrogen by heating in hydrogen at 1100° for 12 hrs. did not show an increase in tensile strength. Temper brittleness then is apparently due to soln. of small amts. of iron-nitride present and is accelerated by cold work, since hardening of annealed material does not occur below a temp. of 350°. In order to det. if dispersion hardening is possible as suggested by Sawyer (*C. A.* 17, 3147) and indicated by the Fe-N diagram, a sample of electrolytic air-melted iron was heated to 500° and quenched. Rockwell hardness increased from 40 to 70 and on holding at room temp. 24 hrs., increased to 95. Aging at higher temps. decreased hardness by agglomeration of the nitride until 300° where hardness increased as a result of soln. The Fe-N system is then a typical dispersion-hardening system which shows room-temp. hardening to a marked degree. A. W. HOLMES

**Chromium alloys.** FREDERICK M. BECKET. Union Carbide & Carbon Research Labs., Inc., N. Y. *Mining and Met.* 9, 551-4(1928); 10, 10-5(1929).—An historical account is given of the development of chromium steels. Chromium steels are of three types, low, medium and high Cr content. Low-Cr steels (up to 5%) have enhanced strength, toughness and hardness as compared with plain C steels. Up to 0.3% V and Mo added to Cr steel improves its physical characteristics. In tool steel 3.5 to 5.0% Cr is necessary for retaining hardness when red-hot. Seven to eight % Cr produces

a steel suitable for valves in combustion engines. Proper heat treatment of steels contg. 0.25 to 0.4% C and 12 to 14% Cr produces non-corrodible or "stainless" steels. Rustless irons have a lower C content and from 12 to 18% Cr. Such steels are used in making turbine blades, in app. for the production of cellulose nitrate and of  $\text{HNO}_3$  from  $\text{NH}_3$ , in metal app. exposed to acid mine waters, in recuperators, heat exchangers, baffles, in power plants, in Cottrell precipitator plants and bins for holding hot calcines in the copper industry. Cr-Fe castings contg. 22 to 28% Cr combine remarkable heat resistance with excellent wearing qualities. Tubes of Cr-Fe have met with great success in the com. cracking of gases. Steels contg. 22% Cr and 10% Ni with Mn and Si in more than normal quantities are highly resistant to oxidation at high temps. Cr plating produces a surface exceedingly hard and resistant to wear. The plating of marine engine piston rods and cracking stills in the oil industry are recent applications of this development in the use of Cr.

A. J. KING

Nickel and its alloys. A. J. WADHAM. International Nickel Co. *Mining Met.* 10, 183-9(1929).—The early history of the metal, attempts to produce it commercially, and its importance in modern industry are reviewed.

E. H.

Heat treatment and mechanical properties of some copper-zinc and copper-tin alloys containing nickel and silicon. W. C. ELLIS AND FARLE E. SCHUMACHER. *Am. Inst. Mining Met. Eng. Tech. Pub.* No. 188, 17 pp.(1929).—Alloys of Cu-Zn contg. 3% Ni and Si in the proportion  $\text{Ni}_3\text{Si}$  were melted under charcoal in a graphite crucible and cast into plates 0.75 in. thick. These plates with frequent annealing were cold-rolled to 18- and 24-gage sheets. The alloys contained 10, 20 and 30% Zn. The quenching temp. giving the best results was  $800^\circ$ . After quenching, the alloys were aged 1 hr. at  $500^\circ$  for 10 and 20% Zn, and  $400^\circ$  for 30% Zn. After this heat treatment the properties of the 10, 20 and 30% Zn alloys were: Rockwell hardness "B," 86, 85, and 79; proportional limit, 44,500, 37,200 and 38,000 lbs. per sq. in.; ultimate strength, 90,000, 85,800 and 85,400 lbs. per sq. in.; elongation in 2 in. 14.0, 21.5 and 28.0%. The hardness and ultimate strength were further increased by cold-rolling. Variations in heat treatment showed that mech. properties could be varied over a large range. Incomplete tests of the fatigue behavior in reversed bending indicate an endurance limit about the same as high brass sheet. Some preliminary results with heat-treated phosphor-bronze contg. 3% Ni-Si showed what mech. properties can be varied by heat treatment.

A. W. HOLMES

Alloys of zirconium. II. C. SYKES. *J. Inst. Metals* (advance copy) No. 492, 11 pp.(1929); cf. *C. A.* 22, 1942.—Five partial series of Zr alloys, viz., Cu-Zr, Fe-Zr, Ni-Zr, Al-Zr and Ag-Zr, were examd., and in each case intermetallic compds. were formed with only a limited range of soly., thus making com. application of these alloys doubtful. Measurements of certain elec. and magnetic properties of Cu-Zr, Fe-Zr and Ni-Zr alloys and resistivity figures for Al-Zr alloys (1.2, 3.2, 6.0 and 9.4% Zr), are given, together with measurements of tensile strength, Brinell hardness, ductility and corrodibility of Al-Zr and Ag-Zr alloys.

DOWNS SCHAAP

The system magnesium-zinc. W. HUME-ROTHERY AND E. O. ROUNSEFELL. *J. Inst. Metals* (advance copy) No. 691, 20 pp.(1929).—Investigation was made of the equil. diagram of the Mg-Zn system, particular attention being paid to the structure of the solid alloys and the limits of solid soln. in the various phases. The solid soly. of Mg in Zn increases from 0.15 atomic % Mg at  $200^\circ$  to 0.3 atomic % at the temp. of the Zn-MgZn<sub>2</sub> eutectic, which was accurately detd. by cooling curves and quenching expts. to be  $364^\circ$ . A new compd. MgZn is shown to exist, and any Zn in alloys like Elektron present in excess of that contained in solid soln. in Mg will exist as MgZn and not, as previously supposed, as MgZn<sub>2</sub>.

DOWNS SCHAAP

The constitution of the cadmium-rich alloys of the system cadmium-gold. P. J. DURRANT. *J. Inst. Metals* (advance copy) No. 490, 33 pp.(1929).—Saldau's equil. diagram of the Cd-Au alloys contg. from 0 to 48 atomic % of Au has been modified in the following manner: (1) the liquidus from the eutectic point at 7.95 atomic % of Au and  $309^\circ$  rises not to a triple point at 25 atomic % of Au and  $495^\circ$ , but to a max. at 28.6 atomic % of Au and  $500^\circ$ , and thereafter falls to a eutectic point at 30 atomic % of Au at  $496^\circ$ ; between the compns. 30 and 48 atomic % of Au the form of the liquidus is not a smooth curve, but is broken by a sharp discontinuity at 39.4 atomic % of Au and  $540^\circ$ ; (2) a new area of solid soln. has been detected which lies in the field described by Saldau as contg.  $\beta + \gamma$ , and has been found to undergo two polymorphic changes—one at about  $500^\circ$ , and the other at  $375^\circ$ .

DOWNS SCHAAP

Influences related to the speed of deformation and to the temperature of the production of cold-hardening. ALBERT ROUX AND JEAN COURNOT. *Compt. rend.* 188, 631-3(1929).—Pure Al wires were treated with different loads and at different temps. and then tested spectrographically with x-rays. The speed of deformation has a great influence on the production of cold-hardening; too slow a speed allows annealing to destroy the cold-hardening.

MALCOLM DOLE

Equilibrium relations in aluminum-magnesium alloys of high purity. E. H. DIX, JR. AND F. KELLER. *Am. Inst. Mining Met. Eng., Tech. Publication* No. 187, 17 pp. (1929).—Al of high purity (analysis Cu 0.016%, Si 0.008% and Fe 0.020%) was melted in a crucible of Acheson graphite and alloys up to 20% Mg were made by adding pure Mg (analysis Si 0.00%; Cu 0.00%, other group II metals, 0.01%; Fe 0.00% and Al 0.01%). Some of the alloys above 10% Mg were made by adding a 20% Mg hardener. The alloys were chill-cast, then annealed for 168 hrs. at temps. ranging from 420° to 445° for various lots. Sections of each alloy were quenched at these temps. while other sections were cooled to a lower temp., held at these lower temps. and finally quenched. The sections were then polished, etched with 0.5 % aq. HF and examd. with the microscope to det. if the  $\beta$ -phase was present in the  $\alpha$ -phase. The  $\alpha$ -phase is defined as solid soln. of Mg in Al. As a result of these tests, values of temp.-solv. relations were detd.: 451° satn. limit (Mg%), 14.9; 400°, 11.5%; 350°, 8.7%; 300°, 6.4%; 250°, 4.9%, and 200°, 4.0%. The temp. of the eutectic arrest was detd. by cooling curves on alloy of 20% Mg and was 451°. In order to det. if the Al-Mg alloys were susceptible to pptn. heat treatment tests were made on 10% Mg-Al alloy. This alloy was not made of high-purity metal. The attempts to improve the properties of the quenched alloys by artificial aging were unsuccessful.

A. W. HOLMES

Experiments on the most suitable preparation of the "Y"-alloy (1.5% Mg, 2.0% Ni, 4.0% Cu, 92.5% Al). WILLI CLAUS AND E. KALAHEHNE. *Die Giesserei* 15, 1200-3 (1928).—The preliminary alloy (necessary for the prepn. of the "Y"-alloy) is so produced that the loss due to burning is reduced to a min. This alloy consists of 10% Ni, 20% Cu and 70% Al, the Ni and Cu being melted down first, and the Al then added. The burning loss in its prepn. is 6-8%, and the melting interval 580-710°. To prep. 10 kg. of the "Y"-alloy, 2.00 kg. of the preliminary alloy, 7.85 kg. Al and 0.15 kg. Mg are used. The Al is first fused, the preliminary alloy dissolved in it at 700° and the Mg finally added at 680°. The fusing temp. must be kept below 720°, as the "Y"-alloy absorbs gas strongly.

J. BALOZIAN

The age-hardening of some aluminum alloys. MARIE L. V. GAYLER AND G. D. PRESTON. *J. Inst. Metals* (advance copy) No. 499, 44 pp. (1929).—Five typical Al alloys contg. Cu, Mg, Si, or both, were examd. under similar conditions of heat treatment for Brinell hardness, tensile strength, d., elec. cond. and changes in the crystals as detd. by x-ray analysis. The changes in d. and in lattice size, which take place during aging, suggest that pptn. from solid soln. occurs. The results of the investigation may be regarded as strong confirmation of the theory that hardening is due to the pptn. of highly dispersed particles.

DOWNES SCHAAF

New aluminum alloys and beryllium. A. VOSMAER. *Chem. Weekblad* 26, 186 (1929).—Be bids fair to become as important as the various Al alloys.

G. C.

Duralumin experiments. E. SCHMID AND G. WASSERMANN. *Metallwirtschaft* 7, 1329-35(1928).—The purpose of this work was a study of the hardening of Al alloys to det. what constituent exerts the greatest influence. The alloys examd. were all Al alloys with the following compn. (the added metals only being given): 1, 0.23% Si; 2, 0.56% Mg; 3, 0.36% Fe; 4, 4.50% Cu; 5, 4.12% Cu, 0.35% Si; 6, 4.51% Cu, 0.51% Mg; 7, 4.07% Cu, 0.53% Mg, 0.31% Si; 8, 4.35% Cu, 1.28% Si, 1.07% Fe; 9, 3.79% Cu, 1.27% Si, 1.17% Fe; 10, 0.52% Mg, 0.29% Si; 11 (duralumin), 4.36% Cu, 0.54% Mg, 0.33% Si, 0.39% Fe, 0.77% Mn. Constitutional diagrams of the systems Al-Cu, Al-Mg, Si, Al-Si, Al-Mg and Al-Fe show that according to the sepn. hypothesis a hardening effect might be expected from either CuAl, Mg<sub>2</sub>Si, or Si. The specimens, in the form of 1 mm. wire, were heated for 2 hrs. at 210°, quickly quenched in cold H<sub>2</sub>O and then aged at 150° and at room temp., the progress of the hardening being measured by tensile strength and elongation detns. The results are given in tables and curves. In the binary alloys aged at 150°, Al-Cu shows an increase in tensile strength of about 45% in 20 hrs., while Al-Si, Al-Mg and Al-Fe show no hardening effect. At room temp. about the same amt. of hardening is shown with the Al-Cu alloy after 6 or 7 days, while the Al-Mg and Al-Fe are not affected. A slight hardening is indicated in Al-Si (5.1 to 5.6 kg./sq. mm.). In the ternary alloys aged at 150°, addn. of a small quantity of Si to the Al-Cu alloy has no harmful effect, but with a large amt. of both Si and Fe as in Nos. 8 and 9, the increase in tensile strength is much less (27 to 33 kg./sq. mm. in

48 hrs.). This is probably due to the Fe. At room temp. Nos. 8 and 9 are as good as No. 4. In the Al-Cu alloys, binary and ternary, the hardening is always rapid at first and then slows after a few hrs. at 150° or about 3 days at room temp. A Cu-free alloy contg. Mg<sub>2</sub>Si, however, shows a more gradual hardness increase at 150°, which continues at an almost linear rate for over 24 hrs. Thus the tensile strength of No. 10 increases from 12.3 kg./sq. mm. to 19.4 in 1 day, 20.9 in 2 days and 22.3 in 3 days. This same alloy shows only very slight hardening at room temp. At 150°, addn. of Mg to Al-Cu has only a slight effect, but on addn. of Si to the Al-Cu-Mg alloy a very favorable effect is obtained, due doubtless to Mg<sub>2</sub>Si. At room temp. Mg produces a greater increase than at 150° (28.4 to 39.6 kg./sq. mm. for No. 6), while addn. of Si to this produces still greater hardening (26.7 to 40.7 kg./sq. mm. for No. 7). Duralumin behaves more like the Al-Cu-Mg alloy (32 to 43.5 in 7 days for No. 11). Conclusion: CuAl<sub>2</sub> is the most effective hardening constituent, although both Mg<sub>2</sub>Si and Mg exert considerable influence. Röntgenographs of specimens aged at 150° or 200° give a faint indication of CuAl<sub>2</sub> sepn., but where the aging is at room temp., the method is not sufficiently sensitive to detect the extremely fine sepn. H. STOERTZ

Piston alloys. R. STERNER-RAINER. Frankfurt a. Main. *Metallwirtschaft* 7, 1228-30(1928).—A discussion of the requirements of piston alloys and the development and application of light metal alloys in piston manuf. Cast Al-Si alloys and pressed Mg-Al alloys are meeting with favor in Germany. H. STOERTZ

Supplementary information on the corrosion of brass. MAX HAAS. *Korrosion Metallschutz* 5, 25-35(1929).—A review of the literature on the effect of grain size and compn. on the corrodibility of brasses, followed by a series of tests under various conditions. Automobile radiators corroded in spots which showed evidences of dezincification primarily at the grain boundaries of large grains. Quenching of brass ordinarily in the  $\alpha$ -range from high temps. left free  $\beta$  particles; the resulting  $\alpha/\alpha + \beta$  brass corroded more rapidly.  $\alpha/\alpha + \beta$  brass having a uniform grain size is more corrosion-resistant than the same material having grains of different sizes; similarly c. m. f. measurements indicate that the former has a lower soln. pressure. B. E. ROETHLI

Methods of testing to determine the corrosion resistance to weathering and sea water. E. RACKWITZ AND ERICH K. O. SCHMIDT. *Korrosion Metallschutz* 5, 7-13 (1929).—Methods of testing Al and Al alloys are described, combining immersion in 3% NaCl solns. contg. 1% H<sub>2</sub>O<sub>2</sub> with physical tests. The methods give results which are in close agreement with those found in actual service tests in the atm. and in sea H<sub>2</sub>O. B. E. ROETHLI

The decreased attack on aluminum in alkaline solutions due to colloid additions. H. RÖHRIG. *Korrosion Metallschutz* 5, 41-3(1929).—Colloids, such as glue, agar agar, starch, gum arabic or gelatin, when added to 10% NaOH or 10% Na<sub>2</sub>CO<sub>3</sub> solns. markedly decrease the rate of soln. of Al. (Na<sub>2</sub>SiO<sub>3</sub> accelerates corrosion in the NaOH soln. while it affords 100% protection in the soda soln.) The rate of soln. remains const. with time. The proportional protection afforded is const. for different concns. of electrolyte. Protection is increased by increasing the concn. of colloid. The limiting concn. is detd. by the viscosity of the resultant soln. B. E. ROETHLI

Resistance of copper-silicon-manganese alloys to corrosion by acids. U. A. BEDWORTH. Am. Inst. Mining Met. Eng., *Tech. Publication No. 189*, 14 pp.(1929).—Alternate immersion tests at room temp. and at 60° of Cu-Si-Mn alloys varying in compn. from 0.5% Si, 0.2% Mn to 4% Si, 1.2% Mn in dil. HCl and H<sub>2</sub>SO<sub>4</sub> have shown that addns. of Si and Mn up to 3 and 1%, resp., materially increase the corrosion resistance of the alloy to these acids. Further addns. did not increase the resistance materially. Hard-drawn wires contg. more than 2% Si showed decidedly greater loss by corrosion than annealed wires of the same compn. The loss of annealed wire approached that of hard wire as Si decreased from 2.5 to 0.5%. Hard-drawn wires contg. 4% Si and 1.2% Mn showed greater loss in tensile strength than hard drawn wires contg. 3.2% Si and 0.9% Mn. It was found by examn. under the microscope that 4% alloy contained small undissolved particles of Mn<sub>2</sub>Si inclusions, but showed practically the same corrosion rate as 3% alloy. Annealing is believed to counteract the harmful effect of Mn<sub>2</sub>Si inclusions. Results are reported as wt. loss and loss in tensile strength and elongation. B. E. ROETHLI

The passivity of metals. II. The breakdown of the protective film and the origin of corrosion currents. ULICK R. EVANS. *J. Chem. Soc.* 1929, 92-110; cf. C. A. 22, 3575.—Corrosion commences at isolated points in consequence of breaks in the protective film. Tests on Fe, steel, Zn, and Al show that the breakdown of the film occurs where the surface has been bent or cut or where rolling or casting defects occur at the surface. Occasionally the O<sub>2</sub> dissolved in the water repairs the broken film and

corrosion does not occur. Pre-existing cavities may det. the sites of corrosion, but this cannot be the common cause of localized attack which can be obtained under anaerobic conditions if an external e. m. f. be applied. Internal stresses are important in character as to keep the film in a state of weakness.

e. m. is. approaching 0.0 and so off when a current actually flows. The extension of mechanism of the film can be followed by potential changes.

B. E. ROETHLI

**Some new developments in acid-resistant alloys.** BURNHAM E. FIELD. *Am. Inst. Mining Met. Eng., Tech. Publication No. 191*, 12 pp. (1929).—Ni-Mo alloys contg. more than 15% Mo are resistant to 10% HCl at 70°. In Ni-Mo-Fe alloys contg. 20% Mo and 0-40% Fe the corrodibility passes through a max. at 10% Fe and rises again at 25% Fe, after which the corrosion rate becomes high. C hardens and stiffens the alloy, and decreases acid resistance. Mn improves the workability and up to 3% does not decrease acid resistance. Mg counteracts S effects. Ni-Mo-Fe alloy is resistant to all cold mineral acids except HNO<sub>3</sub>. Penetrations in cold 37% HCl range as low as 0.00036 in. per year; at 70° in 10-37% HCl 50-80 times as much; in 10-77% H<sub>2</sub>SO<sub>4</sub> at 70° 30-70 times as much. The alloy is attacked by oxidizing agents such as moist Cl<sub>2</sub> and acids contg. oxidizing salts. Ni-Si alloys contg. above 10% Si and Ni-Al contg. above 20% Al are acid-resistant but brittle. Alloys contg. 10% Si and 5% Al are strong and acid-resistant. Cu between 2.5 and 3% give finer-grained and stronger alloys.

B. E. ROETHLI

**Corrosion of metals in the Lehigh Valley.** C. E. REINHARD. *Am. Inst. Mining Met. Eng. Tech. Publication No. 190*, 9 pp. (1929).—Test pieces exposed to weathering conditions in various localities in the Lehigh Valley showed different corrosion rates in different atms. The kinds of metal tested were not designated. B. E. ROETHLI

**Causes and prevention of corrosion.** C. R. TEXTER. *Boiler Maker* 28, 51-2; *J. Am. Water Works Assoc.* 20, 442 (1928).—A broad general survey, both practical and theoretical. D. K. FRENCH

**Corrosion of metals in sea water.** J. N. FRIEND. *Mettall.* 98, 9 (1928); *Wasser u. Abwasser* 25, 41.—In a 4 yr. test where Sn, Ni, Pb, Cu, Zn, Al, Ni and Pb were affected the least, Al was corroded to the greatest extent. C. R. F.

**Corrosion of machines in the viscose rayon industry, and its prevention.** JOHANN EGGERT. *Korrosion* 3, 45-6 (1928); 4, 13-4 (1929).—A dense, non-porous, homogeneous cast Fe is best to resist alkalis, alk. sulfides and acids. The best protection for cast Fe is a bituminous paint of high m. p., high free-C content (which is improved by adding the finest ground graphite), and freedom from mineral substances. The casting should be cleaned in a HCl bath followed by several days in a hot oleic-acid bath, then exposed to the air for several days, after which it is slowly raised to 200-50° and 2 or 3 coats of the melted paint applied and cooled slowly. The paint should not be dissolved before applying; the proper selection and compn. of the bitumen are of the utmost importance. The coating is very resistant and lasting. Wrought Fe and steel are best protected by several layers of suitable metals or alloys. The oil in bearings should be changed at least once a week. J. H. MOORE

**Mechanism of corrosion.** ULICK R. EVANS. *J. Chem. Soc.* 1929, 11-20.—The corrosion of half-immersed specimens of Zn, Al, Fe, steel and Cu commences at certain weak points, mainly along the bottom and cut edges, but frequently in the center also; in those cases where corrosion is very slow, it may occur along the water line. In Zn, Fe and steel in chloride or sulfate solutions, the attack spreads out from these points very rapidly, the greater part of the immersed area being finally attacked; the insol. corrosion products are of four different types, which appear according to the manner in which the anodic and the cathodic products come together; in Cu and Al one of these types is usually absent, but otherwise there is general correlation between the results with Zn, Fe and steel. Quant. expts. show that under conditions of differential aeration electrolytic Fe is attacked nearly as rapidly as steel, and K<sub>2</sub>SO<sub>4</sub> and KCl cause similar rates of corrosion, notwithstanding that the shapes of the corroded area are quite different; MgSO<sub>4</sub> causes much slower attack. Zn is attacked more quickly than Fe, and Al much more slowly. O<sub>2</sub> produces quicker attack on steel than air, but the attack is restricted to a smaller portion of the specimens; doubling the breadth of half-immersed specimens nearly doubles the rate of attack, but increase of the length of the immersed area has much less effect. All these results are understood if it is remembered that the corrosion current flowing between the cathodic and the anodic areas will depend on the e. m. f. of the cell (metal-O<sub>2</sub>) greatly reduced by polarization. With

Al, where the film repairs itself readily and the anodic areas remain small, the anodic polarization will be most important, but with Zn, Fe and steel, the cathodic polarization, which depends on the supply of  $O_2$  will det. the rate of attack; Fe is corroded less quickly by  $MgSO_4$  than by  $K_2SO_4$ , since the cathodic product,  $Mg(OH)_2$ , interferes with the access of  $O_2$  to the metal; Zn is corroded more quickly than Fe—even with the same facilities of  $O_2$  supply—because here the value of the unpolarized e. m. f. is higher. B. E. RORTHELI

**Electric behavior of surfaces of corroding iron.** A. L. MCAULAY AND S. H. BASTOW. *J. Chem. Soc.* 1929, 85-92.—Fe when immersed in  $O_2$ -free electrolyte tends to attain a reproducible e. m. f. after a certain variable time. Expts. on the behavior of the metal are reproducible under conditions of the reproducible e. m. f. The behavior of pure electrolytic Fe is also typical of that of mild steel and cast Fe. Compn. has little effect unless it is such as to produce "air passivity" (stainless Fe). Stainless Fe shows no very definite normal potential. Potentials of Fe in air-free 0.5 N  $K_2SO_4$  ranged between 0.75 and 0.80 on the satd.-calomel scale, the variations probably being due to differences in  $pH$ . The electrodes were exposed to air for varying lengths of time, re-immersed, potentials measured and e. m. f. change vs. time was observed. The protective power of the film formed was found to increase with time exposed up to a max. of 2 hrs. after which little increased protection was obtained. The Fe returned to the "standard state" after about 1 hr's. immersion. The film is destroyed by the electrolyte but not by leaving in contact with an inert gas. Anodic oxidation produces a much more resistant film than the air exposure. The passage of currents has no effect on the ennobling film that gives rise to potential differences which produce them. The e. m. fs. are modified temporarily by polarization effects, but these effects rapidly disappear when the current is stopped, leaving the film unchanged except for the action of the electrolyte. B. E. RORTHELI

**Pneumatic and reciprocating apparatus for dry separation of ore constituents, etc.** HENRY M. SUTTON, WALTER L. STEELE and EDWIN G. STEELE. U. S. 1,710,521, April 23.

**Settling and baffle apparatus for separating constituents of ore pulp.** THOMAS G. MARTYN. U. S. 1,709,676, April 16.

**Flotation process.** WILHELM SCHÄFER and SOC. ERZ- u. KOHLE-FLOTATION G. m. b. H. *Erz.* 649,270, Feb. 20, 1928. Polythionates or other derivs. of polythionic acids, particularly polythionates of multivalent metals, are used in the flotation process for

ore, coal, graphite, etc., treatment. Acids or alkalis which produce H ions or OH ions in the pulp may also be present and may be used for effecting differential flotation.

Ore concentrating apparatus utilizing a horizontal water stream carrying slimes and coarser material which settles by gravity. JOHN F. NEWSOM. U. S. 1,709,365, April 16.

Concentrating oxidized ores. JOSEPH T. TERRY (to Cordelia E. Terry). U. S. 1,709,329, April 16. Ores other than sulfides, and which may contain Pb, Zn, Ag, Hg and Bi, in the form of a finely ground pulp, are treated with a chromate soln. such as  $\text{Na}_2\text{CrO}_4$  to effect formation of Cr compds. of metal present in the ore, and then subjected to froth flotation to obtain a concentrate of the metal affected by the chromate treatment.

Concentrating manganese ore. HOWARD TRUMBO and ANDREW J. TRUMBO (to Manganese Patents Corp.). U. S. 1,710,522, April 23. Crude Mn ore is subjected to the action of a cleaning soln. such as  $\text{Na}_2\text{CO}_3$  and the Mn mineral is sepd. from gang by gravity concn. Various details of treatment are described.

Apparatus for amalgamating ores, etc. DANIEL H. KLEINSCHMIDT. U. S. 1,708,970, April 16.

Treating ores, etc. FRIED. KRUPP GRUSONWERK A.-G. Ger. 473,016, Dec. 8, 1923. Relates to processes of the kind in which ores, residues, etc., contg. volatilizable metals are mixed with C and conveyed through a furnace under such conditions that the metals volatilize and are then oxidized, the oxide fumes being collected. The improvement consists in conducting such processes so as to render them entirely or as far as possible thermally self-supporting. Cf. C. A. 23, 1861.

Treating sulfide ores. F. KRUPP GRUSONWERK A.-G. Brit. 297,597, Nov. 24, 1927. Sulfide ores or other sulfidic products are first roasted in an oxidizing atm. (suitably in a rotary tubular furnace) to remove a portion of the S present in the form of  $\text{SO}_2$ , so as to effect a saving in the quantity of binding material for the S necessary in a process such as that described in Brit. 234,826 (C. A. 20, 735). The material is then immediately subjected to a volatilizing operation with the addition of reducing agents and materials such as alk. earths to bind the remainder of the S present in the residue; waste gases from the preliminary roasting furnace may be combined with gases from the volatilization furnace or gases from the latter may be conveyed through the roasting furnace and air may be added to assist oxidation and form sulfates if desired and the product may be subsequently lixiviated. The process is especially suitable for use in connection with the manuf. of electrolytic Zn and any Pb sulfate assocd. with the  $\text{ZnSO}_4$  remains as an insol. residue on lixiviation.

Smelting zinc ores. RICHARD L. LLOYD (to Dwight & Lloyd Metallurgical Co.) U. S. 1,709,135, April 16. Receptacles such as condensers for use in smelting Zn ores are formed mainly of  $\text{ZnO}$  bonded with  $\text{ZnSO}_4$ .

Iron ores. ALLMÄNNA INGENJÖRSBYRÅN H. G. TORULF. Fr. 649,273, Feb. 20, 1928. Fe ores which are not or only slightly magnetic in the natural state are transformed into magnetic ores, e. g., by reduction of  $\text{Fe}_2\text{O}_3$  to  $\text{Fe}_3\text{O}_4$ , and then enriched by a magnetic process. An app. is described.

Roasting sulfur-containing materials. F. KRUPP GRUSONWERK A.-G. Brit. 297,419, Sept. 21, 1927. A tubular rotary furnace is used for roasting S-contg. materials and that part of the furnace in which the greatest heat is generated is cooled to prevent sintering of the material. Air or water may be used for the cooling or the thickness of the furnace wall may be such as to facilitate loss of heat by radiation.

Metallurgical process. VACUUMSCHMELZE G. m. B. H. Fr. 648,205, Sept. 15, 1927. Metals are obtained from their oxides or sulfides by submitting the latter in the solid or molten state at a sufficiently high temp. to a vacuum for sufficient time for the decompn. of the compd.

Casting slag. L. F. J. C. A. THIBAUDIER and G. V. E. VAGNE. Brit. 298,046, March 31, 1928. Blast-furnace slag is cast in small pigs or lumps in molds mounted on a rotary table which presents the molds successively to the tapping orifice. An app. is described.

Apparatus (with pivoted mold halves) for casting metal articles. I. D. TRAVIS. Brit. 298,355, Sept. 22, 1927.

Apparatus for casting metal articles in permanent molds. CHARLES L. LEE and THOMAS C. VANDERKRIEF (to General Motors Research Corp.). U. S. 1,709,317, April 16. Mech. features.

Permanent mold for casting cup-shaped articles from aluminum alloys, etc. JAMES J. DUNN (to Permold Co.). U. S. 1,709,249, April 16. Structural features.

Casting hollow articles around a meltable core. HERBERT E. FIELD (to Wheeling

Mold & Foundry Co.). U. S. 1,710,534, April 23. The metal such as iron or steel which is to form the cast article is poured around a core of material (such as brass) of sufficiently lower m. p. that the material of the core is melted by heat from the casting and flows from the mold after the casting has solidified.

Cores for use in making hollow metal bars. R. S. HADFIELD. Brit. 297,522, July 7, 1927. Metal cores for use in rolling or forging hollow billets into hollow steel rods for making drills, rifles, revolvers, etc., are formed of Mn steel such as that known as "Hadfield's manganese steel" and may be coated with graphite or like material. Various details of mech. procedure are described.

Renovating foundry sand by action of an air current, a brushing device and a screen, etc. W. J. BELL. Brit. 298,396, Nov. 24, 1927. An app. is described. The sand under treatment may be further mixed with fresh sand, molasses, flour or other binders, water, etc.

Purifying light metals such as magnesium and aluminum. HERMAN E. BAKKEN (to American Magnesium Corp.). U. S. 1,710,398, April 23. In order to remove entrained impurities from a readily oxidizable light metal such as Mg or Al the metal in liquid state is passed through a porous mass of metal substantially insol. in the molten metal, e. g., through steel wool, which retains the impurities. An app. is described.

Treating metals. SIEGFRIED JUNCHANS. Fr. 648,638, Feb. 10, 1928. Unfinished substances of crystalline structure, particularly metals or alloys, are treated with Foucault currents produced by high frequency to modify the properties thereof.

Separating metals. I. G. FARBENIND. A.-G. Fr. 648,947, Feb. 14, 1928. Metals such as Fe, Ni and Co are sepd. from mixts. contg. them by forming the carbonyl compds. at a high temp. and high pressure of CO, and submitting the carbonyls to a dephlegmation, fractional distn. or other method of sepn.

Flux for melting metals. G. W. WARDLE. Brit. 297,635, Feb. 17, 1928. A flux suitable for use in melting Al and other non-ferrous metals comprises cryolite, crushed, heated to the fusion temp. and formed into blocks.

Apparatus for treating molten metals and alloys with purifying reagents. F. W. CORSALLI. Brit. 297,759, June 23, 1927. Intermixture with reagents such as C, Al, soda, etc., is effected by flowing the materials in successively reversed directions to subject them to impact in a described app. and then subjecting them to vibration in a collecting app.

Mechanical working of metals such as lead or aluminum alloys while heated. JAMES ROSENBERG (to Metal Forming Process, Inc.). U. S. 1,709,323, April 16. In forming articles such as printing plates or phonograph records, the metal used is sufficiently heated materially to reduce its resistance to change in form and the maximum pressure of a forming tool is maintained on the material for a sufficient time to cause it completely to conform with the contour of the tool, but the tool is removed before it is itself affected in form. An app. is described.

Centrifugal apparatus for purifying molten metals such as steel or iron. EDWARD R. HEWITT. U. S. 1,709,939, April 23.

Heat treating metals such as iron or steel. GES. FÜR INDUSTRIEGASVERWERTUNG. Brit. 297,796, Sept. 28, 1927. The cooling stage is continued for the same length of time as that taken for the heating stage whether ordinary cooling agents such as water or oil or low-temp. cooling agents are used; when using water or oil, the cooling stage is interrupted from time to time. Use of liquid air as a cooling medium also is described.

Metallurgical furnace. HERMAN C. SIEBERT (to Bethlehem Steel Co.). U. S. 1,709,042, April 16. The fuel-supply valve of the furnace is controlled by a pyrometer in the furnace and the air-supply valve is controlled in accord with the compn. of the combustion products from the furnace. Various structural details are described.

Pot furnace suitable for melting metals. ADOLPH L. NELSON (to Bohn Aluminum & Brass Corp.). U. S. 1,710,234, April 23. Structural features.

Furnace (rotating on an inclined axis) for melting metals, etc. K. SCHMIDT GES (to K. Schmidt). Brit. 297,432, Sept. 21, 1927. The body of the furnace is in the form of an oblate spheroid and nozzles may be provided for blowing air into or onto the bath of metal. Various structural details are described.

Reversible regenerative furnace suitable for melting steel, etc. TOM WILSON (to Bethlehem Steel Co.). U. S. 1,710,242, April 23. Structural features.

Furnaces for sulfur ores. XAVIER DE SPIRLET. Fr. 648,097, Feb. 2, 1928. Construction of metallic scrapers.

Furnace for annealing metal sheets. WILLIAM ALFERINK (one-third each to Wilbert French and Joseph Weaver). U. S. 1,710,332, April 23. Structural features.

Furnace for the continuous treatment of steels or other magnetic materials. VIC-

TOR SORREL and LOUIS A. LAFONT. Fr. 649,268, Feb. 20, 1928. The pieces pass through the furnace under the influence of gravity and magnetic attraction.

**Blast supply for cupola furnaces.** CRIFFIN WHEEL CO. Brit. 297,715, April 20, 1927. Hot air is supplied to the zone of fusion of a remelting cupola at a plurality of points uniformly distributed around its circumference. Various structural features are specified.

**Air-cooled internal-combustion engine cylinders.** GLENN D. ANGLE and GEORGE E. A. HALLETT. U. S. 1,710,136, April 23. Various details are specified for bonding a steel cylinder lining to an Al head and casing carrying cooling flanges.

**"Rustless iron."** VERA B. BROWNE. U. S. 1,710,446, April 23. "Rustless iron" is prepd. by melting in a carbon-arc furnace a charge contg. a low-C Fe-Cr alloy, lime and Mn oxide, proportioned to yield a basic oxidizing slag capable of preventing substantial accession of C to the bath.

**Rustproofing iron and steel.** W. H. COLE. Brit. 298,328, Aug. 22, 1927. The process described in Brit. 289,906 (C. A. 23, 811) is carried out under superatm. pressure and at a temp. higher than the normal b. p. of the liquor used.

**Rust-preventing.** WILLIAM H. COLE. Fr. 648,106, Feb. 2, 1928. The process for proofing iron or steel against rust by treating it with a soln. of phosphates of Al, Zn, Fe or Cr is carried out under pressure at a temp. above the b. p. of the liquor in a stationary or movable autoclave. Cf. C. A. 23, 2415.

**Iron and steel.** ALBERT A. FREY. Fr. 648,235, Feb. 4, 1928. See Brit. 284,976, (C. A. 22, 4453).

**Pickling iron and steel.** L. B. SEBRELL (to Goodyear Tire & Rubber Co.). Brit. 298,390, Oct. 21, 1927. An inhibiting agent for addn. to acid pickling baths comprises the reaction product of an aldehyde with  $H_2S$  or alkali metal sulfide, such as may be prepd., e. g., by passing  $H_2S$  through a 40% soln. of  $CH_2O$  cooled to 0–10°.

**Steel.** HERMAN J. VAN ROYEN. Fr. 648,669, Feb. 11, 1928. See Brit. 285,814 (C. A. 23, 87).

**Steel.** THE INTERNATIONAL NICKEL CO. Fr. 649,214, Feb. 17, 1928. See U. S. 1,689,043 (C. A. 23, 87).

**Steel.** SCHWEIZ. IND.-GES. Swiss 129,352, Dec. 20, 1927. High-speed steel is hardened by heating in an elec. salt-bath and then plunging into a warm or cold bath of C-yielding material.

**Bessemer steel.** FRANK W. DAVIS (to Samuel G. Allen, trustee). U. S. 1,709,389, April 16. See Brit. 286,745 (C. A. 23, 1368).

**Steel ingots.** MIDWEST METALLURGICAL CORP. Fr. 648,146, Feb. 3, 1928. Formation of cavities in steel ingots is prevented by adding F compds. such as fluorspar (30–170 g. for 1350 kg. of steel) to the steel after flowing from the furnace or in the casting ladle or in the mold. Cf. C. A. 22, 2545.

**Apparatus for hardening and tempering steel.** HERBERT W. TINKER (to Federal Pressed Steel Co.). U. S. 1,709,160, April 16. A treating chamber for hardening and tempering automobile bumpers or springs or other steel articles by air and heat treatment has an artificially cooled bottom, side and top walls and specially formed air inlets which are described.

**Apparatus for case-hardening steel articles.** R. KAIER (to Singer Mfg. Co.). Brit. 298,132, Oct. 3, 1927.

**Apparatus for carburizing steel articles.** PETER CHAMBERS (to Security Mfg. Co.). U. S. 1,709,247, April 16. Structural details are described of an app. comprising a carburizing chamber and a briquet chamber arranged to communicate with each other so that gases from the briquet chamber effect carburization.

**Pot for holding carburizing baths of cyanide or other materials.** FREDERICK K. LANDGRAF and EDWARD S. FITZSIMMONS (to Flannery Bolt Co.). U. S. 1,709,729, April 16. The pot is formed of an inner layer of metal such as wrought iron or low-C steel which is resistant to the action of the contents of the pot and with an outer layer of metal such as a Cr-Fe-Ni alloy which is resistant to the action of heat. One of the layers is formed *in situ* by united beads of metal deposited by a welding operation.

**Thin metal foil.** CARL MÜLLER (to Karl Mey). U. S. 1,709,801, April 16. A foil-forming layer, which may be made from Ni by electrodeposition, is placed or formed between 2 layers of other material such as 2 Cu layers. The foil is formed by stamping or other mech. treatment and then the outer layers are removed by molecular decompn. (suitably by the action of an ammoniacal electrolyte in the case of layers of Cu); the outer protective layers are sufficiently thin as to avoid detrimental stress being exerted on the foil layer on their removal.

**Tin from cassiterite.** E. A. ASHCROFT. Brit. 297,784, June 24, 1927. Cassiterite

is heated with reducing agents comprising powdered iron, Al or Mg or powdered alloys of Fe and Sn, Ni and Sn or Ni, Fe and Sn. The Fe used may be produced *in situ* from Fe oxide and carbonaceous material, and when Fe is used the temp. is not allowed to exceed 900° to prevent sintering or slagging of the charge.

**Coating metals.** COMPAGNIE FRANÇAISE POUR DES L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 649,387, Dec. 31, 1927. Fe or steel, before plating with a metal such as Ni which readily alloys with the Fe on heating, is coated with a metal such as Cu which does not alloy so readily; after the 2nd coating the metal is heated in an inert or reducing atm. to the alloying temp. The Ni coating may be heavier than the Cu. Cr or W may also be coated on to a layer of Cu, and Ni on Ag, Ni on Cr, W on Ni or Cr on W.

**Treating ferrous metals from corrosion.** G. NOBILLEAU and J. GUIPET. Brit. 297,832, Sept. 29, 1927. Articles such as those of iron or steel are embedded in a mixt. of ZnCO<sub>3</sub>, powdered Zn, BaCO<sub>3</sub> and SiO<sub>2</sub> in boxes and the boxes and contents are heated in a gas or salt-bath furnace to a temp. somewhat below the m. p. of Zn. The articles may be suitably cleaned before this treatment, by successive treatment with boiling KOH soln., warm water and a 10% H<sub>2</sub>SO<sub>4</sub> soln.

**Surface treatment of magnesium or its alloys to form a protective coating.** EDWARD C. BURDICK (to Dow Chemical Co.). U. S. 1,709,894, April 23. The surface of articles is treated with a di-H phosphate such as that of Na or Mg.

**Apparatus for tinning brass strips, etc.** E. W. TAYLOR. Brit. 297,961, Sept. 15, 1927.

**Treating tinned scrap iron.** A. DOSSMANN. Brit. 298,103, June 29, 1927. The scrap is subjected to a preliminary pickling to remove Zn and then treated with a hot NaOH soln. contg. a sol. carbohydrate material such as molasses for removal of insol Pb compds. still adhering to the material. The cleaned scrap is then formed into briquets of such a d. that the penetration of the heating gas, during the subsequent heating which welds the briquets into billets, is reduced to a minimum. Substances which neutralize the oxidizing effect of the heating gases or reduce the oxides on the scrap, such as lubricating oils, smoke black, C<sub>10</sub>H<sub>8</sub>, or fluxes, etc., may be added to the scrap before or after its formation into briquets.

**Detinning tinned scrap.** T. TWYNAM. Brit. 297,528, July 11, 1927. Tinned scrap is immersed in HCl dild. with 3 or 4 times its vol. of water and heated, suitably to about 80-90°, to form a soln. of SnCl<sub>2</sub> practically free from Fe. The Sn may be pptd. from the soln. by use of Zn, and waste pickle liquor may be used as the source of the HCl for the process in which case either the Fe present or both the Sn and Fe may be electrolytically recovered. Lump coke may be added to accelerate the action of the HCl on the scrap. An app. is described.

**Aluminum alloy.** SAMUEL DANIELS. U. S. 1,710,148, April 23. An alloy which is suitable for use in aircraft or engine construction comprises Al together with Cu 2.25-3.0, Fe 0.75-1.5% and a "few tenths of a per cent" each of Mg and Si (the ratio of the Mg to Si being about 1.7 to 1.0).

**Magnetic alloys.** PAUL P. COFFI (to Bell Telephone Laboratories). U. S. 1,708,936, April 16. In order to obtain substantially constant permeability in a Ni-Fe-Co alloy over a wide range of field intensities, the alloy is heated (suitably to about 700-1100°) and while cooling is subjected to a field for substantially neutralizing the magnetizing effect of extraneous fields acting on the alloy.

**Magnetic alloys of cobalt and iron.** BELL TELEPHONE LABORATORIES. Brit. 297,938, Aug. 29, 1927. Magnetic alloys of high permeability contain iron and 40-60% Co and are heat treated to give them a permeability above that of Armco iron at a corresponding magnetizing force (suitably by heating at about 1100° 2-3 hrs. and then slowly cooling).

**Heat-resistant ferrous alloys.** H. G. A. VON KANTZOW. Brit. 298,408, Dec. 10, 1927. Fe alloys are formed contg. Al 0.5-14% and up to 6% of Co or of Co and Ti together, with or without addn. of Cr up to 30% or Mn up to 12% or both.

**Alloy of molybdenum, nickel and iron.** FREDERICK M. BECKETT (to Electro Metallurgical Co.). U. S. 1,710,445, April 23. An alloy which is acid-resistant comprises Ni at least 40, Mo 15-40 and a quantity of Fe not less than 10% nor greater than 5 times the amt. by which the Mo % exceeds 10.

**Iron alloys.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 649,369, Oct. 21, 1927. Hard alloys of Fe with at least 10% of W or Mo and not more than 0.1% of C are obtained by heating the metals closely assoc. to a temp. at which a solid soln. of W or Mo in the Fe is produced, then cooling rapidly and afterward heating to, and maintaining at, an intermediate temp. at which a pptn.

of a compd. contg. a relatively high proportion of the hardening metal takes place. Thus, an alloy contg. 10–14% of W is obtained by heating to about 1,500° in an atm. of H, cooling in water and afterwards heating to 700° for 10 hrs.

**Iron alloys.** TURK R. HAGLUND. Fr. 648,538, Feb. 8, 1928. Alloys of Fe or steel with Cr or Mn are obtained by the reduction of ores, etc., contg. oxides of Fe with the addn. of excess of an alloy of Cr or Mn, the excess being used for reduction of part or all of the Fe, a slag being obtained which is rich in oxides of Cr or Mn. Other reducing agents may also be used.

**Iron alloys.** THOMPSON PRODUCTS, INC. Brit. 298,250, April 8, 1927. Fe alloys contg. Cr, Ni, Si and C are obtained in non-austenitic form by heating to about 870–900° for more than 1 hr. and cooling slowly at the rate of not more than 28° per hr. for more than 3 hrs. Various details are given.

**Steel alloys.** F. KRUPP A.-G. Brit. 297,420, Sept. 21, 1927. Steel alloys are formed contg. Mn 9–17, C 0.8–1.7 and Al up to 5%, and other metals such as Ni, Cr, W, Mo or V also may be added.

**Alloy steel for rails.** GRANULAR IRON CO. Brit. 298,118, April 2, 1927. Iron produced as described in Brit. 284,040 (C. A. 22, 4101) is melted and combined with C and Mn in such proportions that the finished steel contains C 0.6–0.9 and Mn 0.7–1.25%.

**Material for use in making tungsten-containing alloy steels.** HILAND G. BACHELLER and JESS D. KELLEY (to Ludlum Steel Co.). U. S. 1,709,817, April 16. A frangible conglomerate suitable for use in making W-contg. alloy steels comprises partially reduced W oxide and slag material comprising fixation combinations of impurities such as Mn, Sn and As with soda or soda ash which do not enter the steel when the conglomerate is used in the steel-making process.

**Silver alloys.** I. G. FARBERIND. A.-G. Brit. 298,122, June 30, 1927. Ag alloys are formed contg. up to 22% of a mixt. of Mn with one or more of the elements Ti, Mg, Zn, As, Sb, Bi or Sn, or a mixt. of Mn, Ti and Si with one of the specified addns., or a mixt. of Mn and Si with As, Sb, Bi or Mg.

**Silver alloys resistant to chemical action.** I. G. FARBERIND. A.-G. Brit. 297,665, June 30, 1927. Ag, at least 78%, is alloyed with up to 22% of Ti or a mixt. of Ti with one or more of the elements Mg, Zn, As, Sb, Bi, Sn or Si. Cf. C. A. 23, 2414.

**Removing scale from metal bars and plates.** S. WILLIAMS. Brit. 297,526, July 8, 1927. An app. is described by which the material, while supported on a table with all surfaces exposed, is subjected to a water spray or sheet which moves across the table with a varying trajectory.

**Cooling tank for annealing copper wire.** R. SOBELIN. Belg. 352,807, Aug. 31, 1928. Constructional features.

**Electrodes for arc welding.** ALLOY WELDING PROCESSES, LTD. Fr. 648,545, Feb. 8, 1928. Electrodes for welding Al or alloys of Al consist of a core of Al or alloy coated with a flux contg. a reducing agent such as C, charcoal or sawdust so as to form a reducing atm. round the arc. The flux may also contain alkali chlorides, fluorides, borates, bisulfates, etc. The ingredients are ground to a fine powder and made into a paste with water which may contain dextrin, etc.

**Welding long seams of pipes, etc., by use of alternating electric current.** J. F. LAWSON. Brit. 298,273, July 8, 1927. An app. and various mech. features are described.

**Welding copper wires or rods.** BELL TELEPHONE LABORATORIES, INC. Brit. 297,493, June 23, 1927. The abutting surfaces of the parts are heated to above the welding temp., then cooled to welding temp. and percussively engaged with each other. An app. is described.

**Welding rod.** JOHN B. HAWLEY, JR. U. S. 1,709,474, April 16. A rod suitable for welding Cu to steel comprises a solid core which may be formed of solid Cu, a flux such as borax glass covering the core, and a metal jacket which may be formed of phosphor bronze around the flux with annular grooves rolled in the jacket to form pockets which serve to hold the flux.

**Solder flux.** JOHN D. RAYMOND. U. S. 1,709,542, April 16. HCl 3, oleic acid 2, rosin 2 and NaCl 1 part.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

**Synthesis of aromatic hydrocarbons from methane at atmospheric pressure and without catalysts.** F. FISCHER. *Brennstoff-Chem.* 9, 309-16(1928); cf. *C. A.* 23, 1119.—Pure  $\text{CH}_4$  from various sources and  $\text{CH}_4$  with other gases (coal gas) is decompd. by passage through porcelain or quartz tubes heated  $900^\circ$  to  $1200^\circ$ . The tar formed is pptd. by a Cottrell precipitator and light oils are absorbed by active charcoal. The time of contact is fully as important as the temp. *E. g.*, 346 l.  $\text{CH}_4$  (89% with 8%  $\text{N}_2$ ) passed through the 1-mm. annular space between concentric 14- and 16-mm. tubes 22 cm. long at 63 l./hr. gave 7-g. oil, 3-g. tar and 0.2-g. C. Higher temps. with the same gas flow favor pptn. of C. Tar and oil do not form to an appreciable extent below  $900^\circ$ . The tar is aromatic, naphthalene, anthracene and phenanthrene being isolated. The oils contain mostly benzene with xylene and  $\text{C}_{10}\text{H}_8$ .  $\text{SiO}_2$ , W, Mo and Sn as catalysts did not favor oil yields; Fe, Cu and graphite favored C pptn. J. D. DAVIS

**Autoxidation of hydrocarbons.** P. DUMANOIS AND P. MONDAIN-MONVAL. *Ann. office nat. comb. liquides* 3, 761-78; *Compt. rend.* 187, 892-4(1929).—Mixts. with air of  $\text{C}_5\text{H}_{12}$ ,  $\text{C}_6\text{H}_{12}$  contg. 0.11% of  $\text{PbEt}_4$ , and  $\text{C}_6\text{H}_6$  are heated at temps. from  $20^\circ$  to  $300^\circ$  in a rotating cylindrical steel bomb of 700-cc. capacity under an initial pressure (at  $20^\circ$ ) of 5.3 kg. above atm. The temps. are measured by a Hg thermometer inserted into a specially constructed well in the axle of rotation which extends to the center of the bomb. No ignition takes place at temps. below  $300^\circ$  when the quantity of  $\text{C}_6\text{H}_{12}$  is about 10% less than the calcd. amt. for complete combustion. But with 0.5 cc. (the amt. of liquid  $\text{C}_6\text{H}_{12}$  calcd. as necessary for complete combustion) up to 10 cc., the curve connecting rise in temp. with pressure is at first practically linear, it bends at  $120^\circ$  corresponding to a less rapid rise in pressure, and continues in nearly a straight line until at  $10$ - $15^\circ$  below the ignition temp. the pressure increases very rapidly. The ignition temps. decrease from  $238^\circ$  to about  $220^\circ$  and the explosions of the  $\text{C}_6\text{H}_{12}$ -air mixts. become less violent as the proportion of  $\text{C}_6\text{H}_{12}$  increases. D. and M.-M. suggest that the less rapid rise of pressure above  $120^\circ$  may be due to the partial formation of oxygenated compds. of hydrocarbons analogous to the peroxides detected by Moureu and Dufraisse. In the presence of 0.11% of  $\text{PbEt}_4$  spontaneous ignition occurs below  $300^\circ$  only when the proportion of  $\text{C}_6\text{H}_{12}$  is above that required for complete combustion. The  $\text{PbEt}_4$  causes the bend in the curve to be less marked. Ignition is preceded by a slight increase in pressure and occurs at temps. which, for the same proportion of  $\text{C}_6\text{H}_{12}$ , are higher than when  $\text{PbEt}_4$  is absent ( $251$ - $230^\circ$  in comparison with  $238$ - $220^\circ$ ). The curves obtained for 1-5 cc. of  $\text{C}_6\text{H}_6$  under the same conditions of expt. show no particular bends, and no ignition takes place below  $300^\circ$  R. E. SCHAAD

**Production of isomers in the formation of the double bond by the dehydration of substituted alcohols.** WM. CHALMERS. Univ. of Brit. Columbia. *Trans. Roy. Soc. Can.* [3], 22, III, 69-78(1928); cf. *C. A.* 21, 2663.—A theoretical study of the dehydration compds. of secondary alcs. and an exptl. study of the formation of isomers in dehydrating chlorohydrins. All possible isomers are to be expected in some proportion, Saytzeff's rule notwithstanding. Steric hindrance phenomena were observed in the reaction of NaI with Cl-derivs. of  $\text{Me}_2\text{C}:\text{CHMe}$  and  $\text{Me}_2\text{C}:\text{CMe}_2$ . Apparently in a series of substituted alcs. a H atom will sep. most easily from the following groups in the order given:  $\text{CH}_3\text{CO}_2\text{H}$ ,  $\text{CH}_3\text{OEt}$ ,  $\text{CH}_3\text{Ac}$ ,  $\text{CH}_3$ ,  $\text{CHO}$ ,  $\text{CH}_3\text{CO}_2\text{Me}$ ,  $\text{CH}_2\text{Cl}$ , iso-Pr, iso-Bu, Et, Me. Saytzeff's rule is incapable of foretelling what isomer will be produced in the dehydration of compds. contg. the  $\text{ClCH}_2$  group. Dehydration of  $\text{ClCH}_2\text{C}(\text{OH})\text{MeEt}$  by distn. over anhyd. ( $\text{CO}_2\text{H}$ ), gave a mixt. of 44%  $\alpha$ -chloro- $\beta$ -methyl- $\Delta^2$ -butene, b.  $96$ - $7^\circ$ ,  $d_4^{20}$  0.9170, 15% *trans*- $\beta$ -chloromethyl- $\Delta^2$ -butene and 41% of *cis*- $\beta$ -chloromethyl- $\Delta^2$ -butene and  $\beta$ -chloromethyl- $\Delta^2$ -butene.  $\text{PCl}_5$  acting on *as*-methyl-*ethylethylene* oxide gives a mixt. of chloroamylenes and  $\alpha,\beta$ -dichloro- $\beta$ -methylbutene, b.  $133$ - $5^\circ$ ,  $d_4^{20}$  1.0785. Dehydration of  $\alpha$ -chloro- $\beta,\gamma$ -dimethylbutan- $\beta$ -ol, b.  $162$ - $4^\circ$ ,  $d_4^{20}$  1.049, gave 48%  $\alpha$ -chloro- $\beta,\gamma$ -dimethyl- $\Delta^2$ -butane, 20%  $\gamma$ -methyl- $\beta$ -chloromethyl- $\Delta^2$ -butene, and 32%  $\gamma$ -methyl- $\alpha$ -chloromethyl- $\Delta^2$ -butene. *as*-Methyl-*isopropylethylene* oxide, b.  $100$ - $1^\circ$ ,  $d_4^{20}$  0.8261. This oxide and the chlorohydrin (given above) have not been prepd. before. J. W. SHIPLEY

**Allylic transposition and addition compounds of erythronic hydrocarbons. I. Theoretical.** CHARLES PRÉVOST. *Ann. chim.* [10], 10, 113-46(1928).—P. has corrected the previously published work and his own results (*C. A.* 21, 3598; 22, 579, 2737;

3, 371) on the basis of his ionic theory of tautomerism. *Synonimie* of mobile groups (X) in the structure X-A-B-C is explained by ionization. **II. Experimental part** (1) **Preparation, allylic transposition and dehydration of vinylcarbinols.** *Ibid* 147-81.—Addn. of 1.2 moles of RBr in 5 vols. of Et<sub>2</sub>O to 25 g. of Mg in 200 cc. of Et<sub>2</sub>O at -10°, followed by 0.9 mole of pure *acrolein* (I) in 5-6 vols. of Et<sub>2</sub>O during 3-4 hrs. produced 16 g. compds. which were hydrolyzed after 18 hrs. standing to give the following yields of carbinols: *methylvinyl* (II) 60%, *ethylvinyl* (III) 65%, *propylvinyl* (IV) 60%, *butylvinyl* (V) 45%, *ethylpropenyl* (VI) 70% from *crotonaldehyde* instead of I. Dehydration of II over Al<sub>2</sub>O<sub>3</sub> gave *1,3-butadiene* and some isomerization to *2-butenol* (VII). With PBr<sub>3</sub> and C<sub>6</sub>H<sub>5</sub>N, II gave *1-bromo-2-butene* (VIII) which upon hydrolysis with dil. KOH gave 60% of II and 40% of VII and upon treatment with alc. KOH or EtONa gave *1-ethoxy-2-butene* and a small quantity of *3-ethoxy-1-butene*. With dil. HCl, partial isomerization of II took place, giving VII and in addn. the following ethers: *di[1-vinylethyl]* (IX), b. 123-5°, d<sub>4</sub><sup>20</sup> 0.7975, n<sub>D</sub><sup>20</sup> 1.4185; *2-butenyl[1-vinylethyl]* (X), b. 133-5°, d<sub>4</sub><sup>22</sup> 0.8075, n<sub>D</sub><sup>22</sup> 1.4245; and *di[2-butenyl]* (XI), b. 143-4°, d<sub>4</sub><sup>22</sup> 0.8138, n<sub>D</sub><sup>22</sup> 1.4275. The quantities of these ethers present in the mixt. were in the ratio 2:6:2. Esterification of II with AcOH (catalyzed by HCl) gave the corresponding *acetate*, b. 112°; with Cl<sub>3</sub>CCO<sub>2</sub>H, II gave *trichloroacetates* of II (55%), b<sub>12-5</sub> 74.0-4.5°, d<sub>4</sub><sup>22</sup> 1.2990, n<sub>D</sub><sup>22</sup> 1.4588, and of VII (45%), b<sub>12-5</sub> 89-9.5°, d<sub>4</sub><sup>22</sup> 1.3130, n<sub>D</sub><sup>22</sup> 1.4710, together with small quantities of IX and X. Hydrolysis of these acetates was normal resulting in the corresponding alcs. With PBr<sub>3</sub> and C<sub>6</sub>H<sub>5</sub>N, com. *geraniol* gave an unidentified *hydrocarbon*, b<sub>3</sub> 34°, b<sub>12</sub> 62°, d<sub>4</sub><sup>22</sup> 0.8175, n<sub>D</sub><sup>22</sup> 1.4780, and a *bromide* (XII), b<sub>12</sub> 101-2°, d<sub>4</sub><sup>22</sup> 1.0940, n<sub>D</sub><sup>22</sup> 1.4858, which decompd. upon distn. to yield a *hydrocarbon* (XIII), b<sub>12</sub> 65°, d<sub>4</sub><sup>22</sup> 0.8340, n<sub>D</sub><sup>22</sup> 1.4784. With NaOAc, XII gave XIII and also an *acetate*, b<sub>12</sub> 115°, d<sub>4</sub><sup>22</sup> 1.0004, n<sub>D</sub><sup>22</sup> 1.4500. Com. *linalool* gave XII together with a *hydrocarbon*, b<sub>3</sub> 37°, b<sub>12</sub> 100°, d<sub>4</sub><sup>22</sup> 0.8477, n<sub>D</sub><sup>22</sup> 1.4815. Over Al<sub>2</sub>O<sub>3</sub> at 360°, III gave 70% of *1,3-pentadiene*, b. 138-9°, d<sub>4</sub><sup>20</sup> 0.6830, n<sub>D</sub><sup>20</sup> 1.4280 (*tetrabromide*, m. 114°); isomers and 20% of *2-pentenol*, b. 138-9°, d<sub>4</sub><sup>20</sup> 0.8468, n<sub>D</sub><sup>20</sup> 1.4299, and other products, b. 118-250°. Under these conditions, IV gave *2-hexenol*, b. 154-6°; *1,3-hexadiene*, b. 72-5°, d<sub>4</sub><sup>13</sup> 0.7152, n<sub>D</sub><sup>12</sup> 1.4416 (*tetrabromide*, m. 91°); *2,4-hexadiene* (XIV), b. 82°, d<sub>4</sub><sup>22</sup> 0.7179, n<sub>D</sub><sup>22</sup> 1.4490 (*tetrabromide*, m. 185°), and an *isomer*, b. 77-8°, d<sub>4</sub><sup>13</sup> 0.7167, n<sub>D</sub><sup>12</sup> 1.4450 (*tetrabromide*, m. 162°). Dehydration of VI with ZnCl<sub>2</sub> at 100° gave XIV, *isomers* and *polymers*, the latter having unsatn. equiv. to about 1.45 C:C per C<sub>6</sub>. Dehydration of VI over Al<sub>2</sub>O<sub>3</sub> gave about 2% of XIV. An unidentified mixt. of isomeric hydrocarbons was obtained from V over Al<sub>2</sub>O<sub>3</sub>.

A. S. CARTER

The allylic transposition and the additive derivatives of the erythreic hydrocarbons. **III. Experimental part.** (2) Some derivatives of the erythreic hydrocarbons; some transpositions. CHARLES PRÉVOST. *Ann. Chim.* [10], 10, 356-439 (28).—This paper (cf. preceding abstr.) gives special attention to the exptl. details, a considerable no. of constts., some of which are new, the others being corrections. Possible stereochem. constitutions are listed. CH<sub>2</sub>:CHCH:CHCH<sub>3</sub> yields a solid *tetrabromide*, m. 114°, together with a liquid, b<sub>3</sub> 121-31°, d<sub>4</sub><sup>18</sup> 2.3195, n<sub>D</sub><sup>18</sup> 1.5915. MeCH:CHCH:CHMe yields the known *tetrabromide*, m. 185°, together with the 2 *tetrabromides*, m. 108° and 162°, and a mixt. of liquid *tetrabromides*, b<sub>3</sub> 128-33°, d<sub>4</sub><sup>16</sup> 1.5930, n<sub>D</sub><sup>16</sup> 1.5831; the *tetrabromides* m. 95-7° and 64-5° were never encountered. MeCBrCBr:CHMe has d<sub>4</sub><sup>22</sup> 1.8225, n<sub>D</sub><sup>22</sup> 1.5630. MeCH:CBrCBr:CHMe, b<sub>12</sub> 83-6°, d<sub>4</sub><sup>22</sup> 1.6700, n<sub>D</sub><sup>22</sup> 1.5400, treated with an excess of Br yields MeCHBrCBr:CBrCHBrMe, b. 12-3°. MeC≡CC≡CH, b. 54-6°, d<sub>4</sub><sup>21</sup> 0.7375, n<sub>D</sub><sup>21</sup> 1.4431, while ethyl- and propylstyrene have only been obtained as their Ag derivs. PhC≡CC≡CMe, m. 22.45°, b. 29°, d<sub>4</sub><sup>18</sup> 0.9745, n<sub>D</sub><sup>18</sup> 1.6368, adds only 2 mols. Br, yielding two *tetrabromides*, b. 27-31° and 98°, resp.; treated with aq.-alc. HgCl<sub>2</sub>, it yields PhCIC:C(HgCl)C(HgCl):CHMe. The *dibromides* of CH<sub>2</sub>:CHCH:CHMe, b<sub>11</sub> 70°, d<sub>4</sub><sup>18</sup> 1.6992, n<sub>D</sub><sup>18</sup> 1.5477 and b<sub>11</sub> 85-6°, d<sub>4</sub><sup>15</sup> 1.7482, n<sub>D</sub><sup>15</sup> 1.5523, resp.; these *dibromides* yield two *dibromides*, b<sub>11</sub> 112-5°, d<sub>4</sub><sup>23</sup> 1.0446, n<sub>D</sub><sup>23</sup> 1.4398, and b<sub>13</sub> 104-5°, d<sub>4</sub><sup>21</sup> 1.0386, n<sub>D</sub><sup>21</sup> 1.4365, the latter being probably the diacetate of EtCH:C(OH)CH<sub>2</sub>OH. The *dibromide* b<sub>12</sub> 87-8°, on hydrolysis yields 3 *glycols*, b<sub>14</sub> 109°, d<sub>4</sub><sup>17</sup> 1.0147, n<sub>D</sub><sup>17</sup> 1.4633, b<sub>14</sub> 117-109°, d<sub>4</sub><sup>17</sup> 1.4790, n<sub>D</sub><sup>17</sup> 1.4898, b<sub>14</sub> 120-109°, d<sub>4</sub><sup>20</sup> 1.4575, n<sub>D</sub><sup>20</sup> 1.4775. MeCH:CHCH:CHMe, b<sub>12</sub> 87-8°, on hydrolysis yields 3 *glycols*, b<sub>14</sub> 109°, d<sub>4</sub><sup>17</sup> 1.0147, n<sub>D</sub><sup>17</sup> 1.4633, b<sub>14</sub> 117-109°, d<sub>4</sub><sup>17</sup> 1.4790, n<sub>D</sub><sup>17</sup> 1.4898, b<sub>14</sub> 120-109°, d<sub>4</sub><sup>20</sup> 1.4575, n<sub>D</sub><sup>20</sup> 1.4775.

CHMe, two diacetates are obtained,  $b_{14}$  117–8°,  $d_4^{21}$  1.0247,  $n_D^{21}$  1.4460 (60% yield) and  $b_{14}$  106–9°,  $d_4^{21}$  1.0210,  $n_D^{21}$  1.4390 (35% yield). The corresponding glycols are, resp.: *trans*-MeCH(OH)CH:CHCH(OH)Me,  $b_{11}$  117–8,  $d_4^{21}$  0.9865,  $n_D^{21}$  1.4660, and MeCH(OH)CH(OH)CH:CHMe,  $b_{11}$  99–100,  $d_4^{21}$  0.9838,  $n_D^{21}$  1.4614. By the action of an excess of finely powd. KOH on the appropriate glycol in Et<sub>2</sub>O satd. with Br, the

following substituted erythrene oxides are obtained:  $\text{O} \cdot \text{CHMe} \cdot \text{CHCH} \cdot \text{CH}_2 \cdot \text{O}$ , b.

146°,  $d_4^{17}$  1.0813,  $n_D^{17}$  1.4382;  $\text{O} \cdot \text{CHMe} \cdot \text{CH}_2 \cdot \text{CH} \cdot \text{O} \cdot \text{CH} \cdot \text{CH}_2$ , b. 145°; a mixt. of

the stereoisomers of  $\text{O} \cdot \text{CHMe} \cdot \text{CHCH} \cdot \text{CHMe} \cdot \text{O}$ , b. 161°,  $d_4^{21}$  1.0312,  $n_D^{21}$  1.4375;

$\text{MeCH} \cdot \text{CH} \cdot \text{O} \cdot \text{CH} \cdot \text{CHMe}$ , b. 151°,  $d_4^{21}$  1.0373,  $n_D^{21}$  1.4350. By hydration, these

compds. yield erythritols, methylerythritol, m. 109.5°, and 1,4-dimethylerythritol, m. 172°.  $\text{BrH}_2\text{CCH:CHCH:CHCH}_2\text{Br}$  yields a mixt. of diacetates,  $b_{13}$  129–31°,  $d_4^{21}$  1.0700,  $n_D^{21}$  1.4760: they correspond to the glycols  $\text{CH}_2\text{:CHCH:CHCH(OH)CH}_2\text{OH}$  and  $\text{CH}_2\text{:CHCH(OH)CH:CHCH}_2\text{OH}$ . At the same time, another diacetate, m. 25°,  $d_4^{21}$  1.0762 (supercooled),  $n_D^{21}$  1.4350, is obtained: it corresponds to  $\text{CH}_2(\text{OH})\text{CH:CHCH:CHCH}_2\text{OH}$ . The spontaneous decompn. of  $\text{Me}_2\text{BrCCH:CHCBrMe}_2$  seems to yield  $\text{BrH}_2\text{CC(Me):CHCH:CMe}_2$ ,  $b_3$  64–7°,  $d_4^{18}$  1.2230,  $n_D^{18}$  1.5522; this is converted into the acetate,  $b_3$  77–9°,  $d_4^{18}$  0.9570,  $n_D^{18}$  1.4890; the latter hydrolyses to  $\text{Me}_2\text{C:CHCH:C(Me)CH}_2\text{OH}$ ,  $b_4$  77–8°,  $d_4^{17}$  0.9197,  $n_D^{17}$  1.5095, which is reduced to  $\text{Me}_2\text{CHCH}_2\text{:CH}_2\text{CH(Me)CH}_2\text{OH}$ .

ALBERT L. HENNE

**The preparation of allyl alcohol.** RAYMOND DELABY and PIERRE DUBOIS. *Compt. rend.* 188, 710–1(1929); cf. *C. A.* 23, 1107, 1867. The previous paper has shown that good yields of alc. are dependent upon the formation of the *disformate of glycerol*. This paper gives the exact conditions of temp., pressure and time necessary to obtain max. yields of this ester, and for its conversion into allyl alc. by heat. Yields are 70%, 15% higher than previous reports.

VALENTINE F. HARRINGTON

**Hydroxycitronellol.** R. SORNET. *Rev. chim. ind.* 38, 34–7(1929); cf. *C. A.* 22, 2738, 2754, 3113, 3417.—Hydroxycitronellol prepd. by 3 methods is odoriferous in one case only. S. attributes this to the position of the HO group, the tertiary compd. being odoriferous and the secondary odorless. The relative quantity of each depends on the concn. of the acid and the temp. during hydroxylation. The odoriferous compd. is more viscous and the b. p. is lower by 2° or 3°,  $b_{14}$  148–152°. Details are given for the prepn. in the lab. with abs. alc.; this is not practical on a large scale. S. has worked out a com. process but does not reveal the procedure. The odor of hydroxycitronellol is not immediately noticeable after distn. but develops on standing.

P. THOMASSET

**The so-called arachic acid and other acids of high molecular weight from peanut oil.** D. HOLDE, W. BLEYBERG and I. RABINOWITSCH. *Tech. Hochschule Berlin. Ber.* 62B, 177–83(1929).—Ehrenstein and Stuewer believe that Gossmann's "arachic acid," m. 74.5–5°, is isobehenic acid, m. 74.5°, while Cohen claims that the "crude arachic acid" is a mixt. of eicosanic acid, m. 74.5–5°, and lignoceric acid, m. 80.5°. The object of the present work was to clear up this lack of agreement. The com. peanut oil acids used as raw material were worked up as already described (*C. A.* 20, 1590) by combined high vacuum distn. and recrystn. of the acids or their esters and fractional pptn. of the Li salts. The presence of a docosanic acid (denied by C.) was established beyond doubt but mixed m. p. detns. showed that, contrary to E. and S., it is *n*-, not isobehenic acid. There were also obtained small quantities of an acid (I) with a mol. wt. (323–4) corresponding to  $\text{C}_{21}\text{H}_{42}\text{O}_2$ , whose homogeneity seemed established by the constancy of its m. p. (69–70°) and mol. wt. after pptn. with Li and repeated recrystn. but in view of the considerably higher m. p. (75–6°) given by Levene and Taylor for synthetic heneicosanic acid, I needs to be characterized more sharply. The eicosanic acid, whose presence in peanut oil was definitely proven by C., was entirely or almost entirely absent from the authors' "crude arachic acid," m. 73°, freed of unsatd. and lower satd. acids, but they believe it remained in the lower acids sep'd. by crystn. As regards the acid  $\text{C}_{20}\text{H}_{40}\text{O}_2$ , m. 79°, found by Holde and Godbole in Indian peanut oil, the highest fraction of the acids in the present work yielded 1.3 g.

of an acid of almost the same m. p. (78–8.8°) but whose mol. wt. (381–4) pointed rather to the compn.  $C_{20}H_{16}O_2$ . Although fractional pptn. with LiOAc effected no detectable sepn., cautious high vacuum distn. yielded a residue which, after 3 crysts. from  $C_6H_6$  and  $Me_2CO$ , m. 81–2.4° and showed a mol. wt. of 390. By analogy with the arachic and behenic acids, this acid is probably also of the normal series, although L. and T. give 88–9° as the m. p. of the synthetic acid. The m. ps. of some of L. and T.'s synthetic acids are strikingly higher than the values hitherto reported for the natural products; this may be due in part to the rapidity of heating (10° per min.) in their m. p. detns. C. A. R.

The mechanism of the reaction between mixed Grignard reagent and *N*-disubstituted crotonamides. NICOLAS MAXIM. *Bul. soc. chim. Romania* 10, 97–115 (1928).— $MeCH:CHCONEt_2$  (I),  $b_{23}$  113°,  $b_{766}$  224°, and  $MeCH:CHCONPh_2$  (II), m. 113–4°, were prepd. nearly quant. by dropping the acid chloride into the corresponding amine (1 mol. chloride in 200 cc. of benzene and 2 mols. amine in 500 cc. benzene). The *crotonyl chloride* was prepd. in 95% yield by heating the acid with  $SOCl_2$  (20% excess) for 4 hrs. at 60°.  $EtMgBr$  (III) and  $PhMgBr$  (IV) with I and II give complexes by 1,4-addn. These by hydrolysis with 20% KOH give enol forms which immediately give a satd. acid amide (following abstr.) exactly as with cinnamic acid (C. A. 22, 4114). I and III give quant.  $\beta$ -methylvaleric diethylamide (V),  $b_{23}$  123°,  $b_{766}$  224°. I and IV give 2 fractions, the one, b. 180–200°, yields 80%  $\beta$ -phenylbutyric diethylamide (VI),  $b_{23}$  184–5°. II and III give quant.  $\beta$ -methylvaleric diphenylamide (VIII), m. 76°,  $b_{18}$  267°. In the above condensations the Grignard and the amide are refluxed 4 hrs. After 12 hrs. excess 20% HCl is added, then  $NaHCO_3$ . The mixt. is dried with  $Na_2SO_4$ . VII and VIII are hydrolyzed by 40% HBr to give racemic acids. V and VI are not sapond. Quant. methods for prepg. substituted satd. acids and their amides are given. VALENTINE F. HARRINGTON

The mechanism of the reaction of Grignard reagents on *N*-disubstituted cinnamic anilides. N. MAXIM AND N. IOANID. *Bul. soc. chim. Romania* 10, 116–26 (1928).—Grignard reagents give with *N*-disubstituted cinnamic anilides (I) after hydrolysis either satd. acids or unsatd. ketones, depending on the reagent used (cf. C. A. 22, 4114).  $EtMgBr$  or  $PhMgBr$  gives only the former, but  $MeMgI$  gives the latter in 25% yield (cf. preceding abstr.). This last reaction can be only 1,2-addn. The first may be either 1,4 or 3,4. To decide this the I are condensed with  $PhMgBr$ , then with  $AcCl$ . Sapon. of 2 g. of this product with 20 g. of 20% alc. KOH gives the alc. which immediately changes to the keto form. This on hydrolysis with 40% HBr gives the satd. acid. If the addn. had been 3,4 a ketone would have resulted.  $PhMgBr$  with methyl-, ethyl- and phenyl-cinnamic anilides yielded 3,3-diphenyl-1-methylphenyl-amino- $\Delta^1$ -1-propenol acetate, m. 154°, 3,3-diphenyl-1-ethylphenylamino- $\Delta^1$ -1-propenol acetate, m. 138°, and 3,3-diphenyl-1-diphenylamino- $\Delta^1$ -1-propenol acetate, m. 148°. The Grignard was prepd. from 100 g. ether, 3 g. Mg and 20 g.  $PhBr$ ; 20 g. of the anilide was added, heated 3 hrs., and 20 g.  $AcCl$  in ether was added. V. F. H.

A crystallized acetin and diglyceride. M. BATTEGAY, H. BUSER AND E. SCHLAGER. *Compt. rend.* 188, 790–8 (1929).—Anhyd. glycerol (120 g.) and 200 g. of HOAc were heated below 135° with 2 g. of  $H_2SO_4$  (66 Bé.), distg. off the  $H_2O$  as formed; the HOAc was replaced 5 times in 20-cc. portions at 8-hr. intervals. Fractionation *in vacuo* gave 3 fractions: 40 g.  $b_{14}$  140–60°; 30 g.  $b_{16}$  160–90°; 10–20 g.  $b_{18}$  190–250° and a residue of 30–40 g. The 2nd fraction gave 4–8 g. of crystals, which were recrystd. from  $H_2O$  and found to be diglycerol diacetate (I),  $C_{21}H_{38}O_6(OAc)_2$ , m. 124°,  $b_{16}$  179° (cf. Rangier, C. A. 22, 4468). Boiling I in EtOH with HCl for 1 hr. and evapg. the EtOAc, EtOH and HCl gave diglycerol (II),  $C_3H_8O_3$ ,  $b_{16}$  173°, m. 96–7°. Acetylation of II gave I; benzooylation gave the dibenzoate, m. 138°, and fusing II with  $PCl_5$  gave diglycerol dichloride, m. 112°. II is either  $HOCH_2CH_2CH_2OCH_2CH(CH_2OH)CH_2O$  or

A. S. CARTER

The relation of chemical structure to the rate of hydrolysis of peptides. V. Enzyme hydrolysis of dipeptides. P. A. LEVINE, ROBERT E. STEIGER AND LAWRENCE W. BASS. Rockefeller Inst. *J. Biol. Chem.* 82, 155–66 (1929).—The action of erepsin on the following peptides was studied: glycylglycine, glycyl- $\alpha$ -aminoisobutyric acid, glycyl-*dl*-phenylaminoacetic acid, glycyl-*dl*-phenylalanine, glycyl-*dl*-phenylmethylaminoacetic acid, glycyl-*dl*-phenylalanine, glycyl-*dl*-phenylmethylaminoacetic acid and glycyl-*l*-phenylaminoacetic acid. The chem. structure of the substrate is shown to play a great part in enzymic hydrolysis. The disconn. cons. of the groups involved in the peptide linkage are also, in certain cases at least, a factor in this hydrolysis.

Peptides contg. one component enantiomorphous to the natural amino acids were not hydrolyzed by erepsin. Dipeptides, contg. one *d,l*-amino acid and one naturally occurring amino acid were hydrolyzed to the extent of 50%. Dipeptides in which the free  $\text{CO}_2\text{H}$  and the  $\text{NH}_2$  groups involved in the peptide linkage are attached to a tertiary C atom were not hydrolyzed in the time intervals of the expts. *Methods* for the *prepn.* of the above-mentioned peptides are given. **VI. Hydrolysis of dipeptides by alkali.** P. A. LEVENE, LAWRENCE W. BASS AND ROBERT E. STEIGLER. *Ibid* 167-70.—The alk. hydrolysis constns. of the first 5 peptides mentioned above and of glycyl-*dl*-alanine, *dl*-alanylglycine and *dl*-alanyl-*dl*-alanine, were detd. at  $25^\circ$ . These constns. varied widely according to the structures of the dipeptides. Unlike the case of acid hydrolysis, the rates of alk. hydrolysis are not a function of the intrinsic constns. of the groups involved in the peptide linkage. ARTHUR GROLLMAN

**Complex oxalates of scandium.** J. ŠTĚRBA-BOHM AND S. ŠKRAMOVSKÝ. Univ. Charles, Prague. *Collection Czechoslov. Chem. Comm.* 1, 1-18(1929).—Sc oxalate is obtained in a pure form only in the abs. absence of  $\text{NH}_4$  and K ions. It is highly desirable that Na ions be absent also.  $\text{Sc}_2(\text{C}_2\text{O}_4)_3 \cdot 6\text{H}_2\text{O}$  and also the dihydrate have been obtained. Sc oxalate easily forms ammoniated complexes, even in an acid medium. The literature data referring to a salt obtained by pptn. with  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  really describe salts more or less soiled with ammoniated complexes. Sc oxalate absorbs gaseous  $\text{NH}_3$  readily. Only  $\text{NH}_4\text{ScC}_2\text{O}_4$  exists in the solid state, among the ammoniated derivs.  $(\text{NH}_4)_3\text{Sc}(\text{C}_2\text{O}_4)_3 \cdot 5\text{H}_2\text{O}$ , which is often mentioned, may exist in soln but cannot be isolated. Among the K derivs. it was possible to isolate  $\text{KSc}(\text{C}_2\text{O}_4)_2 \cdot 2\text{H}_2\text{O}$ , which has always been described erroneously as an anhyd. salt.  $\text{K}_3\text{Sc}(\text{C}_2\text{O}_4)_3 \cdot 4\text{H}_2\text{O}$  is easily formed but is not very stable and readily hydrolyzed.  $\text{NaSc}(\text{C}_2\text{O}_4)_2 \cdot 3\text{H}_2\text{O}$  has been isolated with difficulty, it hydrolyzes readily, it changes spontaneously into the dihydrate.  $\text{NaSc}(\text{C}_2\text{O}_4)_3 \cdot 6\text{H}_2\text{O}$  has been described, the literature considered it as a pentahydrated salt. ALBERT L. HENNE

**Adipic acid and its derivatives.** G. C. *Rev. prod. chim.* 32, 73 5(1929).—A review of the *prepn.*, properties and uses of these products. P. THOMASSET

**Conjugated double bonds. VII. Determinations of side-chains in bixin and crocetin.** RICHARD KUHN, ALFRED WINTERSTEIN AND LÁSZLÓ KARLOVITZ. *Helv. Chim. Acta* 12, 64 71(1929).—K., W. and K. give further evidence in favor of their formulas for bixin (I) and  $\alpha$ -crocetin (II) (cf. *C. A.* 22, 2950). The detn. of the oxidation no. (atoms of O required to oxidize 1 mol. of I completely to  $\text{AcOH}$ ,  $\text{CO}_2$  and water) of I gave 45.2 (theory 45). Titration of  $\text{AcOH}$  showed 3.97 mols. (theory 4.00) for each mol. of I. The criticism of their formula for I by Rinkes (cf. *C. A.* 23, 101) is not justified since the formation of the unsatd. aldehyde,  $\text{C}_8\text{H}_{10}\text{O}_3$ , from which R. obtained  $\beta$ -methyladipic acid, can readily be explained on the basis of the authors' formula for I. The oxidation nos. for II were 33.7 and 33.6 (theory 33). From the oxidation of II 2.95 mols. (theory 3.00) of  $\text{AcOH}$  was obtained for each mol. of II (cf. *C. A.* 22, 4464). FREDERICK C. HAHN

**A new case of Walden inversion in the hexose series.** P. A. LEVENE, A. L. RAYMOND AND A. WALT. Rockefeller Inst. *J. Biol. Chem.* 82, 191-5(1929).—Comparison of the 3,6-anhydroglucose osazone of Fischer and Zach (*C. A.* 6, 1295) and the osazone from fructose-3-phosphoric acid showed that the differences between them are analogous to those observed in the pair glucosazone and allosazone. The fructose-3-phosphoric acid is, therefore, regarded as 3,7-anhydroallosazone and the hydrolysis of the  $\text{PO}_4$  group during osazone formation is regarded as accompanied by Walden inversion. ARTHUR GROLLMAN

**Isocyanates. VI. Condensations of methyl isocyanate with cyanamide under the influence of triethylphosphine.** K. H. SLOTTA AND R. TSCHESCHKE. Univ. Breslau. *Ber.* 62B, 137-45(1929); cf. *C. A.* 21, 1232.—The structure of the substances formed by the condensation of  $\text{MeNCO}$  with  $\text{CNNH}_2$  has now been completely cleared up. In  $\text{Et}_2\text{O}$  there is no reaction but on addn. of  $\text{PEt}_3$  there begins to sep. a solid substance  $(\text{MeNHCO})_2\text{NCN}$  (I), irrespective of the relative quantities of  $\text{MeNCO}$  and  $\text{CNNH}_2$ , used although, of course, the yield varies. That I is not a deriv. of  $\text{C}(\text{:NH})_2$  is shown by the fact that one of the  $\text{MeNHCO}$  groups is held very loosely. This group is split off even by  $\text{CH}_2\text{N}_2$  in  $\text{Et}_2\text{O}$ , but the primary cleavage product  $\text{MeNHCONHCN}$  (II) is at once methylated to  $\text{MeNHCONMeCN}$  (III), which is obtained in small quantity, together with much resinous products. The II can be obtained almost quantitatively by treating I in  $\text{MeOH}$  at room temp. with  $\text{H}_2\text{S}$ ; if  $\text{H}_2\text{S}$  is again passed in and the soln. boiled a short time,  $\text{H}_2\text{S}$  adds to the II and  $\text{MeNHCONHCSNH}_2$  is formed. In all reactions of I the same phenomenon occurs: primary formation of II and further transformation of the latter. Thus, with  $\text{NH}_3$  is obtained  $\text{MeNHCONHC}(\text{:NH})\text{NH}_2$ .

(IV), with  $\text{HN}_2$ ,  $\text{MeNHCONHC}(\text{N}:\text{NH}:\text{N}:\text{N})$  (V). The 2nd cleavage product,  $\text{MeNCO}$ ,

was identified as  $(\text{NHCONHMe})_2$  (VI) in the reaction between I and  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ . As in the case of  $\text{MeNCO}$ , the polymerization of II proceeds differently according as  $\text{PEt}_3$  is or is not present. When I is simply boiled some hrs. in  $\text{AcOEt}$ , the  $\text{MeNCO}$  split off can be detected by its odor and there is obtained in good yield the normal polymerization product,  $\text{MeNHCON}(\text{CN})\text{C}(\text{NH})\text{NHCONHMe}$  (VII). If, however, there are a few drops of  $\text{PEt}_3$  in the  $\text{AcOEt}$  there is formed an abnormal polymerization product which is believed to have the structure VIII. VII is almost as labile as I; on boiling with  $\text{H}_2\text{O}$  it loses a  $\text{MeNHCO}$  group and yields  $\text{NCNH}(\text{NH})\text{NHCONHMe}$  (IX) which, however, is not the stable degradation product of VII, for with acids or alkalis VII yields directly a ring compd. which is certainly formed through IX and is doubtless *N*-methylammelene (X), as indicated by its amphoteric character and great stability. With  $\text{Ac}_2\text{O}$  it gives substances which are probably not normal acetylation products; perhaps a 2nd 6-membered ring is formed on acetylation. Concd. hot alkalis either do not attack X or completely decomp. it so that no further degradation product could be isolated. VIII yields a 1,3-di-Ac deriv. (XI). With hot concd. alkalis it loses both the 2-NH and 6-MeNHCON groups, yielding *N*-methylcyanuric acid (XII); by more cautious treatment (only short boiling with 2 *N* NaOH) it is possible to split off only the 2-NH group with formation of the ammeline XIII. If VIII is added to concd.  $\text{H}_2\text{SO}_4$  at  $100^\circ$ , about  $\frac{2}{3}$  is decompd. but about 20% of it can be recovered as the perchlorate of a base which, from its compn. and properties must have been formed by the longer side chain in VIII swinging about on C atom 6 and anchoring itself on C atom 2 with formation of the compd. XIV. Bis[methylcarbaminy]-cyanamide (I) (6 g. from 2 g.  $\text{CH}_2\text{N}_2$ , 6 g.  $\text{MeNCO}$  and 0.5 g.  $\text{PEt}_3$  in cold  $\text{Et}_2\text{O}$ ), decomp.  $124^\circ$ . *N,N'*-Dimethyl-*N*-cyanourea (III), m.  $114^\circ$ . *N*-Methyl-*N'*-guanlyurea (IV), decomp.  $165^\circ$ , gives a white Ag salt with aq.  $\text{AgNO}_3$ . *C*-[(Methylcarbaminy)amino]tetrazole (4-[*N*-methylureido]-1,2,3,5-tetrazole) (V), sinters  $265^\circ$  (incipient decompn.), carbonizes above  $300^\circ$ , dissolves in hot  $\text{H}_2\text{O}$  only with decompn. into  $\text{MeNCO}$  and *C*-aminotetrazole, m.  $203^\circ$ . *N,N'*-Bis[methylcarbaminy]hydrazine (VI), decomp.  $270^\circ$ . *N*-Methyl-*N'*-cyanourea (II), decomp.  $122^\circ$ , gives a white Ag and a green Cu salt. *N,N'*-Bis[methylcarbaminy]-*N*-cyanoguanidine (VII), begins to sinter  $190^\circ$ , m.  $280.5^\circ$  (decompn.). *N*-[Methylcarbaminy]-*N'*-cyanoguanidine (IX), microcryst. ppt., decomp.  $320.5^\circ$ . X, sol. in boiling alkalis, easily in acids, decomp.  $242.5^\circ$ . 5-Methyl-6-[methylcarbaminy]ammelene (VIII), easily sol. in acids, decomp.  $290^\circ$ . XI, m.  $214^\circ$ . 5-Methyl-6-[methylcarbaminy]ammelide, gradually turns brown and decomp. above  $300^\circ$ . XIV, easily sol. in acids, in alkalis only on heating, decomp.  $320^\circ$ .

**New results in carbohydrate chemistry.** KARL JOSEPHSON. Stockholm's High-school. *Svensk. kem. Tids.* 41, 24-48(1929).—A review of recent expts. and speculations on the nature of carbohydrate structure, with 155 references. A. R. ROSE

**Sugar oxidation and decomposition. II. The influence of hydrogen peroxide on glucose, etc., in the presence of calcium carbonate.** K. BERNHAUER and J. NISTLER. Deutsche Univ., Prag. *Biochem. Z.* 205, 230-9(1929).—Glycerol under the action of  $\text{H}_2\text{O}_2$  in the presence of  $\text{CaCO}_3$  yields  $\text{HCHO}$ ,  $\text{HCO}_2\text{H}$ ,  $\text{AcOH}$ ,  $\text{CH}_3(\text{OH})\text{CH}(\text{OH})\text{CO}_2\text{H}$  and  $\text{HOCH}(\text{COOH})_2$ . It is also very probable that  $\text{HOCH}_2\text{CH}(\text{OH})\text{CHO}$  and  $\text{AcH}$  are formed first, the  $\text{HOCH}_2\text{CH}(\text{OH})\text{CHO}$  being either oxidized to glyceric and tartaric acid, or after changing to  $\text{AcCHO}$  it gives  $\text{HCO}_2\text{H}$  and  $\text{AcOH}$  or  $\text{AcOH}$  and  $\text{HCHO}$ . The formation of  $\text{AcCO}_2\text{H}$  as an intermediate step could not be corroborated. Lactic acid was not observed under these exptl. conditions, but on oxidation this yields more  $\text{HCO}_2\text{H}$  than  $\text{AcOH}$ .  $\text{AcOH}$  yields principally  $(\text{CO}_2\text{H})_2$ , but also  $\text{HCO}_2\text{H}$  and  $\text{CO}_2$ .  $\text{HCO}_2\text{H}$  is much more slowly oxidized than  $\text{AcOH}$ , yielding  $\text{CO}_2$ . From glucose under the same conditions were formed  $\text{HCHO}$ ,  $\text{HCO}_2\text{H}$ ,  $\text{AcOH}$ , also oxalic and sac-

charic acids. Many HO acids were produced but they were not identified. Pentoses were not formed. The formation of AcOH is explained as being possible so long as there are mol. groupings giving rise to AcCHO. For this reason gluconic and saccharic acids were studied. The former gave AcH as well as AcOH and other products just like glucose, but saccharic acid yielded only  $\text{HCO}_2\text{H}$  but no AcOH because apparently no fragment is formed suitable to the production of AcCHO. S. MORGULIS

**The absorption of formaldehyde by starch.** J. I. BLANKSMA. Univ. Leiden. *Rec. trav. chim.* **48**, 351-60 (1929).—Polyhydric alcs. and sugars easily react with aldehydes with the formation of acetals; in the present paper expts. are described on the reaction of polysaccharides with HCHO. According to Classen (*Therap. Monatsh.* **11**, 33-4 (1897)) amyloform contains a const. quantity of HCHO, viz., 1 mol. of starch to 1 mol. of HCHO, whereas Longard states that it is a mixt. of HCHO and starch (*Therap. Monatsh.* **11**, 34-5 (1897)). It is now shown that on heating 4 g. potato (wheat, maize, arrowroot) starch with 2 g. trioxymethylene in a sealed tube for 3 hrs. at  $160^\circ$ , a product is obtained with the same structure as the original starch, which is still colored blue by I. Further expts. carried out with varying quantities of starch and trioxymethylene, the vol. of the reacting tube being kept const. (50 cc.), showed that on heating 4 g. of starch with 40 mg. of trioxymethylene for 3 hrs. at  $160^\circ$  an amyloform with 0.65% HCHO was obtained; with 80 mg., a product with 1.2%; with 125 mg., 1.8%; with 250 mg., 3.2%; with 0.5 g., 5.0%; with 1.0 g., 9.7%; with 2 g., 15% and with 4 g., 21.2%; the quantity of HCHO in the reaction product was detd. according to Clowes' method (*Ber.* **32**, 2841 (1899)) by conversion into formaldehyde-phenylglucinol. An analysis of the product with 21.2% HCHO showed it to be formed without the elimination of water while in the formation of acetals from polyhydric alcs., sugars and aldehydes, water is formed simultaneously. Moreover an examn. of the curve, obtained on plotting the % of HCHO of the reaction product against the amt. of trioxymethylene used per 4 g. of starch, shows the great similarity between this curve and an adsorption curve and thus the conclusion is drawn that the products under consideration are not chem. compds. of starch and HCHO but adsorption compds. In accordance with this conception a straight line is obtained on plotting the logarithm of the quantity of HCHO taken up by 1 g. of starch ( $v\ m$ ) against those of the concn. Again, in accordance with this conception, the quantity of HCHO taken up by one g. of starch increases with decreasing vol. of the tube, the HCHO content of the reaction product being 10.3%, 9.7% and 7.7% when 4 g. of starch are heated for 3 hrs. at  $160^\circ$  with 1 g. of trioxymethylene in tubes of 25, 50 and 65 cc., resp. By special sets of expts. it was shown that the equil. is reached on heating trioxymethylene and starch during 2-3 hrs. at  $160-70^\circ$ , but that at  $120^\circ$  and  $140^\circ$  longer heating is necessary. The addn. of water has a great effect on the results obtained; the HCHO content of the reaction product decreasing with increasing quantity of water. With small quantities of water HCHO-starch is obtained which still retains a granular structure but the granules are swollen or ruptured. With more water gels are formed, which, on heating above  $130^\circ$ , are converted into sols completely miscible with water, and, on evapn. over concd.  $\text{H}_2\text{SO}_4$ , leave a residue of dextrin, free from HCHO. C. F. VAN DUIN

**The absorption of formaldehyde by cellulose.** J. J. BLANKSMA. Univ. Leiden. *Rec. trav. chim.* **48**, 361-2 (1929); cf. preceding abstr. Swedish filter paper, cut into small pieces, about a sq. mm. in area, degreased cotton wool, wood and viscose silk were heated with trioxymethylene for 3 hrs. at  $160^\circ$ ; from an analysis of one of the reaction products, contg. 14% HCHO, it appeared that the cellulose had taken up the HCHO without the elimination of water such as occurs in the formation of acetals. In the same way as is described in the preceding abstr. for starch, it was shown that the HCHO is adsorbed by the cellulose without the formation of a chem. compd. When not too great a quantity of HCHO is taken up, the reaction product retains the structure of the cellulose used; with high concns. of HCHO the cellulose swells, giving a clear, transparent jelly. C. F. VAN DUIN

**Some derivatives of cyclobutane.** I. BLANCHARD. *Compt. rend.* **188**, 503-4 (1929).—One mol. of  $\text{BrCH}_2\text{CH}(\text{OC}_2\text{H}_5)_2\text{CH}_2\text{Br}$  condenses with 1 mol. of  $\text{CN}_2(\text{CO}_2\text{Et})_2$  and gives  $\text{C}_8\text{H}_{14}\text{OCH}$   $\begin{matrix} \text{CH}_2 \\ \diagup \quad \diagdown \\ \text{CH}_2 \end{matrix}$   $\text{C}(\text{CO}_2\text{Et})_2$ ,  $b_p$   $175^\circ$ ,  $d^{25}_4$  1.011,  $n_D$  1.44361. By sapon.

with KOH, the corresponding di-acid is obtained; it is sol. in  $\text{H}_2\text{O}$ , and its Cu salt crysts. with 1  $\text{H}_2\text{O}$ , becoming anhyd. on heating at  $150^\circ$  and at the same time changing from blue to purple. By heating at  $155^\circ$ , the di-acid loses 1  $\text{CO}_2$  and yields 1-amyloxy cyclobutane-3-carboxylic acid, sol. in  $\text{H}_2\text{O}$ ,  $b_p$   $164-6^\circ$ ,  $d^{25}_4$  1.003,  $n_D$  1.45112, whose Ag salt has been prepd. ALBERT L. HENNE

The importance of the acetone and boric acid methods in the study of alicyclic 1,2-diols. CHR. J. MAAN. Techn. Univ., Delft. *Rec. trav. chim.* **48**, 332-50(1929).—The configuration of the cyclopentane- and hydrindene-1,2-diols was established by van Loon (*Diss. Delft*, 1919; cf. Böseken, *C. A.* **18**, 1281) by the acetone and  $H_2BO_3$  methods. The correctness of the result obtained by means of these methods was confirmed by the resolution of that cyclopentanediol which, according to the corresponding result of both methods, must be the *trans*-isomer, into its optical antipodes. With the cyclohexane- and cycloheptane-1,2-diols these methods are only partially applicable or useless; both cyclohexane-1,2-diols lower the cond. of  $H_2BO_3$  while only one gives an acetone compd., whereas both cycloheptane-1,2-diols furnish an acetone compd. and both increase the cond. of  $H_2BO_3$  (Böseken and van Giffen, *C. A.* **14**, 2472; Derrx, *C. A.* **16**, 3081). These results, which cannot be explained by Baeyer's ring-strain theory, are in harmony with the theoretical considerations of Sachse (*Ber.* **23**, 1363(1890); *Z. physik. Chem.* **10**, 203(1892)) and Mohr (*C. A.* **13**, 2661; **16**, 2850) which were more fully confirmed by the work of Hüchel (*C. A.* **19**, 1269; **21**, 1112, 2890, 2903) and Ruzicka (*C. A.* **20**, 1792, 2150, 2151). In the present paper substituted 5- and 6-rings are dealt with. The *cis*-diols were obtained by oxidizing the alc. solns. of the corresponding unsatd. hydrocarbons at  $-40^\circ$  to  $-50^\circ$  with 4.5%  $KMnO_4$  containing also 5% cryst.  $MgSO_4$  (cf. Straus and Rohrbacher, *C. A.* **15**, 1896) an excess of about 25%  $KMnO_4$  being used because the EtOH is also oxidized to some extent; yield 20-30%. Phenylcyclohexane-*cis*-1,2-diol was prepd. by hydration of the oxide, which gives a mixt. of the *cis*- and *trans*-isomerides. The *cis*-isomeride was then converted into the acetone compd. which was sepd. from the *trans*-diol by distn. with steam and then hydrolyzed. The *trans*-diols were prepd. by oxidation of the corresponding unsatd. hydrocarbons with *recrystd.*  $BzO_2H$  in  $CHCl_3$  to the oxides, which were hydrated by shaking with 10 vols. of 0.02 *N*  $HCl$  or, as in the case with 1-phenylcyclohexene 1,2 oxide, with 0.05 *N*  $H_2SO_4$ . 1-Phenylcyclopentene 1,2-oxide could not be converted into the diol. For details regarding the prepn. of these diols cf. Verkade, *et al.* (*C. A.* **23**, 2095). The *cis*-diols were converted into the acetone compds. by means of abs. acetone, contg. 0.25%  $H_2SO_4$ ; after standing at room temp. the soln. was neutralized with powd. lime, most of the acetone distd. off through a Vigreux column and the acetone compd. distd. with steam. In this way all the diols prepd. by oxidation of cyclic unsatd. hydrocarbons with  $KMnO_4$  gave an acetone compd., the following compds. being described: 1-Methylcyclopentane-*cis*-1,2-diol, m.  $23^\circ$ ; acetone compd.,  $b_{760}$  157.5-7.8°,  $n_D^{18}$  1.4300,  $d_4^{18}$  0.9409; 1-methylcyclopentane-*trans*-1,2-diol, m.  $65^\circ$ ; 1-phenylcyclopentane-*cis*-1,2-diol, m.  $65^\circ$ ; acetone compd., m. 52.5-3.5°; 1-methylcyclohexane-*cis*-1,2-diol, m.  $68^\circ$ ; acetone compd.,  $b_{760}$  183.5-84°,  $n_D^{16}$  1.4496,  $d_4^{16}$  0.9701; 1-methylcyclohexane-*trans*-1,2-diol, m.  $85^\circ$ ; 1-phenylcyclohexane-*cis*-1,2-diol, m.  $96^\circ$ ; acetone compd.,  $b_{15}$  155-7°,  $n_D^{16}$  1.5304,  $d_4^{15}$  1.066, *M. R.* 67.25, calcd. 66.76; 1-phenylcyclohexane-*trans*-1,2-diol, m.  $99^\circ$ . From the figures given for the mol. refractivities of the acetone compds. and the oxides, it appears that the observed values agree with the "theoretical" ones in the case of the unsubstituted compds. and the Me-substituted ones, but that in combination with the Ph group a noticeable exaltation occurs. This exaltation amounts to 0.49 for the acetone compd. of 1-phenylcyclohexane-*cis*-1,2-diol, to 0.79 with 1-phenylcyclopentene 1,2-oxide and to 0.74 with 1-phenylcyclohexane 1,2-oxide. Measurements of the change of the cond. of aq.  $H_2BO_3$  solns. by the addn. of these diols showed that the cond. was largely increased by 1-methylcyclopentane-*cis*-1,2-diol, and decreased to a small extent by 1-methylcyclopentane-*trans*-1,2-diol, by both the 1-methylcyclohexane-1,2-diols and the 1-phenylcyclohexane-1,2-diols. With 1-phenylcyclopentane-*cis*-1,2-diol 70% alc. had to be used as a solvent, with water even in very dil. solns. a complex compd. crystg. out; a small increase of the cond. was observed under these circumstances. *K* 1-methylcyclopentane-*cis*-1,2-diol borate,  $C_7H_{12}O_5BOK \cdot 4H_2O$ , is obtained by adding an excess of warm satd. aq.  $H_2BO_3$  to the diol, followed by a somewhat smaller vol. of 50%  $KOH$ ; in the same way *K* 1-methylcyclohexane-*cis*-1,2-diol borate,  $C_7H_{12}O_5BOK \cdot 4H_2O$ , was prepd. On dissolving 1-phenylcyclopentane-*cis*-1,2-diol (1 g.) in 100 cc. warm water and adding 3 g.  $H_2BO_3$ , 1-phenylcyclopentane-*cis*-1,2-diol boric acid,  $C_{11}H_{12}O_5BOH$ , m.  $107-10^\circ$ , is obtained. On extg. the soln. of this compd. in dil.  $KOH$  continuously with  $CHCl_3$ , a complex  $H_2BO_3$  compd. of the di-diol type,  $(C_{11}H_{12}O_5)_2BH$ , m.  $129^\circ$ , is obtained. The reaction with acetone, the influence on the cond. of  $H_2BO_3$  solns., and the complex compd. formation with  $H_2BO_3$  and *K* borate, taken in connection with the behavior of the unsubstituted compds., clearly prove the correctness of the stereochem. formulas assigned to the various diols, as given above.

M. has also carried out detns. of the hydrolysis const. of compds. derived from K borate and alicyclic 1,2-diols, the method of Walker and Robertson (*Proc. Roy. Soc. Edinburgh* **24**, 363(1903); *Z. physik. Chem.* **47**, 373(1904)) being used, starting from the following considerations: The K salts of both 1-methylcyclopentane-*cis*-1,2-diol boric acid and 1-methylcyclohexane-*cis*-1,2-diol boric acid undergo hydrolysis in  $H_2O$ , into K borate and the corresponding diol since both diols can be isolated from such a soln. by continuous extn. with  $CHCl_3$ . Whereas for the quant. extn. of the 6-ring diol, 24 hrs. are sufficient, the 5-ring diol requires 12 days; it is therefore highly probable that the complex borate compd. of the 5-ring diol is only slightly and that of the 6-ring diol strongly hydrolyzed. The sum of the degrees of hydrolytic and elec. dissocn. appeared to be 1.00 with the above-mentioned 5-ring diol borate and 1.74 with the 6-ring diol borate. Since the degree of elec. dissocn. of a K borate soln. of about the same concns. appeared to be 0.83 and 0.86, resp., the hydrolysis of the 5-ring diol complex amounts to 0.17 and of the 6-ring diol complex to 0.88. Now 1-methylcyclopentane-*cis*-1,2-diol increases the cond. of a  $H_3BO_3$  soln. considerably while 1-methylcyclohexane-*cis*-1,2-diol does not; it is, therefore, to be expected that both the corresponding *trans*-diols, which do not increase the cond. of  $H_3BO_3$  solns., will not undergo complex formation with  $H_3BO_3$  and indeed a hydrolysis 1.00 was found in these cases. The same difference which was noticed between the methylated 5- and 6-ring compds. was also found with the phenylated ones; with 1-phenylcyclopentane-*cis*-1,2-diol and K borate the sum of degrees of elec. and hydrolytic dissocn. was found to be 1.03 and with 1-phenylcyclohexane-*cis*-1,2-diol, 1.80. In connection with these results M. points out that in cases where the  $H_3BO_3$  method gives ambiguous results owing either to the small soly. of the diol or to the necessity of using alc.-water mixts. as a solvent, the detn. of the hydrolytic const. of the complex with K borate may give information as to the configuration of the diol.

C. F. VAN DUIN

**The ketone function.** R. CORNUBERT AND CHARLES BORREL. *Compt. rend.* **188**, 798-800(1929).—The following  $\alpha$ -substituted  $\alpha'$ -methylcyclopentanones were prepd.: *Me*, b. 147°; *Et*, b. 164-5°; *Pr*, b<sub>18</sub> 78-9°; *iso-Pr*, b. 178°; *Bu*, b<sub>16</sub> 93-4°; *iso-Bu*, b<sub>18</sub> 82-3°; *benzyl*, b<sub>18</sub> 150°. These were converted into the corresponding tetrahydropyronic derivs. (I) by treatment with  $BzH$  and  $HCl$ , in the following yields: *Me*, m. 127°, 73%; *Et*, m. 98-9°, 59%; *Pr*, m. 116-6.5°, 59%; *iso-Pr*, m. 125.5°, 10%; *Bu*, m. 101-2°, 54%; *iso-Bu*, m. 118°, 35%; *benzyl*, m. 156.5°, 77%. The marked difference in the formation of I from the *Me* and the *iso-Pr* derivs. is similarly noted in the formation of oximes from these compds. (Haller and C., *C. A.* **21**, 570), and the other members of the series bear out the variations, but no interpretation can be gained except that a relation exists between the ketonic properties and the substituents. This is also indicated by the failure to get I from  $\alpha, \alpha'$ -dibenzylcyclohexanone (II) as compared to a quant. yield with the  $\alpha, \alpha'$ -di-*Me* deriv. (*C. A.* **22**, 3146). An irregularity in the ketonic function is shown by II and  $\alpha, \alpha, \alpha', \alpha'$ -tetramethylcyclohexanone (III); II readily gives a semicarbazone (m. 190-1°), and an oxime only with difficulty; III gives no semicarbazone but readily forms the oxime, using the same conditions throughout.

A. S. CARTER

**Methylation of cycloheptanone.** MARCEL GODCHOT AND (MLLE.) GERMAINE CAUQUIL. *Compt. rend.* **188**, 794-6(1929).—Following the method of Haller (*C. A.* **21**, 1635, 2464), cycloheptanone (I) was methylated in dry  $Et_2O$  with an equiv. of  $NaNH_2$  followed by an excess of  $MeI$  with several hrs. heating. Uncombined I was sep'd. from the resulting mixt. of ketones, b. 179-92°, by pptn. with  $NaHSO_4$ . The resulting mixt. was next converted to semicarbazones and sep'd. into 2 pure fractions by crystn. from ligroin and  $Et_2O$ , giving a small quantity of  $\alpha, \alpha$ -dimethylcycloheptanone, b<sub>110</sub> 191-2° (cor.), d<sub>18</sub> 0.9221,  $n_D^{18}$  1.4565 (semicarbazone, m. 174.5°; oxime, m. 83°, *carbanilidoxime*, m. 93-4°), and considerable  $\alpha$ -methylcycloheptanone (II), b<sub>106</sub> 185-6° (cor.), d<sub>18</sub> 0.9395,  $n_D^{18}$  1.461 (semicarbazone (III), m. 117-8°; oxime, b<sub>116</sub> 126°; *carbanilidoxime*, m. 96-7°). III was previously reported as m. 129-31° by Wallach (*Ann.* **345**, 146), but the formula of II was established by its oxidation with  $KMnO_4$  to yield  $\epsilon$ -acetylcaproic acid, b<sub>20</sub> 186-7°, m. 29-30° (semicarbazone, m. 113-4°). A. S. CARTER

**The oxidation of unsaturated compounds by means of perbenzoic and peracetic acids.** J. BÖESEKEN AND G. ELSSEN. *Techn. Univ., Delft. Rec. trav. chim.* **48**, 363-9(1929); cf. *C. A.* **21**, 2877; **22**, 2549.—It has already been shown that the oxidation of a double bond by means of  $AcO_3H$  always gives a mixt. of the diol and its acetates (Böeseken, *C. A.* **22**, 2549) and the hypothesis had been put forward that this reaction consists of the addn. of a mol. of  $AcO_3H$  to the double bond with the formation of the monoacetate of the diol. On the other hand the oxidation with  $BzO_3H$

yields ethylene oxides, the velocity of the reaction being largely dependent on the groups attached to the unsatd. C atoms.  $\text{PhCH:CHMe}$  is oxidized much more quickly than  $\text{PhCH}_2\text{CH:CH}_2$ ,  $\text{PhCH:CHEt}$  more quickly than its isomers, etc. (Derr, *C. A.* 16, 3081; Böeseken and Blumberger, *C. A.* 19, 1260). The present paper deals with the oxidation of several unsatd. compds. with  $\text{AcO}_2\text{H}$ ; in connection with the considerations mentioned above, it is to be expected that the monoacetate is the principal product of the reaction when the oxidation proceeds quickly whereas in the case of a slow oxidation the formation of the diacetate is to be expected. *1,3-Diphenylpropene*, prepd. from cinnamyl bromide and  $\text{PhMgBr}$  (cf. Braun and Köhler, *C. A.* 12, 2197) was oxidized with a 100% excess of  $\text{AcO}_2\text{H}$ ; the reaction proceeds quickly and yields the nearly pure monoacetate and the same result was obtained on oxidizing *anethole* and  *$\beta$ -isosafole* with a 6% excess of  $\text{AcO}_2\text{H}$ . On the other hand allylbenzene and safole were oxidized only slowly; allylbenzene gave a mixt. of the mono- and diacetates in which the latter largely predominates, while safole was also oxidized in other directions. From these examples it was to be expected that in general unsatd. compds. having a double bond in conjugation with the benzene nucleus, are oxidized quickly while those, where the unsatd. center is removed further from the benzene nucleus, are oxidized far more slowly. It is therefore surprising that eugenol is oxidized quickly by  $\text{AcO}_2\text{H}$  with the formation of the monoacetate, contg. only a small amount of the diacetate. Indene is also oxidized quickly but the reaction product contains more of the diacetate than in the case of eugenol, although the monoacetate predominates. With cyclohexene the chief reaction product is the monoacetate; there is also formed a small amount of the diacetate and, by sapon., of the diol. These expts. show that the oxidation of unsatd. compds. with  $\text{AcO}_2\text{H}$  consists of an addn. of the reagent to the double bond, the monoacetate being acetylated further if the reaction only proceeds slowly, or being oxidized in other directions (safole).

C. F. VAN DUIN

**The reaction between phenylmagnesium bromide and some alkyl esters of acids of the fifth group elements.** HENRY GILMAN AND JACK ROBINSON. *Chem. Dept., Ames, Iowa. Rec. trav. chim.* 48, 328 31 (1929).—Alkyl esters of  $\text{SO}_3\text{H}$  acids are unlike all other alkyl esters in their reaction with organomagnesium halides, showing an alkylating action, the course of which is probably:  $\text{RSO}_2\text{Alkyl} + \text{R'MgX} \rightarrow \text{R'Alkyl} + \text{RSO}_2\text{MgX}$  (I);  $\text{RSO}_2\text{MgX} + \text{RSO}_2\text{Alkyl} \rightarrow \text{AlkylX} + (\text{RSO}_2)_2\text{Mg}$  (II) (cf. Rossander and Marvel, *C. A.* 22, 2140; Gilman and Heck, *C. A.* 22, 3150). With aryl esters of sulfonic esters there is no arylation, sulfones and phenols being formed as follows:  $\text{RSO}_2\text{Aryl} + \text{R'MgX} \rightarrow \text{RSO}_2\text{R'} + \text{ArylOMgX}$  (III). This type of reaction (III) is the one observed with all esters other than the alkyl sulfonates, the only exception being the formation of  $\text{PhMe}$  from  $\text{Me}$  borate and  $\text{PhMgBr}$  (Khotinsky and Melamed, *C. A.* 3, 2947), which, however, could not be confirmed by Gilman and Vernon (*C. A.* 20, 1605). In the present communication it is shown that the interaction of  $\text{PhMgBr}$  and alkyl esters of acids of the 5th group elements also occurs in accordance with equation III, no alkylation taking place. *Butyl nitrite* (0.1 mol.) and 0.45 mol.  $\text{PhMgBr}$  gave 20.6%  $\text{Ph}_2\text{NH}$ , 63%  $\text{Ph}_2$  and 67.5%  $\text{BuOH}$ ; *Et nitrate* did not give any  $\text{PhEt}$  with 5.4 moles of  $\text{PhMgBr}$ ; from 0.3 mol. *tri-Me phosphite* and 0.9 mol.  $\text{PhMgBr}$  was obtained 42% of methyldiphenylphosphine oxide,  $\text{MePh}_2\text{PO}$ , m.  $110^\circ$ , which is formed by rearrangement of the primary reaction product,  $\text{Ph}_2\text{POMe}$  (cf. *C. A.* 5, 1397). *Tri-Ethyl phosphite* (0.2 mol.) and  $\text{PhMgBr}$  (0.57 mol.) gave 10% of  $\text{Ph}_2\text{PO}$ ; *tri-Me* and *tri-Et phosphates* did not give  $\text{PhEt}$  but after hydrolysis of the reaction product 16% of phenylphosphoric acid and 17% diphenylphosphoric acid were obtained; with *tri-Et vanadate* again  $\text{PhEt}$  was not formed, an extensive coupling reaction taking place with quant. formation of  $\text{Ph}_2$ . From *tri-Et arsenite* (0.2 mol.) and  $\text{PhMgBr}$  (0.6 mol.) 85% of  $\text{AsPh}_3$  was obtained, while *tri-Et arsenate*, on treatment with 3 moles of the Grignard reagent, gave a substance, m.  $270^\circ$ , which was not identified with certainty, but probably consists of  $\text{Ph}_4\text{AsCl}$ .

C. F. VAN DUIN

**Isophenyl sulfide and its derivatives.** O. HINSBERG. *Ber.* 62B, 127 35 (1929).— $\text{Ph}_2\text{S}$  and about 2 vols. 70%  $\text{HClO}_4$  on heating react quite vigorously even before the b. p. is reached and from the reaction mixt. can be isolated a faintly yellow amorphous substance (I). The reaction proceeds without any material oxidizing action by the  $\text{HClO}_4$ . A quant. expt. (detn. of the  $\text{HCl}$  in the  $\text{HClO}_4$  after the reaction:  $\text{HClO}_4 = \text{HCl} + \text{O}_2$ ) showed that only about  $1/16$  mol.  $\text{O}_2$  is consumed per mol.  $\text{Ph}_2\text{S}$ . As there is apparently no cleavage the chief reaction must be a rearrangement or polymerization or an addn. reaction. As a matter of fact it consists chiefly in a rearrangement of the  $\text{Ph}_2\text{S}$  into a quinoid sulfonium base with addn. of  $\text{H}_2\text{O}$  and formation of the compd.  $\text{PhS(OH):C(CH:CH)}_2\text{CH}_2$  (II). I is the basic perchlorate,  $\text{PhS(OCIO}_2)_2$ :

$C(CH_3CH)_2CH_2$ . II, and by double decompn. yields analogous salts of other acids, such as the *iodide* (III = I with I instead of  $OCIO_3$ ). III or the free II on distn. lose HI and  $H_2O$  to regenerate  $Ph_2S$ . With KOH in MeOH on the  $H_2O$  bath II yields an oil (IV), sol. in petroleum ether, with the same compn. and very nearly the same b. p. as  $Ph_2S$  but which with excess of  $H_2O_2$  gives a *sulfone*  $Ph_2SO_2 \cdot 0.5H_2O$  (V), m.  $81^\circ$ , while the ordinary  $Ph_2SO_2$  m.  $128^\circ$ , and more gentle oxidation gives an oily *sulfoxide* (VI) whereas the known sulfoxide m.  $70.5^\circ$ . IV is beyond doubt a new form of  $Ph_2S$  and is therefore designated as *isophenyl sulfide*. Although the isomerism of the sulfoxides could be explained on the same basis as the van't Hoff theory for C compds. by assuming that the S atom is at the center of a hexahedron toward whose corners its 6 valences are directed, in the sulfoxides, in which the S is quadrivalent, the S atom at the center of a tetrahedron would not be asym., and finally the sulfides cannot be represented by a space formula as the centers of gravity of the substituents always lie in a plane. It therefore seems permissible to make use, as has already often been done by H., of the atomic formula with 2 centers of valency for S; the isomers could then be represented by the accompanying formulas. *Basic isodiphenylsulfonium*

*perchlorate* (I), obtained in 9–10 g. yield from 10 g.  $Ph_2S$  by heating 5 cc. com.  $Ph_2S$  with 10 cc. 70%  $HClO_4$  and 0.3 cc.  $AcOH$  (finally to boiling after the 1st vigorous reaction has ceased), cooling to  $100^\circ$ , pouring into much  $H_2O$ , repeating the procedure 10 times, washing with  $H_2O$ , taking up in MeOH, filtering, evapg., again taking up in MeOH and evapg. and freeing from unchanged  $Ph_2S$  by kneading with petroleum ether, forms a yellowish or brownish mass gradually softening on warming and deflagrating on rapid heating, slowly decompn. on standing, dissolves in  $AcOEt-HClO_4$ , still contains about 0.5% of the substance VII (below) and a small quantity of firmly bound Cl. III, reddish, softens about  $80^\circ$ , dissolves in  $HI-AcOEt$ . *Basic chloroplatinate*,  $[(C_{12}H_{10}S)_2H_2O]_2 \cdot H_2PtCl_6$ , yellow-brown cryst. powder. *Isodiphenylsulfonium hydroxide* (II), faintly red amorphous mass, gradually softening on heating, extraordinarily stable toward reducing agents (unchanged by boiling 15 mins. with Zn, HCl and  $AcOH$ ), converted by oxidizing agents ( $CrO_3-AcOH$ ) into a yellow-red substance. IV, purified by converting it into VI and reducing back the latter in boiling MeOH with  $H_2SO_4-Zn$  dust, b.  $300-40^\circ$  (partial decompn.), rearranged into ordinary  $Ph_2S$  by repeated distn. or heating 3 hrs. at  $300^\circ$ . VI, gives a blue color with concd.  $H_2SO_4$ . V is unchanged by boiling 1 hr. with Zn,  $AcOH$  and HCl, by hot  $Ac_2O$  or by aq.  $KMnO_4$ , seps. from abs. MeOH in prisms with 0.25 mol. MeOH, m.  $83^\circ$ . VII, difficultly sol. needles, m.  $225^\circ$ , behaves like a sulfone and has the compn. of an *isophenoxin sulfone*,

C. A. R.

**Nitration of methane- and ethanesulfonyl-*p*-phenetidines.** FRÉDÉRIC REVERDIN. *Helv. Chim. Acta* 12, 113-21 (1929).—A no. of *nitro derivs.* of methane- (I) and ethanesulfonyl-*p*-phenetidine (II) were prepd. as follows: From I: 2-nitro (III), m.  $100^\circ$ , 81%, by heating I in alc. with  $HNO_3$  (d. 1.185) on the water bath; 2,6-dinitro, m.  $176-7^\circ$ , 40%, similarly to III except with  $HNO_3$  of d. 1.4; 2,3,6-trinitro, m. indistinctly at  $235^\circ$ , by treating I at  $20-5^\circ$  with  $HNO_3$  (d. 1.52). From II: 2-nitro, m.  $91-2^\circ$ , 52%, by treating II in  $AcOH$  with  $HNO_3$  (d. 1.4) at  $28^\circ$ ; 2,6-dinitro (IV), m.  $182^\circ$ , 81%; 2,5-dinitro, m.  $166-7^\circ$ , 43% (crude), by treating II with  $HNO_3$  (d. 1.52) at  $-5^\circ$  to  $15^\circ$ ; 2,3,6-trinitro, m.  $229^\circ$ , by heating IV with  $HNO_3$  (d. 1.52) on the steam bath. *Ac derivs.* of I and II m.  $112^\circ$  and  $81^\circ$ , resp.

FREDERICK C. HAHN

**The preparation of quinhydrone for potentiometric use.** M. TRÉNEL AND C. BISCHOFF. *Z. angew. Chem.* 42, 288-9 (1929).—The detn. of  $pH$  with the quinhydrone electrode depends upon the purity of the quinhydrone which often contains ferrous and ferric Fe as impurities. It is best prepd. in 21% yield by dissolving 115 g. ferric  $NH_4$  alum in 230 cc.  $H_2O$  at  $50^\circ$  and then adding with stirring to 25 g.  $p-C_6H_4(OH)_2$  in 100 cc.  $H_2O$  at  $60^\circ$ , then stirring and cooling with an ice bath; the crystals which sep. are filtered with suction, washed about 7 times with  $H_2O$  until the washings are free from  $Fe^{+++}$ , and dried between filter papers.

N. A. LANGR

**Chemical decompositions under high pressures.** N. A. ORLOV. *Metallbörse* 18, 565-6, 678(1928); cf. *C. A.* 22, 75, 396, 1151.—A review of the literature on chem. conversion caused by H at high pressures. The method can be used extensively for various reactions of org. substances, *e. g.*, alicyclic-aromatic ketones are reduced to the corresponding hydrocarbons. Some substituted benzenes formed from homologs of PhCOMe in theoretical yields have a very mild, sweet odor. E. M. SYMMES

**Nor- and nor- $\psi$ -ephedrine.** II. S. KANAO. *J. Pharm. Soc. (Japan)* 48, 1070-81 (1928); cf. *C. A.* 23, 2431.—Transformation of nor-*dl*-ephedrine into nor-*dl*- $\psi$ -ephedrine: Nor-*dl*-ephedrine (I) in Et<sub>2</sub>O with Ac<sub>2</sub>O in the presence of alkali gave *N*-acetyl-nor-*dl*-ephedrine (II), m. 135°. By boiling II with concd. HCl it gave nor-*dl*- $\psi$ -ephedrine (III). I in Et<sub>2</sub>O with an equal amt. of BzCl gave the *N*-Bz deriv. (IV), m. 143°. IV and excess concd. HCl gave nor-*dl*- $\psi$ -ephedrine benzoate-HCl (V), m. 220°. V is unstable and it changes into *N*-benzoyl-nor-*dl*- $\psi$ -ephedrine (VI) in the presence of alkali. Benzoylation of IV gave *O,N*-dibenzoyl-nor-*dl*-ephedrine (VII), m. 167-8°. This is in harmony with *O,N*-dibenzoyl-nor-*dl*- $\psi$ -ephedrine (VIII) (*J. Pharm. Soc. (Japan)*, No. 127, 832). Soln. of nor-*dl*-ephedrine-HCl (IX) and *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>COCl in Et<sub>2</sub>O gave dark yellow crystals (X), m. 189°. By heating X with concd. HCl it changes into nor-*dl*- $\psi$ -ephedrine nitrobenzoate-HCl (XI), m. 221°. X is unstable and changes into *N-p*-nitrobenzoyl-nor-*d*-ephedrine (XII), m. 170°. Transformation of nor-*d*-ephedrine into *l*- $\psi$ -ephedrine: On heating *N-p*-nitrobenzoyl-nor-*d*-ephedrine (XIII), m. 175-6°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> 49.95° (in CHCl<sub>3</sub>), with excess concd. HCl it gave nor-*l*- $\psi$ -ephedrine *p*-nitrobenzoate-HCl (XIV), m. 246°, [ $\alpha$ ]<sub>D</sub><sup>22</sup> 54.63° (in water). NH<sub>3</sub> with aq. XIV gave a substance, m. 199°, [ $\alpha$ ]<sub>D</sub><sup>21</sup> - 105.57° (in CHCl<sub>3</sub>), does not depress the m. p. of *N-p*-nitrobenzoyl-nor-*l*- $\psi$ -ephedrine (XV). Nor-*l*- $\psi$ -ephedrine and *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>COCl in Et<sub>2</sub>O gave after recrystn. in alc. XV, m. 199°, [ $\alpha$ ]<sub>D</sub><sup>25</sup> - 104.89° (in CHCl<sub>3</sub>). Transformation of nor-*l*-ephedrine into nor-*d*- $\psi$ -ephedrine: By boiling *N-p*-nitrobenzoyl-nor-*l*-ephedrine (XVI), m. 175-6°, [ $\alpha$ ]<sub>D</sub><sup>23</sup> - 49.58° (in CHCl<sub>3</sub>) with concd. HCl it gave colorless needles (XVII), m. 246°, [ $\alpha$ ]<sub>D</sub><sup>22</sup> 54.63° (in water), does not depress the m. p. of nor-*d*- $\psi$ -ephedrine *p*-nitrobenzoate-HCl. NH<sub>3</sub> with aq. XVII gave crystals, m. 199.5°, [ $\alpha$ ]<sub>D</sub><sup>22</sup> 105.17° (in CHCl<sub>3</sub>), does not depress the m. p. of *N-p*-nitrobenzoyl-nor-*d*- $\psi$ -ephedrine (XVIII). *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>COCl and nor-*d*- $\psi$ -ephedrine gave XVIII, m. 199.5°, [ $\alpha$ ]<sub>D</sub><sup>25</sup> 104.96° (in CHCl<sub>3</sub>). By boiling XVII with excess HCl it gave colorless crystals, m. 291°, [ $\alpha$ ]<sub>D</sub><sup>20</sup> 40.67° (in water), does not depress the m. p. of nor-*d*- $\psi$ -ephedrine-HCl. F. I. N.

**Tautomerism of diketones.** The two tautomeric forms of phenylbenzylglyoxal and phenylanisylglyoxal. HENRI MOURRET. Collège de France. *Compt. rend.* 188, 504-6 (1929); cf. *C. A.* 23, 1339.—The following forms of PhCH<sub>2</sub>(CO)<sub>2</sub>Ph have been sepd.: *A* $\alpha$ , yellow, m. 67°; *A* $\beta$ , yellowish white, m. 90°; *B*, lemon-yellow, m. 35-0°. Similarly, MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>(CO)<sub>2</sub>Ph gives: *A* $\alpha$ , pale yellow, m. 70°; *A* $\beta$ , yellow, m. 82°; *B*, lemon-yellow, m. 23-4°. By heating at about 70° the first compd. (*A* $\alpha$ ) is transformed into the *A* $\beta$  form. The same result is obtained by seeding a satd. soln. of *A* $\alpha$  with a crystal of *A* $\beta$ . Distn. under 1 mm. transforms *A* into a mixt. of about 90% *A* and 10% *B*, which was previously described as the "liquid isomer." Alk. catalyzers are particularly active in the isomerization: heating in ordinary glass causes rapid transformation, but in quartz the reaction is slowed down to such an extent that it may become inappreciable. The formula RCH<sub>2</sub>:C(OH)COR' is assigned to the *A* forms and RCH<sub>2</sub>(CO)<sub>2</sub>R' to the *B* forms. ALBERT L. HENNE

**Synthesis of homogentistic acid.** GEORG HAHN AND WILLY STENNER. Univ. Frankfurt. *Z. physiol. Chem.* 181, 88-100(1929).—Homogentistic acid has hitherto been available only as a constituent of pathol. urine. The synthesis here described consists essentially in the mol. rearrangement of the monoallyl ether of *p*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub>, whereby the allyl migrates to the nucleus, and subsequent oxidation of the allyl by O<sub>2</sub>, the OH groups meanwhile being protected by benzylation. The final yield of homogentistic acid is 26% on the basis of the C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> employed. The successive steps are: *p*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub>  $\longrightarrow$  *p*-HOC<sub>6</sub>H<sub>4</sub>OBz  $\longrightarrow$  *p*-C<sub>6</sub>H<sub>4</sub>(OC<sub>6</sub>H<sub>5</sub>)OBz  $\longrightarrow$  1,2,4-HOC<sub>6</sub>H<sub>3</sub>(C<sub>6</sub>H<sub>5</sub>)OBz (which undergoes disproportionation into 1,2,4-(HO)<sub>3</sub>C<sub>6</sub>H<sub>3</sub>C<sub>6</sub>H<sub>5</sub> and 1,4,2-(BzO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>C<sub>6</sub>H<sub>5</sub>)  $\longrightarrow$  1,4,2-(BzO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH<sub>2</sub>CO<sub>2</sub>H  $\longrightarrow$  1,4,2-(HO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH<sub>2</sub>CO<sub>2</sub>H. *p*-HOC<sub>6</sub>H<sub>4</sub>OBz was obtained in 68% yield by the slow addn. of BzCl over a period of 5 hrs. to *p*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> in Na<sub>2</sub>CO<sub>3</sub> with very rapid stirring. By shaking this for 24 hrs. with dry MeAc, dry K<sub>2</sub>CO<sub>3</sub> and C<sub>6</sub>H<sub>5</sub>Br in the presence of glass beads 70% of benzoylhydroquinone allyl ether (I), m. 71-2°, was obtained. The non-benzoylated hydroquinone under the same treatment yielded only 22% of hydroquinone monoallyl ether, m. 43°, and considerable hydroquinone diallyl ether, m. 36-7°. The rearrangement

of I was effected by boiling *in vacuo* 2-3 hrs. in a metal bath at 280° and finally distg. *in vacuo*. The distillate yielded crystals of *dibenzoylallylhydroquinone*, m. 107-8°, which resulted from disproportionation of the monoether first formed. The mixt. was then completely benzoylated by treatment in pyridine with BzCl, the yield of di-Bz deriv. being 82%. Oxidation of the di-Bz deriv. was effected by passing a stream of O contg. 2.5% O<sub>2</sub> into the AcOH soln. at 80° for 2 hrs. A yield of 83% of *dibenzoylhomogentisic acid*, m. 180-1°, was thus obtained; the *Me ester* m. 125°, and *Et ester*, m. 130-1°, were prepd. by esterification with HCl and the alc. *Homogentisic acid*, m. 146-7°, was obtained by sapon. of the di-Bz deriv. with 2 N NaOH on the water bath in a N atm., and acidifying with HCl; *Et ester*, m. 119-20°.

A. W. DOX

**Formation of acetaldehyde from alanine in the presence of pyrocatechol.** F. SCHAAF. Dermatol. Klinik, Univ. Zürich. *Biochem. Z.* **205**, 449-50(1929).—When 3,4-dihydroxyphenylalanine undergoes oxidation the 2 OH groups in the *o*-position are involved and NH<sub>2</sub> and CO<sub>2</sub> are produced in the process in a definite proportion to the destroyed 3,4-dihydroxyphenylalanine. It is supposed that when the *o*-OH groups react with O<sub>2</sub>, an *o*-quinone deriv. is first formed and that the quinoid system offers the necessary conditions for the oxidative destruction of the amino acid group with the formation of an aldehyde. As this could not be proved by direct evidence a model reaction has been devised to demonstrate this. Shaking equiv. amts. of pyrocatechol and alanine in H<sub>2</sub>O with O<sub>2</sub> in the presence of amidon a small yield of AcH is obtained.

S. MORGULIS

**Synthesis of  $\gamma$ -phenylglutaminic acid.** A. VON BEZNAK. Physiol. Inst. Univ. Debreczen. *Biochem. Z.* **205**, 414-9(1929).—The synthesis of  $\gamma$ -phenylglutaminic acid from ClCH<sub>2</sub>CHPhCO<sub>2</sub>H is described. This is possible through the condensation of ClCH<sub>2</sub>CHPhCO<sub>2</sub>H with malonic acid, the introduction of an oximine group into the ester and reduction to the NH<sub>2</sub> group.

S. MORGULIS

**Substitution capacity of aromatically bound hydrogen atoms.** JULIUS V. BRAUN, GOTTFRIED MANZ AND ERNST REINSCH. Univ. Frankfurt. *Ann.* **468**, 277-303(1929).—*m*-MeC<sub>6</sub>H<sub>4</sub>Bz, BrCH<sub>2</sub>CO<sub>2</sub>Et and Zn yield an unsatd. ester, b<sub>16</sub> 208-10° (not pure); sapon. gives  $\beta$ -*m*-tolylcinnamic acid, b<sub>17</sub> 229-32°, m. 114°; reduction gives  $\beta$ -*m*-tolylhydrocinnamic acid, b<sub>13</sub> 206-10°, m. 109°; chloride, b<sub>16</sub> 200°; AlCl<sub>3</sub> gives 60% of the ketone, MeC<sub>6</sub>H<sub>3</sub>.CO.CH<sub>2</sub>.CHPh, b<sub>16</sub> 210-5°, m. 61°; oxime, m. 163°. Oxidation

of the ketone with alk. KMnO<sub>4</sub> gives 2,5-benzophenonedicarboxylic acid, m. 285°. *Benzyl-m*-xylylmalonic acid, m. 168°; *Et ester*, b 231-3° (70% yield); *benzyl-m*-xylylacetic acid, m. 67-8°; the chloride with AlCl<sub>3</sub> gives the ketone MeC<sub>6</sub>H<sub>4</sub>.CO.CH(CH<sub>2</sub>Ph).CH<sub>2</sub>, b<sub>17</sub> 223-4°, m. 87-9°; oxime, m. 163°; semicarbazone,

m. 196°. The structure of the ketone was confirmed by synthesis from *m*-MeC<sub>6</sub>H<sub>4</sub>.CH<sub>2</sub>CH<sub>2</sub>CO<sub>2</sub>H.  $\beta$ -*o*-Tolylcinnamic acid, b<sub>14</sub> 218-20°, m. 114°; the hydro deriv., m. 129°, yields a chloride, b<sub>16</sub> 189°; AlCl<sub>3</sub> gives 80% of the ketone, C<sub>6</sub>H<sub>4</sub>.CO.CH<sub>2</sub>.CH-

C<sub>6</sub>H<sub>4</sub>Me, b<sub>14</sub> 195-6°, m. 87°; oxime, m. 166°; semicarbazone, m. 267°. Oxidation with HNO<sub>3</sub> gives 2,2'-benzophenonedicarboxylic acid, m. 148-50°, forming the anhydride, which m. 212°. Reduction gives a hydrindene deriv., C<sub>10</sub>H<sub>14</sub>, b<sub>14</sub> 160-2°, m. 57°.  $\beta$ -*p*-Tolylcinnamic acid, m. 140°; *Et ester*, b<sub>14</sub> 205-10°;  $\beta$ -*p*-tolylhydrocinnamic acid, b<sub>14</sub> 230-2°, m. 108-12°; chloride, b<sub>14</sub> 194°; AlCl<sub>3</sub> gives 70% of the ketone, C<sub>6</sub>H<sub>4</sub>O, b<sub>14</sub> 202-4°, m. 92°; oxime, m. 200°; semicarbazone, m. 219°; oxidation gives 2,4'-(HO<sub>2</sub>.CC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>CO, m. 241°; reduction gives a hydrocarbon, C<sub>16</sub>H<sub>17</sub>(C<sub>14</sub>H<sub>16</sub>)<sub>2</sub>, b<sub>14</sub> 168-70°, d<sub>4</sub><sup>20</sup> 1.0455, n<sub>D</sub><sup>20</sup> 1.5878. *Benzyl-p*-xylylmalonic acid, m. 155-7° (decompn.); *Et ester*, b<sub>14</sub> 232-5°; *benzyl-p*-xylylacetic acid, b<sub>13</sub> 235-7°, m. 88-9°; amide, m. 131°; the chloride and AlCl<sub>3</sub> give 70% of the ketone, C<sub>17</sub>H<sub>16</sub>O, b<sub>14</sub> 221-3°; semicarbazone, m. 195-7°.

$\alpha$ -Hydrindone and *p*-MeC<sub>6</sub>H<sub>4</sub>CHO give the ketone, C<sub>6</sub>H<sub>4</sub> $\begin{matrix} \text{CH}_2 \\ \diagup \quad \diagdown \\ \text{CO} \end{matrix}$ C:CHC<sub>6</sub>H<sub>4</sub>Me, m. 138°; the reduced ketone, C<sub>17</sub>H<sub>16</sub>O, b<sub>18</sub> 223-6°; oxime, m. 132°; phenylhydrazone, m. 109°.

6-Methylhydrindone and BzH give the ketone, MeC<sub>6</sub>H<sub>4</sub> $\begin{matrix} \text{CO} \\ \diagup \quad \diagdown \\ \text{CH}_2 \end{matrix}$ C:CHPh, m. 165°;

reduction gives the ketone, C<sub>17</sub>H<sub>16</sub>O, b<sub>13</sub> 206-10°, m. 38-9°; oxime, m. 130-43°. *p*-Tolylphenylpropyl alc., b<sub>20</sub> 210-5°, by the reduction of *Et p*-tolylhydrocinnamate with Na and EtOH; bromide, b<sub>14</sub> 202-3°; nitrile, b<sub>14</sub> 211-22°; sapon. gives  $\gamma,\gamma'$ -phenyl-*p*-tolylbutyric acid, b<sub>14</sub> 238-9°; the chloride (b<sub>14</sub> 205-8°) gives with AlCl<sub>3</sub> 70% of the ketone C<sub>17</sub>H<sub>16</sub>O, b<sub>14</sub> 198-200°, m. 75°; semicarbazone, m. 204°; oxidation gives 2,4'-

(HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>CO. 2-β-Naphthylcinnamic acid, m. 217°; the dihydro deriv., m. 132°; the chloride with AlCl<sub>3</sub> gives the ketone C<sub>19</sub>H<sub>14</sub>O, b<sub>13</sub> 257-9°, m. 119°; oxime, m. 190-2°; semicarbazone, m. 235-8° (decompn.); reduction gives 3-phenyl-6,7-benzohydrindene, b<sub>13</sub> 226-9°, m. 79°. α-C<sub>10</sub>H<sub>7</sub>MgBr and α-hydrindone give 1-β-naphthylindene, b<sub>14</sub> 246-50°, m. 88°; the dihydro product b<sub>13</sub> 229-30°, m. 47°. Oxidation of the ketone gives β-benzoyl-α-naphthoic acid, m. 139-40°. Benzyl-β-naphthylmethylmalonic acid, m. 111-3° (decompn.); Et ester, b<sub>0.3</sub> 225-30°; benzyl-β-naphthylmethylacetic acid, m.

103-4°; the chloride with AlCl<sub>3</sub> in PhNO<sub>2</sub> gives 70% of the ketone, C<sub>16</sub>H<sub>8</sub>  $\begin{matrix} \text{CH}_2 \\ \diagup \quad \diagdown \\ \text{CO} \end{matrix}$  CHCH<sub>3</sub>-

Ph, b<sub>0.5</sub> 205-10°, m. 72-4°; this was also obtained from benzylidene-6,7-benzoindanone, m. 166°, by catalytic reduction. Benzyl-α-naphthylmethylmalonic acid, oil; Et ester, b<sub>0.5</sub> 225-30°; benzyl-α-naphthylmethylacetic acid, b<sub>0.5</sub> 245-50°, m. 101-3°; the chloride with AlCl<sub>3</sub> gives 70% of a mixt. of ketones, from which was isolated benzyl-peri-naphthindanone, whose oxime m. 163-4°. Its structure was established by condensing peri-naphthindanone and BzH (the benzal deriv. m. 163°) and catalytically reducing the product. α-Hydrindone and α-C<sub>10</sub>H<sub>7</sub>CHO give the isomeric ketone, C<sub>20</sub>H<sub>16</sub>O, m. 87-8°. Et α-naphthylmethyl-β-naphthylmethylmalonate, b<sub>0.05</sub> 255-60°; the free acid is an oil; α-naphthylmethyl-β-naphthylmethylacetic acid, b<sub>0.05</sub> 280-90°; the chloride with AlCl<sub>3</sub> gives 25% of the ketone C<sub>24</sub>H<sub>16</sub>O, m. 138-9°; the remaining oily product could not be crystd. This ketone was synthesized by condensing 6,7-benzoindan-1-one and α-C<sub>10</sub>H<sub>7</sub>CHO and reducing the product.

C. J. WEST

Technical preparation of tannic acid and its derivs. ISAMU TAKINO. *J. Pharm. Soc. (Japan)* 49, 1-59(1929). Methods of techn. prepn. of tannic, gallic and pyrogallic acids are discussed thoroughly.

F. I. NAKAMURA

Condensation of phthalyl chloride and nitrobenzene. I. T. KONDO AND Y. MIYASHITA. Tokyo Imp. Univ. *J. Pharm. Soc. (Japan)* 48, No. 561, 1111-4(1928).--Condensation of phthalyl chloride and PhNO<sub>2</sub> with Zn dust as catalyst at 40-50° gave C<sub>17</sub>H<sub>9</sub>NO<sub>4</sub> (I), m. 196-7°. Decompn. of I with Na-Hg gave C<sub>6</sub>H<sub>7</sub>NO<sub>2</sub> (II), m. 70-1° (Ac deriv., m. 178-9°; benzal deriv., m. 192°; picrate, m. 185°) and MeOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H (III), m. 123-4°. III on standing or by heating changes into a substance, C<sub>8</sub>H<sub>6</sub>O<sub>2</sub>, m. 73°.

F. I. NAKAMURA

Norcarane. FR. EBEL, R. BRUNNER AND P. MANGELLI. *Helv. Chim. Acta* 12, 19-26(1929).--Cyclohexene (I) and N<sub>2</sub>CHCO<sub>2</sub>Et (II) heated for 9 hrs. at 125° in a sealed tube give 10% of the Et norcaranecarboxylate (III). The treatment of I and Cu (catalyst) at 88° gradually with a mixt. of II and Et<sub>2</sub>O gives 53% of III, while heating a mixt. of all the ingredients to boiling gives 30% maleic acid but no III. Cu pptd. from CuSO<sub>4</sub> soln. by Zn gives the best form of catalyst. Sapon. of III with 7% alc.-KOH gives 61% of the free acid (IV), m. 97°. Salts of IV with alk. earth and heavy metals are insol. in water. IV does not add Br, and it is stable in alk. KMnO<sub>4</sub> soln. Dry distn. of IV with a mixt. of BaO and ZnO gives norcarane, b. 110°, mixed with an ethylene isomer from which it is sepd. by treatment with BzO<sub>2</sub>H.

F. C. H.

Reply to O. Aschan (pinene chlorine and bromine addition products). I. L. KONDAKOV. Revnice bei Prag. *Ber.* 62B, 151-2(1929); cf. A, C. A. 22, 1346.--Polymical.

C. A. R.

Chemistry of fenchene. I. L. KONDAKOV. Org. Chemistry Lab., Charles Univ., Prague. *Chem. Listy* 23, 49-54(1929).--d-Fenchene was reduced to dl-fenchyl alc. according to Wallach's and also Gardner-Cockburn's method, sepd. from the liquid products and purified. The remaining liquids were converted to dl-fenchyl alc. by repeated reductions. dl-Fenchyl alc. m. 45°, b<sub>750</sub> 201.5°, [α]<sub>D</sub><sup>20</sup> -12.3°. A mol. of H<sub>2</sub>O was removed with anhyd. KHSO<sub>4</sub> at a temp. not exceeding 180° and the mixt. was distd. The distillate contg. fenchyl alc., fenchene and SO<sub>2</sub> was neutralized by NaOH and redistd. 7 times (until the crystals of fenchyl alc. failed to appear in the condenser). The purified fenchene was fractionated and contained 2 fractions: I, b. 147.5-155°, d<sub>20</sub> 0.8574, [α]<sub>D</sub> 10.85°, [α]<sub>D</sub><sup>20</sup> 12.64°, n<sub>D</sub> 1.46278, M. R. 43.71 (43.51); II, b. 155-162°, d<sub>20</sub> 0.8558, [α]<sub>D</sub> 13.75°, [α]<sub>D</sub><sup>20</sup> 16.06°, n<sub>D</sub> 1.46771, M. R. 44.201 (43.511). With K.'s method, both fractions were converted to fenchene-HCl, and a fenchene isomer was regenerated which b. 152.5-157.5°; this fraction was refractionated into 2 liquids: I, b. 152.5-3.5°, d<sub>20</sub> 0.8600, [α]<sub>D</sub> 12.48°, [α]<sub>D</sub><sup>20</sup> 14.88°, n<sub>D</sub> 1.46667, M. R. 43.997 (43.511); II, b. 153.5-5°, d<sub>20</sub> 0.8621, [α]<sub>D</sub> 11.01°, [α]<sub>D</sub><sup>20</sup> 13.15°, n<sub>D</sub> 1.46973, M. R. 43.933 (43.511). The fenchene-HCl yielded a small quantity of insol. chloride. The finished product consisted of α-, β- and γ-fenchenes without any cyclofenchene, δ-fenchene, or any high-boiling isomer. Another product prepd. during the dehydration of fenchyl alc. is a cryst.

fenchyl alc., m. 48.5–9.0°. When this alc. is treated again with  $\text{KHSO}_4$ , the product m. 47°; when this is dehydrated 2 more times an alc., m. 49°, results which has the form of hexagonal plates and a sharp odor recalling borneols and fenchyl alc. The mixt. b. 48–48.5° showed in EtOH (c 5.1)  $[\alpha]_D -0.50^\circ$ ,  $[\alpha]_D^{20} -12.10^\circ$ ; the mixt. b. 48.5–49.0° showed: (1) in EtOH (c 6.56)  $[\alpha]_D 0.28^\circ$ ,  $[\alpha]_D^{20} -5.36^\circ$ ; (2) in  $\text{C}_6\text{H}_6$  (c 5.2)  $[\alpha]_D -0.30^\circ$ ,  $[\alpha]_D^{20} -6.6^\circ$ . The prepn. b. 48.5–49.0° is considered as pure  $\alpha$ -fenchyl alc. (exostereoisomer). The urethan of the  $\alpha$ -fenchyl alc., prepd. by treating with  $\text{PhNCO}$ , m. 80–2°. The  $\alpha$ -fenchyl alc. was treated with 1 mol.  $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$  for 10 hrs. at 110° and 5 more at 125°. The resulting ether is a homogeneous cryst. mass, m. 145°. The prepn. b. 48.5–9.0° was converted to fenchyl chloride, b<sub>18</sub> 90°. Alcoholysis with KOH yields: fenchene, fenchyl alc., and the remaining fenchyl chloride. The fenchene b<sub>732</sub> 157.5–160°,  $d_4^{20} 0.8676$ ,  $\alpha_D^{20} -29.8^\circ$ ,  $[\alpha]_D -34.35^\circ$ ,  $n_D 1.46827$ , M. R. 43.64 (43.51) which correspond to the original fenchene. This pure *dl*- $\alpha$ -fenchene at room temp. with alk. 3%  $\text{KMnO}_4$  yielded *dl*- $\alpha$ -fenchocamphorone, which gave a semicarbazone, m. 210–1°, a Na salt of an  $\alpha$ -hydroxyfenchene, m. 153–4°, and a small quantity of  $\text{HCO}_2\text{H}$ . The pure  $\alpha$ -fenchene alc. yields a mixt. of fenchyl chlorides which contain an unstable deriv. in abundance and a stable deriv. in small quantity. Splitting off HCl yields clear homogeneous semicyclic  $\alpha$ -fenchene which confirms that homogeneous exofenchyl alc. yields a tertiary chloride corresponding to  $\alpha$ -fenchene hydrate without any of the  $\beta$ -isomer. Conclusion: The prepn. of Kenyon and Priston contained a certain quantity of the  $\beta$ -isomer. FRANK MARESH

**Organic sulfur compounds. XI. Comparison of the dissociation tendency of polymeric thioketones with the dissociation tendency of corresponding compounds of the ethane series.** ALEXANDER SCHÖNBERG. *Techn. Hochschule, Charlottenburg. Ber. 62B*, 195–9 (1929); *C. A.* 23, 579. By the recent prepn. of a no. of thioketones and a study of their ability to polymerize it has become possible to correlate the latter property with their constitution and to compare the dissocn. tendency of polymeric thioketones with that of the corresponding compds. of the  $\text{C}_2\text{H}_6$  series. In both the  $\text{C}_2\text{Ph}_6$  and (hypothetical) hexaphenyltrithiane series replacement of the Ph groups by H or Me has a stabilizing effect, H having the stronger influence. Again, in both series, replacement of 2 Ph groups by a substituted methylene residue gives radicals which are incapable of existence in the "free" state. Just as the partial or complete replacement of the Ph groups in  $\text{C}_2\text{Ph}_6$  by the groups *o*- and *p*- $\text{MeOC}_6\text{H}_4$ ,  $\text{PhC}_6\text{H}_4$ ,

$\text{Me}_2\text{NC}_6\text{H}_4$ ,  $\text{C}_6\text{H}_4 \begin{array}{c} \diagup \diagdown \\ \text{X} \end{array} \text{C}_6\text{H}_4$  (X = O or S) gives compds. having a similar or greater dissocn. tendency than  $\text{C}_2\text{Ph}_6$  itself, so also the compds.  $(\text{MeOC}_6\text{H}_4)_2\text{CS}$ ,  $(\text{PhC}_6\text{H}_4)_2\text{CS}$ ,  $(\text{Me}_2\text{NC}_6\text{H}_4)_2\text{CS}$ ,  $\text{C}_6\text{H}_4 \begin{array}{c} \diagup \diagdown \\ \text{S} \end{array} \text{C}_6\text{H}_4$  and  $\text{C}_6\text{H}_4 \begin{array}{c} \diagup \diagdown \\ \text{O} \end{array} \text{C}_6\text{H}_4$  have no more tendency to

polymerize than  $\text{Ph}_2\text{CS}$ . As in the  $\text{C}_2\text{H}_6$  series, substituted vinyl groups have the same influence as Ph groups in thioketones. From all the data available, the following law can be formulated: The same constitutional changes which strengthen (weaken) the polymerization tendency of "free" methyls also strengthen (weaken) the polymerization tendency of monomol thioketones. The same constitutional changes which strengthen (weaken) the dissocn. tendency of ethanes also strengthen (weaken) the dissocn. tendency of polymeric thioketones. C. A. R.

**The dehydration of some symmetrically disubstituted  $\alpha$ -glycols and the isomerism of the corresponding ethylene oxides. The orienting influence of some cyclic and acyclic radicals.** JEANNE LÉVY AND FRAJDA GOMBIN-KA. *Compt. rend.* 188, 711–3 (1929).—L. and G. have studied 8  $\alpha$ -glycols of the type  $\text{ArCH}(\text{OH})\text{CH}(\text{OH})\text{R}$  (Ar is cyclic and R acyclic), also the corresponding ethylene oxides. The results confirm the theory that the OH group next to the cyclic group is eliminated on dehydration. The product is  $\text{ArCH}_2\text{COR}$ . Heat with catalysts (not mentioned) causes the ethylene oxides to rearrange to the same products as dehydration of the glycols. This is also evidence of the weakness of the same O bond. VALENTINE F. HARRINGTON

**Oximes and the Beckmann rearrangement. IX. Oximes of the three methylbenzils.** JAKOB MEISENHEIMER, OTTO BEISSWENGER, HANS O. KAUFFMANN, UDO V. KUMMER AND JAKOB LINK. *Univ. Tübingen. Ann.* 468, 202–58 (1929); cf. *C. A.* 22, 3887.—Condensation of 11.2 g. BzH and 15.5 g. *o*- $\text{MeC}_6\text{H}_4\text{CH}_2\text{NO}_2$  with 0.3 g.  $\text{Na}_2\text{CO}_3$ , 0.75 g.  $\text{MeNH}_2$ , HCl and 20 drops EtOH gives 98% of 2-methyl-7-nitrostilbene, yellow, m. 92°, and a little *by-product*,  $\text{C}_{11}\text{H}_{11}\text{O}_2\text{N}$ , m. 195° (decompn.). The stilbene, treated as described in *C. A.* 2, 78, gives 60–5% of  $\alpha$ -2-methylbenzil 7-oxime 7',7'-dimethylacetal,

m. 179°; concd. HCl gives quant.  $\alpha$ -2-methylbenzil 7-oxime ( $\alpha_1$ -monoxime) (I), m. 117–8°; warming with concd. HCl at 100° causes about 30% decompn.; 8 hrs.' heating with EtOH in a sealed tube causes no rearrangement but partial decompn. Heating I with 15% NaOH on the H<sub>2</sub>O bath for 3 hrs. causes decompn. into *o*-MeC<sub>6</sub>H<sub>4</sub>CONH<sub>2</sub>, BzOH and *o*-MeC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H. The Bz deriv. of I m. 110°; sapon. with dil. EtOH-NaOH gives 99% of BzOH and 85% of *o*-MeC<sub>6</sub>H<sub>4</sub>CN. The *o*-tolyl deriv. m. 82–3°. I and NH<sub>2</sub>OH give quant.  $\alpha$ -2-methylbenzil dioxime (II), m. 250° (quick heating, 260°); this is not rearranged by heating with 15% NaOH for several hrs.; *di*-Ac deriv., m. 139°; *di*-Bz deriv., m. 162–3°. Condensation of *o*-MeC<sub>6</sub>H<sub>4</sub>CHO and PhCH<sub>2</sub>NO<sub>2</sub> gives nearly quant. 2-methyl-7'-nitrostilbene, m. 99°, and a little of the by-product, m. 195°, but which analyzes for C<sub>21</sub>H<sub>13</sub>NO<sub>2</sub>.  $\alpha$ -2-Methylbenzil 7'-oxime 7',7'-dimethyl acetal ( $\alpha_1$ -acetaloxime), m. 174°.  $\alpha$ -2-Methylbenzil 7'-oxime ( $\alpha_1$ -monoxime) (III), m. 119°; NH<sub>2</sub>OH gives II; Bz deriv., m. 87–8°. If the  $\alpha_1$ -acetaloxime is allowed to stand several days with concd. HCl, there results  $\beta$ -2-methylbenzil 7'-oxime ( $\beta_1$ -oxime) (IV), m. 121°; with C<sub>6</sub>H<sub>6</sub> of crystn., m. 88–90°; Bz deriv., m. 129°. IV and NH<sub>2</sub>OH give  $\gamma$ -2-methylbenzil dioxime (V), m. 188.5° (decompn.); slow heating converts V into II; *di*-Bz deriv., m. 127–8°; heating with excess 15% NaOH 5 hrs. gives 98% of phenyl-*o*-tolylfuran, m. 49°. Oxidation of V with NaOCl gives 95% of  $\alpha$ -phenyl-*o*-tolylfuroxan, m. 103°. Heating 2-methyl-7-nitrostilbene with 50% NaOH at 150–60° for 0.75 hr. gives nearly quant.  $\beta$ -phenyl- $\alpha$ , $\gamma$ -di-[*o*-tolyl]isoxazole (VI), m. 111.5°;  $\alpha$ , $\gamma$ -diphenyl- $\beta$ -[*o*-tolyl]isoxazole (VII), m. 126°, results similarly from 2-methyl-7'-nitrostilbene. Oxidation of VI by O<sub>3</sub> gives not over 25% of *o*-tolyl- $\beta$ -2-methylbenzil 7-oxime (VIII), m. 114°. Oxidation of VII gives IV. Sapon. of VIII gives 95% of  $\beta$ -2-methylbenzil 7-oxime ( $\beta_1$ -monoxime) (IX), m. 124°. IX and NH<sub>2</sub>OH give quant.  $\delta$ -2-methylbenzil dioxime (X), m. 184°, then solidifies and m. 250–60° (decompn.); *di*-Bz deriv., m. 112–3°; sapon. gives 86% of phenyl-*o*-tolylfuran. Oxidation of X gives  $\beta$ -phenyl-*o*-tolylfuroxan, m. 80–7°. Condensation of 3-MeC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>NO<sub>2</sub> and BzH with MeNH<sub>2</sub>.HCl gives 3-methyl-7-nitrostilbene, yellow, m. 82°; with MeOH-KOH this yields 85% of  $\alpha$ -3-methylbenzil 7',7'-dimethylacetal, m. 176°, yielding with concd. HCl (10 mins.) a poor yield of  $\alpha$ -3-methylbenzil 7'-oxime ( $\alpha_1$ -monoxime) (XI), m. 83°, or, after 24 hrs, the  $\beta$ -oxime ( $\beta_1$ -monoxime) (XII), m. 122°; Bz deriv., m. 136°; Ac deriv., m. 67°. The  $\alpha$ -dioxime, from XI, m. 216°; *di*-Bz deriv., m. 185° (decompn.); heating 2 hrs. at 170–5° gives the  $\beta$ -dioxime, m. 150°, crystg. also with 1 mol. C<sub>6</sub>H<sub>6</sub>; *di*-Bz deriv., m. 141.5°. XII gives a mixt. of the 2 oximes. XII in the cold gives the  $\delta$ -dioxime (XIII), m. 141°; Na salt; *di*-Bz deriv., m. 152°, sapon. by boiling 10% NaOH to phenyl-3-tolylfuran, b. in high vacuum 175–85°, m. 37°. Oxidation with NaOCl gives  $\beta$ -phenyl-3-tolylfuroxan, m. 77.5°. 3-Methyl-7'-nitrostilbene, pale yellow, m. 51°, b<sub>14</sub> 195° (65% yield). 3-Methylbenzil 7'-oxime 7,7'-dimethylacetal ( $\alpha_1$ -acetaloxime), m. 214° (decompn.); sapon. gives  $\alpha$ -3-methylbenzil 7'-oxime ( $\alpha_1$ -monoxime) (XIV), m. 113°. Na salt, orange; the C<sub>6</sub>H<sub>5</sub>N soln. and Co salts give an intense yellow-brown color; Bz deriv., m. 91°. If the sapon. mixt. stands 24 hrs., there results the  $\beta$ -oxime (XV), m. 134°; Bz deriv., m. 120°. XV and NH<sub>2</sub>OH give the  $\gamma$ -dioxime, crystg. with 1 mol. C<sub>6</sub>H<sub>6</sub>, m. 126.5°; this is unstable and rearranges to the  $\beta$ -dioxime on recrystn. from C<sub>6</sub>H<sub>6</sub> (1 expt.) but normally into the  $\alpha$ -dioxime; *di*-Bz deriv., m. 108–16°. Oxidation with NaOCl gives  $\alpha$ -phenyl-3-tolylfuroxan, m. 75.5°. 4-Methyl-7-nitrostilbene, yellow, m. 75–6°. 4-Methylbenzil 7-oxime 7',7'-dimethylacetal, m. 217°;  $\alpha$ -4-methylbenzil 7-oxime (XVI), m. 115° (Bz deriv., m. 118°); cold concd. HCl (20 hrs.) gives the  $\beta$ -oxime (XVII), m. 134° (Bz deriv., m. 156°); the  $\alpha$ -dioxime, from XVI, m. 223–4°; 12 hrs.' heating with 5 parts of EtOH gives quant. the  $\beta$ -dioxime, crystg. with 0.5 mol. C<sub>6</sub>H<sub>6</sub>, m. 184° (*di*-Bz deriv., m. 140°). XVII and NH<sub>2</sub>OH give the  $\delta$ -dioxime, m. 160° (*di*-Bz deriv., m. 119°). NaOH (10%) gives phenyl-4-tolylfuran, m. 80°; NaOCl gives  $\beta$ -phenyl-4-tolylfuroxan, m. 117°. 4-Methyl-7'-nitrostilbene, yellow, m. 79° (85% yield); 1 by-product, C<sub>21</sub>H<sub>13</sub>O<sub>2</sub>N, m. 108°; a 2nd is 1-phenyl-2-[4-tolyl]-2-methoxy-1-nitroethane, yellow, m. 93°. 4-Methylbenzil 7'-oxime, m. 120–1°; 7,7'-dimethylacetal, m. 215° (decompn.); Bz deriv., m. 94°.  $\gamma$ -Dioxime, crystg. with 1 mol. CHCl<sub>3</sub>, m. 150°; *di*-Bz deriv., m. 137°. NaOCl gives  $\alpha$ -phenyl-4-tolylfuroxan, m. 121°.  $\alpha$ , $\gamma$ -Diphenyl- $\beta$ -[3-tolyl]isoxazole, m. 156°. 1-Phenyl-2-[*m*-tolyl]-2-methoxy-1-nitroethane, m. 89°.

C. J. West

Relative ease of formation of five, six- and seven-membered carbon rings. JULIUS V. BRAUN AND GOTTFRIED MANZ, Univ. Frankfurt. Ann. 468, 258–77 (1929); cf. C. A. 22, 1153, 1972.—PhCH: CPhCO<sub>2</sub>H yields an *Et* ester, b<sub>14</sub> 192°, m. 33–4° which is reduced by a large excess of Na to a mixt. of PhCH<sub>2</sub>CHPhCO<sub>2</sub>H, PhCH<sub>2</sub>CHPhMe, b<sub>13</sub> 145–8°, m. 50°, and  $\beta$ , $\gamma$ -diphenylpropyl alc., b<sub>13</sub> 185–8° (60% yield); bromide, b<sub>13</sub> 188–90°; KCN gives about 50% of PhCH<sub>2</sub>CHPhCN, b<sub>13</sub> 204–6°, which is easily sapond.

to the acid.  $\text{PhCH}_2\text{CHPhCOCl}$ ,  $\text{AlCl}_3$  and  $\text{CS}_2$  give 75% of 3-phenyltetral-1-one,  $b_{13}$  213-5°,  $m$ . 65-6°; *oxime*,  $m$ . 190°; *semicarbazone*,  $m$ . 208°. Reduction gives *phenyltetralin*,  $b_{13}$  180-1°,  $d_4^{18}$  1.0579,  $n_D^{18}$  1.5980; its constitution follows from the production of  $\beta\text{-C}_{10}\text{H}_7\text{Ph}$  on passing over dark red  $\text{PbO}$ . *Et benzyl- $\gamma$ -phenylpropylmalonate*,  $b_{13}$  244-7° (70% yield); the free acid  $m$ . 96° and on heating gives 80% of *benzylphenylpropylacetic acid*,  $b_{13}$  243-5°; the chloride with  $\text{AlCl}_3$  gives 60% of 2- $\beta$ -phenylpropyl-1-hydrindone (I),  $b_{13}$  227-9°; *semicarbazone*,  $m$ . 172°; *p-nitrophenylhydrazones*, orange,  $m$ . 161°; *oxime*, oily, reduced by Na and EtOH to 1-amino-2- $\gamma$ -phenylpropylhydrindene,  $b_{13}$  217° (*picrate*,  $m$ . 203°). Reduction of I gives 2- $\gamma$ -propylhydrindene,  $b_{13}$  197°,  $d_4^{18}$  1.0128,  $n_D^{18}$  1.5667, whose mol. refraction proves that it is a 5-ring compd.; Br deriv.,  $m$ . 82°. *Cinnamalhydrindone*, yellow,  $m$ . 124°, from  $\alpha$ -hydrindone and  $\text{PhCH}:\text{CH}:\text{CHO}$ ; catalytic reduction gives I.  $\text{PhCH}_2\text{CH}(\text{CO}_2\text{Et})_2$ ,  $\text{ICH}_2\text{CH}_2\text{CO}_2\text{Et}$  and Na give 85% of *Et  $\delta$ -phenyl- $\gamma,\gamma$ -dicarboxyvalerate*,  $b_{13}$  219-21°; sapon. gives  $\delta$ -phenyl- $\gamma,\gamma$ -dicarboxyvaleric acid,  $m$ . 166°; heating *in vacuo* gives  $\alpha$ -benzylglutaric acid,  $m$ . 76°;  $\text{SOCl}_2$  gives the *anhydride*,  $m$ . 81°, which gives with  $\text{AlCl}_3$  30% of 2- $\alpha$ -hydrindonyl- $\beta$ -propionic acid,  $b_{14}$  238-43°,  $m$ . 103-5°; *oxime*,  $m$ . 145°; *semicarbazone*,  $m$ . 244-6°. Dry distn. with soda lime gives  $\alpha$ -hydrindone. (with R. MURJAHN.) *o-PhC}\_6\text{H}\_4\text{NH}\_2*, through the Sandmeyer reaction, gives 50% of the *cyanide*,  $b_{14}$  163°,  $m$ . 36°; sapon. is very difficult but catalytic reduction readily gives 45% of *o-phenylbenzylamine*,  $b_{12}$  163°; *HCl salt*,  $m$ . 212°; *picrate*,  $m$ . 188°; *acetate*,  $m$ . 125°; *Bz deriv.*,  $m$ . 95°.  $\text{NaNO}_2$  gives *o-phenylbenzyl alc.*,  $b_{13}$  174°; *chloride*,  $b_{12}$  154°; *bromide*,  $b_{12}$  166°. *Dithiourethan*,  $m$ . 106°; warming with dil. KOH gives the *mercaptan*,  $b_{12}$  160°. The bromide and Na give 2,2'-dibiphenylethane,  $b_{12}$  260°. *o-Phenylbenzyl cyanide*,  $b_{12}$  182°; sapon. with concd. HCl at 120° gives *o-biphenylacetic acid*,  $m$ . 114°. *Et o-phenylbenzylmalonate*,  $b_{12}$  245-50° (80% yield); the free malonic acid loses  $\text{CO}_2$  on heating with  $\text{H}_2\text{O}$  and gives 2- $\beta$ -phenylpropionic acid,  $m$ . 125°; the chloride with  $\text{AlCl}_3$  gives 4-phenylhydrindone,  $b_{11}$  200-5°, *semicarbazone*,  $m$ . 192°. C. J. WEST

**Derivatives of Bz-tetrahydrocoumarone.** FR. EBEL, F. HUBER AND A. BRUNNER. *Helv. Chm. Acta* 12, 16-9 (1929).— $\alpha$ -Chlorocyclohexanone condenses with  $\text{AcCHNa}:\text{CO}_2\text{Et}$  giving  $\alpha$ -cyclohexanonylacetoacetic ester (I) which exists in 2 forms. 24% keto form,  $b_{13}$  110-3°, decomp. 150°, and enol form,  $b_{13}$  119-22°. Boiling 2.5% alc. KOH converts I into *acetonilycyclohexanone* (II),  $b$ . 112° (3% yield). Attempts to prep. the furan deriv. by treating II with  $\text{P}_2\text{O}_5$ ,  $\text{POCl}_3$  or  $\text{H}_2\text{SO}_4$  were not successful because of complicated side reactions. II and  $\text{PhMNH}_2$  give violet red crystals of a *quinoline deriv.*,  $m$ . 87°. I and boiling 15% HCl give 72% *Et 1-methyl-Bz-tetrahydrocoumarone-2-carboxylate* (III),  $b$ . 134°. III with boiling 7% alc. KOH gives 50% of the corresponding acid,  $m$ . 156°. FREDERICK C. HAHN

**Anthraquinone-1,5-dicarboxylic acid and some simple and mixed anthraquinone-carboxylic acid anhydrides.** ROLAND SCHOLL, SIGFRID HASS AND HANS K. MEYER. *Tech. Hochschule, Dresden. Ber.* 62B, 107-15 (1929).—*Anthraquinone-1,5-dicarboxylic acid* (I) had been prepd. 15 yrs. previously from 1,5- $\text{H}_2\text{NC}_6\text{H}_3(\text{CO})_2\text{C}_6\text{H}_4\text{NH}_2$  (II) but the yield was so poor that the prepn. was not described. It can also be made from 5,1- $\text{H}_2\text{NC}_6\text{H}_3(\text{CO})_2\text{C}_6\text{H}_3\text{CO}_2\text{H}$  (III). Both methods have been used for the present work and the 1st has been so improved that I can now easily be obtained in 60% yield from II. When heated with  $\text{Ac}_2\text{O}$  I changes into a mixed anhydride (IV) which, unlike I, is relatively easily sol. in org. solvents. Anthraquinone- and 2-methylantraquinone-1-carboxylic acids behave in the same way toward  $\text{Ac}_2\text{O}$  while 2- $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_3\text{CO}_2\text{H}$  recryst. unchanged from boiling  $\text{Ac}_2\text{O}$ . On heating, these mixed anhydrides decomp. into  $\text{Ac}_2\text{O}$  and the simple anhydride of the corresponding anthraquinone-carboxylic acid, and with boiling concd. AcOH they yield the free anthraquinonecarboxylic acid. They are light yellow, like most of the free acids, while the arylated lactones of type V (to be described in a later paper) are white. Moreover these mixed and simple anhydrides give like anthraquinone in abs. alc. with Na-Hg olive-green solns. sensitive to the air and very readily converted into vat dyes by alk.  $\text{Na}_2\text{S}_2\text{O}_4$ .  $\text{Na}_2\text{S}_2\text{O}_4$  in AcOH or  $\text{H}_2\text{O}$  converts them into the characteristic red anthrahydroquinone- $\alpha$ -carboxylic acid lactones (VI) and in dil.  $\text{NH}_4\text{OH}$  into the corresponding blue  $\text{NH}_4$  salts, compds. to be reported on in the near future. At the same time are formed the free anthrahydroquinone- $\alpha$ -carboxylic acids. The behavior of these anhydrides toward  $\text{Na}_2\text{S}_2\text{O}_4$  is similar to that of the anthraquinonecarboxylic esters for which the normal structure  $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_3\text{CO}_2\text{R}$  has been made very probable by their prepn. from the corresponding anthracene- $\alpha$ -carboxylic esters. The mixed anhydrides are therefore believed to have the normal anhydride  $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_3\text{C}(\text{O})\text{OAc}$  (VII) structure rather than the HO lactone form VIII. The structure and mol. wt. of the simple anthraquinone-

**1,5-dicarboxylic anhydride (IX)** obtained by heating the mixed anhydride could not be detd. because of its slight soly. in even high-boiling solvents. The relatively low m. p. (around 336°) speaks in favor of the simplest mol. wt., *i. e.*, of a formula with an O bridge between the C atoms of the 1- and 5-CO groups or the normal anhydride structure. For the prepn. of I the II must be perfectly pure. The product obtained from the com. di-NO<sub>2</sub> compd. can be purified through the sulfate or the pure II, m. 318-9° (cor.), can be obtained by treating K<sub>2</sub>SC<sub>6</sub>H<sub>3</sub>(CO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>SO<sub>2</sub>K with NH<sub>3</sub> and an appropriate oxidizing agent under pressure. Previously, it had been prepd. (with WILLY WINKLER) through **1,5-di-*p*-toluenesulfonamidoanthraquinone** (from the di-Cl compd., MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NH<sub>2</sub> and a little Cu(OAc)<sub>2</sub> in PhNO<sub>2</sub>), needles with golden luster, m. 310-1°, converted into II by concd. H<sub>2</sub>SO<sub>4</sub> at 50-60°. **1,5-Dicyanoanthraquinone**, obtained by diazotizing II in concd. H<sub>2</sub>SO<sub>4</sub> with solid NaNO<sub>2</sub>, treating the pptd. yellow bisdiazonium bisulfate in H<sub>2</sub>O suspension with CuSO<sub>4</sub>-KCN, boiling the ppt. with H<sub>2</sub>O and then 10% HNO<sub>3</sub> until free of Cu and crystg. from quinoline and PhNO<sub>2</sub> or subliming *in vacuo*, yellow, begins to darken 370°, m. about 390° (decompn.), forms with alk. Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> a green vat which with air gives a violet ppt. Refluxed with moderately concd. H<sub>2</sub>SO<sub>4</sub> 5 mins. it gives I. The final purification of the nitrile involves great losses but the crude product (about 150 g. from 150 g. II after boiling with H<sub>2</sub>O and HNO<sub>3</sub>) can be sapond. directly with concd. NaOH, yielding about 60% I (purified by boiling with HNO<sub>3</sub> of d. 1.35). I, yellowish needles, does not m. 390° but gradually reddens above 300° with partial autoreduction and formation of anthrahydroquinone-1,5-dicarboxylic dilactone. Solns. of I in alkalis are almost colorless. **K salt**, almost colorless; **pyridine salt**, yellowish; **Ca salt**, yellowish. **Dichloride**, from I refluxed with POCl<sub>3</sub>-PCl<sub>5</sub>, pale yellow, m. 260-3° (decompn.). (With SOLON BRISSIMDJI AND WILH. MESSE.) **5-Cyanoanthraquinone-1-carboxylic acid** (29 g. from diazotized III (35 g.) with CuSO<sub>4</sub>-KCN), yields I with boiling 20% NaOH. (With CHR. SEER.) **1,5-Diidoanthraquinone**, from diazotized II and KI, yellow, m. 308-9°, difficultly sol. in concd. H<sub>2</sub>SO<sub>4</sub> with yellow color, in alk. Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> with red color. **Acetic anthraquinone-1,5-dicarboxylic anhydride**, AcOC(:O)C<sub>6</sub>H<sub>2</sub>(CO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>C(:O)OAc (IV), pale yellow, m. about 202°. **Acetic anthraquinone-1-carboxylic anhydride**, m. 188-90°, begins to give off Ac<sub>2</sub>O at about 220°; **anthraquinone-1-carboxylic anhydride**, m. 285-7°. **Acetic 2-methylantraquinone-1-carboxylic anhydride**, begins to m. 173°; **2-methylantraquinone-1-carboxylic anhydride**, m. 298-5° (darkening), becomes dark brown in 1 day in the light.

**Derivatives of 2-methylantraquinone and anthraflavone.** PAUL RUGGLI AND EMIL MERZ. *Helv. Chim. Acta* 12, 71-99(1929). **1-Iodo-2-methylantraquinone** and Br in PhNO<sub>2</sub> at 160-70° give 20% of the crude **1-iodo-2-dibromomethyl deriv. (I)** contg. some **mono-Br (II)** from which I, m. 210°, was sepd. by crystd. from AcOH, or by forming the water-sol. **pyridinium salt (IV)** of II by treating the mixt. of Br derivs. with pyridine (III). The treatment of IV in H<sub>2</sub>O with HNO<sub>3</sub>, KI, KSCN, NaClO<sub>3</sub>, or picric acid gives the corresponding pyridinium salts. The **pyridinium salt (V)** of 1,2-C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>(NO<sub>2</sub>)CH<sub>2</sub>Br, m. 262-9° (decompn.). The Br in V is easily replaced with other anions by treating the water soln. with a salt contg. the resp. anion. **5,6,7,8-Tetrachloro-2-dibromomethylantraquinone** heated with Cu in PhNO<sub>2</sub> gives **5,6,7,8,5',6',7',8'-octachloroanthraflavone**, m. above 300°. **1,4,2-C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>C<sub>6</sub>H(NH<sub>2</sub>)-BrMe (VI)**, diazotized with concd. H<sub>2</sub>SO<sub>4</sub> and NaNO<sub>2</sub>, and then treated with alc. gives 77% of **4-bromo-2-methylantraquinone (VII)**, m. 199-200°. VII and **p-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>NH<sub>2</sub>** heated with AmOH, NaOAc and Cu(OAc)<sub>2</sub> give 88% **4-*p*-toluenesulfonamido-2-methylantraquinone (VIII)**, m. 232-3°. Treatment of VIII with concd. H<sub>2</sub>SO<sub>4</sub> gives 100% **4-amino-2-methylantraquinone**, m. 193°. VII and **p-MeC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>** heated with KOAc gives 100% **4-*p*-toluino-2-methylantraquinone**, m. 174-5°. Refluxing VII and Na<sub>2</sub>S in alc. gives the Na salt of **2-methyl-4-mercaptoanthraquinone (IX)**. Oxidation of the soln. of IX with air gives 60% **2,2'-dimethyldiantraquinonyl 4,4'-disulfide (X)**. The gradual addn. of X to boiling concd. HNO<sub>3</sub> gives **2-methylantraquinone-4-sulfonic acid (XI)**. Treatment of XI with HCl and KClO<sub>3</sub> gives **4-chloro-2-methylantraquinone**, m. 186-8°. VII heated with Cu in PhNO<sub>2</sub> gives 50-70% of **3,3'-dimethyl-1,1'-di-anthraquinonyl (XIII)**, m. 354-5°. **3,3'-Dimethyl-meso-benzodianthrone** is obtained by heating XIII with concd. H<sub>2</sub>SO<sub>4</sub> in the presence of Cu. VII and Br in PhNO<sub>2</sub> at 160-70°

give 80% 4-bromo-2-dibromomethylanthraquinone (XIV), m. 214-5°. Heating XIV in PhNO<sub>2</sub> in the presence of Cu gives 52% 4,4'-dianthraflavone, m. above 300°. Bromination of XII yields 4-chloro-2-dibromomethylanthraquinone (XV), m. 223-4°. XV in PhNO<sub>2</sub> contg. Cu gives 4,4'-dichloroanthraflavone. Diazotization of VI in concd. H<sub>2</sub>SO<sub>4</sub> with NaNO<sub>2</sub>, and treatment of the resulting diazo salt with KSCN gives 50-60% of 2-methylanthraquinone 1,4-dithiocyanate (XVI), m. 250-1°. XVI with boiling alc.-KOH yields the K salt of 2-methyl-di-thioquinizarin (XVII) which was not isolated in its free form because of its ready oxidizability. A soln. of XVII and EtBr yields 2-methylanthraquinone 1,4-dithioethyl ether, m. 195-205°. Similarly XVII and PhCH<sub>2</sub>Cl give the corresponding dithiobenzyl ether. Oxidation of XVI with boiling concd. HNO<sub>3</sub> yields 2-methylanthraquinone-1,4-disulfonic acid (XVIII). The treatment of XVIII with HCl and KClO<sub>3</sub> gives 90% 1,4-dichloro-2-methylanthraquinone (XIX), m. 185-6°. XIX and Br in PhNO<sub>2</sub> at 160° gives 1,4-dichloro-2-dibromomethylanthraquinone, m. 172-5°. XIX and *p*-MeC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> heated with amyl alc., NaOAc and a trace of Cu give 80% 1,4-di[*p*-toluenesulfonamido]-2-methylanthraquinone (XX), m. 204-5°. XX and concd. H<sub>2</sub>SO<sub>4</sub> give the corresponding diamino deriv., m. 246-8°. F. C. H.

**Bamba oil and the terpenes and higher-boiling fraction of Cajeput oil.** D. B. SPOELSTRA. Amsterdam, Colonial Inst. *Rec. trav. chim.* **48**, 372-6 (1929). —A. *Bamba oil*.—The Bamba oil (called "Laurel oil" in British Guiana) investigated by S., showed  $d_{15}^{20}$  0.9326,  $[\alpha]_D$  33.6,  $n_D^{20}$  1.4816, and was sol. in 0.5 vol. 80% alc. and in 9 vols. 70% alc.; acid no., 1.8; ester no., 3.0; OMe, 6.79%. The ester no. after acetylation, detd. after diln. with 4 vols. of xylene showed the presence of 15.3% of an alc. C<sub>10</sub>H<sub>18</sub>O. (On fractionation of 325 g. under 18 mm. the following fractions were obtained: (1) 49-58°, 175 g.; (2) 58-71°, 16 g.; (3) 71-105°, 42.5 g.; (4) 158-61°, 70 g. Fraction 1 on refractionation gave 152 g.  $b_{760}$  52-4°,  $b_{760}$  155-7°,  $d_{15}^{20}$  0.8622,  $\alpha_D$  40.4,  $n_D^{20}$  1.4661, which was identified as *pinene* by the prepn. of the semicarbazone of pinonic acid, m. 204°. Fraction 2 was mixed with 10 g. higher-boiling residue of fraction 1 and refractionated over Na; the chief fraction, thus obtained,  $b_{760}$  170-7°,  $d_{15}^{20}$  0.8500  $[\alpha]_D$  43.7,  $n_D^{17}$  1.4728, and on bromination in AcOH gave a mixt. of *d*-limonene tetrabromide, m. 104°, and dipentene tetrabromide, m. 124°. On sapon. and fractionation fraction 3 yielded *d*- $\alpha$ -terpineol, which was converted into the phenylurethan, m. 111°, and the nitroso-chloride, m. 108°, whereas fraction 4, on refractionation, gave 55 g. of a compd.  $b_{16}$  161-2°,  $n_D^{17}$  1.5305,  $d_{15}^{20}$  1.1598,  $[\alpha]_D$  -0.07°, which could be identified as *dillapiol* by the OMe content of 27.25%, the formation of the tribromide, m. 108°, by bromination in AcOH and the conversion into *dill-iso-apiol*, m. 44°, by means of alc. KOH; the latter compd. was also converted into *dill-iso-apiol picrate*, m. 81.5°. The compn. of Bamba oil is therefore: *d*- $\alpha$  pinene, 47%; *d*-limonene and dipentene, 5%; *d*- $\alpha$ -terpineol, 15%; *dillapiol*, 24%. B. *The terpenes and higher-boiling fractions of Cajeput oil*.—According to Gildemeister and Hoffmann (*Die aetherischen Oele*, III, 312 (1916)) Cajeput oil contains cineole, *i*- $\alpha$ -terpineol, *l*- $\alpha$ -pinene, BuCHO, BzH, HCO<sub>2</sub>H, PrCO<sub>2</sub>H and BuCO<sub>2</sub>H and chlorophyll. In the present paper it is shown that limonene, dipentene and sesquiterpenes and sesquiterpene alcs. of the cadaline type are also present. The cineole fraction was treated repeatedly with a 50% resorcinol and the terpenes isolated in this way were fractionated, *l*- $\alpha$ -pinene being obtained together with a fraction, showing  $b_{760}$  174-6°,  $d_{15}^{20}$  0.8496  $n_D^{20}$  1.4746,  $[\alpha]_D$  -33.4°. On bromination in AcOH this fraction gave a cryst. product which could be sepd. into *l*-limonene tetrabromide, m. 104°, and dipentene tetrabromide, m. 124°. The fractions with a  $b_{16}$  higher than 85° were sapond. and fractionated repeatedly, *i*- $\alpha$ -terpineol being obtained and the fractions: (1)  $b_{16}$  122-45°; (2) 145-56°; (3) 156-65° under 25 mm. On refractionation fraction 1 gave a middle fraction with  $d_{17}^{20}$  0.9054,  $n_D^{20}$  1.5023,  $[\alpha]_D$  4.3°,  $M_D$  66.7 (calcd. for C<sub>15</sub>H<sub>24</sub>, 66.1 and for C<sub>15</sub>H<sub>24</sub>, 67.8), thus showing the presence of mono- and bicyclic sesquiterpenes. With HCl a cryst. addn. product could not be obtained but on dehydrogenation with 3 atoms of S (cf. Ruzicka and Meyer C. A. 15, 3476) a blue reaction product was obtained, which, on treatment with H<sub>3</sub>PO<sub>4</sub>, gave a small amount of azulene, the picrate and styphnate of which m. 114-5° and 127°, resp. The part of the reaction product which had not reacted with H<sub>3</sub>PO<sub>4</sub>, contained cadaline (picrate, m. 114°; styphnate, m. 138°). Fraction 2, consisting of a mixt. of sesquiterpenes and sesquiterpene alcs., was not investigated further; fraction 3 on refractionation  $b_{16}$  160-5°,  $d_{15}^{20}$  0.9758,  $n_D^{17.5}$  1.5086, and chiefly consists of an alc., C<sub>15</sub>H<sub>24</sub>O, on dehydration with HCO<sub>2</sub>H a hydrocarbon, C<sub>15</sub>H<sub>24</sub>, being obtained, which, on dehydrogenation with S, yields cadaline.

C. F. VAN DUIN

**Synthesis of 1,5-naphthyridine.** B. ROBRANSKI AND K. SUCHARDA. *Rozprawy*

*Chem.* 7, 241-5(1927); cf. *C. A.* 22, 777.—In this abst. the reference was incorrectly given *Roczniki Chem.* 7, 192-203(1927). E. J. C.

**Benzopolymethylene compounds. XV. Composition, constitution and synthesis of fluoranthene.** JULIUS V. BRAUN AND ERNST ANTON. Univ. Frankfurt a. M. *Ber.* 62B, 145-51(1929); cf. *C. A.* 22, 2748.—The experimentally confirmed theory that tricyclic systems can be formed by fusion onto a  $C_6H_6$  nucleus of adjacent 5- and 6-, 6- and 7- or two 6-membered rings but not of two 5-membered rings is based on the assumption, now firmly established, that the distance between adjacent C atoms in  $C_6H_6$  nuclei is almost the same as in aliphatic chains. It can furthermore be deduced that ring structures such as I would have an extremely small tendency to be formed and a correspondingly slight stability whereas it should not be very difficult to obtain substances with the structure II. Two facts did not agree with these deductions: (1) the existence of fluoranthene (III),  $C_{18}H_{10}$ , to which, from the work of Fittig and Goldschmidt, hardly any other structure than I could be assigned, and (2) the observation of Mayer that neither 9-fluorenylacetyl (V) nor  $\beta$ -6-fluorenylpropionyl chloride (VI) undergoes an intramol. Friedel-Crafts reaction with  $AlCl_3$ , whereas according to the above theory V should, indeed, not be capable of ring formation but VI should be able to form a ring with not much greater difficulty than  $\beta$ -hydriindylpropionyl chloride. Now, the calcd. C and H values for  $C_{18}H_{10}$  and  $C_{18}H_8O_2$ , the formulas hitherto assigned to III and its oxidation product, the so-called fluoranthenequinone (VII), differ but slightly from the values calcd. for formulas with 1 more C atom ( $C_{19}H_{10}$  and  $C_{19}H_8O_2$ ), and it occurred to v. B. and A. that III might really not be an indene but a naphthalene deriv. (II); that oxidation should give, together with the quinone, which would then have the structure IX, fluorenone-1-carboxylic acid can be explained just as well on the basis of formula II as of I. M.'s work was accordingly repeated and it was found that whereas V gives not a trace of the cyclic ketone X, VI undergoes cyclization to about the same extent as  $\beta$ -hydriindylpropionyl chloride; the resulting ketone (XI) can be smoothly reduced to XII which on dehydrogenation yields quant. a compl.  $C_{18}H_{10}$ , identical in all respects with III; IX is likewise identical with VII. This seems to solve definitely the fluoranthene question and also to throw light on the formation of III in the distn. of coal; it is very probable that it is formed by the combined pyrogenic dehydrogenation of  $C_{10}H_8$  and  $C_8H_6$ , perhaps through  $\alpha$ - $C_{10}H_7$ Ph. It also shows why Graebe was unable to synthesize it by the dehydrogenation of 9-ethylfluorene. (With H. WAGNER.) In the prepn of V the Et dibenzofulvenecarboxylate can be reduced much more rapidly and smoothly with Ni and  $H_2$  than with Al Hg, 100 g. requiring only about 5 mins. at  $230^\circ$  for complete satn. of the double bond; the resulting satd. ester,  $b_D^{20}$  193-3°, is entirely homogeneous and on sapon. gives the perfectly pure acid,  $b_D^{20}$  218-20°. The fluorenylpropionic acid (XIII) is smoothly obtained from Et 9-fluorene-carboxylate with  $ICH_2CH_2CO_2Et$  or  $ClCH_2CH_2CO_2Et$ . V, from the acid and  $SOCl_2$  at  $100^\circ$ ,  $b_D^{20}$  194-6°.  $\beta$ -9-Fluorenyl ethyl alc., obtained in about 40% yield from Et fluorenylacetate reduced by the Ladenburg method, is a thick, almost odorless oil; it is very difficult to completely replace the HO group by Br and furthermore to convert the bromide into the cyanide with KCN, so this method of prepg. XIII was abandoned. VI,  $b_D^{20}$  180-5°, m.  $58-9^\circ$ . 4-Keto-1,2,3,4-tetrahydrofluoranthene (XI), m.  $98^\circ$ ; semicarbazone, m.  $250-1^\circ$ ; oxime, m.  $170-1^\circ$ . 1,2,3,4-Tetrahydrofluoranthene (XII), from XI by the Clemmensen method,  $b_D^{20}$  152-60°, m.  $69^\circ$ . 9,10-Benzoaacenaphthylene (II = III), from vapors of XII in  $CO_2$  passed over red hot  $PhO$ -pumice, m.  $110^\circ$ .

C. A. R.

**Rubrene. Action of acids.** CHARLES MOUREU, CHARLES DUFRASSE AND LÉON FENDRIAN. *Compt. rend.* 188, 873-5(1929); cf. *C. A.* 22, 4521.—Rubrene is decolorized by acids. In most solvents with HI the product is a colorless isomer, m.  $276-8^\circ$ .

Some I is also liberated. In ether much I is liberated and a colorless compd., m. about 230°, has been isolated, probably a hydrogenation product. This is being investigated. HNO<sub>3</sub> gives a colorless oxidation product which is also being studied. V. F. H.

**Constitution of hydrangenol and phyllodulcin.** YASHUIKO ASAHINA AND JUNTARO ASANO. Univ. Tokyo. *Ber.* 62B, 171-7(1929); *J. Pharm. Soc. (Japan)* 49, 117-28 (1929).—Hydrangenol, C<sub>16</sub>H<sub>12</sub>O<sub>4</sub> (I), obtained from the blossoms of *Hydrangea opuloides*, Steud. var. Otakusa, Maxim., had been shown to be a lactone with two HO groups which is converted by heating with alkalis into an isomeric isohydrangenol (II); on fusion with KOH it gives 2,6-Me(HO)C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H and *p*-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H. At the same time were studied the specific, sweet constituents, phyllodulcin, C<sub>16</sub>H<sub>14</sub>O<sub>8</sub> (III), and its isomer, isophyllodulcin (IV), of the leaves of *H. opuloides*, Steud. var. Thunbergii, Makino, which, unlike I, are optically active and are ketones with 2 HO and 1 MeO group; both are converted by alkalis into the *dl*-isophyllodulcin and on fusion with KOH give 2,6-Me(HO)C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H and 3,4-(HO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H. Since the hydrangenols and phyllodulcins occur in 2 closely related plants and show almost the same chem. properties it was concluded that they have the same skeletal structure and the formulas V-VIII were suggested for I, II, III and IV, resp. In order to det. whether these structures are correct, attempts were made to synthesize substances with a similar structure for comparison with the natural products. 2-MeOC<sub>6</sub>H<sub>4</sub>COCOPh was accordingly demethylated with HBr; the resulting HOC<sub>6</sub>H<sub>4</sub>COCOPh is easily rearranged by alkalis into the amorphous 2-hydroxybenzilic acid (IX) which is converted by hot Ac<sub>2</sub>O into the cryst. lactone acetate (X). X is even more readily obtained from the lactone of 2-HOC<sub>6</sub>H<sub>4</sub>CHPhCO<sub>2</sub>H with Br and KOAc. Both IX and X give a deep violet color with concd. H<sub>2</sub>SO<sub>4</sub> while I-IV dissolve without color. 2,4'-Dihydroxybenzilic acid (XI) and its lactone diacetate (XII), similarly prepd. from 2,4'-dimethoxybenzil, likewise gave the characteristic Ph<sub>3</sub>C(OH)CO<sub>2</sub>H color reaction with H<sub>2</sub>SO<sub>4</sub>. Furthermore, IV easily forms a *mono-Me ether* (XIII) which gives a red-violet color with FeCl<sub>3</sub>, indicating the presence of a HO group in the *o*-position to the C:O group. These results make the old formulas for I-IV wholly untenable. Reduction of XIII with Na-Hg in acid soln. gives the mono-Me ether (XIV) of desoxyphyllodulcinic acid (XV), also obtained by methylation of XV. XIV also gives a red-violet color with FeCl<sub>3</sub> and with KMnO<sub>4</sub> yields 3,4-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH:CHCO<sub>2</sub>H. XIV, III and IV can therefore be assigned the structures 3,2-HO(HO<sub>2</sub>C)C<sub>6</sub>H<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>C<sub>6</sub>H<sub>3</sub>(OMe)<sub>2</sub>, 3,4, XVI and XVII (R = 3,4-HO(MeO)C<sub>6</sub>H<sub>3</sub>), resp., and it may be stated with great probability that the hydrangenols are desmethoxyphyllodulcins. 2-Hydroxybenzil (4.2 g. from 8 g. of the Me ether in AcOH with 48% HBr heated in a current of CO<sub>2</sub> at 140-50°), yellowish, m. 74°, somewhat sol. in Na<sub>2</sub>CO<sub>3</sub>, easily in alkalis with yellow color, gives a red-violet color with alc. FeCl<sub>3</sub>, has a somewhat sweet and at the same time biting taste. X, m. 115°, insol. in Na<sub>2</sub>CO<sub>3</sub> and cold alkalis. 2,4'-Dihydroxybenzil, m. 164°, is faintly sweet, dissolves in Na<sub>2</sub>CO<sub>3</sub>, gives a blood-red color with H<sub>2</sub>SO<sub>4</sub> and red-violet with alc. FeCl<sub>3</sub>. XII, m. 215°, mol. wt. (Rast) 351. XIII, from IV and alk. Me<sub>2</sub>SO<sub>4</sub>, m. 115°; acetate, m. 141°. With alk. KMnO<sub>4</sub> XIII yields 3,4-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H. XIV, m. 133°. Benzylphthalide and 3-phenylhydroisocoumarin with Na-Hg, just as with HI and P, although much less readily, give *o*-HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CH<sub>2</sub>Ph which on heating with alkalis smoothly yields, through *o*-HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>CH:CHPh, *o*-MeC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H and BzOH; it is therefore easy to see how IV (= XVII) yields 2,6-Me(HO)C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H and 3,4-(HO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H on fusion with KOH.

C. A. R.  
**Existence of dihydro- and octahydro-*p*-indole.** ERWIN FERRER. Tech. Hochschule, München. *Ber.* 62B, 183-95(1929).—v. Braun and Gawrilow believed that

they had proved that  $p\text{-H}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{Cl}$  (I) under certain conditions undergoes ring closure in the  $p$ -position with formation of  $p$ -dihydroindole,  $\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot\text{CH}_2$

(II), but this is doubted by Willstätter on the basis of work of his own in the tropine series and also on theoretical considerations involving ring tension. With the object of settling this point experimentally F. has repeated v. B.'s work and concludes that II cannot be obtained by his method. In spite of the great care with which he carried out his expts. he appears to have obtained  $o$ -dihydroindole (III) instead of II. III is formed with extraordinary ease by mere distn. of  $o\text{-H}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{Cl}$  (IV) with steam. v. B.'s statement that nitration of  $\text{PhCH}_2\text{CH}_2\text{Cl}$  at  $-15^\circ$  gives  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{Cl}$  (V) exclusively is also erroneous; as a matter of fact there are formed at the same time about 30% of the  $o$ -isomer (VI) and also a di- $\text{NO}_2$  compd. (VII), m.  $136^\circ$ , which can be only  $2,4\text{-(O}_2\text{N)}_2\text{C}_6\text{H}_3\text{CH}_2\text{CH}_2\text{Cl}$ . The HCl salts of  $p$ - and  $o\text{-H}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{Cl}$  are described as m.  $205^\circ$  but F. found the  $p$ -compd. really m.  $209\text{--}10^\circ$ . This was perhaps because in the reduction with  $\text{SnCl}_2$  he isolated the  $p\text{-H}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{Cl}$  (VIII) as the difficultly sol. and well-crystd. double salt. The properties of the free VIII also differ from those given in the literature; it can be boiled without change in  $\text{Et}_2\text{O}$  or alc. for hrs. and even for several hrs. in alc. contg. 1.2% KOH; under the conditions given by v. B. for the ring closure it remains unaltered and can be recovered quantitatively. More vigorous treatment (heating at  $110^\circ$  or with strong alkali) always gives the amorphous products of extramol. condensation described by v. B. Nitration of  $\text{PhCH}_2\text{CH}_2\text{OAc}$  at  $-15^\circ$  gives 86% of a mixt. of the  $o$ - and  $p\text{-NO}_2$  derivs. which on sapon. yields 74%  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{OH}$  (IX), m.  $60\text{--}1^\circ$ ; the  $p$ -position of the  $\text{NO}_2$  group was proved by the prepn. of IX from pure  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{Cl}$ , and by oxidation of IX with  $\text{KMnO}_4$  to  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ , m.  $237.5^\circ$ . Reduction of IX, best with Zn dust in the presence of  $\text{CaCl}_2$ , yields 90%  $p\text{-H}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{OH}$  (X), converted through the diazonium compd. into tyrosol,  $p\text{-HOC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{OH}$  (XI), m.  $92\text{--}3^\circ$ . As primary amines are probably intermediate products in the fermentation of  $\text{NH}_2$  acids, F. attempted to convert X into XI by phytochem. means but neither by adding it all at one time nor slowly to the fermenting soln. was the X altered. Considerations of ring tension make it probable that if a ring can be formed at all by closure in the  $p$ -position, it should be formed most readily in perhydrogenated systems, especially as some alkaloids contain such rings, but all attempts to effect such a ring closure in *hexahydro- $p$ -aminophenylethyl chloride* (XII) have thus far failed, although some interesting compds. were formed. Catalytic hydrogenation of X or V in strong HCl by the Skita method gives chiefly XII; there is only very little dehalogenation, resulting in the formation of 6.5% of  $(\text{CH}_2\text{CH}_2\text{C}_6\text{H}_{10}\text{NH}_2)_2$  (XIII). There is also always formed a certain amount of a tertiary base. XII exerts a remarkably severe action on the skin; the smallest amounts produce violent itching and after several days, without any visible corrosion, blisters appear. All attempts to close the ring gave a solid trimol. product  $(\text{HN}\cdot\text{C}_6\text{H}_{10}\cdot\text{CH}_2\cdot\text{CH}_2)_3$  (XIV). *p*-Aminohexahydrophenylethyl alc. (XV) was likewise prepd. from IX or X. X m.  $108^\circ$  (Pistschimuka, probably by mistake, gives  $171^\circ$ ).  $\alpha,\delta\text{-Bis}[p\text{-aminocyclohexyl}]$ butane (*p,p'*-diaminoperhydrodiphenylbutane) (XIII), yellowish oil of characteristic basic odor, attracts  $\text{CO}_2$  from the air, blues litmus,  $b_{710}$  about  $312^\circ$  (decompn.), mol. wt. (Rast)  $246\text{--}62$ ,  $n_D^{19}$  1.5077,  $d_4^{19}$  0.9774; HCl salt, m.  $207^\circ$ , gives a white amorphous ppt. with phosphotungstic acid.  $\beta\text{-}[p\text{-Aminocyclohexyl}]$ ethyl chloride (XII), yellowish viscous oil of overpowering, conine-like odor causing headache, quickly darkens in the air, b. about  $136^\circ$  and solidifies to a white substance,  $d_4^{20}$  1.0332,  $n_D^{20}$  1.5036; chloroplatinate, yellowish white, m.  $231^\circ$  (decompn.). XIV, flocks, mol. wt. (Rast) 365.3, dissolves in HCl; the faintly acid soln. gives with dil.  $\text{HNO}_3$  a voluminous white ppt., with  $\text{CrO}_3$  a red-brown ppt., with  $\text{FeCl}_3$  a red color, with picric acid a yellow amorphous ppt., m. around  $143^\circ$ , with phosphotungstic acid a white ppt., with  $\text{HNO}_3$  an intense red color and then red flocks.  $\beta\text{-}[p\text{-Aminocyclohexyl}]$ ethyl alc. (XV), begins to m.  $77^\circ$ , m. completely  $85^\circ$ . C. A. R.

**Derivatives of Bz-tetrahydroindole.** I. COSTIN D. NENITZESCU *Bul. soc. chim. România* 10, 131-3(1928).— $\alpha$ -Bromcyclohexanone condensed with  $\text{AcCHNaCO}_2\text{Et}$ , then boiled with HOAc and  $\text{NH}_4\text{OAc}$  yields 4,5,6,7-tetrahydro-2-methyl-3-carbethoxyindole, m.  $132^\circ$ . Yields are less than 1%. II. Some derivatives of 4,5,6,7-tetrahydro-3,6,6-trimethyl-4-ketoindole. COSTIN D. NENITZESCU AND VIRGINIE SCORTZEANU. *Ibid* 134-40.— $\text{AcCH}(\text{NH}_2)\text{CO}_2\text{Et}$  condenses with 1,1-dimethylcyclohexane-3,5-dione (IV) to give "satisfactory" yields of 4,5,6,7-tetrahydro-3,6,6-trimethyl-4-keto-2-carbethoxyindole (I) by loss of 1 mol.  $\text{H}_2\text{O}$  from the O on the 3-C atom in IV and the H on the  $\text{NH}_2$  group and another from the H on the 4-C atom in IV and the O of

the Ac group in  $\text{AcCH}(\text{NH}_2)\text{CO}_2\text{Et}$ . I on hydrolysis gives the free 2-carboxylic acid (II), m. 235°, which on melting gives the tetrahydrotrimethylketoindole (III), m. 162°, by loss of  $\text{CO}_2$ . Br with I gives a red condensation product, m. 132°, with 2.5 Br atoms for each mol. of I. It loses Br spontaneously to give I. This product boiled with HOAc gives on addition of water a white ppt., a Br deriv., m. 202° (violent decompn.). To 93 g.  $\text{AcCH}_2\text{CO}_2\text{Et}$  in 230 cc. HOAc add 49 g.  $\text{NaNO}_2$ , 100 g. of IV in 440 cc. HOAc and 150 g. Zn dust, boil 1 hr., add water, recrystallize from 50% alc. Yield 100 g., m. 171°. III with  $\text{HNO}_3$  gives colorless crystals, m. 193°. III boiled with excess alc. aq. KOH for 3 hrs. and neutralized with HCl gives II, m. 235°. III. Some polynuclear derivatives of 4,5,6,7-tetrahydro-3,6,6-trimethyl-4-ketoindole. COSTIN D. NENITZESCU. *Ibid* 141-8.—Two mols. of 4,5,6,7-tetrahydro-3,6,6-trimethyl-4-ketoindole (III) condense with 1 mol.  $\text{H}_2\text{CO}$  with loss of 1 mol.  $\text{H}_2\text{O}$  to give di[ $\beta$ -tetrahydrotrimethylketoindyl]methane (I) and 1 mol. of III with 1 of  $\text{ClN:NPh}$  gives 4,5,6,7-tetrahydro-3,6,6-trimethyl-4-ketoindole-2-azobenzene (VI). Attempts to condense III with  $\text{HCO}_2\text{H}$  to give [4,5,6,7-tetrahydro-3,6,6-trimethyl-4-ketoindyl][4,5,6,7-tetrahydro-3,6,6-trimethyl-4-ketoindenyl]methene (II) were unsuccessful. III with  $\text{HC}(\text{OR})_3$  gives tri[4,5,6,7-tetrahydro-3,6,6-trimethyl-4-ketoindyl]methane (IV) which with concd. HCl gives II, colored. The inaptitude of the pyrrole to change to the

pyrrole may be due to the ketone group. To test this the O was replaced by H by the Kischner-Wolff reaction. The product, 4,5,6,7-tetrahydro-3,6,6-trimethylindole (V), colorless, is very sensitive to oxidation but its picrate is easily handled. Some di[4,5,6,7-tetrahydro-3,6,6-trimethylindyl]azine (VII) also was formed. V has not been condensed with  $\text{HCO}_2\text{H}$  as was hoped. To 5 g. III in alc. add 1.5 mol. of 40%  $\text{H}_2\text{CO}$  and 2 drops concd. HCl and boil 15 mins. The product, I, m. 267°. To 3.6 g. III in dil. alc. add 2 g. aniline as  $\text{PhN:NCl}$ . Neutralize with NaOH. The VI, yellow, m. 224°. To 3 g. I in 15 cc.  $\text{Ac}_2\text{O}$  add excess  $\text{HC}(\text{OEt})_3$  and boil. IV, m. 284°. II, m. 264°. To 3 g. of III in 5 cc. alc. add 5 g.  $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ . Heat 8 hrs. Add 3 g. Na in 40 cc. MeOH, heat 12 hrs. at 150°. V, m. 63°. This cannot be purified. The picrate, m. 140°. VII, m. 300°.

VALENTINE F. HARRINGTON

**Derivatives of 2,5-diphenyloxazole.** STEFAN MINOVICI, COSTIN D. NENITZESCU and BARBU ANGELESCU. *Bul. soc. chim. România* 10, 149-59 (1928).—2,5-Diphenyloxazole (I) and its derivs. are prepd. by condensation of a cyanohydrin of an aromatic aldehyde with an aromatic aldehyde (*Ber* 29, 205, 2103 (1896)). Why such reactions occur only with aromatic compds. has not been explained. This paper concerns the effect of negative groups on the condensation. The cyanohydrin of BzH (I), anisaldehyde (II),  $p\text{-MeC}_6\text{H}_4\text{CHO}$  (III), and  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$  have been condensed with I, II, III, piperonal,  $o$ - and  $m\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$ ,  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$  (IV),  $o$ - and  $m\text{-ClC}_6\text{H}_4\text{CHO}$  and  $o\text{-BrC}_6\text{H}_4\text{CHO}$ . In all cases an oxazole results except that II with IV gives only  $p$ -nitrobenzal(methoxymandelic)amide (V). I with IV gives both an oxazole and a mandelic amide. The basic nature of the compds. diminishes with the negative nature of the substituting group. The compds. were all prepd. by adding 0.1 mol. of the aldehyde and of the cyanohydrin to 50 cc. of dry ether and passing in dry HCl. The base is pptd. by adding water. All yields are 80%. 2- $p$ -Tolyl-5-phenyloxazole, m. 74° (HCl salt, m. 160-1°); 2-phenyl-5- $p$ -tolylloxazole, m. 81° (HCl salt, m. 180°); 2- $p$ -methoxyphenyl-5- $p$ -tolylloxazole, m. 88° (HCl salt, m. 100°); 2-piperonyl-5-phenyloxazole, m. 116-7° (HCl salt, m. 193°); 2- $o$ -nitrophenyl-5-phenyloxazole, m. 132° (125°), m. ps. in parentheses are those of materials prepd. by another method (HCl salt unstable); 2- $m$ -nitrophenyl-5-phenyloxazole, m. 154-5° (149°); 2- $p$ -nitrophenyl-5-phenyloxazole, m. 208° (204°); nitrobenzal-mandelic amide, m. 168°; 2- $o$ -chlorophenyl-5-phenyloxazole, m. 83°; 2- $m$ -chlorophenyl-5-phenyloxazole, m. 107°; 2- $p$ -tolyl-5- $p$ -methoxyphenyloxazole, m. 90° (HCl salt, m. 179°); 2-methylenedioxyphenyl-5- $p$ -methoxyphenyloxazole, m. 145°; 2- $o$ -nitrophenyl-5- $p$ -methoxyphenyloxazole, m. 116°; 2- $m$ -nitrophenyl-5- $p$ -methoxyphenyloxazole, m. 163°; 2- $o$ -chlorophenyl-5- $p$ -methoxyphenyloxazole, m. 108° (HCl salt, m. 128°); 2- $m$ -chlorophenyl-5- $p$ -methoxyphenyloxazole, m. 123° (HCl salt, m. 162°); 2-phenyl-5- $p$ -nitrophenyloxazole, m. 187° (HCl salt unstable); V, m. 168°.

VALENTINE F. HARRINGTON

**A diacetylenic heterocyclic compound.** LESPICHAU. *Compt. rend.* 188, 502-3 (1929).— $\text{CH}_2 \cdot \text{C} \cdot \text{C} \cdot \text{CH}_2 \cdot \text{O} \cdot \text{CH}_2 \cdot \text{C} \cdot \text{C} \cdot \text{CH}_2 \cdot \text{O}$ , m. 180° (Maquenne block) is formed

in minute quantities from  $\text{ClCH}_2\text{OCH}_2\text{Cl}$  and a Grignard deriv. of  $\text{C}_2\text{H}_5$ . It gives a ppt. with aq.  $\text{HgCl}_2$ .

Constitution of kikokunetin. SHIZUO HATTORI. Tokyo Imp. Univ. *J. Pharm. Soc. (Japan)* 48, 561, 1064-70(1928).—H. extd.  $\text{C}_{19}\text{H}_{11}\text{O}_4(\text{OMe})$  (I), kikokunetin, m. 194-5° from the dry flower of *Pseudoclea triflora*.

117-8°.

F. I. NAKAMURA

The occurrence of euxanthone in the heart wood of *Platonia insignis* Mart. ("Geelhart" or "Pakoeli"). D. B. SPOELSTRA AND MISS M. J. VAN ROYEN. Amsterdam, Colonial Inst. *Rec. trav. chim.* 48, 370-1(1929).—On extn. with petr. ether, benzene or alc., the heart wood of *Platonia insignis* gives a residue of 1.0%, 1.5% or 11%, resp. The product obtained by extn. with benzene appeared to be euxanthone; m. p. after 3 recrystns. from alc. 239°. The product was identified by comparison with an authentic specimen, prepd. from "Indian Yellow," as well as by comparison of the Ac deriv., m. 185°, and the di-Br compd., m. 278°, prepd. from both specimens. When the wood was first extd. with benzene and then with alc., the residue of the alc. extn. consisted of a brown powder, m. 205-25°, from which, however, a cryst. substance could not be obtained.

C. F. VAN DUIN

Pyocyanin, the blue pigment of *Bacillus pyocyaneus*. IV. The constitution and synthesis of pyocyanin. FRITZ WREDE AND ERICH STRACK. Univ. Greifswald. *Z. physiol. Chem.* 181, 58-76(1929); cf. *C. A.* 22, 3891.—Pyocyanin,  $\text{C}_{26}\text{H}_{26}\text{N}_4\text{O}_2$ , the blue  $\text{CHCl}_3$ -sol. pigment produced by *Bacillus pyocyaneus*, yields 80%  $\alpha$ -hydroxyphenazine (I) by alk. cleavage in the presence of O. The O consumption is 3 atoms per mol. If the oxidation is performed by  $\text{H}_2\text{O}_2$  instead of atm. O,  $\text{CH}_2\text{O}_2$  is also formed. Treatment with HI yields MeI in addn. to the phenazine, and at higher temps. a 2nd mol. of MeI is formed (MeN detn.). Acetylation in alk. soln. even with exclusion of O gives only derivs. of I. In acid soln. ( $\text{Ac}_2\text{O}$  + concd.  $\text{H}_2\text{SO}_4$ ) however, 2 Ac groups may be introduced without cleavage of the mol., the  $\text{H}_2\text{O}$ -sol. product forming cryst. salts with picric acid,  $\text{AuCl}_3$  and  $\text{PtCl}_4$ . This Ac deriv. is instantaneously sapond. by free bases but not by carbonates. When hydrogenated in the presence of Pt, pyocyanin adds 4 H and yields a product with 0.5 the original mol. wt. Hydrogenation of the Ac deriv. takes place in the same manner, yielding an Ac deriv.,  $\text{C}_{13}\text{H}_{11}\text{N}_2\text{OAc}$ , which is sol. in alkali and reppd. by acid. When this is methylated with  $\text{CH}_3\text{N}_2$  the product is no longer sol. in alkali. Concd. HCl sapons the hydrogenated Ac deriv. and addn. of alkali then gives back the original pyocyanin in good yield. On the assumption that pyocyanin contains 2 phenazine groupings, the formation of  $\text{CH}_2\text{O}_2$  and MeI accounts for the remaining 2 C as Me groups. The 2 O atoms in the mol. must be so placed that reduction yields 2 OH groups without removal of C, as shown by the soly. of the reduction product in alkali. The most satisfactory assumption is therefore 2 CO in the pyocyanin mol., and the resulting quinonoid structure also accounts for the color. The lability of the Me attached to N may seem surprising, but the same behavior has been observed with other alkylated phenazine derivs. The reduction product, with 0.5 the mol. wt. of pyocyanin, would then have the structure I and 2 mols. of this when oxidized should yield pyocyanin. The synthesis was performed by addn. of  $\text{Me}_2\text{SO}_4$  to  $\alpha$ -hydroxyphenazine and treatment of the resulting methosulfate with alkali. A nearly quant. yield of pyocyanin was thus obtained. A formula for pyocyanin which meets all requirements indicated by the above reactions is II.

New substances described are pyocyanin perchlorate and chloroplatinate, *N*-acetyl- $\alpha$ -hydroxyphenazine, m. 123°, *N*-benzoyl- $\alpha$ -hydroxyphenazine, m. 176°; *N*-acetylhydroxy-*N'*-methyl- $\alpha$ -ketophenazine picrate, m. 167° (decompn.), chloroaurate, chloroplatinate; *N*-acetyl-*N'*-methyl- $\alpha$ -hydroxyphenazine, m. 125-7°; dibenzoyldihydrophenazine, m. 206°; acetyl- $\alpha$ -methoxydihydrophenazine, m. 175°; *Bz* deriv. of reduced pyocyanin, m. 150° and its picrate.

A. W. DOX

Constitution of tectoridin. Y. ASAHINA, B. SHIBATA AND Z. OGAWA. *J. Pharm. Soc. (Japan)* 48, 1087-93(1928).—B. Shibata (*C. A.* 21, 3050) has extd. from *Iris*

*tectorum* Maxim the glucoside tectoridin,  $C_{22}H_{34}O_{11}$  (I). I on hydrolysis gave  $C_6H_{12}O_6$  and tectorigenin.  $C_{16}H_{14}O_6$  and the structure I was proposed. Recently Baker (C. A. 22, 2356) has shown that irigenin, the aglucone of iridin, is an isoflavanone deriv. and proposed the structure II. In order to study the relationship between tectorigenin and irigenin the authors undertook the study and proposed the structure II with  $p$ - $HOC_6H_4$  instead of  $HO(MeO)_2C_6H_2$  for tectorigenin.

F. I. NAKAMURA

**Constitution of daphnin.** F. WESSELY AND K. STURM. Univ. Wien. Ber. 62B, 115-9(1929).—Leone (C. A. 20, 1070) recently obtained by coupling daphnetin (7,8-dihydroxycoumarin) (I) with  $\beta$ -acetobromoglucose a glucodaphnetin which, according to him, is identical with natural daphnin (II). This synthesis, however, does not permit of deciding whether II is an 8- or 7-glucoside deriv. of I. Although a repetition of his work confirmed his statements on the whole, the results of W. and S. hold strictly only for the synthetic II which they have not yet been able to compare with the natural product. The synthetic II was treated with  $CH_2N_2$  and the crude methylation product was hydrolyzed. The resulting *monomethyldaphnetin* (III) with  $MeCHN_2$  gave a *methylethyldaphnetin* (IV) decompd. by  $NaOMe$  into  $EtI$  and a  $MeO(EtO)_2C_6H_2CH-CHCO_2H$  (V) oxidized to 4,2,3- $MeO(EtO)_2C_6H_2CO_2H$  (VI), identical with the acid obtained by exhaustive ethylation of 4,2,3- $MeO(HO)_2C_6H_2CO_2Me$ . The synthetic II is, therefore, an 8-glucoside-7,8-dihydroxycoumarin. This method of detg. the structure of II is valid only if the methylation with  $CH_2N_2$  proceeds in only 1 direction and others than the free HO group of the  $C_6H_6$  nucleus are not methylated in side reactions. No indications of any such side reactions were noted, however. In the methylation of both II and its tetra-Ac deriv. the homogeneous 7-methoxy-8-hydroxycoumarin (III) was obtained almost quantitatively. Moreover, 7-ethoxy-8-methoxycoumarin (VII), obtained by successive alkylations in an order the reverse of that used in prep. the 7-methoxy-8-ethoxy compd. (IV), is different from IV. No by products were found in these alkylations but they did appear in working up the methylation mixt. of crude tetraacetyldaphnin. In the condensation of I with acetobromoglucose there is formed, along with the cryst. *tetraacetyldaphnin* (VIII), a sirup which on treatment with excess of  $CH_2N_2$  and subsequent hydrolysis with acids gives chiefly I; this sirup seems to be a diglucodaphnetin. VIII, m. 217° (L., 220°),  $[\alpha]_D^{17} -31.64^\circ$  for 0.0190 g. in 3.1924 g. abs. MeOH (L. gives  $-52.52^\circ$  for a 2.98% soln. but W. and S. were unable to obtain a soln. of so high a concn.). II, m. 216-7°,  $[\alpha]_D^{17} 29.36^\circ$  (the rotation of the natural product is not given in the literature). III was obtained, not quite pure, in 0.16 g. yield from 0.5 g. VIII in MeOH treated with twice the calcd. quantity of  $CH_2N_2$  in  $Et_2O$ , freed after 45 mins. from the  $Et_2O$ , excess of  $CH_2N_2$  and most of the MeOH by distn. under atm. pressure, heated a short time *in vacuo* at 100°, hydrolyzed by heating 15 mins. on the  $H_2O$  bath with 1:8  $H_2SO_4$  and finally evap. to dryness, extd. with  $Et_2O$  and distd. under 0.2 mm. at 180°, m. 175° (all m. ps. cor.). 7-EtO homolog, similarly prepd. with  $MeCHN_2$ , b.<sub>4</sub> 160-70°, m. 145°. IV, b.<sub>4</sub> 190°, m. 85.5°. VII, m. 80.5°, depresses the m. p. of IV 20°. 4-Methoxy-2,3-diethoxycinnamic acid (V), m. 157-8°. 4-Methoxy-2,3-diethoxybenzoic acid (VI), m. 74-6°. C. A. R.

**Constitution and properties of fraxin.** F. WESSELY AND E. DEMMER. Univ. Wien. Ber. 62B, 120-6(1929).—After it had been shown that fraxetin (I) is 6-methoxy-7,8-dihydroxycoumarin (C. A. 22, 4115) there remained of the 24 possible structures for fraxin (II) only that of an 8- or 7-glucoside deriv. of I. It was at first attempted to det. which of these structures is correct by a method similar to that used for daphnin (preceding abstr.), but although the degradation reactions were already known the synthesis of the compds. necessary for comparison with the degradation products offered unexpected difficulties. Bargellini had obtained by oxidation of dimethyldaphnetin with  $K_2S_2O_8$  a compd. (III) which he considered to be the mono-Me ether of I or an isomer. The work of W. and D. has shown that the latter is correct, since III on methylation gives dimethylfraxetin (IV), showing that the new HO group in III is adjacent to the old HO groups. Diethyldaphnetin with  $K_2S_2O_8$  gives a hydroxydiethoxycoumarin (V) yielding on methylation diethylfraxetin (VI), which on the one hand shows that the MeO group in I is in the 6-position and on the other hand, confirms Thoms' formula,

2,5,3,4-(MeO)<sub>2</sub>(CH<sub>2</sub>O)<sub>2</sub>C<sub>6</sub>HCO<sub>2</sub>H, for apioleic acid (VII), since if it had the 2,3,4,5-structure VI would have to be 8-methoxy-6,7-diethoxycoumarin, a compd. which could never be produced by the simple introduction of a MeO group into diethyl-daphnetin. The 7-methoxy-8-ethoxycoumarin described in the preceding abstr. gives with K<sub>2</sub>S<sub>2</sub>O<sub>8</sub> a 6-*HO* deriv. (VIII) yielding on methylation the fraxetin deriv. 6,7-dimethoxy-8-ethoxycoumarin (IX). Now, if II is methylated, hydrolyzed to the monomethylfraxetin (X) and ethylated, it gives IX, showing that II is the 8-glucose deriv. of I. The reverse order (ethylation → hydrolysis → methylation) gives a compd. (XI) different from IX. The sugar component of II is *d*-glucose (identified as the osazone); since II is hydrolyzed by emulsin, the sugar probably belongs to the  $\beta$ -series. The II, obtained from the bark of *Fraxinus excelsior*, seps. from abs. alc. in yellow needles, from 80% alc. in smaller crystals, with about 14% H<sub>2</sub>O which it loses completely only at 120–30° under 0.2 mm. and it then m. 205° (all m. ps. cor.) on slow heating; it shows a beautiful blue-green fluorescence, especially in very weak alk. soln. 6,7-Dimethoxy-8-hydroxycoumarin (X), m. 195° (darkening). IX, m. 108.5°. 6-Methoxy-7-ethoxy-8-hydroxycoumarin, from II ethylated with MeCHN<sub>2</sub> and hydrolyzed with H<sub>2</sub>SO<sub>4</sub>, m. 153–4° (darkening), gives with CH<sub>2</sub>N<sub>2</sub> 6,8-dimethoxy-7-ethoxycoumarin (XI), m. 82°. 6-Hydroxy-7,8-dimethoxycoumarin (III), m. 184°. Diethyl-daphnetin, from daphnetin and MeCHN<sub>2</sub>, m. 67–8°. 6-Hydroxy-7,8-diethoxycoumarin (V), faintly yellow, m. 149–50°. VIII, faintly yellow, m. 150–7°. C. A. R.

**Rhamnoconvolvulic acid.** ÉMILE VOTOČEK AND F. VALENTIN. École polytech., tchéque, Prague. *Collection Czechoslov. Chem. Comm.* 1, 47–54 (1929).—The acid described in the literature as convolvulic acid is not a chem. species. This is demonstrated by its fractional pptn. from alc. by means of Et<sub>2</sub>O. Besides a little purgic acid, an acid, C<sub>32</sub>H<sub>42</sub>O<sub>32</sub>·7H<sub>2</sub>O, [ $\alpha$ ]<sub>D</sub> –35.31°, was isolated and has been named rhamnoconvolvulic acid. It loses its water of crystn. at 100°. Its hydrolysis with 6 mols. H<sub>2</sub>O gives 1 mol. of a non-glucosidic acid (dihydroxypalmitic acid (cf. following abstr.)), 4 mols. of *d*-glucose and 2 mols. of *l*-rhamnose. Since rhamnoconvolvulic acid has still an acid function, the sugar elements must be linked on the HO groups of the substituted palmitic acid. It is admitted that the 6 monose mols. are distributed sym., i. e., that they form 2 triglucosidic radicals, C<sub>18</sub>H<sub>31</sub>O<sub>14</sub>, corresponding to 1 mol. *l*-rhamnose and 2 mols. *d*-glucose. The formula postulated for rhamnoconvolvulic acid would

**3,12-Dihydroxypalmitic acid, a component of rhamnoconvolvulic acid.** ÉMILE VOTOČEK AND V. PRELOG. École polytech. tchéque, Prague. *Collection Czechoslov. Chem. Comm.* 1, 55–64 (1929); cf. preceding abstr.—The formula of the di-HO acid obtained by hydrolysis of rhamnoconvolvulic acid is demonstrated. Me(CH<sub>2</sub>)<sub>8</sub>CH(OH)(CH<sub>2</sub>)<sub>2</sub>CH(OH)CH<sub>2</sub>CO<sub>2</sub>H, m. 84°, is reduced by HI and I to palmitic acid, and oxidized by CrO<sub>3</sub> to a mixt. of AcOH, Me(CH<sub>2</sub>)<sub>8</sub>CO(CH<sub>2</sub>)<sub>8</sub>COMe, CO<sub>2</sub> and Me(CH<sub>2</sub>)<sub>8</sub>CO(CH<sub>2</sub>)<sub>8</sub>CO<sub>2</sub>H, m. 69°; the oxime of the latter decompd. into BuNH<sub>2</sub>, HO<sub>2</sub>C(CH<sub>2</sub>)<sub>8</sub>CO<sub>2</sub>H, m. 133°, BuCO<sub>2</sub>H and NH<sub>2</sub>(CH<sub>2</sub>)<sub>8</sub>CO<sub>2</sub>H. ALBERT L. HENNE

**The natural porphyrins. XXIII. Bromoporphyrin I and its conversion into deuteroporphyrin.** H. FISCHER AND G. HUMMEL. Tech. Hochschule Munich. *Z. physiol. Chem.* 181, 107–29 (1929); cf. C. A. 22, 2382.—The bromoporphyrin (I) obtained by the action of Br on hematoporphyrin-HCl in AcOH is now believed to be identical with dibromodeuteroporphyrin (II) (C. A. 21, 591). Oxidation of the former by CrO<sub>3</sub>, H<sub>2</sub>O<sub>2</sub> or HNO<sub>3</sub> yields 1 mol. of bromocitraconimide, and reduction by N<sub>2</sub>H<sub>4</sub> and Pd in alc. KOH converts it into deuteroporphyrin, identified by the m. p. of its Me ester and mixed m. p. of this with the known substance. The same product is obtained by removal of Br from the ester of I by heating with succinic acid at 220°. Reduction of the ester of II with N<sub>2</sub>H<sub>4</sub> and Pd in alc. KOH gives only a recovery of the original substance. The tetra-Br derivs. obtained from I, II, deuteroporphyrin and deuterohemin by heating with PBr<sub>5</sub> are all identical, since their esters show the same m. p., 262°, with no depression when mixed together. Treatment of the Me ester of I with MeMgI converts it into the phyllin of a ditertiary alc., m. 289°, the analysis of which is in agreement with a structural formula applicable to both I and II. Schumm's pyroporphyrin (C. A. 23, 152), obtained by fusion of hemin with resorcinol is identical with deuteroporphyrin, since the esters of their complex Fe derivs., pyratin and deuterohemin, resp., show no m. p. depression when mixed. The resorcinol fusion also converts tetramethylhematoporphyrin Fe salt into deuterohemin. A. W. DOX

**Porphyrins and their metal salts.** FELIX HAUROWITZ AND KONRAD ZIRM. Deut. Univ. Prag. *Ber.* 62B, 163–70 (1929).—Like Fischer and his collaborators, H. and Z.

find that the Zerevitinov method of detg active H gives inconstant results with derivs. of the blood pigment. This they ascribe chiefly to the spontaneous change in the compn. of the Grignard reagent, the concn. of which rapidly decreases in contact with  $O_2$ . With most org. compds. this is immaterial, for according to Flaschenträger they react quantitatively, with evolution of  $CH_4$ , as long as the reagent is at least 0.8 N; only hydrated compds., according to F., require a 1.5 N reagent for quant. reaction of both H atoms of the  $H_2O$  of crystn. The porphyrins and their metal derivs. behave like hydrated compds.; they apparently contain H atoms which react only with a concd. reagent. Thus, chlorohemin gave 2-3 active H atoms with a weak and 3-6 active H atoms with a strong reagent. These H atoms cannot belong to  $H_2O$  ( $EtOH$ ,  $AcOH$ ) of crystn., for the preps. had been dried at  $110^\circ$  and 12 mm. over  $P_2O_5$  and soda-lime and analysis showed they were free of solvent of crystn. Nor do active H atoms on the N or C of the pyrrole nucleus have any peculiar property as compared with the H of HO groups, for pyrroles, malonic esters, fluorene and indene show no appreciable difference in their behavior toward a strong or weak reagent. A large series of analyses showed that detns. of active H atoms in blood pigment derivs. are comparable only when carried out with the same Mg soln. and at as nearly as possible the same time. When these precautions were observed the following results were obtained: (1) The change of chloro- into hydroxyhemin results in no increase of active H atoms; the FeOH groups cannot, therefore, be ascribed any acid property and, contrary to the prevailing view, the formation of tri-K salts of hydroxyhemin cannot be considered as consisting of a change of FeOH into FeOK; the 3rd acid group (along with the two  $CO_2H$  groups) is perhaps the NH group of a pyrrole ring. (2) In the formation of complex metal compds. with Cu, Zn or FeCl the no. of active H atoms in the porphyrins decreases by 1 equiv. at most. To avoid disturbing salt formation on the  $CO_2H$  groups, these expts. were made with the di-Me ester (I) of mesoporphyrin. The complex metal compds. are therefore not formed, like K pyrrole, by simple salt formation at 2 pyrrole H atoms. The org. porphyrin skeleton must be materially altered in combining with the metals. (3) The FeCl compd. of I contains as many active H atoms as the Zn or Cu salt. This suggests that the FeCl group is bivalent, i. e., that the Fe is trivalent. Now, H. recently showed that porphyrins in general form hemins with  $Fe^{+++}$  salts only if a reducing agent is added. The question of the valency of the Fe in hemins was therefore taken up again to det. whether the  $Fe^{++}$  to be introduced may not be converted into  $Fe^{+++}$  by reduction of the solvent, but no reduction of the  $H_2O$  to  $H$ , nor of valeric acid (to the aldehyde or alc.) could be detected. The reverse process (splitting out of Fe with acids according to Küster) was then followed, mesohemins being used instead of chlorohemin to exclude the reducing action of the side chains; in full agreement with K., cleavage of  $Fe^{+++}$ , without formation of  $Fe^{++}$ , was observed. The discordance between the cleavage of  $Fe^{+++}$  from hemins and the formation of the same hemins from porphyrins and  $Fe^{++}$  (e. g., in a  $H_2S$  atm.) cannot be fully explained. Perhaps in the latter process there is first formed a  $Fe^{++}$  compd. (hemo-chromogen?) which is so labile in acid soln. that even in the presence of  $H_2S$  it changes into the  $Fe^{+++}$  compd. (hemin), at the same time reducing the solvent to a compd. of unknown constitution.

C. A. R.

**Racemization.** VIII. The action of alkali on proteins; racemization and hydrolysis. P. A. LÉVENE and LAWRENCE W. BASS. Rockefeller Inst. *J. Biol. Chem.* **82**, 171-90(1929); cf. *C. A.* **22**, 2748.—The rates of racemization of albumin, casein, edestin, fibrin and gelatin by 0.2, 1.0 and 5.0 N NaOH were studied. The results with the first 4 mentioned proteins offer no evidence in favor of the ketopiperazine structure of the protein mol. With gelatin, the results indicate that it, at least, is not composed of ketopiperazines only. The relation of recent studies on hydrolysis and racemization of proteins to the elucidation of their structure is discussed. A. G.

**Autracemization.** RICHARD KUHN and THEODOR WAGNER-JAUREGG. Eidgen. Tech. Hochschule, Zürich. *Naturwissenschaften* **17**, 103-4(1929).—The Walden autoracemization of bromosuccinic ester is actually caused by traces of HBr that can be completely eliminated by repeated distns. in a high vacuum. The pure ester is very stable and the constn. of racemization are therefore to be revised. After double vacuum distn., shaking of the acetone soln. with animal C and again distg., bromosuccinic di-Me ester showed after 4.5 hrs. heating in acetone at  $52^\circ$  only a decrease in rotation of  $[\alpha]_D = 3.13^\circ$  to  $3.05^\circ$ . Other bromides also accelerate the racemization (cf. Holmberg, *C. A.* **8**, 1576) and the solvent has considerable influence. In acetone soln. ( $k = 0.00058$  at  $52^\circ$ ) a trace of KBr, not detectable by  $AgNO_3$ , gave a  $k$  of 0.0018; in MeOH 0.5 to 1.0 N bromide soln. was required for the same effect. Animal carbon, AgBr, PbBr<sub>2</sub>, PbO and  $CuSO_4$  retard the racemization, probably by adsorptive or

chem. action. Of the metals, Ag, Hg, Cu and Zn retard the racemization; Mg has no influence. Other accelerating substances are chlorides and iodides.  $\text{ZnBr}_2$  is exceptional among the halides; it retards the action of other halides. Other cases of autoracemization may also be attributed to catalysis. A soln. of mononitrodiphenic acid in cyclohexanone racemized at  $60^\circ$  in glass with a  $k$  of 0.0038, in quartz with  $k = 0.00077$ , indicating traces of alkali catalysis.

**Autoracemization.** Remark on the note of Richard Kuhn and Th. Wagner-Jauregg. F. WEDSKIND. Forstl. Hochschule, Hannover-Münden. *Naturwissenschaften* 17, 199 (1929); cf. preceding abstr.—Other cases of racemization by halogen catalysis (cf. Z. *Elektrochem.* 12, 330(1906); C. A. 22, 4527; 23, 1641) are recalled.

**Guaninedesoxypentoside from thymus nucleic acid.** P. A. LEVENE AND E. S. LONDON. Rockefeller Inst. J. *Biol. Chem.* 81, 711-2(1929).—Thymus nucleic acid was digested by intestinal juice obtained from dogs and the guanine nucleoside was isolated from the products of hydrolysis. It was purified by the usual Pb process. The nucleoside is very unstable and is completely hydrolyzed by 0.025 N  $\text{H}_2\text{SO}_4$  in 10 mins.,  $[\alpha]_D^{20}$   $-37.5^\circ$ , contracts at  $200^\circ$  in a sealed capillary tube and does not m.  $290^\circ$ .

**The oxidation of cholesterol.** Mechanism of the oxidation with chromic acid. STEFAN MINOVICI AND M. VANGHELOVICI. *Bul. soc. chim. Romania* 10, 91-6(1928).—Mauthner and Suida (*Monatsh.* 17, 584(1896)) obtained by this oxidation an alc. The structure and formula were not fixed. M. and V. find the formula to be  $\text{C}_{27}\text{H}_{44}\text{O}_3$ . The mechanism is given without proof. Cholesterol (I) acetylates in glacial HOAc to give  $\text{CH}_2\text{CH}(\text{OAc})\text{CHCH}:\text{CH}$  which is attached to the rest of the mol.,  $\text{C}_{22}\text{H}_{39}$ , at the points indicated. Addn. of  $\text{CrO}_3$  gives  $\text{CH}_2\text{CH}(\text{OAc})\text{CHCH}(\text{OH})\text{CHOH}$ , then  $\text{CH}_2\text{CH}(\text{OAc})\text{CHCOCO}$ . Hydrolysis yields the alc., m.  $217^\circ$ . The chloride of I yields by the same treatment  $\text{C}_{27}\text{H}_{44}\text{OCl}$ , m.  $137^\circ$ , which is a ketone. Its *p*-nitrophenylhydrazone m.  $200^\circ$ . The only formula possible is  $\text{CH}_2\text{CHClCHCOCH}_2$ . Windaus (*Ber.* 37, 3702(1904)) has prepd. a similar isomer of known structure  $\text{CH}_2\text{CHClCHCH}_2\text{CO}$ , m.  $180^\circ$ . Mauthner obtained still another, m.  $129^\circ$  (*Monatsh.* 24, 656(1903)). The possible isomers are  $\text{CH}_2\text{CH}(\text{a})\text{Cl}(\text{b})\text{CH}(\text{b})\text{CH}_2\text{CO}$ ,  $\text{CH}_2\text{CH}(\text{b})\text{Cl}(\text{a})\text{CH}(\text{a})\text{CH}_2\text{CO}$ ,  $\text{CH}_2\text{CH}(\text{a})\text{Cl}(\text{b})\text{CH}(\text{b})\text{COCH}_2$  and  $\text{CH}_2\text{CH}(\text{b})\text{Cl}(\text{a})\text{CH}(\text{a})\text{COCH}_2$  (a means above the plane of the paper and b, below).

**Catalytic oxidation of organic compounds.** ALPHONS O. JAEGER (to Selden Co.). U. S. 1,709,853, April 23. In effecting production of  $\text{CH}_2\text{O}$  by the oxidation of vapors

of  $\text{CH}_3\text{OH}$  by the action of an oxidizing gas such as air or in similar oxidations, a catalyst is used which comprises an alkali metal, alk. earth metal or earth metal the oxide of which is not readily reducible by H, and catalysts such as Mo or V compds. Numerous details and examples are given. Cf. C. A. 23, 2185.

**Hydrocarbons.** SOC. POUR L'IND. CHIM. A. BALE. Brit. 298,090, Oct. 1, 1927. Vapors of MeOH are passed in contact with an alk. earth metal carbide at 200–300° and the  $\text{C}_2\text{H}_2$  produced may be caused to react with compds. present in the reaction chamber and catalysts such as carbides, metals, metal oxides or hydroxides or salts, C, silicates or other materials resistant to high temps. may be used, to form products such as dimethylacetylene and ethylacetylene, isoprene, dimethylallene and higher homologs and polymers up to cinene.

**Hydrocarbons.** I. G. FARBENIND. A.-G. Fr. 648,946, Feb. 14, 1928. See Brit. 293,572 (C. A. 23, 1648).

**Organometallic compounds.** MICHAEL MELAMID. Fr. 648,102, Feb. 2, 1928. Organometallic compds. are obtained by heating naphthene acids in the presence of water with oxides or hydrates of As, Sb or Bi, or by reacting salts of naphthene acids with halogen compds. of the metals, or by melting naphthene acids with oxides or hydrates of the metals. Thus, naphthene acid in suspension in water is heated with  $\text{BiO}_3$  for several hrs. on the water bath. On purification the product is a white amorphous substance sol. in  $\text{CHCl}_3$ ,  $\text{CS}_2$ , etc. Other examples are given.

**Organometallic compounds.** CARL OECHSLIN. Fr. 648,325, June 14, 1927. An arsenical compd. of Bi is obtained by the action of isohydroxypropyldiarsenic acid on an O compd. of Bi or by double decompn. between a salt of this acid and a salt of Bi. The product contains an atom of Bi for 2 atoms of As.

**Organic bases.** I. G. FARBENIND. A.-G. Brit. 296,423, Sept. 2, 1927. See Fr. 646,711 (C. A. 23, 2185).

**Salts of halogen-substituted aliphatic tetraammonium bases.** E. GLUCKSMANN. Brit. 297,839, Sept. 29, 1927. Salts such as those of  $(\text{C}_2\text{H}_5)_3\text{N}(\text{OH})(\text{C}_2\text{H}_4\text{Br})$  are made reaction of a salt of the base with a metal salt of the desired acid (preferably one which forms an insol. salt with the anion of the initial tetraammonium salt). The use of salts of Ag and of Ba is described.

**Olefins and diolefins.** I. G. FARBENIND. A.-G. Brit. 297,398, May 16, 1927. Mineral or artificially prepd. hydrocarbons contg. more than 4 C atoms in the mol. are converted into olefins and diolefins contg. a smaller number of C atoms in the mol. by bringing their vapors, at a temp. of 600° or higher, into contact with catalysts formed at least mainly of difficultly reducible metal oxides or their compds. or mixts. such as alk. earth metal oxides or oxides of Sc, Ti, Yt, Zr, La, W, Mo, Th or U. Numerous details and modifications are described.

**Amines.** I. G. FARBENIND. A.-G. Brit. 297,484, May 23, 1927. Cyclohexylethanolamine together with some diethanolcyclohexylamine is obtained by the action of glycol chlorohydrin or ethylene oxide on cyclohexylamine, or by the action of cyclohexanone on ethanolamine with simultaneous or subsequent reduction with H in the presence of Ni. Homologs of the reacting substances also may be similarly used as starting materials, e. g., methylcyclohexanone, propanolamine and butanolamine. Tetrahydrobenzene oxide may be condensed with aliphatic amines contg. OH groups; or, hydroxyaldehydes and hydroxyketones, such as aldol or sugars, may be treated with hydroaromatic amines, followed by hydrogenation. The products may be used as insecticides, bactericides or fungicides and as preservatives for proteins or similar compds. Their acidyl compds. may be used as softening agents or camphor substitutes.

**Double salts of arylenediamines and halides of zinc, cadmium and mercury.** IMPERIAL CHEMICAL INDUSTRIES, LTD., and A. RILEY. Brit. 297,989, Oct. 17, 1927. Compds. which are sparingly sol. and stable in air are prepd. by adding an aq. soln. of the halide to a soln. of the diamine or by neutralizing the soln. obtained by reduction of nitrosoalkyldialkylanilines or toluidines with Zn and HCl. Examples are given of the prepn. of compds. from *o*-, *m*- and *p*-phenylenediamine and  $\text{ZnCl}_2$ , *p*-phenylenediamine and  $\text{HgCl}_2$ , *m*-phenylenediamine and  $\text{CdBr}_2$ , *p*-aminoacetanilide and  $\text{ZnCl}_2$ , *p*-aminodiphenylamine and  $\text{ZnCl}_2$ , 1,2-naphthylethylenediamine and  $\text{ZnCl}_2$  and 4-chloro-*m*-phenylenediamine and  $\text{ZnCl}_2$  (prepd. by the first-mentioned method) and the compd.  $(\text{C}_2\text{H}_5)_2\text{NC}_6\text{H}_4\text{NH}_2 \cdot \text{HCl} \cdot 0.5\text{ZnCl}_2$  (prepd. by reduction of *p*-nitrosodiethylaniline with Zn and HCl).

**Concentrating fatty acids.** SOC. DES ÉTABLISSEMENTS BARBET. Fr. 649,121, Feb. 16, 1928. In the app. described in Fr. 620,332 for the concn. of acids such as acetic or butyric, a concd. boiling soln. of  $\text{CaCl}_2$  is used instead of anhydrous  $\text{CaCl}_2$ , and the distg. column has a reflux, the dild. acid being fed in at a lower point. The

$\text{CaCl}_2$  soln. is concd. from time to time and when it becomes too colored it is heated to a temp. at which the tars are destroyed.

**Carboxylic acids of  $\omega$ -aminoalkylaminonaphthalenes.** I. G. FARBERNIND, A.-G. (Winfrid Hentrich, inventor). Ger. 468,811, Oct. 24, 1926. Addn. to 467,626. To prep. carboxylic acids of  $\omega$ -aminoalkylaminonaphthalenes, the process of Ger. 467,626 (C. A. 23, 848) is modified by using hydroxy- or aminonaphthalenecarboxylic acids not having the OH or  $\text{NH}_2$  group in the  $\alpha$ -position to the COOH group, instead of the substituted naphthalenesulfonic acids specified therein. According to the examples, (1) 2- $\omega$ -aminoethylaminonaphthalene-6-carboxylic acid is prepd. from 2-hydroxy-naphthalene-6-carboxylic acid,  $\text{C}_2\text{H}_4(\text{NH}_2)_2$ , and  $\text{NaHSO}_3$ , and (2) 2- $\omega$ -aminobutylaminonaphthalene-6-carboxylic acid is prepd. by substituting 1,4-butylenediamine for  $\text{C}_2\text{H}_4(\text{NH}_2)_2$  in example 1. The products are useful as *intermediates for dyes*, and reference is made to the coupling of the products prepd. in the examples with diazotized 4-nitro-1-aminobenzene-2-sulfonic acid.

**Ketonic compounds.** H. LEGERLOTZ. Brit. 297,756, April 22, 1927. *p*-Hydroxybromoacetophenone is treated with methylamine in alc. soln. to produce *p*-hydroxymethylaminoacetophenone which may be purified by recrystg. from alc. or by converting it into the hydrochloride and then pptg. the base with  $\text{NH}_3$ . The benzoate of *p*-hydroxy- $\alpha$ -bromopropiophenone, similarly treated, yields *p*-hydroxy- $\alpha$ -methylaminopropiophenone. These products may be used as *intermediates in making pharmaceutical compds.* *p*-Hydroxybromoacetophenone is formed by brominating *p*-hydroxyacetophenone acetate in  $\text{CS}_2$  soln. and boiling the *p*-hydroxybromoacetophenone acetate thus formed with aq. alc. contg. a small quantity of HBr. *p*-Hydroxy- $\alpha$ -bromopropiophenone benzoate is formed by benzoylating *p*-hydroxypropiophenone and brominating the benzoyl deriv. in  $\text{CS}_2$  soln.

**Anthraquinone derivative.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 129,471, Feb. 10, 1927. Addn. to Swiss 126,195 (C. A. 23, 715). The deriv. is prepd. by treating 1,5-nitrochloroanthraquinone with conc.  $\text{HNO}_3$ . The product, 1,8-dinitro-5-chloroanthraquinone, is a yellow powder, m.  $337^\circ$ .

**Isatin derivatives.** KALLE & CO. A. G. (Maximilian P. Schmidt and Otto Herrmann, inventors). Ger. 473,090, June 7, 1925. Water-sol.  $\alpha$ -derivs. of isatin are prepd. by treating isatin- $\alpha$ -chloride or its substitution products with sulfites. The products are distinguished from the known bisulfite addn. products of isatin by their deeper color and their sensitiveness to light. The prepn. of a water-sol. deriv. from 5-chloroisatin- $\alpha$ -chloride is described by way of example. The derivs. from 2,5-dibromoisatin- and naphthisatin- $\alpha$ -chloride are mentioned also. Cf. Brit. 282,863 (C. A. 22, 3906).

**Morpholines.** IMPERIAL CHEMICAL INDUSTRIES, LTD., J. B. PAYMAN and H. A. PIGGOTT. Brit. 298,336, Sept. 1, 1927. Morpholine and its derivs. are prepd. by condensing alkylene or arylkylene halohydrins with aromatic sulfonamides to form *N*-di( $\beta$ -hydroxyethyl)arylsulfonamides which when treated with  $\text{H}_2\text{SO}_4$  yield a morpholine and an arylsulfonic acid. Arylsulfonylmorpholines may be isolated as intermediate products and treated subsequently with  $\text{H}_2\text{SO}_4$  to form morpholines and arylsulfonic acids. Toluene-*p*-sulfonamide is condensed with ethylene chlorohydrin to form *N*-di-( $\beta$ -hydroxyethyl)toluene-*p*-sulfonamide from which morpholine and toluene-*p*-sulfonic acid are produced. Some monohydroxyethyltoluene-*p*-sulfonamide is formed as an intermediate product. Propylene- $\alpha$ -chlorohydrin and  $\beta$ -chloro- $\beta$ -phenyl- $\alpha$ -hydroxypropionic acid (obtained from glycidic acid and HCl), yield, resp., 2,6-dimethylmorpholine and 3,5-diphenylmorpholine-2,6-dicarboxylic acid. Toluene-*p*-sulfonylmorpholine is prepd. from *N*-di( $\beta$ -hydroxyethyl)-*p*-toluenesulfonamide by heating with  $\text{H}_2\text{SO}_4$ .

**1,8-Naphthoxypenthiophen compounds.** JENS MÜLLER and MAX SCHUBERT (to Grasselli Dyestuff Corp.). U. S. 1,709,277, April 16. In the production of compds. such as 1,8-naphthoxypenthiophen a 1,8-naphthothioglycolic carboxylic acid compd. such as the acid itself is heated in the presence of water to temps. of  $150$ – $200^\circ$ . Monobromo-1,8-naphthoxypenthiophen, m.  $130^\circ$ , is described.

**Mononitrated dipthaloylacridones.** WALTER MIEG and ALBERT JOB (to Grasselli Dyestuff Corp.). U. S. 1,709,945, April 23. 1,2,5,6 (or 3,4,5,6)-Dipthaloylacridone is treated with  $\text{HNO}_3$ - $\text{H}_2\text{SO}_4$  contg. slightly more than 1 mol. proportion of  $\text{HNO}_3$  (80%) at temps. of about  $5$ – $10^\circ$  and the temp. is increased to  $40^\circ$ , in order to form the mononitro deriv.

**Arylated azotized, diaminopyridines.** IVAN OSTROMISLENSKII (to Pyridium Corp.). U. S. reissue 17,281, April 23. See original pat. No. 1,680,108 (C. A. 22, 3736).

**Nitro- and amino-diarylsulfones.** BRITISH DYE STUFFS CORP., LTD., and M. MENDOZA. Brit. 297,855, May 27, 1927. 5-Substituted and 5,6-benzo-substituted

aminodiaryl sulfones of the type in which "Ar" represents an aromatic residue contg. at least one amino group, are made by reduction of the products of condensation of the corresponding sulfinic acids with an aromatic nitro compd. carrying labile H, such as 1-chloro-2-nitrobenzene and its 4-sulfonic acid, 1-chloro-4-nitrobenzene and its 2-sulfonic acid, 1-chloro-2,4-dinitrobenzene, 1-chloro-2,4-dinitronaphthalene, 4-chloro-3-nitrobenzaldehyde, 4-chloro-3-nitrobenzoic acid and its nitrile and 5-nitrobenzoic acid and its nitrile. The products may be used as dye intermediates and numerous examples are given.

**Vinyl esters.** GEORGE O. MORRISON (to Canadian Electro Products Co., Ltd.). U. S. 1,710,181, April 23. By using the process described for the prepn. of vinyl acetate from HOAc (C. A. 23, 1909) other vinyl esters can be obtained from the corresponding carboxylic acids.

**Vinyl esters.** FREDERICK W. SKIRROW and GEORGE O. MORRISON (to Canadian Electro Products Co., Ltd.). U. S. 1,710,197, April 23. See Can. 287,494 (C. A. 23, 1908).

**Concentrating acetic acid.** A. WACKER GES. FÜR ELEKTROCHEMISCHE INDUSTRIE GES. Brit. 298,137, Oct. 3, 1927. Dil. HOAc is concd. by distn. with an acetic ester of b. p. between 105° and 135° such as BuOAc, iso-BuOAc or iso-AmOAc, using a still connected to a distn. column and dephlegmator. After a final addn. of a small proportion of water to the residue to facilitate distn. of remaining ester, a residue of 95% HOAc may be obtained.

**Cholic acid.** CHEMISCHE FABRIK VORM SANDOZ. Swiss 128,727, April 21, 1927. Cholic acid is prepd. from the sapond. product of gall. The fatty acid is treated with a mixt. of water and a fat solvent in presence of a salt of a weak acid. The crude cholic acid so obtained is purified by recrystn.

**Humic acid.** MICHAEL MELAMID. Fr. 648,139, Feb. 3, 1928. Humic acid is made sol. in water for various industrial purposes by treatment with (1) urea, molten or in aq. soln., (2) pyrogallol or like substances, (3) formic acid, (4) formic acid. after dissolving humic acid, (5) oxide of Hg, (6) oleum, (7) HNO<sub>3</sub>, (8) diazobenzenesulfonic acid, (9) a fusion bath of potash, preferably in the presence of saltpeter.

**Mercury compounds of humic acid.** MICHAEL MELAMID. Fr. 648,141, Feb. 3, 1928. Humic acid is dissolved with alkali, Hg oxide is added and the mixt. boiled while air or O is passed through. The product obtained on evapn. may be used for treating seeds.

**Maleic acid and anhydride.** A. BOEHRINGER (trading as C. H. Boehringer Sohn). Brit. 297,667, Sept. 24, 1927. In the catalytic oxidation of furan or its derivs. as described in Brit. 285,426 (C. A. 22, 4539), a large excess of O or air is used (suitably 20-100 times the quantity theoretically required). Steam may be used to assist in vaporizing the furfural, and vanadic acid on pumice may be used as the catalyst at a temp. of 180°.

**Phthalic anhydride.** COMPAGNIE NATIONALE DE MATIÈRES COLORANTES ET MANUF. DE PRODUITS CHIM. DU NORD RÉUNIES, ÉTABLISSEMENTS KUHLMANN. Fr. 648,163, May 13, 1927. Phthalic anhydride obtained by the catalytic oxidation of C<sub>10</sub>H<sub>8</sub> is purified by distn followed by dissolving in toluene, xylenes or mixts. of these solvents and filtering. C<sub>10</sub>H<sub>8</sub>,  $\alpha$ -naphthoquinone and benzoic acid are recovered from the residue.

**Trichloroethane.** I. G. FARBENIND. A.-G. Brit. 298,084, Sept. 30, 1927. 1,1,2-Trichloroethane is obtained by direct addn. of vinyl chloride and Cl gases without use of a solvent, by influence of light or heat energy. Various details are given.

**Aniline and other arylamines.** WILLIAM J. HALE and JOSEPH W. BRITTON (to Dow Chemical Co.). U. S. reissue 17,280, April 23. See original pat. No. 1,607,824 (C. A. 21, 249).

**Racemic phenylpropanolmethylamine.** I. G. FARBENIND. A.-G. Brit. 297,385, Sept. 20, 1927. This compd. is resolved into its optical components by means of *l*-tartaric acid; the *l*-tartrate of the *l*-base seps. first from solu. The *l*-base, which is identical with natural *l*-ephedrine, has a greater physiol. efficacy than either the racemic or *d*-modifications.

**Ethylene glycol.** EDGAR C. BRITTON (to Dow Chemical Co.). U. S. 1,709,805, April 16. An ethylene dihalide contg. 2 different halogens such as ethylene chlorobromide is heated in the presence of water and Na<sub>2</sub>CO<sub>3</sub> or other suitable salt of a strong base and a weak acid at a temp. (suitably about 145°) at which no substantial decomposition of glycol occurs.

**Ethylene glycol.** BRITISH DYESTUFFS CORP. LTD. Fr. 648,157, Feb. 3, 1928. See Brit. 286,850 (C. A. 23, 397).

**Trimethylamineglycol monoborate.** KARL LÜDECKE. Fr. 649,221, Feb. 17, 1928. See Brit. 293,438 (C. A. 23, 1652).

**Polyalkylene glycol esters.** OSKAR LOEHR (to I. G. Farbenind. A.-G.). U. S. 1,701,424, April 23. See Can. 285,358 (C. A. 23, 610).

**Aldol.** I. G. FARBENIND. A.-G. Brit. 298,349, Sept. 19, 1927. Aldol is made by passing a mixt. of acetaldehyde and a condensing agent such as NaOH through reaction chambers provided with cooling devices. The product may be sepd. by first distg. off water and part of the assocd. acetaldehyde by heating under reduced pressure and then raising the temp. to distil remaining acetaldehyde. Various details of app. and procedure are given.

**Thymol and menthol.** SCHERING-KAHLBAUM A.-G. Fr. 648,319, Feb. 4, 1928. See Can. 283,943 (C. A. 23, 611).

**Camphor from borneols.** HERMANN GAMMAY. U. S. 1,710,573, April 23. A borneol such as isoborneol is heated in the presence of a substance of alk. reaction such as Ca(OH)<sub>2</sub> and of graphite, in order to produce camphor of 97–98% purity.

**Thiourea.** I. G. FARBENIND. A.-G. Brit. 297,999, Nov. 9, 1927. Ca cyanamide is treated with an NH<sub>4</sub> sulfide in the presence of water and of an NH<sub>4</sub> salt of an acid forming a Ca salt which is practically insol. in water such as an NH<sub>4</sub> carbonate, sulfate or oxalate.

**Lactones.** M. NAEF & Co. Swiss 128,466, July 27, 1927. The lactone of 14-hydroxytetradecane-1-carboxylic acid is prepd. by heating cyclopentadecanone with H<sub>2</sub>S<sub>2</sub>O<sub>8</sub>. The lactone, m. about 30°, b<sub>1</sub>, 175° and has a mol. refraction of 70.5.

**1,4-Diaminoanthraquinones, etc.** I. G. FARBENIND. A.-G. Brit. 298,279, July 11, 1927. 1,4-Diaminoanthraquinone and its homologs and derivs., including alkyl-amino and hydroarylamino derivs., are obtained in the form of the free bases by oxidation of the corresponding leuco-bases with a substance yielding O in the presence of a catalyst having an acid or basic reaction such as triethylamine, piperidine, thionyl chloride or benzoyl chloride. If an acid catalyst is used it is of such character and quantity that no substantial quantity of a salt of the leuco-base is formed. Mention is made of the use of trichlorobenzene as a solvent and of PhNO<sub>2</sub> as an oxidizing agent.

**Indanthrone.** NEWPORT CO. Brit. 297,602, April 25, 1927. Pure indanthrone is obtained by dehalogenating haloindanthrones such as dibromoindanthrone formed by condensation of 1,3-dibromo-2-aminoanthraquinone. In effecting the dehalogenation, alc KOH, Na amalgam, glucose and caustic alkali, and Cu, with or without a dissolving or diluting agent or catalyst, may be used.

**4-Methyl- and β-methylisatin.** I. G. FARBENIND. A.-G. Swiss 126,719, Jan. 27, 1927. Addn. to Swiss 125,475. The Na deriv. of *N-p*-tolylsulfonyl-*m*-toluide is transformed with oxalyl chloride and the oxyamino acid chloride treated with an acid condensing agent to give a mixt. of *N-p*-tolylsulfonyl-4- and 6-methylisatin, which is then sapond. The crystals, m. 143–145°.

**4-Chloro- and 6-chloro-5-methylisatin.** I. G. FARBENIND. A.-G. Swiss 126,721, Jan. 27, 1927. Addn. to Swiss 125,475. The Na deriv. of *N-p*-tolylsulfonyl-2-chloro-*p*-toluide is transformed with oxalyl chloride and the oxyamino acid chloride treated with an acid condensing agent to give a mixt. of *N-p*-tolylsulfonyl-5-methyl-4- and 6-chloroisatin, which is then sapond. to give the desired product.

**Styrene.** O. H. SMITH (to Naugatuck Chemical Co.). Brit. 298,152, Oct. 4, 1927. See U. S. 1,687,903 (C. A. 23, 156).

**Naphthostyrls.** I. G. FARBENIND. A.-G. Fr. 647,020, Jan. 12, 1928. Naphthostyrls halogenated in the ring are prepd. by treating naphthostyrl or its derivs. with a halogen or halogenating agents in sufficient quantity to form a monohalogen deriv., or by treating naphthostyrls with salts of HOCl or HOBr to form *N*-halogen naphthostyrls which are then heated or treated with acid condensing agents. In examples, a chloro-naphthostyrl, m. 266°, is obtained (1) by dissolving naphthostyrl in concd. H<sub>2</sub>SO<sub>4</sub> contg. a little I and passing in Cl at 15–20°, or (2) by dissolving naphthostyrl in hot HCl and cooling whereby a suspension of the HCl compd. is obtained and adding an aq. soln. of Na<sub>2</sub>ClO<sub>4</sub>, or (3) by adding SO<sub>2</sub>Cl<sub>2</sub> to a soln. of naphthostyrl in tetrachloroethane, or (4) by adding naphthostyrl to a soln. of NaOCl, to form *N*-chloronaphthostyrl, m. 132°, which is converted to chloronaphthostyrl by contact with concd. H<sub>2</sub>SO<sub>4</sub> or by boiling under reflux with PhCl, or by heating alone to 140°. 5-Ethoxy-naphthostyrl (by treating 8-cyanonaphthalene-1,5-disulfonic acid with alk. agents and ethylating the 8-hydroxynaphthostyrl) is suspended in NaOCl soln. and boiled, *N*-chloro-5-ethoxynaphthostyrl, m. 117°, being formed, which is transformed to chloro-

5-ethoxynaphthostyryl, m. 246°, by heating alone to 160° or under reflux with glacial AcOH. Cf. C. A. 23, 2190.

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

A—GENERAL

FRANK P. UNDERHILL

The constitution of silk fibroin. R. O. HERZOG. *Ber.* 61B, 2431(1928).—H. and others (C. A. 18, 2712; 22, 2955) treated silk fibroin with resorcinol at 120° for 30 mins., not 30 hrs. as stated by Meyer and Mark (C. A. 23, 1145). This treatment is not considered excessive in view of the results with peptides. DAVID DAVIDSON

Paths and goals of physiologicocochemical research. OTTO FÜRTH. *Wiener klin. Wochschr.* 42, 161-4(1929).—A lecture. D. B. DILL

Further studies on the relations between substrate and enzyme complex based on determination of the influence of erepsin and trypsin-kinase on polypeptides and related compounds. EMIL ABDERHALDEN AND ERNST SCHWAB. *Univ. Halle. Fermentforschung* 10, 305-18(1929).—The selective hydrolysis of polypeptides by erepsin and by trypsin-kinase bears no relation to the length of the peptide chain. Trypsin-kinase hydrolyzes the dipeptides, *dl*-phenylalanyl-*l*-tyrosine and *l*-tyrosyl-*l*-tyrosine, which are not attacked by erepsin. On the other hand, erepsin hydrolyzes the longest known synthetic polypeptide contg. 19 amino acids, while trypsin-kinase is without action. Certain tripeptides, *e. g.*, *d*-leucylglycyl-*l*-leucine and *l*-leucylglycyl-*l*-tyrosine, are attacked by trypsin-kinase but not by erepsin. A whole series of halogenacyl derivs. of amino acids and peptides undergoes hydrolysis by trypsin-kinase but not one is attacked by erepsin. Chloroacetyl-*l*-tyrosine is especially suitable for demonstrating tryptic action because of the rapidity with which the liberated tyrosine crystallizes out. Not all halogenacyl derivs. are attacked by trypsin-kinase, *e. g.*, *dl*- $\alpha$ -bromoisocaprolyl-*dl*-phenylalanine is resistant, whereas the lower homolog *dl*- $\alpha$ -bromopropionyl-*dl*-phenylalanine undergoes extensive hydrolysis. Waldschmidt-Leitz's view that the electroneg. character of a substrate detrs. its amenability to cleavage by trypsin-kinase is invalidated by the fact that the above bromoisocaprolyl deriv. is more strongly electroneg. than certain dipeptides which are easily hydrolyzed. An accumulation of glycol groupings in these halogenacyl derivs. tends to make the mol. more resistant. Halogenacyl groups not related to naturally occurring amino acids, *e. g.*, *l*- $\alpha$ -bromoisocaprolyl and  $\beta$ -chlorobutyryl, do not necessarily interfere with tryptic cleavage. Acyl derivs. of amino acids, *e. g.*, formyl-*l*-leucine, palmityl-*l*-phenylalanine and stearyl-*d*-glutamic acid, are hydrolyzed by trypsin-kinase, provided the amino acid component is the naturally occurring one. *dl*-Leucine Et ester is attacked by both trypsin and erepsin, while *dl*-tyrosine Et ester is attacked only by trypsin-kinase. Specificity of enzyme action is considered as a matter of sensitivity of the enzyme-substrate complex toward a given H-ion concn. New derivs. not previously described are  $\beta$ -chlorobutyryl-*dl*-phenylalanine, m 130°,  $\beta$ -chlorobutyrylglycyl-*dl*-phenylalanine, m 174°,  $\beta$ -chlorobutyrylglycyl-*dl*-leucine, m 139°, all prepd. from MeCHClCH<sub>2</sub>COCl and the corresponding peptide; also *dl*-phenylalanyl-*l*-tyrosine decomp. 269-70°, by coupling PhCH<sub>2</sub>CHBrCOCl with *l*-tyrosine and treating the oily intermediate with NH<sub>4</sub>OH.

A. W. DOX

Plant proteases. XII. The natural activation of proteases of plant latexes. OTTO AMBROS AND ANNA HARTENECK. I. G. Farbenind. Ludwigshafen. *Z. physiol. Chem.* 181, 24-41(1929); cf. C. A. 22, 2381.—Commercial papain obtained from the pawpaw, *Carica papaya*, hydrolyzes proteins but not peptones or protamines. Treatment of this enzyme with HCN not only activates its cleavage of proteins but also confers the property of hydrolyzing peptones and protamines. A surprising observation now reported is the fact that fresh latex obtained by lacerating the rind of the fruit contains the enzyme in its activated form. In the fresh material an activator is present which does not occur in the com. dried prepsns. In proportion to its activity toward peptone, the enzyme of fresh latex is less amenable to further activation by HCN. The natural activator is not HCN, since all tests for this substance were negative. It is a kinase, for which the name *phylokinase* is proposed on account of its analogy to the enterokinase of trypsin. The extent of activation of the enzyme varies with the stage of maturity of the fruit. The cell juice from the interior contains relatively little enzyme but considerable activator, especially in the later stages of maturity.

Pineapple protease (bromelin) is in most respects similar to papain. It seems probable that all plant proteases capable of activation by HCN are one and the same enzyme, the apparent differences in specificity being due merely to variations in the amt. of natural activator present. When fully ripe the pawpaw fruit no longer yields a latex. From the nearly ripe fruit a latex is obtained which contains the non-activated enzyme specific for the higher proteins. Addn. of press juice from the interior, which itself has little if any proteolytic activity, brings the latex enzyme up to the full activity of papain-HCN. The more immature the fruit the less marked is this sepn., the latex contg. more activated enzyme and the press juice more protease. No erepsin is present as was shown by negative tests with leucylglycine and alanylglycine. Gelatin and peptone cleavage show the same  $p_H$  optimum of 6, a further evidence that the same enzyme hydrolyzes both. The fruit juice and also the seeds, however, contain some erepsin which can be demonstrated in a 16 hr. but not in a 2 hr. digestion of dipeptide. The activator is thermolabile and is destroyed by boiling. As is the case with enterokinase its effect varies with the duration of contact with enzyme and the amt. of activator. In general the activation of pineapple protease is similar to that of pawpaw. The juice from the green fruit is inert toward peptone until after activation by HCN, and then also its activity toward gelatin is doubled. The ripe fruit yields the completely activated enzyme, and HCN is without effect. A sepn. of enzyme and activator is more difficult here because of the peculiar structure of the fruit.

A. W. Dox

**Muscle adenylic acid and yeast adenylic acid.** GUSTAV EMBDEN AND GERHARD SCHMIDT. Univ. Frankfurt. *Z. physiol. Chem.* **181**, 130-9(1929).—On the basis of their difference in behavior toward the deaminase present in muscle, Schmidt (*C. A.* **23**, 853) concluded that adenylic acid obtained from muscle is not identical with that obtained from yeast. Further proof of the non-identity of these 2 substances is now presented. Yeast adenylic acid (I) m. 193-4° and muscle adenylic acid (II) m. 197-200°, both with decompn.; a mixt. of the 2 shows a depression of m. p. to 183° (decompn.). I is difficultly sol. in hot H<sub>2</sub>O and tends to form supersatd. solns.; II is readily sol. and crystallizes rapidly when the soln. is cooled. In 2% NaOH,  $[\alpha]_D^{20}$  for I is -56°, for II -47.5°; in 10% HCl  $[\alpha]_D^{20}$  for I is -36.5°, for II -26°. HNO<sub>2</sub> converts II but not I into inosic acid. Hydrolysis by 0.1 N H<sub>2</sub>SO<sub>4</sub> liberates H<sub>3</sub>PO<sub>4</sub> more rapidly from I than from II, and steam distn. of a soln. in 20% HCl yields much more furfural from I than from II.

A. W. Dox

**Influence of structure on the kinetics of desmolases. II. Uricase. System:** uric acid, liver and kidney pulp. ST. J. V. PRZYŁECKI. Univ. Warsaw. *Z. physiol. Chem.* **181**, 234-54(1929); cf. *C. A.* **23**, 1911.—In studying the kinetics of uricase action in biological material, other factors must be considered besides those entering into the equation for a heterogeneous medium where enzyme and substrate are adsorbed. Colloidal adsorbents occur in a labile sol or gel state in this very complex medium, and activating and inhibiting substances are present. It is almost certain that an alteration of the adsorbent must occur due to the development of acidity from autolysis. The surface becomes diminished; a portion of the enzyme and substrate is included; there is a diminution in the no. of contact groups, an alteration in the surface structure; the plasma movement is retarded and there occurs a mingling of cell content with extracellular medium. Thus a structural disintegration does not always bring about the same effects. A cell membrane which is impermeable to the enzyme and difficultly permeable to the substrate is often the factor which regulates the velocity of the enzyme reaction. The paper deals with the velocity changes in uric acid decompn. caused by mech. agencies (trituration with quartz sand) and chem. agencies (addn. of PROH), the adsorption of uric acid, the state in which the uricase occurs in the cells, and finally P. attempts to analyze the mechanism of the reaction from the mathematical standpoint.

A. W. Dox

**Alcohol fermentation. XVIII. The behavior of yeast toward glyceraldehyde and glyceric acid.** S. KOSTYCHEV AND K. JEGOROVA. *Z. physiol. Chem.* **181**, 264-80(1929); cf. *C. A.* **22**, 3186-7.—The hexose mol. is commonly supposed to break down into a triose, OHCH(OH)CH<sub>2</sub>OH or CO(CH<sub>2</sub>OH), as an intermediate product in the fermentation by yeast. Such an intermediate has never been demonstrated by actual isolation and identification. If it is actually formed during the fermentation, its failure to accumulate in demonstrable quantities can be explained only by the extreme rapidity with which it must undergo further breakdown to the final products EtOH and CO<sub>2</sub>. It is now shown that glyceraldehyde is not fermentable by yeast, nor does it undergo dismutation to glycerol and glyceric acid, although it has no inhibitory effect on the fermentation of sucrose. Its immediate oxidation product glyceric acid is fermentable

only in mere traces even under the optimum conditions of abundant aeration. The only intermediate products actually isolated thus far from alc. fermentation are  $\text{AcH}$ ,  $\text{AcCO}_2\text{H}$  and  $\text{AcCHO}$ . There is no exptl. evidence whatever in support of the intermediate formation of a triose. A. W. DOX

**Musk odor and ring-ketone configuration.** G. MALCOLM DYSON. *Perfumery Essential Oil Record* 20, 75-8(1929).—The paper, mainly discursive, deals under the caption: Synthetic processes with several methods for the prepn. of cyclic ketones which are intimately related to natural musk and civet. In this connection the general properties of certain of the higher cyclic ketones are given in tabular form, the lower no. of the series possessing a pleasant smell somewhat resembling that of peppermint in attenuated diln. The 13th member of the series (cyclotridecanone) has in its concd. form an odor resembling that of cedar wood, but when highly dild. a faint smell resembling musk is observable. This musk odor is, however, more readily perceptible with the 14th member, and reaches a max. in the 15th member (cyclopentadecanone), a substance which resembles highly, so far as its odor is concerned, natural musk, and has been used to a limited extent as a musk substitute. The musk odor of the series decreases again as the size of the ring increases, becoming quite faint with the 18th member, and with higher members disappearing altogether. The odorous principles of natural musk, muscone, and of civet, civetone, are discussed in connection with their probable formulas. Under musk, odor and constitution are considered at some length. It is pointed out that odor in the musk range is by no means confined to many-membered ketone rings as evidenced by the various musk substitutes placed on the market from time to time, notably certain nitro derivs. of butyltoluene and -xylene, so also of isobutyl-*m*-cresolmethyl ether. It seems clear that the olfactory vibrations assocd. with the musk odor are capable of being engendered by 2 entirely different types of mols., a nitrated alkyl-substituted benzene nucleus and a many-membered ketonic ring. W. O. E.

**Physico-chemical properties of the cell membrane. VI. Transition of the chlorine ion through the corpuscular membrane.** SHIROKICHI MORI. *J. Biophysics (Japan)* 2, 165-72(1927); *Collected Papers in Physiology and Biol. Physico-chem.* 4.—The permeability of the cell membrane of the red blood corpuscles to  $\text{Cl}$  ion has been confirmed by the electrometric measurement of the  $\text{Cl}$ -ion concn. in the medium in which the corpuscles were suspended. When the corpuscles are suspended in an isotonic soln. of  $\text{NaCl}$  or  $\text{NaCl} + \text{NaHCO}_3$ , the  $\text{Cl}$  ion comes out from the corpuscles into the medium, even when the medium is more concd. in  $\text{Cl}$  ion than the serum in which the corpuscles were previously suspended. This passage of  $\text{Cl}$  ion is reversible. The corpuscles swell in an isotonic soln. of  $\text{NaCl}$  or  $\text{NaCl} + \text{NaHCO}_3$ . This swelling is also reversible. VII. Does the Donnan equilibrium apply to the cell membrane of the erythrocytes? SATORU KATO. *Ibid* 251-6.—Red corpuscles of horse blood were suspended in an isotonic soln. of  $\text{NaCl} + \text{sucrose}$ , or of  $\text{NaCl} + \text{NaHCO}_3$ . After about an hr., the corpuscles were sepd. from the soln. by centrifuging, and they were laked by repetition of freezing and thawing. The  $\text{H}$ -ion exponent,  $p_{\text{H}}$ , and the  $\text{Cl}$  ion exponent,  $p_{\text{Cl}}$ , of the laked corpuscles as well as of the soln. in which the corpuscles had been suspended, were measured potentiometrically. The concns. of the  $\text{Cl}$  ions and of the  $\text{H}$  ions in the red corpuscles,  $(\text{Cl})_i$  and  $(\text{H})_i$ , as well as in the suspension medium,  $(\text{Cl})_e$  and  $(\text{H})_e$ , were measured, and the following facts were observed: The ratio  $(\text{H})_i/(\text{H})_e$  is a const. while  $(\text{Cl})_i/(\text{Cl})_e$  is an increasing function of  $(\text{Cl})_e$ .  $(\text{Cl})_i > (\text{Cl})_e$  in the isotonic  $\text{NaCl}$  soln.,  $(\text{Cl})_i < (\text{Cl})_e$  when  $(\text{Cl})_e$  is very small, and  $(\text{Cl})_i = (\text{Cl})_e$  at a certain intermediate value of  $(\text{Cl})_e$ . In every case the elec. charge of the corpuscles is negative. The Donnan theory of membrane equil. is not applicable to the ionic distribution between the corpuscles and the suspension medium. C. R. FELLERS

**The photochemical action of sterols from different sources.** L. HOUGOUNENG AND F. COUTURE. *Compt. rend.* 188, 742-3(1929); cf. *C. A.* 23, 1944.—Sterols obtained from ox blood and from snails had no action on a photographic plate even when in direct contact. Sterols extd. from silk worm moths gave a positive impression after 15 days' exposure. A pure specimen of ergosterol from beer yeast (m. 154-155°) produced a spot on sensitized gelatin after 15 days' exposure by direct contact, or when sepd. by either a 3-mm. layer of air or a thin film of cellophane. S. B. FOSTER

**The catalase activity of organically combined iron.** HANS V. EULER and HARALD NILSSON. *Arkiv. Kemi Mineral. Geol.* 10B, 1-6(1929) - Pyratin,  $\text{C}_{30}\text{H}_{48}\text{O}_4\text{N}_4\text{FeCl}$ , obtained by the action of resorcinol on hemin, has catalase activity that is destroyed by  $\text{H}_2\text{S}$ . ARTHUR GROLLMAN

**Chemical equilibrium at an interphase and its importance for the physical chemistry of the cell.** D. DEUTSCH. *Metallbörse* 18, 989, 1157(1928).—An address dealing

with the application of Gibbs' adsorption formula to the living cell. An attempt is made to explain certain simple physiol. activities of the cell in terms of surface phenomena.

ARTHUR GROLLMAN

An inherent defect in the theory that growth rate is controlled by an autocatalytic process. GEORGE D. SNELL. Harvard Univ. *Proc. Natl. Acad. Sci.* 15, 274-81 (1929).—Because of the expanding vol. of the growing organism, the usual equations derived from the law of mass action cannot be applied to the processes involved in the synthesis of new protoplasm. This fact renders invalid the hypotheses put forward, according to which growth is controlled by a single or master autocatalyzed monomol. reaction.

ARTHUR GROLLMAN

The question of "active" iron. HELMUT PETOW AND HANS KOSTERLITZ. *Klin. Wochschr.* 8, 600-1 (1929).—The conversion of benzidine into benzidine blue by Fe salts is always greater, except with ferric salts, than one would expect from their mol. concn. The mol. conversion index is 7 for ferrous salts, 27-37 for complex Fe salts and 490 for hemoglobin. This converting ability is markedly enhanced by  $H_2O_2$  in the hemoglobin and complex Fe salts, but not in the ferrous salts. *Bacillus influenzae* (Pfeiffer) and *B. hemoglobinophilus* (Friedberger) could not be grown in a medium contg. "active" Fe other than hemoglobin.

Chemical action of quinones on proteins. II. EVELYN ASHLEY COOPER AND RAYMOND B. HAINES. Chem. Dept., Univ. Birmingham. *Biochem. J.* 23, 4-9 (1929); cf. *C. A.* 22, 2960.—The saline constituents of Ringer's soln. considerably accelerate the reaction between benzoquinone and glycine, but have only a slight effect with toluquinone. The chem. interpretation already put forward does not at the present time account for the high temp. coeff. for germicidal action.

BENJAMIN HARROW

Denaturation of proteins. V. Denaturation by acid. HENRY K. CUBIN. Lab. of Physical Chem., Univ. Liverpool. *Biochem. J.* 23, 25-30 (1929); cf. Lewis, *C. A.* 21, 1994.—In the region of moderate acidity the critical increment of denaturation, both for oxyhemoglobin and for egg albumin, is very much lower than it is in the neighborhood of the neutrality point of water, in which region the process is known as heat denaturation. The  $pH$  range over which pptn. occurs is greater in the absence of formaldehyde than in its presence. This confirms the view that flocculation involves the amino groups.

W. D. LANGLEY

Rennin action in relation to enterokinetic phenomena. G. A. RICHARDSON AND L. S. PALMER. *J. Phys. Chem.* 33, 557-76 (1929).—"The chemistry of pure casein is almost identical with that of pure paracasein, but synthetic caseinate and paracaseinate 'milks' have always shown significant differences, especially with regard to their sensitivity to electrolytes." These differences are studied by use of electrophoresis measurements upon the "milks" with and without added phosphate. The first set of measurements is of the actual migration and subsequent distribution of the protein along a tube after the current has passed for a definite period; the second, of the linear migration of the column of sol along a tube, measurements being made at definite intervals of time. The action of rennin is related to the elec. charges on the caseinate micellae. The isoelec. point of rennin lies between  $pH$  values of 6.9 and 7.0. The addn. of rennin to caseinate solns. having  $pH$  values between 6.1 and 6.9 reduces the rate of migration, to caseinate between 7.0 and 7.25, increases the rate, and between 7.5 and 7.69, has no appreciable effect upon the rate of migration. The migration velocities depend somewhat upon the previous heat treatment of the sols.

W. D. LANGLEY

Oxidation-reduction systems of biological significance. III. The mechanism of the cysteine potential at the mercury electrode. E. S. GUZMAN BARRON, LOUIS B. FLEXNER AND L. MICHAELIS. Johns Hopkins Univ. *J. Biol. Chem.* 81, 743-54 (1929);

cf. *C. A.* 23, 1424.—"Cysteine reacts in the same way as cyanide with metallic Hg. Both form reducing systems with the metal consequent upon this sort of reaction:  $2\text{XH} + \text{Hg} \rightleftharpoons \text{HgX}_2 + 2\text{H}$ . The correct formula for the cysteine potential at Hg is therefore:  $E = E_0 - (RT/F) \ln ([\text{RSH}]/\sqrt{[(\text{RS})_2\text{Hg}]}) + (RT/F) \ln [\text{H}^+]$ . The concn. of  $(\text{RS})_2\text{Hg}$  is so little altered by reaction between RSH and metallic Hg in the absence of  $\text{O}_2$ , that it can be included in the const. of the equation when exptl. results are evaluated. It is improper to speak of a 'cysteine-cystine system' at Hg. It is the 'cysteine-mercuric cysteinate system' which det. the potential. This system is not related to the problem of cysteine oxidation in metabolism." A. P. LOTHROP

**The non-toxicity of carbon monoxide for non-differentiated cells.** SUZANNE LALLEMAND. *Bull. sci. pharmacol.* 36, 65-72(1929).—Fresh hen eggs are kept in the gas in question for a certain time, then left for 24 hrs. in air and put in the incubator for 48 hrs. After this time, the development of the germ was observed. The time required for a certain gas to produce a visible injury in the germ was considered as toxic time. It was found to be for  $\text{H}_2\text{S}$  3 mins., for  $\text{NH}_3$  3 mins., for  $\text{SO}_2$  2 hrs., for  $\text{HCl}$  2 hrs., for  $\text{Cl}$  5 hrs., for  $\text{C}_2\text{H}_2$  2 days, for  $\text{CO}_2$  3 days, for illuminating gas 6 days.  $\text{CO}$  behaved absolutely like an inert gas; its poisonous action depends on the presence of hemoglobin.

A. E. MYER

**Studies on the hydrolytic products of proteins by the acidimetric method.** J. TILLMANS, P. HIRSCH AND F. STRACHE. Univ.-Inst. für Nahrungsmittelchemie, Frankfurt a. m. *Biochem. Z.* 199, 399-433(1928).—The dissociation const. of various di- and tripeptides as well as that of asparagine were detd. by the electrometric measurements of  $p_{\text{H}}$  at  $20^\circ$ . The values thus obtained for both acid and basic const. are greater than those found for simple amino acids (asparagine  $k_a = 1.41 \times 10^{-9}$ ,  $k_b = 1.41 \times 10^{-12}$ ; leucylasparagine  $k_a = 5.9 \times 10^{-9}$ ,  $k_b = 5.7 \times 10^{-12}$ ; leucylisoserine  $k_a = 6.2 \times 10^{-9}$ ,  $k_b = 1.33 \times 10^{-11}$ ; alanylalanine  $k_a = 4.6 \times 10^{-9}$ ,  $k_b = 1.43 \times 10^{-11}$ ; aminobutyryl- $\alpha$ -aminobutyric acid  $k_a = 4.1 \times 10^{-9}$ ,  $k_b = 9.2 \times 10^{-12}$ ; alanylglycylglycine,  $k_a = 7.1 \times 10^{-9}$ ,  $k_b = 1.35 \times 10^{-11}$ ; triglycine  $k_a = 8.53 \times 10^{-9}$ ,  $k_b = 1.55 \times 10^{-11}$ ; leucyloctaglycylglycine  $k_a = 1.44 \times 10^{-8}$ ,  $k_b = 1.47 \times 10^{-12}$ ). For tripeptides the values are even greater than those for dipeptides. The strength of the acidic and basic properties changes most abruptly between the amino acid and dipeptide, and becomes progressively less with the enlargement of the mol. Simple diketopiperazines in either acid or alk. medium bind neither acid nor base, so that the peptide linkage in the anhydride ring within the range of electrometrically determinable  $p_{\text{H}}$  has no acid- or base-binding capacity. This is also true for the  $\text{CONH}_2$  group of the asparagine. Therefore, diketopiperazines are not suitable for acidimetric studies, and in a mixt. of peptides and diketo-piperazines the former alone are thus measured. The protein hydrolysis with acid and more particularly with alkali proceeds in a number of stages of different velocities. The first attack by the alkali proceeds very easily and quickly, but subsequent attacks are much slower. In hydrolysis at boiling temp with 0.5 *N* NaOH the reaction slows down very considerably after the initial effect. This is interpreted to show that some of the bonds in the protein mol. are weak and some are firm. Simple diketopiperazines are most easily attacked by the alkali and hydrolyzed. Peptides as a rule are hydrolyzed with much greater difficulty. The condition of the protein in its native state as well as the product of its complete hydrolysis by  $\text{HCl}$  have not contributed much to the characterization and identification of the protein mol. because the former is too labile, while in the latter the identity of the protein is really lost. A middle ground was sought by employing a 4 hrs. hydrolysis with 0.5 *N* NaOH at  $100^\circ$ , and a 24 hrs. hydrolysis with 0.5 *N*  $\text{HCl}$  at  $100^\circ$ . The titration curves were detd. for a variety of proteins, but they all show the same characteristics and are of little value for analytical differentiation in some cases though in others the curves may be helpful (differentiation of gelatin from other proteins).

S. MORGULIS

**Hydrolysis of proteins by ammonia under pressure. Preparation of peptones.** V. S. SADIKOV. Univ., Leningrad. *Biochem. Z.* 205, 360-8(1929).—Various proteins upon heating in an aq. soln. of  $(\text{NH}_4)_2\text{CO}_3$  or of  $\text{NH}_4\text{OH}$  at  $150$ – $180^\circ$  in an autoclave for 2–12 hrs. yield hydrolyzates consisting chiefly of peptones. Dried, these form a residue which is easily pulverized. The powder is not hygroscopic, is almost colorless, and reacts acid. Fibrin peptone obtained after hydrolyzing 2 hrs. gives solns. of considerable viscosity, and furnishes a very favorable bacteriol. medium. After 24 hrs. hydrolysis of casein several amino acids were obtained that do not correspond to the usual hydrolytic products. Furthermore, among the crystallizable products no peptide- or piperazine-like compds. have been found.

S. MORGULIS

**Chemistry of bilirubin. II. Colored oxidation products of bilirubin and their**

behavior under changed hydrogen-ion concentration. WILLIAM KERFFOLA AND ERKKI LEIKOLA. Univ. Helsinki. *Skand. Arch. Physiol.* 55, 70-77(1929); cf. C. A. 22, 4549.—During the oxidation of bilirubin in its various solvents under the influence of the  $\text{NaNO}_2\text{-HCl}$  mixt. various colors appear in regular succession reproducing the order of the solar spectrum changing from reddish yellow to reddish violet then to rose-red, violet-ocher, red-ocher, gold-ocher, and ocher-yellow, then finally becomes colorless. The color resulting from the Ehrlich diazo reaction is partly due to a simple oxidation product of bilirubin and partly to the sulfanilic acid. III. Influence of radiant energy on bilirubin. *Ibid* 78-86.—Bilirubin does not change in color in the dark; this has been found to hold true with a range of  $p_H$  7 to 14. Ultra-violet rays cause a change in color of bilirubin regardless of the solvent. In acid solns. the colors change over the entire gamut of the solar spectrum, turning to rose-red, then yellowish brown, and finally fade out entirely. In basic solns. the color changes from greenish brown to water-blue, yellow-green and finally disappears. Similar results are obtained with various other radiation systems (daylight, x-rays, Ra radiation). IV. The solubility of bilirubin and of its colored oxidation products and treatment with reduction and condensation reagents. *Ibid* 87-90.—The soly. of the colored oxidation products of bilirubin as well as of bilirubin in various solvents is closely associated with the H-ion concn. The various products differ somewhat in their behavior towards the solvents. Peculiar changes with a variety of reagents are fully described. V. Some further observations on the properties of bile pigments. *Ibid* 258-9.—Bile pigments are oxidized by atm.  $\text{O}_2$  in alk. soln. Bilirubin in strongly alk. soln. gives a rich blue or green-blue color with an excess of phosphotungstic acid, whereby the tungstic acid becomes reduced to  $\text{W}_2\text{O}_5$ . Alk. Fehling soln. as well as Almén-Nylander reagents is likewise reduced. The migration of bilirubin in the elec. field was also studied but only in alk. soln. since it is insol. in acid. In a medium of  $p_H$  10 to 11 the bilirubin rapidly oxidizes to biliverdin. The migration within the  $p_H$  range 6 to 11 is always to the anode so that it must be negatively charged. VI. The demonstration of bilirubin and of its colored oxidation products and their determination. *Ibid* 260-6.— $\text{SCl}_3$  and  $\text{CCl}_3\text{COOH}$  color bilirubin pure red; biliverdin is recognized by its green color, the shade of which varies according to the degree of acidity or alk.; bilicyanin is greenish violet in neutral soln. but assumes characteristic blue tints in acid or alk. media, and with condensation reagents becomes blue-green; bilipurpurin has different colors in neutral, acid or alk. soln. which also vary according to the bilipurpurin (I, II or III); and finally the color of bilitecin is most variable. Methods are given for the detn. of these various pigments.

S. MORGULIS

The nature of the factors which determine the sequence of growth-cycles and its relationship to the differentiation of tissues. T. BRAILSFORD ROBERTSON. Univ. of Adelaide, Australia. *J. Gen. Physiol.* 12, 329-44(1929).—Growth in animals and plants is an autocatalyzed process; in animals it usually occurs in several superimposed autocatalytic cycles. In many cases the velocity const. of the unimol. growth formula falls as growth proceeds, at first rapidly, then more slowly. In the white mouse the fall in the velocity const. is directly proportional to the fall of the ratio,  $NC/CY$ , in which  $NC$  is the mass of the nucleic acid contained in the nuclei of all the tissues, and  $CY$ , the mass of the tissue protein. This ratio is obtained by the chem. method of LeBreton and Schaeffer (Trav. Inst. Physiol. Faculté Med. Strasbourg, Paris, 1923). On the assumption that this relationship is generally applicable to animals and plants, the following deductions are made: (1) Increase of protoplasm in any given growth cycle is proportional to the concurrent increase of nuclear material; (2) growth of cytoplasm takes place in accordance with a unimol. formula in which the velocity const. varies directly as the mass of the nucleus. On the basis of the hypothesis that each growth cycle represents the growth of a sep. group of cells within the animal, it is concluded that: (a) the cells which participate in growth during any cycle have initially lower  $NC/CY$  ratios than the cells which participated in the preceding cycles; (b) cells having large  $NC/CY$  ratios in multicellular animals inhibit the growth of cells having smaller ratios. The deductions imply that the nucleus has a predominant part in detg. the development of the cell in which it resides.

C. H. RICHARDSON

The thermic effect of death. V. V. LEPESHKIN. Univ. of Ill. *J. Gen. Physiol.* 12, 345-53(1929).—See C. A. 23, 854.

C. H. RICHARDSON

The influence on the fermentation process of the antiseptics in use for enzyme studies (based upon experiments with saliva diastase). EMANUEL PRECHTL. Tierärztliche Hochschule, Wien. *Biol. generalis* 4, 181-90(1928).—Investigations were made on the question whether  $\text{MePh}$  (I),  $\text{CHCl}_3$  (II),  $\text{Cl}_3\text{CCH}(\text{OH})_2$  (III),  $\text{NaF}$  (IV) and thymol (V) have an inhibitory influence on the enzymic activity of saliva diastase.

Biedermann's method was used for the detn. of the diastatic power ( $D$ ). The expts. were carried out at 16–8°. Three cc. of a 1% amylose soln. was added to 5 cc. of dil. saliva (1 : 200) and the occurrence of the achromic point established by means of I-KI.  $D$  was calcd. from the values obtained; it was greatly influenced by the degree of satiation of the organism, the greatest value being obtained shortly after the principal meal. With the same individual the const. value of  $D = 3600$  was found 1 hr. after the principal meal. Increasing amts. of the antiseptics were added to the saliva-amylose mixt. with care that the antiseptic was always in intimate contact with the mixt. Then the degree of inhibition was calcd. from  $D$ . I was absolutely innocuous in a concn. of below 0.2% of the total vol.; II below 2.0%; III below 1.5%; IV below 1.0% and V (in aq. soln.) in any quantity. A 100% inhibition of the diastatic activity was obtained with the following concns.: I 9.77%, II 57.37%, III 5.78%. With IV no complete inhibition could be produced; the presence of 2.85% caused 80% inhibition.

G. SCHWOCH

Remarks on O. Gerngross' article on the "chemistry of the proteins." R. O. HERZOG. Kaiser Wilhelm-Inst. Faserstoffchem. Dahlem. *Z. angew. Chem.* **41**, 426 (1928).—Criticism of Gerngross' statements on the chemistry and mol. wt. of proteins, especially of collagen and gelatin (cf. *C. A.* **22**, 4269).

G. SCHWOCH

Remarks on the preceding article of R. O. Herzog. O. GERNGROSS. *Tech. Hochschule Berlin-Charlottenburg. Z. angew. Chem.* **41**, 426–7 (1928).

G. SCHWOCH

Hydrolysis of the protein of hen's eggs. JUNIRO MOTOMURA. *Bul. Sci. Fakultatu Terkultura, Kjusu Imp. Univ.* **3**, 182–6 (reprint).—The whole protein of the hen's eggs was hydrolyzed with HCl and the monoamino acids were isolated, thus: glycocoll 0.2, alanine 3.9, valine 13.2, leucine 6.5, phenylalanine 1.6, proline 3.6, aspartic acid 4.2 and glutaminic acid 4.6.

M. H. SOULE

Isoelectric point of crystalline urease. JAMES B. SUMNER AND DAVID B. HAND. Cornell Univ. *J. Am. Chem. Soc.* **51**, 1255–60 (1929).—Cryst. urease undergoes electrophoresis toward the anode in buffered solns., varying from neutrality to  $p_H$  5.5. In buffered solns. more acid than  $p_H$  5.5 no migration could be observed. Urease begins to ppt. with K acid phthalate at  $p_H$  5.3 and the pptn. is almost complete at 4.6; it is pptd. by buffered Pb(OAc) at  $p_H$  4.7 and the pptn. is almost complete at 5.6. The regions for pptn. by phthalate and Pb overlap at  $p_H$  4.95, where 20% of the urease is pptd. by either ion. Urease is pptd. by  $Hg^{++}$  and  $Cu^{++}$  ions over a much wider range than for Pb ions. Dil. electrolytes have 3 effects on the soly. of urease: a pptn. by certain ions such as phthalate and Pb, over a certain range of  $p_H$ ; a solvent effect on urease; a pptg. action where the dil. salts bring the soln. to the  $p_H$  of the isoelec. point of urease. The isoelec. point of urease as detd. by the point of min. soly. in dil. acetate buffer is at  $p_H$  5.0 to 5.1. This point is far to the acid side of the  $p_H$  of optimum activity for urease. Urease is active on both sides of its isoelec. point. C. J. WEST

MITCHELL, H. H. AND HAMILTON, T. S.: *The Biochemistry of the Amino Acids*. Monograph No. 48 of Am. Chem. Soc. New York: The Chemical Catalog Co., Inc. 619 pp. Reviewed in *J. Franklin Inst.* **207**, 710 (1929).

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Localization of a lesion in the brain by differential staining of blood smears. The 20th report of the peroxidase reaction. (The fourth report of the same title.) KAZUO SUZUKI. *Tohoku J. Exptl. Med.* **11**, 618–25 (1928).—A large no. of substances, the majority in the colloidal state, were injected intravenously into rabbits in an attempt to produce the "striatal blood picture" (myeloid leucocytes negative to the peroxidase, but positive to the oxidase, tests). Though the peroxidase reaction was always posi-

tive, yet in some cases it was much weaker, the oxidase reaction always remaining normal.

B. C. BRUNSTETTER

**Examination of lobulation of nuclei of neutrophile leucocytes by modified copper peroxidase stain.** The 21st report of the peroxidase reaction. KAZUÉ SUZUKI. *Tohoku J. Exp. Med.* 12, 224-34(1929).—The Cu peroxidase method, in conjunction with safranin, stains neutrophiles distinctively and requires only a short stain time. Even in cell counts of 200, it checks fairly well with results obtained by the Giemsa stain.

B. C. BRUNSTETTER

**The benzidine reaction in urine.** ROAS. Kommunehospitals in Kopenhagen. *Wiener klin. Wochschr.* 42, 368-9(1929); cf. *C. A.* 22, 4139.—The interference of urine with the test as usually performed may be avoided by filtering the specimen and dropping the benzidine reagent directly onto the residue on the filter paper. D. B. DILL

**Spiritus etheris B. P. as substitute for absolute alcohol in microscopy.** D. S. SPENCE. *Microscope Record* 13, 27(1928); *Quart. J. Pharm.* 1, 115(1928).—Spiritus etheris B. P. may satisfactorily replace the more costly abs. alc. for most microscopical work. The spirit should be dehydrated by treatment with anhyd.  $\text{CuSO}_4$  or  $\text{K}_2\text{CO}_3$  before use.

W. O. E.

**Preservation of urine with nipagin.** GIACOMO TELLERA. *Pharm. Ztg.* 74, 366 (1929); cf. *C. A.* 23, 1430.—This deriv. of *p*-hydroxybenzoic acid is regarded as the best all-round preservative for samples of urine.

W. O. E.

**A note on the purification of picric acid for creatinine determination.** STANLEY R. BENEDICT. Cornell Univ. *J. Biol. Chem.* 82, 1-3(1929).—Two methods are described for purifying picric acid. The first method consists in the crystn. of thoroughly dried technical picric acid from glacial AcOH. In the second method, sodium picrate is first formed and the free acid liberated with HCl.

ARTHUR GROLLMAN

**The use of molybdic acid as a precipitant for blood protein.** STANLEY R. BENEDICT AND ELEANOR B. NEWTON. Cornell Univ. *J. Biol. Chem.* 82, 5-10(1929).—Molybdic acid may be entirely substituted for tungstic acid as a blood protein precipitant. In detns. of uric acid in filtrates from molybdic acid pptns. the modified indirect method should be employed because of the presence of larger amts. of thionine in such filtrates. Details of the prepn. and technic for using molybdic acid are given.

A. G.

**The occurrence and determination of thionine (ergothionine) in human blood.** JEANETTE ALLEN BEHRE AND STANLEY R. BENEDICT. Cornell Univ. *J. Biol. Chem.* 82, 11-5(1929).—A method for the detn. of thionine in blood is described in which NaOH is substituted for NaCN as the alkali. Results are given for 15 samples of human blood. A comparison is made between the results obtained using tungstic acid as a precipitant with those in which molybdic acid is used.

ARTHUR GROLLMAN

**The determination of carbon and carbon dioxide.** THEODORE E. FRIEDEMANN AND ARTHUR I. KENDALL. Northwestern Univ. *J. Biol. Chem.* 82, 45-55(1929).—An app. and procedure for detg. C and  $\text{CO}_2$  are described. The method involved wet combustion which is shown to be better adapted for biol. materials than the dry combustion method. If proper attention is paid to the total acid concn., even substances such as AcOH or fats can be completely oxidized without the use of catalysts.

ARTHUR GROLLMAN

**A specific color reaction for ergosterol.** OTTO ROSENHEIM. Natl. Inst. Med. Research, London. *Biochem. J.* 23, 47-53(1929).—When a few crystals, 1 mg. or less, of ergosterol are added to about 0.5 g. chloral hydrate, liquefied by warming in a water bath, they dissolve and immediately give rise to a carmine-red soln., showing a broad absorption band at  $50\ \mu$ . The red color changes within a min. into a green and finally a deep blue, which persists for a considerable time. The esters of ergosterol react similarly. An aq. soln. of  $\text{CCl}_3\text{CO}_2\text{H}$  (9 acid : 1 water) added to ergosterol dissolved in a few drops of  $\text{CHCl}_3$  gives an immediate red soln. (band at  $500\ \mu$ ) and this changes gradually into a clear blue (bands at 570-580 and 650-680  $\mu$ ) without showing any intermediate green phase. An immediate red color with the above reagents is sp. for those sterol derivs. which possess the  $\Delta^{1,2}$  (or  $\Delta^{1,12}$ ) linkage. It is suggested that the primary reaction in all sterol color reactions consists in the shifting of the double linkages into the  $\text{C}_{1,2}$  (or  $\text{C}_{1,12}$ ) position and the subsequent formation of colored carbonium salts.

BENJAMIN HARROW

**Cholesterol and phytosterol and the spectroscopy of the color reactions of the sterols in general.** JAMES MOIR. *J. South African Chem. Inst.* 12, 16-20(1929).—The known color reactions of cholesterol are enumerated. The same reactions are performed with ergosterol, zymosterol, coprosterol and stigmaterol. By examn. with a spectroscope, faint differences in the location of the bands are sometimes observed.

ALBERT L. HENNE

**Detection of dried saliva on cloth.** B. MUELLER. Univ. Frankfurt a. M. *Deut. Z. ges. gericht. Med.* 11, 211-24(1928).—The material is examd. 1st under an analytical quartz lamp. The pale border of the stain is discerned. Then a drop of  $\text{FeCl}_3$  soln. is placed on the skin. If this spot darkens more than a control spot treated with a drop of water, KCNS is considered present and saliva indicated. Tests for ptyalin are made.

FRANCES KRASNOW

**Demonstration of nitrites in forensic judgment of damage from shooting.** G. GORONCY. Univ. Königsberg. *Deut. Z. ges. gericht. Med.* 11, 482-6(1928). F. K.

**The glass electrode and its use in measuring hydrogen-ion concentration.** A. F. MIRSKY AND M. L. ANSON. Rockefeller Inst. *J. Biol. Chem.* 81, 581-7(1929).—A glass electrode and the app. needed for its use are described. The glass electrode is as accurate as the H electrode within the  $p_H$  range of biol. significance, is as rapidly operated as the quinhydrone electrode and is more widely applicable than either.

A. P. LOTHROP

**Observations on the reaction of M. Weiss.** PIETRO BERRI. *Boll. soc. ital. biol. sper.* 3, 1002-8(1928).—Chlorates, hypochlorites, perborates, and peroxides were used as oxidizing agents to see whether they would give the same yellow color to Weiss-positive urine as  $\text{KMnO}_4$ . They all failed to produce the color. A Weiss-positive urine was placed into a U tube and a current of 3-5 v. was passed through it; Pt electrodes were used. After 30 mins. a marked yellow color formed around the anode. No color formed at the cathode. A normal urine which was Weiss-neg. failed to produce a color at the anode. An oxidation reaction apparently took place in the Weiss-positive urine around the anode. This shatters the hypothesis that the yellow color in the positive urines is due to some chem. combination brought about by the  $\text{KMnO}_4$ . In order to ascertain the chem. nature of the substance in urine which gives the color, numerous compds. were tested *in vitro* in aq. soln. or suspension, or mixed with normal urine. The diazo reaction was run simultaneously. The results showed that only the true phenols and certain phenolic substances gave a positive Weiss and diazo reaction. Substances contg. alc. hydroxyls were negative. Pyrrole also gave a positive reaction. There was not a strict agreement between the diazo reaction and the Weiss reaction.

PETER MASUCCI

**Clinical microdetermination of the  $p_H$  of blood with an antimony electrode.** R. BRINKMAN AND F. J. J. BUYTENDIJK. *Physiol. Inst. Univ. Groningen. Biochem. Z.* 199, 387-91(1928).—The method depends upon the facts that the e. m. f. of Sb in an aq. soln. is detd. by the  $p_H$ , and that the direct proportionality holds also for the blood. Pure Sb is not suitable; a deposit of the metal upon a Pt electrode is used. A few crystals of  $\text{SbCl}_3$  are dissolved in celluloid (Durofix of the Rawlplug Co.) to give a 5-10% soln. A 0.2 mm. Pt-iridium wire fused into a glass tube is attached to the cathode and is placed in a drop of the  $\text{SbCl}_3$ -celluloid mixt. put on a piece of Sb which is attached to the anode of an 8-v. battery. The properly coated electrode is dried 12 hrs. in the air and is rinsed for 1.5 mins. with a boiling phosphate mixt. (4 parts 0.067 N  $\text{Na}_2\text{HPO}_4$  and 1 part  $\text{NaH}_2\text{PO}_4$ ). The electrode is standardized against 3 mixts. of the Sorensen phosphate salts with  $p_H = 7.73, 7.38$  and  $7.17$ , resp. At  $18^\circ$  the e. m. f. against a normal calomel electrode should be 450 mv., 435 mv. and 426 mv., resp. The relation between  $p_H$  and e. m. f. is thus linear and the e. m. f. difference for a unit  $p_H$  difference is 43 mv. The electrode is very sensitive to temp. changes increasing by  $\pm 0.5$  mv. per degree. In carrying out a  $p_H$  detn. on finger blood, the electrode is first checked up against the 3 buffer mixts. of the above indicated  $p_H$  values; the electrode should give const. results. The finger blood is sucked into a capillary tube, which is bodily transferred to a tube completely filled with a 0.1%  $\text{Na}_2\text{C}_2\text{O}_4$  soln. adjusted to a  $p_H = 7.5$  with a trace of NaOH. The tube is at once closed and shaken to permit the hemolysis of the blood and its uniform distribution. The Sb electrode is now immersed in the tube contg. the hemolyzed blood and the e. m. f. against a normal calomel electrode is measured. In as much as the same linear relationship between  $p_H$  and e. m. f. exists in blood as in the phosphate mixt. the  $p_H$  of the former is obtained directly by interpolation. S. M.

**An iodometric microchemical method for the determination of chlorides.** S. PRIKLA-DOVITZKII AND A. APOLLONOV. *Military Med. Acad., Leningrad. Biochem. Z.* 200, 135-44(1928); *Zhurnal expil. Biol. Med.* 10, 448-57(1929).—One-tenth of a cc. of blood is measured with a pipet calibrated in 0.001 cc. into 2-3 cc. Cl-free  $\text{H}_2\text{O}$  in a small Erlenmeyer flask. Now, 2 cc. of dil. (1 : 3)  $\text{HNO}_3$  is added in case of blood, or only 1 cc. if plasma has been used, and 2 cc. of 0.01 N  $\text{AgNO}_3$ , and the flask is heated on a sand bath to boiling, when 15-20 drops satd.  $\text{KMnO}_4$  is added and the heating continued for 10 min. The color must be retained. After heating the soln. is decolorized by adding drop by drop a satd. glucose soln. until a clear colorless fluid is

obtained. After cooling this is filtered into another small flask through a small wad of washed cotton. The first flask is washed twice with 3 cc.  $H_2O$  which is also poured through the filter. The excess of  $AgNO_3$  is detd. by titrating the filtered soln. with  $I_2-KI$ , 3-4 drops of starch being used as indicator. S. MORGULIS

**A new microchemical method for the determination of adrenaline.** Its application to studies on the intermediary metabolism. M. CHIKANO. Med. Acad., Osaka. *Biochem. Z.* 205, 166-75(1929).—The method depends upon the reaction of adrenaline with  $HIO_3$ . The reaction, however, is not sp. In analysis of serum the proteins must be removed with 5% metaphosphoric acid. Various substances in the blood have a very slight effect upon the reaction except uric acid which, especially in pathol. sera, may be a serious source of error. Certain other end and intermediary products of protein metabolism also react with the reagent. The method is therefore primarily a measure of the protein metabolism. S. MORGULIS

**Sources of error in the tyrosine, phenol and uric acid determination with phosphotungstic acid.** E. SCHIRMER. Psychiatrische Universitätsklinik, Florenz. *Biochem. Z.* 205, 245-55(1929).—The methods developed by Folin and his school utilize labile complex polyphosphotungstic acids which are easily reduced with the formation of the blue  $W_2O_8$ , but this oxidizing property is nonspecific and therefore leads to errors. All inorg. reducing substances, with the exception of  $HNO_2$ , produce a blue coloration,  $H_2O_2$  behaving likewise as a reducing substance. Bivalent Fe compds. even in extreme diln. reduce the phosphotungstic acid. Among the aliphatic compds. the unsatd. compds. give an intense coloration. Although  $HCHO$  or  $CH_3CHO$  does not reduce the reagent, aldehyde condensation products cause blueing even in dilns. in which only tyrosine or adrenaline is effective. Apart from the phenols, the reaction is given by aromatic amines, the reduction being proportional to the number of  $NH_2$  groups. The leucobases of the triphenylmethane dyes, various animal and plant pigments, hemoglobin and chlorophyll all reduce strongly. Colored products obtained in protein hydrolysis cause great errors in detns. by Folin's method even if the hydrolyzate had been completely decolorized with charcoal since the latter contains Fe which is reduced to bivalent Fe in the decolorization process. Furthermore, urea gives a strong blueing of the phosphotungstic reagent and thus interferes with the detn. of uric acid or phenol in urine. S. MORGULIS

**Determination of hippuric acid in urine.** A. VON BEZNÁK. Univ. Debreczen. *Biochem. Z.* 205, 409-13(1929).—The hippuric acid is extd. from the urine with ether in a specially devised extractor suitable for any liquid heavier than ether. The hippuric acid is then hydrolyzed in the presence of 10%  $H_2SO_4$  for 1.5 hrs. at 2.5 kg. pressure per sq. cm., which liberates the glycine quantitatively. Actually, 10-20 cc. urine acidified with 1 cc.  $H_2SO_4$  and 3 cc. 10% Na tungstate is extd. for 1-2 hrs. with 80 cc. ether. After adding 10 cc.  $H_2O$  to the ether ext., the ether is driven off, the remaining soln. is acidified with 1 cc.  $H_2SO_4$ , autoclaved and finally dild. to 25 cc. In 2 cc. aliquots the amino-N is detd. by Van Slyke's method. S. MORGULIS

**The determination of silver in biological fluids and tissues.** E. I. STERKIN. State Med. Inst., Charkow. *Zhurnal expl. Biol. Med.* 10, 423-30(1929); cf. *C. A.* 23, 175.—The material to be analyzed for Ag is oxidized in  $H_2SO_4$  and every trace of Cl is removed by adding towards the end of the combustion pieces of metal Zn. The  $H_2$  set free reacts with the Cl, which is driven off as  $HCl$  gas. The actual combustion is carried out in a test tube in which, in addn. to the blood, are placed 0.5 g.  $Na_2SO_4$ , 0.25 g.  $CuSO_4$ , 4 cc.  $H_2SO_4$  and 2 cc. satd.  $KMnO_4$ . The tube is heated on a sand bath and more  $KMnO_4$  added until the mixt. is decolorized. Then, after diln. 3-4 times with  $H_2O$ , the Zn is added. The liberated Ag is titrated with a 0.01 N  $NH_4SCN$  with Fe alum as indicator. Intravenous injection of Solargentum leads to such rapid disappearance of the Ag that it cannot be detected in the blood even soon after the injection. When the dose is sufficiently large to cause death or symptoms of toxicity, Ag is always found in the blood. S. MORGULIS

**The examination of sperm stains by ultra-violet light.** C. SIMONIN. *Ann. méd. légale criminol. police sci.* 9, 60-2(1929).—Dried sperm becomes fluorescent under ultra-violet light (Wood's light); but the brilliant white fluorescence can be modified according to the nature of the base on which the stain has been applied. Moreover, it is not specific, as other org. liquids can give a similar or identical fluorescence. The fluorescence of sperm stains seems to be due to the presence of choline. A. P.-C.

**A specific color reaction for ergosterol and its transformation products.** E. P. HAÜSSLER AND E. BRAUCHLI. Chem. Labor. F. Hoffmann-La Roche & Co., Basel. *Helv. Chim. Acta* 12, 187-93(1929).—According to Tortelli and Jaffe (*C. A.* 9, 1255) the presence of cod-liver oil in fats or oils can be detected by the green color developed

upon addn. of 2.5 cc. of a 10% soln. of Br in  $\text{CHCl}_3$  to 5 cc. of the oil or fat in 10 cc.  $\text{CHCl}_3$  + 1 cc.  $\text{AcOH}$ . H. and B. found the development of the color due to the presence of ergosterol (I). Solns. of 1 g. pure cholesterol or 1 g. pure phytosterol in 10 cc.  $\text{CHCl}_3$  + 5 cc. olive oil gave a negative reaction. With pure I in 10 cc.  $\text{CHCl}_3$  + 5 cc. olive oil, 1.0 mg. gave a distinctly positive, and 0.5 mg. a weakly positive reaction. In presence of 1.3 g. cholesterol or 1.3 g. phytosterol, the min. amts. of I to be detected were 1.5 and 1.0 mg., resp. In presence of 1.0 g. cholesterol oleate, 0.25 g. cholesterol digitonide gave a negative reaction, while with 1 mg. ergosterol acetate, 1 mg. ergosterol monosuccinate or 4.0 mg. ergosterol digitonide a distinctly positive reaction was obtained. Smedley McLean (C. A. 22, 1985) has stated that her purest zymosterol (II) ( $[\alpha]_D^{20} = +34.1$ ) still contained I, though less than 5%. The impure II (m. 108-9°;  $[\alpha]_D^{20}$  in  $\text{CHCl}_3 = +17.0$ ) prepd. by H. and B. gave a green color, being about 5 times weaker than that obtained with pure I. This impure II could be purified by 4 different methods, namely, by repeated crystn. from  $\text{Et}_2\text{O}$ ; by oxidation with  $\text{KMnO}_4$ , which oxidizes I more easily than II; by irradiation of a 1% soln. in pure  $\text{EtOH}$ ; by allowing it to stand in  $\text{CHCl}_3$  soln. for 2 weeks. The final product m. 105-7°,  $[\alpha]_D^{20}$  in  $\text{CHCl}_3 = +44.0$ . The intensity of the coloration given by the purified II amounted to about  $1/10$  to  $1/20$  of that given by I. With iso-ergosterol acetate the reaction was about  $1/2$  as strong as with I; with dehydro-ergosterol (III) or the acetate of III the reaction was about 2 to 4 times stronger than with I. The color reaction slowly lost in intensity on irradiating 0.3 g. of I in olive oil in PhH soln. Since in the latter soln. the  $l$ -rotation disappeared after  $1/2$  hr., while the decrease in the color intensity only amounted to  $1/4$ , H. and B. assume also that the first transformation products give the color reaction. After 16 hrs. the intensity of the color was reduced to  $1/10$ . I was not present in the following oils: olive, cotton-seed, sesame, peanut, walnut, peach kernel, sweet almond, soy bean, castor, croton, hydnocarpus and rape-seed. Negative results were also obtained with neat'sfoot fat, with 0.5 g. of the crude stearins isolated from adeps lanae anhydr., which contain ischolesterol, and with 0.1 g. cholic acid, 0.1 g. glycocholic acid, 0.1 g. taurocholic acid and 0.3 g. cholates of the gall from ox, swine and humans. A color developed with poppy-seed, linseed and chaulmoogra oil, the  $\text{Et}_2\text{O}$  exts. from meconium and the stearins extd. by  $\text{Me}_2\text{CO}$  from gallstones of females. G. SCHWOCH

**Preparations of pepsin and trypsin from *Acanthias vulgaris*.** H. J. VONK, JR. *Arch. néerland. physiol.* 11, 437-9(1926).—The mucosa of the shark's stomach was treated with 0.35%  $\text{HCl}$  for several days under toluene. Pepsin was detected in the filtrate. When dialyzed with  $\text{H}_2\text{O}$  the pepsin was pptd. A small quantity of enzyme remained unpptd. and could be isolated by concn. and pptn. with basic lead acetate and  $\text{NH}_4\text{OH}$  followed by treatment with oxalic acid and dialysis. The pancreas was ground with sand plus  $\text{H}_2\text{O}$  and  $\text{CHCl}_3$ ; the filtrate contained trypsin which was obtained by pptn. when the  $p_{\text{H}}$  was adjusted to 4. M. H. SOULE

**Determination of choline.** J. W. LE HEUX. *Arch. néerland. physiol.* 12, 313-8 (1927).—Choline is converted into acetylcholine and assayed biologically against a known amount of the latter. At present 3 methods are available: the perfused frog heart, error of 12% (the organ increases in sensitiveness to a const. level; summer hearts cannot be used since they are not sensitive); the rabbit's small intestine, error 8.3%; the blood pressure of the decapitated cat. For this last-named test adrenaline is infused at a const. rate to maintain a higher blood pressure than normally occurs in this prepn. (1 cc. 1:50,000 every 5 min.) and thus make the acetylcholine fall more definite; error 4.4%. One should give alternate doses of standard and unknown. If the presence of choline is questionable the effect before and after acetylation must be compared with the action of choline and acetylcholine on the same tissue. M. H. S.

**The use of the antimony electrode in the determination of  $p_{\text{H}}$  in vivo.** F. J. J. BUYTENDIJK. *Arch. néerland. physiol.* 12, 319-21(1927).—The Sb electrode was used to det. the  $p_{\text{H}}$  of a drop of blood and of tissues and the circulating blood. Frog muscle at rest gave a  $p_{\text{H}}$  of 8, active  $p_{\text{H}}$  6.9. The  $p_{\text{H}}$  of circulating rabbit blood was 7.35. It was necessary to standardize the electrode with buffer mixts. The  $p_{\text{H}}$  was recorded photographically if desired by connecting the electrode with a galvanometer. M. H. SOULE

**The effect of amino acids upon the methods for determining sugar with especial reference to cysteine and cystine.** YUZURU OKUDA AND KITARO KATAI. *Bul. Sci. Fakultato Terakultura, Kjusu Imp. Univ.* 3, 182-6(reprint).—A study was made of the effects of cysteine, cystine, tryptophan, glycine, aspartic acid, tyrosine, alanine, leucine and histidine, and also of gelatin cleavage-products, which contain all amino acids except cysteine, cystine, tyrosine and tryptophan, upon sugar detns. By Bang's

method cysteine, cystine and tryptophan behaved as glucose. The other amino acids had little or no action. Cystine and cysteine influenced the methods of Folin-Wu, Benedict, Hagedorn and Shaffer-Hartmann.

BARRAL, ET., AND BARRAL, PH.: *Précis d'analyse biologique clinique urine*. Paris: J. B. Baillière et Fils. 527 pp. F. 40. Reviewed in *Chimie & industrie* 21, 677-8(1929).

## C—BACTERIOLOGY

CHARLES B. MORREY

Biochemical method for preparing fats. V. KULIKOV. *Oil and Fat Ind.* (Russia) 1928, No. 4, 21-3.—K. succeeded in obtaining a non-virulent strain of the tubercle bacillus which formed a complete membrane during a growth of 3-4 days in molasses in broth. This culture contained 22-36% of fatty substances sol. in ether, and contained glycerides of the palmitic and stearic acids m. about 66° and waxes (ethers of higher alcs.) m. 70°. Solid fats of the type of coconut oil could be obtained by this method.

A. A. BOEHLINGK

Comment on the paper by Chikano: The preparation of *d*-tyrosine from racemic tyrosine by means of *Oidium lactis*. FELIX EHRLICH. Univ. Breslau. *Z. physiol. Chem.* 181, 140(1929); cf. *C. A.* 23, 1924.—C. has overlooked E.'s paper (*C. A.* 21, 2715) where a method is described which gives a better yield of *d*-tyrosine in a shorter time.

A. W. DOX

Further studies on the disinfection of dried anthrax films. G. POHL. *Z. Inf. parasit. Krankh. u. Hyg. d. Haustiere* 32, 304-38(1928); *Wasser u. Abwasser* 25, 163.—Chloramine,  $\text{Ca}(\text{OCl})_2$  with an active Cl content of 25%,  $\text{Na}_2\text{S}$ , Sulfo-liquid DS, tetralol, bromotetralol, tetralresorcinol,  $\text{NaCl}-\text{HCl}$ ,  $\text{HgCl}_2-\text{CH}_3\text{O}$ , and  $\text{NaOH}-\text{NaCl}$  were used in various concns. on exposed anthrax films. Only the  $\text{Na}_2\text{S}$ , 50-62% and the  $\text{NaCl}-\text{HCl}$  mixts. proved effective. Both chloramine and  $\text{Ca}(\text{OCl})_2$  contg. 25% active Cl were satisfactory surface disinfectants but did not possess good penetrating power.

C. R. F.

Bactericidal action of the nitroso compounds. EVELYN A. COOPER AND RAYMOND B. HAINES. Univ. Birmingham. *Biochem. J.* 23, 10-16(1929).—Nitroso compds. owe their slow germicidal action and marked inhibitory power to their gradual chem. interaction with the nuclear constituents of the cell, thus interfering with and retarding the biochem. mechanism of growth.

BENJAMIN HARROW

Relation of the growth of certain microorganisms to the composition of the medium. IV. The addition of mannitol. VERA READER. Oxford Univ. *Biochem. J.* 23, 61-7 (1929); cf. *C. A.* 22, 2960.—The increased weight of bacteria grown in the presence of mannitol is not due to increased fat production. Treatment with charcoal at various pH values and subsequent recrystn. failed to remove any growth-promoting factor from the mannitol. Mannitol prepd. from mannose (which has no growth-promoting effect) was found to be equally active. Dulcitol, sorbitol, glycerol and inositol cannot be substituted for mannitol.

BENJAMIN HARROW

Reduction potential, energy exchange and cell growth. Experiments with *B. coli*. JUDA HIRSCH QUASTEL AND WALTER REGINALD WOOLDRIDGE. *Biochem. Lab., Cambridge. Biochem. J.* 23, 115-37(1929).—Succinate and cysteine (or —SH) inhibit the anaerobic growth of *B. coli* in lactate-fumarate medium. Formate at low concns. increases the rate of proliferation of *B. coli* in this medium. The rate of growth is not dependent on the oxidation or reduction intensity of the environment.

B. H.

Antiseptic power of certain essential oils. A. MOREL AND A. ROCHAIX. Univ. Lyon. *Bull. sci. pharmacol.* 35, 631-4(1928); cf. *C. A.* 21, 3046, 3928.—The power of certain essential oils toward certain organisms such as the bacilli of Eberth or Loefler and staphylococci is not always superposable upon their disinfectant actions. Thus lemon oil which is active as a disinfectant has but slight antiseptic power. Thyme from thymol has 3 to 5 times the antiseptic power of thyme from carvacrol. Oil of *Eucalyptus citriodora* has about 10 times the antiseptic power of the oil of *E. globulus*. There is a diminution in the antiseptic power of essential oils on passing from the mol. state to the colloidal micellary state. This is attributed to the degree of dispersion and changed amt. of contact between the oil and the organism.

E. H.

Tests with the nutrient medium of Muller for the examination of feces. H. G. HOFERRE. Inst. for Tropical Hyg., Amsterdam. *Geneeskund. Tijdschr. Nederland. Indië* 69, 125-31(1929).—Growth of *B. coli* was very much inhibited. Typhoid and salmonella bacilli and proteus and paracoli bacteria grow well, but *B. dysenteriae* and *B. paratyphosus* are very much inhibited in growth. The use of the nutrient medium of Muller

is recommended for typhoid and salmonella bacteria in feces, in conjunction with an Endo plate. J. C. JURRIENS

**Proteolysis by *Streptococcus lactis*.** L. T. ANDEREGG AND B. W. HAMMER. *J. Dairy Science* 12, 114-28(1929).—Certain cultures of *S. lactis* showed a definite proteolytic activity in milk, while others did not. The butter cultures studied showed proteolysis in milk regularly.  $\text{CaCO}_3$  added to the milk showed more pronounced proteolysis than without addn. Sterile lactic acid added to milk in quantities approximating those developed by *S. lactis* cultures did not increase the amt. of sol. N at room temp. An increase of sol. N through the growth of *S. lactis* in milk usually caused an increase in amino N as detd. by the Van Slyke method. Addn. of peptone appeared to retard protein decompn. rather than accelerate it. In general, protein decompn. with *S. lactis* occurred with cultures coagulating milk rapidly, while no decompn. took place with cultures coagulating slowly. *S. citrovorus* and *S. paracitrovorus* did not cause proteolysis when grown in milk. J. C. JURRIENS

**Bacteria which oxidize indole to indigo.** A. J. KLUYVER. *Nederland. Tijdschr. Hyg. Microbiol. Serol.* 3, 308-13(1929).—A lecture demonstration with discussion. J. C. JURRIENS

**Bacterium gluconium, an organism present in the so-called Kombucha (a mold of the Japanese or Indian tea).** SIEGWART HERMANN. Deutsche Univ., Prague. *Biochem. Z.* 205, 297-305(1929).—A morphological and physiol. study. S. MORGULIS

**Enzymic dismutation through the ketone-aldehyde mutase of *B. subtilis*.** ANTONIO GUALDI. Kaiser Wilhelm Inst. für Biochem., Berlin-Dahlem. *Biochem. Z.* 205, 318-9(1929).—The dismutation of phenylglyoxal hydrate by *B. subtilis* has been investigated. An almost 100% yield of mandelic acid was obtained, of which 84% was the *l*-form. S. MORGULIS

**Increased sensitivity of microbes toward proteolytic enzymes.** P. V. SMIRNOV. State Microbiol. Inst., Narkonizdrav, Moscow. *Zhur. expl. Biol. Med.* 10, 637-40(1929).—As a result of repeated treatment of *B. dysent.* Shiga cultures with small quantities of trypsin the organisms show an increased sensitivity toward proteolytic enzymes, and the cultures undergo autolysis more readily. S. MORGULIS

**The formation of uric acid by bacteria.** K. SCHLOSSMANN. *Centr. Bakt., Parasitenk.*, I Abt., 110, 78-84(1929).—A no. of common bacteria can produce uric acid in peptone media. It is the result of enzyme action on purine bases. The substances which give the uric acid reaction with phosphotungstic acid can be removed from filtrates with ether or  $\text{CHCl}_3$ . Uric acid may also be formed in purine-poor solns., indicating that it may be synthesized by bacteria. This property is species const. and may be utilized in identifying closely related species. JOHN T. MYERS

**The problem of bacterial variation.** V. MELNYK. Bact. Inst. zu Kiew. *Centr. Bakt., Parasitenk.*, I Abt., 110, 113-20(1929).—Seventeen strains of staphylococci were grown on agar contg. from 0.1% to 0.55% of phenol. All grew immediately at 0.1%; 16 strains grew at 0.15 and 0.2%; 15 at 0.25%; 12 at 0.3%, and 2 at 0.35%. None grew at higher concns. One strain acquired the ability to grow at 0.1% after 78 transfers on phenol agar. Phenol changed the colony form to small streptococcus-like colonies. About 20 transfers on standard agar restored the original form. Ability to grow in the presence of phenol had no appreciable effect on sensitivity to higher temperatures. JOHN T. MYERS

**Bacteriophage in the water of the Don.** D. BUYANOVSKII. Staat. Microbiol. Inst. Rostow and Don. *Centr. Bakt., Parasitenk.*, I Abt., 110, 120-5(1929).—The water of the Don has a bactericidal effect on most members of the intestinal group. The effect is destroyed by boiling. This property is probably due to a bacteriophage, whose action is best explained on the theory of d'Herelle. JOHN T. MYERS

**The biological difference between heated and unheated pneumococcus-antigens.** III. **The toxicity of normal culture filtrate (NF), of heated culture filtrate (FK), and standard vaccine, as used for animal immunization.** S. YAMAMOTO. Der kais. Univ. zu Kyoto. *Centr. Bakt., Parasitenk.*, I Abt., 110, 151-5(1929). IV. **Interference with spontaneous phagocytosis of pneumococci by unheated culture filtrate (NF), and heated filtrate (FK).** *Ibid* 156-60.—The relative toxicity of "NF," "FK" and vaccine for rabbits is in the ratio of 1:2:6. Both filtrates interfere with phagocytosis, but this property is independent of toxicity. Active immunity decreases with decreasing phagocytosis. "NF" decreases phagocytosis and increases the leucytosis. J. T. M.

**Decolorization, growth inhibition and bactericidal effects of dyes on the tubercle bacillus.** GERTRUD MEISSNER. *Centr. Bakt., Parasitenk.*, I Abt., 110, 172-8(1929).—Tubercle bacilli were grown by Wright's method, suspensions being made in guinea-pig blood plus the substance to be studied, sealed in capillary pipets and incubated.

A group affinity exists between tubercle bacilli and certain chem. substances. A thousand org. and inorg. substances were studied. Substances which inhibit in the tubes also inhibit in guinea pigs.

JOHN T. MYERS

**Demonstration of a new culture medium (heated blood plates).** WETHMAR. *Centr. Bakt., Parasitenk.*, I Abt., 110, 190-2(1929).—Blood-agar plates were heated 1.5 hrs. at 60°. They assumed a Burgundy-red color. Influenza bacilli and others grow readily.

JOHN T. MYERS

**Studies on the physical affinity of bacterial cells to the dyestuffs.** I. The behavior of bacterial cells toward dyes as influenced by the hydrogen-ion concentration. ETSUO YURI. Univ. Kyoto. *Acta Schol. Med. Univ. Imp. Kioto* 11, 75-95(1928).—The adsorption of dyes occurring on addn. of a dye soln. to a suspension of bacteria at various H-ion concns. was followed microscopically and colorimetrically. The bacteria used for the expts. were: *Bacillus typhosus*, *B. coli*, *B. pyocyaneus*, *B. cholerae*, *B. subtilis*, *B. anthracis*, *B. prodigiosus*, *Sarcina* and *Staphylococcus*. More than 300 dyes were tested. All expts. were carried out in buffered solns. Conclusions: It is confirmed that the affinity between bacterial cells and dyes is controlled largely by the  $p_H$  of the fluid. There are 3 types of behavior of the bacteria cells toward the dyes, the different behavior depending solely on the nature of the dye and not at all on the types of bacteria used. Basic dyes combine with bacterial cells only in alk. or slightly acid soln.; acid dyes combine only in strong acid soln. There were a few dyes that stained only very little or not at all, irrespective of the  $p_H$ . Y. believes that the electrostatic affinity plays the most important role in the adsorption processes. The value of dye therapy may be increased by proper control of the  $p_H$ . Numerous references are given. II. **The mode of combination of bacterial cells with dyestuffs.** *Ibid* 97 115.—Y. investigated the question whether bacterial cells combine with dyes on account of chem. affinities or on account of a mere phys. adsorption. About 60 acid and some basic dyes were employed. *B. anthracis* and *Sarcina lutea* were used in most of the expts. A 0.05 mol. soln. of secondary Na citrate served as the buffer soln. for the acid dyes, a 0.033 *N* soln. of acid phosphate was used for the basic dyes. Different quantities of the dye soln. adjusted to the  $p_H$  desired were added to 1 cc. of the bacteria suspension contg. about 1 mg. of organisms. The resulting solns. were made up to a const. vol. by adding buffer soln. Then the solns. were kept at 37° for 30 mins. and the adsorbed amts. of dye were detd. colorimetrically. As to the acid dyes, it was observed that the combination with bacteria occurs exactly according to the formula of the adsorption isotherm of Freundlich, the exponent  $\alpha$  and the const.  $k$  in the formula being characteristic for the types of bacteria and dyes employed.  $\alpha$  has a positive sign and varies between 0.03 and 1.0, while the values for  $k$  vary between 0.26 and 9.8 ( $p_H$  3.0). With increasing H-ion concn.  $k$  becomes greater, while  $\alpha$  decreases. With some dyes  $\alpha = 1$ , i. e., the relative amt. of the dye fixed by the bacterial cells remains const. at various concns. of the dye. In these cases only  $k$  varies and  $\alpha$  remains const. irrespective of the  $p_H$  and the types of bacteria used. With basic dyes the adsorption processes are much more complicated. In some cases the adsorption law seemed to be valid within certain limits of the dye concn.

THOMAS G. PHILLIPS

**The ergosterol content of yeast.** A. HEIDUSCHKA AND H. LINDNER. Tech. Hochschule Dresden. *Z. physiol. Chem.* 181, 15-23(1929).—For the prepn. of ergosterol from yeast the method of Windaus and Grosskopf (*C. A.* 17, 2417) gives the best yield. Their procedure consists in sapong. the yeast mass with alc. KOH and extg. the dild. filtrate with Et<sub>2</sub>O. A simplification of this procedure now obviates the necessity of shaking a large vol. of soap soln. with Et<sub>2</sub>O. Two kg. of yeast are stirred in a porcelain dish with 1750 cc. of 96% EtOH, transferred to a 5-l. flask and 400 g. KOH added. The mixt. is refluxed 6 hrs. on a water bath, then filtered and the residue again boiled with 3 l. EtOH and 100 g. KOH and filtered as before, and the final residue washed with 250 cc. EtOH. The combined filtrates are evapd. to 800 cc. and cooled to 0° for 25 hrs. The crystals which sep. are filtered off, and a 2nd crop is obtained in the same manner after concg. the mother liquor to 1/3 its vol. These crystals of ergosterol are now placed in a Soxhlet app. and extd. with Et<sub>2</sub>O, the solvent is evapd. and the residue recrystd. from EtOH. For detn. of ergosterol 2 g. of the fresh yeast are rubbed with 2 g. of sand, and the mass is sapond. by boiling 1 hr. with 40 cc. of 25% aq. KOH.

After cooling, the soap soln. is shaken 5 times with 75-cc. portions of  $\text{Et}_2\text{O}$ , the solvent evapd. and the residue taken up in 50 cc.  $\text{C}_6\text{H}_6$ . Five cc. of this  $\text{C}_6\text{H}_6$  soln. is treated with a freshly prepd. mixt. of 2 cc.  $\text{Ac}_2\text{O}$  and 6 drops concd.  $\text{H}_2\text{SO}_4$ . The mixt. is placed in a thermostat at  $18^\circ$  for 2 mins. and then compared in a colorimeter in monochromatic light with a standard. The latter is an aq. soln. of naphthol green B which has been standardized against ergosterol solns. of known concn. By this method the ergosterol content of 10 organisms, including baker's yeast, brewer's yeast, *Torula* yeast and several molds, was detd. On the dry basis the ergosterol content ranged from 0.20% in *Torula pulcherrima* to 1.17% in a press yeast. There was less variation in different yeasts under uniform culture than in the same yeast (*Sacch. cerevisiae*) under different conditions of culture medium, aeration, etc. The highest value, 1.10%, was obtained by growing the organism on a wort medium and passing in O at frequent intervals. Addn. of 5%  $\text{EtOH}$  increased the yield of ergosterol to 0.92%, while addn. of 0.15%  $\text{Na}_2\text{HPO}_4$  decreased it to 0.34%.

**Physiological shrinkage of potatoes in storage.** C. O. APPLEMAN, W. D. KIM-BROUGH AND C. L. SMITH. Md. Agr. Expt. Sta., *Bull.* 303, 159-75(1928).—The ratio between loss in wt. of potatoes and wt. of  $\text{H}_2\text{O}$  evapd. from atmometers was detd. for different varieties and conditions during the storage season. Variations of these ratios from a certain const. indicate that internal factors such as respiration are influencing loss in wt. Internal factors are especially effective in the early and late storage periods, and much less so during the middle of the storage season. Varietal differences appeared only during early and late storage. The more rapid loss of wt. of immature potatoes at low temp. is probably due to delayed cork formation at the lower temp. C. R. F.

**Determination of small quantities of starch in vegetable tissue.** ERNEST J. B. BISH. Univ. Bristol. *Biochem. J.* 23, 31-4(1929).—The method depends upon the principle of relating the Cu-reducing power of the hydrolyzed starch in the plant material to the reducing power of known quantities of a carefully purified starch prepn.

BENJAMIN HARROW

**Note on the characterization of the anthocyanins and anthocyanidins by means of their color reactions in alkaline solutions.** ALEXANDER ROBERTSON AND ROBERT ROBINSON. Univ. Manchester. *Biochem. J.* 23, 35-40(1929).—The colors of several of these compds. are described.

BENJAMIN HARROW

**Nature of the unsaponifiable fraction of the lipid matter extracted from green leaves.** EDITH CLENSHAW AND IDA SMEDLEY-MACLEAN. Lister Inst., London. *Biochem. J.* 23, 107-109(1929).—From spinach was obtained hentriacontane,  $\text{C}_{31}\text{H}_{64}$ . Green leaves and fish-liver oils both give (1) a highly unsatd. hydrocarbon, (2) products which may be regarded as obtained from the higher fatty acids by processes of condensation and reduction, and (3) sterols.

BENJAMIN HARROW

**Biochemistry of dry-rot in wood.** EUSTACE C. BARTON-WRIGHT AND JAMES G. BOSWELL. King's College, London. *Biochem. J.* 23, 110-4(1929).—The effect of the fungus *Merulius lachrymans* (the cause of dry rot in wood) is to remove the galactan, mannan and cellulose fraction in spruce-wood. The hemi-celluloses and lignin are not affected.

BENJAMIN HARROW

**Studies in the wilt disease of cotton in the Bombay Karnatak. III. The pathogeny of wilting in cotton plants.** G. S. KULKARNI AND B. B. MUNDKUR. Agr. Research Inst., Pusa. *Memoirs Dept. Agr. India, Botanical Ser.* 17, 21-7(1928).—The active factor causing wilt in cotton plants appears to be a chem. compd. or compds. occurring in the liquid in which the fungus (*Fusarium vasinfectum*) has grown. This compd. is not destroyed by boiling and is not removable by filtration through porcelain filters. It is not destroyed by heating the filtrates in an autoclave at  $110-115^\circ$ . The nature of the compd. was not detd., but lactic and oxalic acids are definitely excluded and nitrates do not appear to be the cause of the result noted. The solns. in which the fungus had grown were not only fatal to susceptible types of cotton but they also caused wilt symptoms in resistant types and even in types which are considered to be immune.

K. D. JACOB

**Proteins of the avocado (*Persea americana* Mill).** D. BREESE JONES AND CHARLES E. F. GERSDORFF. Bur. of Chem. and Soils. *J. Biol. Chem.* 81, 533-9(1929).—Ripe avocados contain 3 different types of proteins: a globulin contg. 15.31% of N, coagulating at  $68^\circ$ , sol. in 10%  $\text{NaCl}$  and pptd. both by addn. of  $\text{AcOH}$  and by making the soln. 67% satd. with  $(\text{NH}_4)_2\text{SO}_4$ ; a 2nd protein contg. 13.42% of N is obtained by acidifying a 0.1 N, 60% alc.  $\text{NaOH}$  ext. of the residue remaining after the extrn. with  $\text{NaCl}$ ; the 3rd protein contg. 16.23% of N is pptd. by dilg. the slightly acidified alc. filtrate with several vols. of  $\text{H}_2\text{O}$ . The 3 proteins contain the following % of amino acids, resp.: arginine 7.94, 4.46, 12.94; histidine 0.59, 2.04, 0.99; lysine 7.06, 6.71,

2.95; cystine 2.03, 1.84, 1.80; tryptophan 2.12, 0.38, 1.07; tyrosine 7.01, 4.92, 2.81.

A. P. LOTHROP

Studies on plant colloids. XXII. Potato amylopectin, prepared according to different methods. M. SAMEC. Univ. Laibach. *Biochem. Z.* 205, 104-10(1929); cf. *C. A.* 22, 4863; 23, 1931.—The physico-chem. properties of amylopectin prep'd. from potato by the methods of Gruzewska, Tanret, Zwicker, Ling-Nanji, Pringsheim-Wolfsohn, or by the baryta method have been compared, and were found to be practically identical.

S. MORGULIS

Characterization of *Aspergillus niger* strains. II. The significance of acid substrates for the characterization and propagation of fungi. K. BERNHAUER. Deutsche Univ., Prag. *Biochem. Z.* 205, 240-4(1929); cf. *C. A.* 23, 179.—The addn. of acids makes it possible to differentiate strains of fungi characterized by large acid production by their acid resistance. Furthermore, different strains manifest variable resistance toward different acids. Thus some are much more resistant against HCl than  $H_2PO_4$ .

S. MORGULIS

Chemistry and physiology of plant phosphatides. VIII. The phosphatides of yeast. V. GRAFE. Neue Wiener Handelsakad. *Biochem. Z.* 205, 256-8(1929).—When yeast is autolyzed under sterile conditions at 28-30° and is then dialyzed against cold distd. water, the dialyzate contains no protein (protein is present if the dialysis is at a temp. above 15°) but shows much N and P. By various tests it has been established that the N and P are components of phosphatides. The phosphatides cannot be removed from unautolyzed yeast. It is therefore concluded that in the yeast the phosphatide forms a complex with the protein. When this is destroyed by enzyme action the phosphatide becomes dialyzable.

S. MORGULIS

The loss of nitrogen in the process of drying plants. NICOLAI IVANOV and M. I. LISHKEVICH. *Biochem. Z.* 205, 329-48(1929).—The compn. of the dry substance of plants varies according to the method of drying, the dry wt. being a function of the temp. After a const. wt. has been attained at 75°, *in vacuo*, a new const. wt. can be produced at 105°, but at this higher temp., also some N in the form of  $NH_3$  is lost. The loss at 105° is very slight or actually nil in the case of plants contg. their N chiefly in the form of protein, but material contg. labile N products, as for instance mushrooms, loses 18% of its total N, so that when dried at 75° these possess 11.76% of the dry substance in the form of N and only 10.65% N when dried at 105°.

Can dead leaves still assimilate? OLUFSEN. *Mikrokosmos* 22, 50-1(1928).—A review of the work of H. Molisch (*Z. Botan.* 17, 577-93(1925)) which shows that green leaves dried at a low temp., and then moistened, give off O on exposure to light.

GEO. W. MUHLEMAN

The composition of spinach fat (SPEER, *et al.*) 27. The unsaponifiable fraction from spinach fat (HEYL, *et al.*) 27. The occurrence of euxanthone in the heart wood of *Platonia insignis* Mart (SPOELSTRA, VAN ROYEN) 10.

## R.—NUTRITION

PHILIP B. HAWK

Comparative study of the value of biological and physical tests of irradiated ergosterol. RENÉ FABRE and HENRI SIMONNET. *Compt. rend.* 188, 424-6(1929); cf. *C. A.* 23, 421.—According to the light treatment to which ergosterol has been submitted the product may consist of a mixt. of vitamin D and ergosterol or of vitamin D and its degradation products, and, while having the same antirachitic action, will have entirely different ultra-violet absorption curves.

DAVID DAVIDSON

The effect of diet upon reproduction. D. MACOMBER. *J. Am. Dietet. Assoc.* 3, 57-67(1927); *Expt. Sta. Record* 58, 691.—M. summarizes briefly the literature on the effect of dietary deficiencies in protein, mineral elements, and vitamins on the reproductive processes, and discusses what should be included in a normal balanced diet from the point of view of reproduction. Such a diet should include meat once a day as a source of animal protein and Fe; sea fish once or twice a week to supplement the meat proteins and to supply I; one egg a day for its protein, fat-sol. vitamins, and Fe; from 2 to 4 glasses of milk daily for protein, Ca, P and vitamins; fresh fruits once a day as a source of vitamin C; liberal amts. of butter for vitamin A; and some whole grain cereals for vitamin B. In addn. there should be liberal amts. of leafy vegetables, some one of which should be eaten raw, and occasionally root vegetables, seeds such as peas and beans, and nuts. Modifications of such a diet for overweight and underweight subjects are discussed.

H. L. D.

Results of vitamin investigation. FREITAG. *Pharm. Ztg.* 74, 317-9(1929).—A

general discussion of the subject in connection with the practical importance of the several vitamins in our food products. W. O. E.

**An experiment in the free-choice feeding of mineral supplements to dairy cattle.** W. B. NEVENS. Ill. Agr. Expt. Sta., *Bull.* 316, 118-24(1928).—No particular craving or desire for mineral supplements other than for common salt was demonstrated in the dairy cattle kept under the conditions of this expt. The cattle were kept in barns and dry lots, under ordinary herd conditions, and were fed rations consisting of well-cured legume hay, corn silage, and a grain mixt. contg. protein feeds rich in P. In addn. common salt, finely ground limestone, and bone meal of feeding grade were supplied free-choice. Almost insignificant amts. of the limestone and bone meal were consumed when offered in this manner. Feeding common salt at the rate of 1% of the grain mixt. is insufficient to satisfy the desires of dairy cattle for this compd. When additional salt was supplied in feed boxes in the exercising yards, larger amts. were consumed. C. R. F.

**Investigations in poultry nutrition.** A. R. LEE. "O. K." *Poultry J.* 18, 70(1929); *Squibb Abstr. Bull.* 2, A-69.—In growing chicks on a ration of yellow corn, meat meal or dried milk and minerals, increasing the cod-liver oil above 2%, the use of yeast, and variation of the proportions of Ca and P in the mineral mixt., did not prevent leg weakness; the pathol. condition was, however, largely prevented by the addn. of 15% of either bran or middlings to the ration, in addn. to the use of cod-liver oil. The value of cod-liver oil in the feeding of young chicks confined to the brooder house was estd. In hens receiving no direct sunlight, much better laying and more healthy birds resulted under the influence of cod-liver oil addn. Sunlight was shown to be vital in hatchability, egg wt. and shell wt. Where it was lacking, cod-liver oil was of material help. C. R. F.

**Effect of fluorine in dairy cattle ration.** GEO. E. TAYLOR. Mich. Agr. Expt. Sta., *Quart. Bull.* 11, 101-4(1929).—In view of the occasional substitution of raw rock phosphate for steamed bone meal as a mineral supplement in the animal ration, expts proved the decided inferiority of the former. Its continued use had a very detrimental effect on the health of dairy animals. In a 20-day feeding test where  $\text{Ca}_3(\text{PO}_4)_2$  constituted 3% of the grain mixt., the appetites were poor, there was a loss in flesh, the coat was rough and the animals were irritable. A 5-yr. feeding test using 1.5% rock phosphate showed similar results. In an attempt to det. the reason for the inimical effect of the raw rock phosphate, the rock was analyzed and found to contain 3% of F.  $\text{CaSiF}_6$  was then fed to animals with results similar to the rock phosphate expts. As little as 0.125% F in the ration was decidedly detrimental to the animals' health. F interfered with the normal development of the teeth of dairy cows. C. R. F.

**Iron in nutrition; a new inorganic factor as a supplement to iron in hemoglobin building.** E. B. HART. Univ. of Wisc. *Wisc. Med. J.* 28, 60(1929); *Squibb Abstr. Bull.* 2, A-163.—Expts. were performed which assign to Cu a definite and sp. role as a supplement to Fe in the synthesis of hemoglobin in the mammal. Profound anemia produced in young rats by a whole milk diet could not be corrected by the daily feeding of 0.5 mg. of Fe administered as the chloride, sulfate, acetate, citrate or phosphate, but when this same level of Fe was obtained from dried liver or the ash of dried liver, corn grain, or lettuce, the hemoglobin titer regained a normal level accompanied by normal growth and restoration to normal vigor.  $\text{CuSO}_4$  was tried as a supplement to pure  $\text{FeCl}_3$  which in a daily dose of 0.5 mg. was potent in conjunction with the Eli Lilly liver prepn. for pernicious anemia or the ash of the latter or lettuce, in correcting the anemia produced in rats. The striking, consistent and thus far always successful results are illustrated by the fact that in an animal with a hemoglobin titer of approx. 2.5 g. of hemoglobin per 100 cc. of blood, the daily addn. of either 0.01 mg., 0.05 mg., 0.10 mg., or 0.25 mg. of Cu as pure  $\text{CuSO}_4$  plus 0.5 mg. of Fe as  $\text{FeCl}_3$  progressively restored the hemoglobin level to normal. The ash of the (Eli Lilly) liver prepn. used in the treatment of pernicious anemia owes its potency in the treatment of 1 type of anemia, when fortified with Fe, to its Cu content as demonstrated by fractionation with  $\text{H}_2\text{S}$  in HCl soln. No evidence of the existence in liver of an indispensable org. factor for hemoglobin building of anemia exists. This same statement is true concerning the ash of lettuce. C. R. F.

**Studies of inorganic salt metabolism. I. The ward routine and methods.** W. BAUER AND J. C. AUB. *J. Am. Dietet. Assoc.* 3, 106-15(1927); *Expt. Sta. Record* 58, 690-1.—A detailed description is given of the routine developed in the Mass. General Hospital for the study of Ca and P metabolism. Two specimen low-Ca diets are given, together with a tabulation of the Ca and P content of all of the foods used. Figures for Ca not hitherto reported are as follows: milk-free bread 0.011, chicken (white meat)

0.016, chicken (dark meat) 0.02, graham crackers 0.025, Uneeda crackers 0.022, gingerale 0.0006 and 0.0005, ham 0.022, lactose 0.0004, liver, 0.006, low-calcium fudge 0.003, steamed potato 0.011, cooked rice 0.006, round lean steak 0.008, canned tomatoes 0.005, turkey 0.008, goose 0.012, cranberries 0.013, Klim 0.996, and Vegex 0.019 per cent. New figures for phosphorus are broiled bacon 0.096, milk-free bread 0.082, chicken (white meat) 0.164, chicken (dark meat) 0.158, graham crackers 0.111, gingerale 0.001, lactose 0.004, liver 0.275, low-calcium fudge 0.008, steamed potato 0.0475, cooked rice 0.075, fat round steak 0.172, lean round steak 0.172, canned tomatoes 0.042, turkey 0.212, and Vegex 1.17%.

H. G.

**Some sources of vitamin C in India.** R. C. WATTS. *Indian Med. Gaz.* **64**, 79-85 (1929).—The results of a group of expts. in which the basal diet was supplemented by "standard" milk prove that 15 g. of vegetable marrow and 10 g. of pumpkin and melon pumpkin are capable of protecting guinea pigs from scurvy. The effect of feeding various materials low in vitamin C content is discussed. Charts are given in which the dietetic value of *Citrus medica var-acida* for guinea pigs is shown to be capable of protecting these animals from the disease discussed. Post-mortem examns. are fully described. This work is most complete.

FREDERICK G. GERMUTH

**Researches on the phosphoamino lipoids and the sterols of blood plasma and serum.** M. A. MACHEBOEUR. *Compt. rend.* **188**, 109-11 (1929).—By a series of pptns. and solns. of blood plasma or serum, with  $(\text{NH}_4)_2\text{SO}_4$  at varying  $p_{\text{H}}$  values, a fraction was obtained whose compn. remained const. on further treatment. This fraction contained 22.7% phosphoamino lipoids, 17.9% cholesterol esters and 59.1% protein. It was sol. in neutral or alk.  $\text{H}_2\text{O}$ . The physico-chem. properties of the substance, which the author considers as a definite *protein-lipoid* complex, differed markedly from the properties of its constituents.

ARTHUR GROLLMAN

**Liver therapy in scurvy.** H. ARON, H. HIRSCH-KAUFFMANN AND E. SCHÄDRICH. *Klin. Wochschr.* **7**, 2484 (1928).—A freshly prepd. liver ext. contains vitamin C and protects guinea pigs against scurvy. The liquid exts. found on the market do not contain vitamin C.

MILTON HANKE

**Antirachitic action of irradiated ergosterol and its effect upon the arteries.** WOLFGANG HEUBNER. *Klin. Wochschr.* **8**, 407-8 (1929).—The fact that excessive doses of irradiated ergosterol may lead to arteriosclerosis seems to be well established. Adam (*Klin. Wochschr.* **7**, 1825-8 (1928)) claims that the toxic action upon the arteries may be due to impurities and that the prepn., Präformin, has no toxic action. Präformin is, however, highly toxic, and large doses—40 mg. per day to large rabbits—are fatal in 9-10 days. The arteriosclerosis is marked. This prepn. has an antirachitic action of only 0.1 that of Vigantol.

MILTON HANKE

**The factor that protects rats against pellagra.** WERNER KOLLATH. *Klin. Wochschr.* **8**, 408-9 (1929).—K. concludes, from expts. on rats, that alk. hematin supplies the P-P factor and thus protects rats against pellagra. The rats die, after 4-6 weeks, with typical symptoms of beriberi.

MILTON HANKE

**The assay of vitamin D preparations by the protection method.** ARTHUR SCHEUNERT AND MARTIN SCHIEBLICH. *Klin. Wochschr.* **8**, 699 (1929).—White rats weighing 35 g. are placed on McCollum's rickets-producing diet. The animals are divided into groups of 10. The diet of each group is augmented with a known amt. of the ergosterol prepn. The dose is graded. Röntgenographic examns. are made after 14 days. Nine or all of the 10 animals receiving no vitamin D must, at this time, show unmistakable signs of scurvy in the knee joints. The protective unit (S E D) is represented by that quantity of the prepn. that will show normal bone development in 8 of the 10 animals of that group. This method is exact and rapid. An assay on 3 commercial preps. is reported. Vigantol is said to be a 1% soln. of irradiated ergosterol. One cc. of Vigantol contains 25,000 S E D. Radiostol and Präformin contain 2000 and 800-1000 S E D, resp., per cc.

MILTON HANKE

**Vitamins in canned foods. VII. Effect of storage on vitamin value of canned spinach.** WALTER H. EDDY, E. F. KORMAN, AND NELLIE HALLIDAY. *Ind. Eng. Chem.* **21**, 347 (1929); cf. *C. A.* **19**, 683.—The quantity of vitamins A and C in spinach stored 3 years was practically the same as that in freshly canned. The 2 factors in vitamin B were not known when the first tests were made, so no comparison of this could be made. Cooked spinach is probably richer in the antipellagric vitamin which is not easily destroyed by heat.

AMY LEVESCONTE

**Superiority of whole wheat bread.** J. F. LYMAN. Ohio State Univ. *Am. Med.* **34**, 794-8 (1928).—Whole wheat is favorable in its action on the elimination of intestinal waste. It promotes the utilization of the protein of the diet, maintains a healthy condition, produces larger adult animals and larger litters of young.

F. K.

The residue, high-caloric diet. GEORGE E. KNAPPENBERGER. Univ. of Kansas. *Am. Med.* 34, 890-5(1928).

FRANCES KRASNOW

The vitamin A, B and C contents of artificially versus naturally ripened tomatoes. MARGARET C. HOUSE, P. MABEL NELSON AND E. S. HABER. Iowa Agr. Expt. Sta. *J. Biol. Chem.* 81, 495-504(1929).—The vitamin A, B and C contents of green and air-, ethylene- and vine-ripened tomatoes were compared. The method of ripening does not alter the vitamin B content of the green fruit. Ripened tomatoes are richer in vitamin A than the green mature fruit irrespective of the method of ripening. Green tomatoes are relatively poor in vitamin C. Vine-ripened tomatoes contain more vitamin C than the artificially ripened fruit which in turn is considerably superior to the green fruit. The com. method of ripening tomatoes in an air-ethylene mixt. produces fruit which is equally as rich in vitamins A, B and C as fruit which has been picked green and ripened in air.

A. P. LOTHROP

The association of vitamin A with greenness in plant tissue. II. The vitamin A content of asparagus. JOHN W. CRIST AND MARIE DYE. Michigan State Coll. *J. Biol. Chem.* 81, 525-32(1929); cf. *C. A.* 21, 2921.—Sufficient vitamin A to promote health and growth in rats is furnished by 0.1 g. daily of green asparagus, whether fresh, freshly cooked or canned. When as much as 0.5 g. of bleached asparagus is fed, the animals died as rapidly as the negative controls. The poor quality of bleached asparagus as food may not be due alone to vitamin A deficiency as cooking in open-kettle fashion effected an improvement in its nutritive value though not rendering it comparable to the green product similarly cooked. Green asparagus contains less H<sub>2</sub>O and Fe than bleached but more ash, N, S, Ca, P and probably Mn. These data support the conclusion that the vitamin A content of plant tissue is associated with its greenness.

A. P. LOTHROP

Amino acid catabolism. II. The fate of  $\beta$ -alanine and  $\epsilon$ -aminocaproic acid in the phlorhizinized dog. RALPH C. CORLEY. Tulane Univ. Med. School. *J. Biol. Chem.* 81, 545-9(1929); cf. *C. A.* 20, 3724.—The  $\omega$ -amino acids,  $\beta$ -alanine and  $\epsilon$ -aminocaproic acid, are not sugar formers in the completely phlorhizinized dog. A. P. L.

The influence of diet on the body fat of the white rat. H. C. ECKSTEIN. Univ. of Michigan Med. School. *J. Biol. Chem.* 81, 613-28(1929).—"Lipids obtained from rats on diets devoid of preformed 'fat' were analyzed and compared with those obtained from animals ingesting fatty substances of known compn. Lipids obtained from animals on a diet consisting almost entirely of protein were similar to those secured from animals on diets contg. the usual amts. of protein, large amts. of carbohydrate, but free from preformed 'fat.' A definite change in the nature of the lipids was obtained as the result of the ingestion of myristic acid, olein and Na butyrate. The butyryl radical was apparently not deposited in the tissues, while the other 2 were. Arachidonic and linoleic acids were always present in the tissues of the rat and while the contents of the total lipids were found to vary considerably with the diets the amt. of more highly unsatd. acids was appreciably altered only by the feeding of olein. The % of cholesterol in the rats was found to be const. and independent of the diets used."

A. P. LOTHROP

Vitamin B terminology. R. ADAMS DUTCHER, et al. *Science* 69, 276(1929); cf. *C. A.* 22, 4155.—The Committee on Vitamin B Nomenclature of the Am. Soc. Biol. Chemists after much correspondence with various investigators decided to make the following recommendations: (1) That the term "bios," as suggested by the British workers, be retained to denote the factor or factors encouraging the rapid growth of yeast cells; (2) that the term "B" be restricted to designate the more heat-labile (antineuritic) factor; (3) that the term "G" be used to denote the more heat-stable water-sol., dietary factor, called the P-P (pellagra-preventive) factor by Goldberger and associates, and which also has to do with maintenance and growth; and (4) that the naming of newly discovered dietary factors, by other than descriptive terms, should be discouraged until their identity is established beyond question. G. H. W. LUCAS

Seasonal variations in basal metabolism. FLORENCE L. GUSTAFSON AND FRANCIS G. BENEDICT. Wellesley College and Carnegie Inst., Washington. *Am. J. Physiol.* 86, 43-58(1928).—Detns. on 20 college women indicate that basal metabolism tends to be at a low level in the winter and to rise to a higher level during spring and summer. In many of the results there was a hint that metabolism is lowered during the menstrual period.

J. F. LYMAN

Factors which determine renal weight. V. The protein intake. HAYON M. MACKAY, LOIS L. MACKAY AND T. ADDIS. Stanford Univ. *Am. J. Physiol.* 86, 459-65(1928).—A linear relationship between renal wt. and protein intake for 70-day-old rats was demonstrated. VI. Influence of age on the relation of renal weight to

the protein intake and the degree of renal hypertrophy produced by high-protein diets. *Ibid* 466-70.—The relation between renal wt. and protein intake was the same for adult as for young rats.

J. F. LYMAN

The nervous system in rats fed on diets deficient in vitamins B<sub>1</sub> and B<sub>2</sub>. RUBY O. STERN AND G. MARSHALL FINDLAY. Lab. of the Imperial Cancer Research Fund, London. *J. Path. Bact.* 32, 63-9(1929).—Rats fed on a diet deficient in both vitamin B<sub>1</sub> and B<sub>2</sub> exhibit only slight chromatolytic changes in the ganglion cells of the cord. If only B<sub>1</sub> is deficient the same changes occur but to a less extent for the same duration of life. In addn., when symptoms of paralysis are of long standing, early degeneration may be found in the myelin of the peripheral nerves when one or both factors are missing. If only B<sub>2</sub> is lacking there is swelling and vacuolization of the anterior horn cells of the cord with deposition in them of lipochrome pigment, a noticeable increase in the surrounding satellite cells, and an increase in the no. of  $\pi$  granules in the peripheral nerves.

JOHN T. MYERS

Utilization of sulfur by animals. T. BRAILSFORD ROBERTSON. Australia Council Sci. Ind. Research, *Bull.* 39, 5-51(1928).—A detailed review of the literature with complete bibliographical references. The article contains an excellent review of the history of cystine and other S-contg. amino acids, and the relation of these S-compds. to the nutrition of sheep, with especial emphasis on the importance of S-contg. amino acids in the growth of wool.

N. M. NAYLOR

Cod-liver oil and the antimony trichloride reaction for vitamin A. PHILIP B. HAWK. *Science* 69, 200(1929).—A preliminary report. Observations initiated in Norway and continued in this country indicate that cod-liver oil exposed to air, etc., shows a deeper blue color with the SbCl<sub>3</sub> reagent than the oil kept in the dark in order to preserve the vitamin A. This together with other observations causes H. to question the validity of the SbCl<sub>3</sub> reaction for this vitamin. The animal assay according to H. is the only accurate method by which cod-liver oil may be assayed for vitamin A.

N. M. NAYLOR

Influence of vitamin A on hypercholesterolemia. HIDEO KIMURA. Univ. Kyoto. *Acta Schol. Med. Univ. Imp. Kyoto* 11, 319 24(1928).—Hypercholesterolemia was produced in rabbits by daily feeding them with an emulsion of 0.5 g. cholesterol in 2.5 g. olive oil for 5 days in addn. to their diet. The return of the cholesterol to the normal level, which in the controls occurred after several weeks, was not accelerated by adding 0.5 cc. of a 1.5% soln. of *bioslerin*, a purified vitamin A prepn., to the standard diet. On the contrary, the hypercholesterolemia persisted in the test animals for a slightly longer period than in the controls. Similarly, an addn. of 10 cc. cod-liver oil to the diet of hypercholesterolemic rabbits failed to influence the content of the blood cholesterol as compared with that of the controls receiving 10 cc. of olive oil in addn. to the diet.

G. SCHWOCH

The absorption spectrum of vitamin D. T. A. WEBSTER AND R. B. BOURDILLON. Nat. Inst. Med. Research, Hempstead. *Nature* 123, 244(1929).—Solns. of ergosterol were irradiated with ultra-violet rays under various conditions and in various solvents and the unchanged ergosterol was removed by means of digitonin. The sp. absorption of these solns. was measured between 2700 and 2900 Å. U. and the antirachitic properties were examd. It was found that the intensity of the sp. absorption ran parallel with the intensity of the antirachitic power. The substance (I) present in the solns. is assumed to be identical with vitamin D. When these solns. were irradiated through a filter of an alc. CoCl<sub>2</sub> soln. in order to exclude wave lengths below 2600 Å. U. they yielded solns. showing only slight absorption at 2700-2900 Å. U., but strong absorption at 2400 Å. U.; the substance (II) contained in them had no antirachitic properties. W. and B. believe they have confirmed their theory (*C. A.* 23, 616) that by ultra-violet radiation of ergosterol 3 substances are formed in succession, namely, I, II and the final product, which has no antirachitic activity and only a very slight absorption.

G. SCHWOCH

A case of cystinuria and studies of the influence of diet on the cystinuria and on the sulfur metabolism in this case. HIROTADA MISAWA. Univ. Tokyo. *Japan. J. Med. Sci.* 1, 193-202(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 659.—The case reported was the first one observed in Japan and was studied in 4 periods on different diets. In the first 4-day period the patient received ordinary food, the total N was 6.91-9.65 g., cystine (Gaskell method) 275-330 mg. which corresponds to 8.3-10.6% of the total S or 15-25% of the neutral S. In a 5-day period in which a rice-vegetable diet was given, the total N was 6.95-7.88 g., cystine 40 mg. which is equal to 1.5% of the total S or 2% of the neutral S. In a 3-day period on rice and meat the total N was 7.99-8.45 g., cystine 298 mg. equal to 9.5% of the total S and 21% of the neutral S.

In a 3-day period on ordinary diet the total N was 6.38–9.60 g., cystine 245–291 mg. The largest part of the eliminated cystine in this case was of an exogenous nature. Tyrosine and leucine could not be detected in the urine. The mineral content of the blood was normal except that the K content was a little higher (26–26.5–27.1%); similarly the globulin content of the serum (51.5–54.2% of the total protein). R. C. WILLSON

The composition of spinach fat (SPREER, *et al.*) 27. The unsaponifiable fraction from spinach fat (HEYL, *et al.*) 27. Mn in cereals and cereal mill products (DAVIDSON) 12.

**A hormone of the thyroid regulating cerebral excitability.** (Mlle.) G. FUCHS, J. RÉGNIER, D. SANTENOISE AND P. VARE. *Compt. rend.* 188, 419–21(1929).—Extn. of the swollen thyroid glands of dogs "vagotonique ou vagotonisés d'escrine" yields an active substance which, injected into the skull of an anesthetized dog, rapidly causes a lowering of the "chronaxie" of the center of extension of the left anterior paw. No success was had in the extn. of the principle active on the "chronaxie" of the psychomotor centers.

DAVID DAVIDSON

**Bile-pigment formation.** F. ROSENTHAL AND H. LICHT. *Klin. Wochschr.* 6, 2076–81(1927); *Physiol. Abstracts* 13, 242.—The evidence concerning the site of formation of bilirubin is discussed and expts. are described on the formation of bilirubin in dogs after the intravenous injection of hemoglobin soln. If the dog liver be removed, the amt. of bilirubin formed may only be  $\frac{1}{5}$  of the amt. formed in dogs with liver in tact but bile ducts ligatured. The authors conclude that 20 to 33% only of the total bile pigment formed in the intact animal is produced outside the liver. It is also suggested that tolylenediamine and phenylhydrazine poisoning do not give rise to bilirubin production in dogs after hepatectomy, because the destruction of blood corpuscles pursues a course different from that produced by simple laking of blood *in vitro*.

H. L. D.

**Parathyroid hormone and calcium metabolism.** G. HERXHEIMER. *Klin. Wochschr.* 6, 2268–71(1927); *Physiol. Abstracts* 13, 254.—The rate of change of blood Ca following hypodermic injection of parathyroid hormone (prepd. by Collip's method) was followed in cats, dogs and rabbits. In cats the Ca increases to a max. within 10 mins. of the injection, and thereafter falls to normal within about 5 hrs. In dogs the blood Ca rises slowly during the course of several hrs. and then falls, but it may take 2 days to return to the normal level. In rabbits the max. is reached within an hr. and the normal value is again found after 24 hrs. These differences in behavior between cats, dogs and rabbits were observed when solns. of  $CaCl_2$  were injected hypodermically. Collip's results on the ineffectiveness of parathyroid hormone in reducing the toxicity of dimethylguanidine were confirmed.

H. L. D.

**The iron content of the albino rat at different stages of the life cycle.** C. V. SMYTHE AND R. C. MILLER. Penn State College. *J. Nutrition* 1, 209–16(1929).—The av.

Fe content of rats at birth is 0.0055%. A decrease to 0.0026% occurs during the suckling period. A pronounced increase, to 0.0045%, takes place between the ages of 20 and 40 days, after which only slight variations occur. This increase in Fe content apparently results from the taking of solid food. The abs. amt. of Fe present increases very slowly during the suckling period, but more rapidly thereafter, and at a rate closely proportional to the increase in body wt. The Fe content of females is depleted through the growth of the litter during pregnancy; but the analysis of a single individual after the weaning of the young indicates that the Fe content of the female returns to the normal during lactation. C. R. F.

**The female (sex) hormone.** E. LAQUEUR. *Med. Soc. Kiel. Rept. of Meeting*, Dec., 1928; *Squibb Abst. Bull.* 2, A-201; cf. *C. A.* 23, 424.—The biological activity of *menformone*, which is up to the present moment the purest prepn. of female hormone, may be said to consist in its action on the rut and on growth. According to the latest reports, the effect of the hormone in developing the mammary gland and its function may be accepted as valid. It is possible that the prevention of milk secretion in humans and animals or the continuation of stimulation of milk production may depend upon the use of hormone substance during pregnancy. With respect to metabolism, *menformone* is of possible therapeutic value in the female, especially climatic obesity; as for antilimatic influence, that concerns only the testes. Therapeutic interest in the use of *menformone* in prostatic hypertrophy has waned, but its use for temporary sterilization is still disputable. Not only is the action of *menformone* specific in a definite system, but its origin, etc., in definite tissues is unquestionable. Information was imparted from as yet unpublished investigations on the storage of *menformone*. C. R. F.

**Dependence of vagus tonus upon the concentration of adrenaline in the blood.** G. VIALE. *Klin. Wochschr.* 8, 73-4(1929).—Severance of both vagi in dogs that have been adrenalectomized either has no effect upon the heart rate or depresses it. The same is true of normal animals in which the vagi have been cut after the animals have been treated with a quantity of ergotoxine or ergotamine sufficient to overcome the action of the ever-present adrenaline. Severance of the vagi in normal dogs leads to a marked increase in heart rate. This can be depressed by injecting ergotoxine or ergotamine. MILTON HANKE

**Decomposition of stercobilin in vitro.** D. SCHRIJVER. *Klin. Wochschr.* 8, 312-3(1929).—Stereobilin (urobilin) disappears rapidly from undiluted feces. Diln. of feces with 2 or more parts of water markedly decreases the rate of destruction. The decompn. occurs even under strictly anaerobic conditions, but is most rapid in the presence of O. MILTON HANKE

**The significance of the kidney for the acid-base equilibrium of the organism.** FRITZ MAINZER. *Städt. Krankenhaus, Altona. Naturwissenschaften* 17, 196-8(1929).—A short review. B. J. C. VANDERHOEFEN

**The potassium-calcium quotient in normal pregnancy.** R. SPIEGLER AND W. SCHOL. *Arch. Gynäkol.* 135, 461-6(1929).—In pregnancy there is a slight decrease in the Ca content of the blood while the K content is increased, particularly in the second half of pregnancy. The quotient K:Ca, however, shows no great change. While there is a slight decrease in Ca and increase in K in pregnancy, they both remain within physiologic limits. HARRIET F. HOLMES

**The biochemistry of ovarian lipids.** O. FLÖSSNER. *Arch. Gynäkol.* 135, 474-7(1929).—The analysis of 1000 swine ovaries proved choline to be the N-containing base in the ovarian lipids. Other bases are present in traces only. HARRIET F. HOLMES

**The "hormone" of spontaneous contractions of the uterus.** I. VÖGEL AND N. MARGOLINA. *Arch. Gynäkol.* 135, 478-84(1929).—An isolated horn of rabbit uterus suspended in Ringer-Locke solution with free access of air or O<sub>2</sub> after 10-12 mins. of normal rhythmic contractions begins to give stronger and more frequent contractions, at times approaching tetany. Replacement of the soln. by fresh Ringer-Locke soln. brings back the rhythmic contractions. Rabbit uterus in constantly flowing Ringer-Locke soln. will continue in rhythmic contraction for hrs. Ringer-Locke soln. in which rabbit uterus has been actively contracting for 2 or 3 hrs. stimulates the contraction of an isolated piece of uterus. This Ringer-Locke soln. in which the uterus has been contracting has no individual specificity in the nature of a hormone produced by the uterus but chemical analysis indicates there is a decrease in alk. reaction, a decrease in glucose content and an increase in Ca content. HARRIET F. HOLMES

**Histochemical evidence concerning the site of the formation of bile pigment.** P. CORR. *Arch. Path.* 7, 84-100(1929).—A study of the literature and the material from 71 autopsies, with use of the ferrocyanide reaction to differentiate catabolic products of hemoglobin giving the reaction of Fe from bilirubin, which does not contain Fe,

was undertaken in an attempt to throw additional light on the site of the formation of the biliary pigment. The histochem. evidence pointed to the probability that the reticulo-endothelial cells, particularly those of the spleen and the bone marrow, with the Kupffer cells and the large wandering phagocytes being the chief cell reserve, break down the hemoglobin into bilirubin and transfer it to the hepatic cells, where it is excreted into the biliary canaliculi. It could not be said with certainty that catabolism of the pigment does not take place to some small degree in the hepatic cells. The hepatic cells have a definite threshold for hemosiderin as well as for bilirubin, and for both of these substances the threshold is lower than that of the kidney. This occurrence of the bilirubin and the hemosiderin in the same hepatic cell is an overlapping dependent on a concomitant hyperactivity of hemoglobin catabolism with the consequent storage of hemosiderin in the liver and on an interference with the excretion of the biliary pigment from the hepatic cells.

The influence of thyroid extracts on the sexual maturity of the albino rat (*Epimys norvegicus* Erxl). F. DULZETTO. *Boll. soc. ital. biol. sper.* 3, 941-5(1928).—Female rats, 25-30 g. wt., received daily an injection of 0.4 cc. of thyroid ext. until the animals reached sexual maturity. Control animals reached sexual maturity in 44.73 days on an av.; those receiving thyroid ext. reached it in 48 days.

PETER MASUCCI

The action of thyroid extracts on the somatic growth of the albino rat. F. DULZETTO. *Boll. soc. ital. biol. sper.* 3, 945-8(1928).—Female rats 20-25 days old were injected daily with 0.4 cc. thyroid ext. until the vaginal membrane disrupted. The animals were fed with milk, bread, meat and greens. The wt. of each rat was taken before and after the treatment. The av. increase in wt. of the control rats was 65.18 mg. per g., and that of the treated ones was 66.77 mg. per g. No toxic symptoms were noted.

PETER MASUCCI

Acetaldehyde formation from pyruvic acid in the autolysis of red and white muscles. A. UTEVSKI. *Ukraina Biochem. Inst., Charkow. Biochem. Z.* 204, 81-7(1929).—In white muscles of rabbits, chickens and roosters much smaller quantities of AcH (about 1 mg. per 100 g. tissue) are formed than in red muscles. The white muscles cannot transform Na pyruvate into acetaldehyde. On the contrary the red muscles of these animals as well as the breast muscles of pigeons possess this ability.

S. M

Studies on the blood-sugar regulation in mammals. I. The influence of cold and fasting on the blood sugar. BRUNO KISCH, A. SIMONS AND P. WEYL. *Univ. Köln a. Rh. Biochem. Z.* 204, 179-91(1929).—Prolonged exposure to a temp. of about 0° for many hrs. or even days had no effect on the blood-sugar concn. in dogs or rabbits, when these animals are enjoying freedom. Confined in a cold box, dogs show an initial rise in blood sugar of 10-30% followed by a fall below normal. In rabbits fasting about 15 hrs. under similar exptl. conditions there was found only a diminution in the blood sugar, but in rabbits placed in the cold box immediately after feeding a primary hyperglucemia was likewise noticed. In the fed rabbits the blood-sugar curve follows an irregular course so that even the primary hyperglucemia can hardly be attributed to the influence of the cold. In all animals the blood sugar increased to the normal level in a very short time as soon as they were put in the warm (23-26°) again. Fasting (without or with water) even at the end of 10½ days causes only a slight fall in the blood-sugar concn. which, however, occurs already at the end of 24-48 hrs. of fasting and does not after much later.

S. MORGULIS

The physiology of the surviving mammalian heart. V. Sugar consumption of the surviving heart of normal cats. GEORG AMBRUS. *Königl. ungar. Univ., Budapest. Biochem. Z.* 204, 467-73(1929); cf. *C. A.* 22, 4633.—Small hearts utilize relatively much more sugar than large hearts.

S. MORGULIS

Metabolism of frog retina at different temperatures and the Meyerhof quotient at different temperatures. F. KUROWITZ. *Kaiser Wilhelm-Inst. für Biologie, Berlin-Dahlem. Biochem. Z.* 204, 475-8(1929).—Between 15° and 35° respiration and anaerobic glucolysis both increase, but the aerobic glucolysis is well within that temp. range. With further rise in temp. the respiration falls, and then very suddenly glucolysis under aerobic conditions appears and at 40° attains the same degree as the anaerobic glucolysis. Meyerhof's quotient which measures the effect of respiration on fermentation rises considerably with increase in temp. within the non-injurious range, but this is not peculiar to the retina as it is found also in yeast cells.

S. MORGULIS

**The effect of thyroxine on the metabolism of surviving tissues.** K. J. ANSELMINO, O. EICHLER AND H. SCHLOSSMANN. Med. Akad. Düsseldorf. *Biochem. Z.* 205, 481-8 (1929).—One to 7 days after an injection of thyroxine, liver, spleen and kidney tissues show no increase or only a very slight increase in respiration measured by the Warburg method. The anaerobic glucolysis of the kidney increases the more the higher the metabolism of the whole organism is raised by the thyroxine, while the anaerobic glucolysis of the liver and spleen is not affected. It is suggested that the thyroid hormone acts primarily on the anaerobic phase of the metabolism.

S. MORGULIS

**The glycogen and bile formation in the liver.** ERIK FORSGREN. Karolinsches Inst., Stockholm. *Skand. Arch. Physiol.* 55, 144-61 (1929); cf. *C. A.* 22, 2780.—In a number of rabbits on an unrestricted diet of hay, oats and water, the glycogen content of the liver was studied simultaneously with its histological changes. The liver of a normal rabbit contains 3.75 glycogen per kg. of body wt., so that a rabbit of medium size (2.25 kg.) contains on the av. 8.3 g. liver glycogen, but the variations are really very large (0.9 to 8.6 g. per kg. body wt. or 1.3 to 13.1% of the liver wt.). Both the glycogen content and glycogen % undergo regular changes in the course of the 24 hrs. with 2 maxima, at night and in the day, and with 2 minima, in the morning and in the evening. The liver wt. varies parallel to the glycogen content, increasing approx. 1% for every extra 4-5 g. glycogen. These regular variations in both the amt. and % of liver glycogen cannot be attributed entirely to the state of nutrition or to muscle work; they are due to rhythmic changes in the function of the liver, which is alternately assimilatory or dissimulatory. During the assimilatory phase of the liver activity glycogen is deposited probably together with H<sub>2</sub>O and protein and the wt. of the liver may be almost doubled. During the dissimulatory phase bile products and possibly also urea and other catabolic products appear; at the same time the glycogen content diminishes and the liver wt. decreases. The liver activity is detd. by its own rhythm and by its relation to other organs.

S. MORGULIS

**Studies on the behavior of potassium in the organism. I. The potassium and calcium contents of various organs.** MOGENS NORN. Univ. Copenhagen. *Skand. Arch. Physiol.* 55, 162-83 (1929).—The K content of the heart per 100 g. fresh substance is lower than that of skeletal muscle, whereas the reverse is true for the Na. This manifests itself in the K/Na ratio, which in all organisms studied is much lower for the heart than for the skeletal muscle. Per 100 g. by substance the following av. values can be calcd.:

	Rabbit	Pig	Horse	Goat	Man	Dog	Cow
Heart { K	1.195	1.57	1.44	1.49	1.39	1.38	1.35
Na	0.585	0.45	0.34	0.57	0.52	0.49	0.45
Muscle { K	1.595	1.65	1.50	1.83	1.58	1.45	1.66
Na	0.175	0.19	0.22	0.30	0.29	0.28	0.36

In the organs of the same species, however, the individual variations in the K content are not very large. Thus in the rabbit heart the K per 100 g. dry substance varied from 1.14 to 1.47 and in the skeletal muscles from 1.33 to 1.66 g. The variations in various species were from 1.14 g. in the rabbit to 1.57 g. in the pig for the heart K or from 0.34 g. in the horse to 0.65 g. in the rabbit for the heart Na, while for the skeletal muscles the variations were from 1.33 g. in the dog to 1.83 g. in the goat for the K and from 0.17 g. in the rabbit to 0.36 g. in the cow for the Na content per 100 g. dry tissue. The K content of the heart is thus below that of the skeletal muscles, while the Na content is higher. The av. K/N in the heart is 3.0 and in skeletal muscles 6.6. K and Na are not principally components of the liquid portion of the muscles. In the kidneys the Na content unlike that of the muscles is relatively large. Furthermore under experimentally induced excretion of Na and K salts these elements are found in the kidney cells in increased amts. II. Variations in the potassium, sodium and chloride excretion through the kidneys in the course of the day. *Ibid* 55, 184-210.—These expts. the author performed chiefly on himself. The hourly K, Na and Cl elimination through the kidney is not dependent principally upon the amt. of these elements ingested but is lower during the night than during the day, and when the person sleeps in the daytime and works at night the condition is reversed. By dividing the 24 hrs. into 8 three-hour periods, all similar to each other so far as eating and drinking are concerned, and spending 3 periods sleeping in bed and the rest of the time being occupied with the ordinary activities, the following rhythmicity was observed in the course of the 24 hrs.: During the middle night period (3 to 6 hrs.) the excretion of K, Na and Cl is lowest but rises during the last night period (6 to 9 hrs.) and especially the first waking period, reaching the max. value in the second day period (12 to 3) and then

declines gradually so that in the last waking period (9-12 hrs.) it is not much greater than during the first sleep period (12-3). This rhythm depends upon the degree of activity or inactivity. Narcosis seems to have the same effect in man, though not in the rabbit. The night changes are not occasioned either by position or by diminished diuresis. Yet, the changes in the excretion of K, Na and Cl are not apparently due to alterations in muscle activity, since even intense muscle work has no effect on this. The same rhythmicity is observed in a state of inanition and is therefore not associated with changes in absorption of mineral substances. Obviously these changes cannot be due to depression of kidney function during sleep, because the excretion of Ca is the same during the sleeping or waking hrs., while that of Mg is actually greater during sleep. Furthermore, the K concn. of plasma is the same during these nocturnal and diurnal alterations in elimination. III. The variations in the potassium concentration of the plasma following administration of potassium salts and in different types of diuresis and their relation to the potassium excretion in the urine. *Ibid* 211-29.—In expts. on rabbits it was found that oral administration of 2-2.5 g. KCl causes a very appreciable increase, even of more than 100%, in the plasma K within a few hrs. These results were further corroborated in expts. by the author upon himself who took 12 g. KCl in the morning and had no food all through the expt. This caused a quick rise in plasma K, which reached a max. in about 2.5 hrs., returning to normal after 6.5 hrs. In the meantime the Na concn. was practically unaffected. In the urine there was a greatly increased excretion of K but the Na excretion was likewise considerably greater. The max. K excretion coincided with the time when the plasma K has reached its highest value. The ingestion of K salts (or K-rich foods) in more or less large measure causes always an increase in the plasma K concn., which leads to an increased elimination of K through the urine. There is, however, at the same time a definite diuresis and also considerable increase in the Na excretion. The large variations in K excretion during the day and night are not correlated to any changes in the plasma K, and it is, therefore, questionable if there is any const. relationship between the plasma K concn. and urinary K excretion. At any rate, expts. with theophyllin show that a very great excretion of K may actually be accompanied by a fall in the plasma K concn. Likewise, in expts. on water diuresis there is no connection between the degree of the diuresis and the amt. of K excreted in the urine or the changes in the plasma K concn.

S. MORGELIS

**Reaction of human bile and its relation to gall-stone formation.** JOHN G. REINHOLD AND L. KRAAER FERGUSON. Univ. of Pennsylvania. *J. Exptl. Med.* **49**, 681-94 (1929).—The human gall bladder acidifies the bile. In this respect its action is similar to that of the gall bladders of lower animals, previously described by other workers. The H-ion concn. of gall bladder bile is increased considerably in cases of obstruction of the common or cystic ducts. The highest values were found following complete obstruction. The occurrence of gall-stones was not associated with a consistent change in the H-ion concn. of the gall-bladder bile.

C. J. WEST

**Determination of the "acetone bodies" in the blood of pregnant and non-pregnant cows.** ANTON CHRISTALON. Tierärztl. Hochschule, Wien. *Arch. wiss. prakt. Tierheilk.* **57**, 507-13 (1928); *Ber. ges. Physiol. exptl. Pharmakol.* **46**, 700. —It has been reported by other authors that the "acetone body" content of the human blood increases during pregnancy. The values lie between 2.16 and 10.4 mg. per 100 cc. blood, while in non-pregnant women they vary between 1.77 and 4.47 mg. Similar increases were recorded in pregnant cows; in a series of 27 pregnant cows the acetone body values were 5.35-9.75 mg./ (av. 7.45 mg.), while the non-pregnant values were 5.20-7.25 mg. (av. 6.27 mg.). The increases are irregular. There is no relation between the duration of the pregnancy and the increase. The detns. were made according to Engeld's method: blood is treated with K oxalate, deproteinized with Na tungstate, acidified with  $\frac{1}{2}$  N H<sub>2</sub>SO<sub>4</sub>, filtered, the filtrate treated with dichromate-H<sub>2</sub>SO<sub>4</sub>, and the acetone sepd. with suction filtration. It is absorbed in 0.01 N I soln. and alkali, the unused I being titrated back with 0.01 N thiosulfate soln.

R. C. WILLSON

**The influence of the sexual glands on the oxidases in the organs. I. The effect of the testicles.** T. YASUDA. Imp. Univ., Kyoto. *Folia endocrinol. japon.* **3**, 1412-77 (1928); *Ber. ges. Physiol. exptl. Pharmakol.* **45**, 686.—If male rabbits which have reached puberty are castrated there appears within 2-3 months thereafter a definite reduction in the amt. of oxidase in the heart and kidneys. In normal growing male rabbits daily feeding of testicular powder produces a slight general increase in the oxidase. Vasoligation causes a remarkable increase in the oxidase within 2-3 months. Intravenous injections into normal rabbits of ext. from the testicles of normal rabbits effect a slight increase in the cardiac oxidase. If the ext. is from a vasoligated testicle, the

increase is general and very extensive. Y. concludes that the oxidase increase observed after vasoligation is not an effect of the absorption of the semen elements, but is due to an increased activity of the intermediate cells. The intermediate glands appear to play a certain role in intracellular oxidation.

R. C. WILLSON

**Experimental studies of the production of choline from the suprarenal capsule.** SHIRO ONO. Univ. Fukuoka. *Fukuoka-Ikwadaigaku-Zasshi* 20, 1187-1212(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 247.—Studies of rabbits showed that the blood in the veins of the suprarenal capsule had a higher choline content than the blood of any other abdominal organ. That the formation of choline is regulated by the nervous system is shown by the fact that stimulation of the vagus nerve or an injection of pilocarpine causes an increase of the choline, while resection of the vagus causes a decrease in the formation of choline. After the injection of larger amts. of atropine, smaller amts. of choline are formed, while smaller amts. of atropine increase the formation of choline. Stimulation of the splanchnic nerve or adrenaline injections have no effect on the formation of choline. A mono- or bi-lateral extirpation of the suprarenal capsule decreases the choline content of the serum.

R. C. WILLSON

**Salts and blood sugar.** H. MASAMUNE. Univ. Fukuoka. *Fukuoka-Ikwadaigaku-Zasshi* 20, 1437-1522(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 89.—The action of cations and anions on the blood sugar was studied. Na salts have no effect. K salts: acetate, chloride and sulfate have no effect; phosphate causes a decided hyperglucemia. Mg salts all produced a hyperglucemia, which was readily decreased by splanchnicotomy. Ca salts produced a slight centrally limited hyperglucemia. Simultaneous studies of the alkali reserve showed that  $\text{NH}_4\text{Cl}$  produced an acidosis while Mg salts caused an alkalosis. An antagonism between Ca and Mg salts as regards the regulation of the blood sugar could not be detected.

R. C. WILLSON

**Experimental studies of the influence of blocking of the reticulo-endothelial system on the tissue respiration and the glucolysis of the liver and spleen.** YOSHICHI OKAMOTO, FUJIRO AMAKO AND HARUYOSHI IWASAWA. Univ. Tokyo. *Japan. J. Med. Sci.* 1, 413-24(1927). *Ber. ges. Physiol. exptl. Pharmacol.* 46, 184.—Blocking of the reticulo endothelial system with Indian ink has very different effects in the dog and the rabbit. This procedure on the dog weakens the liver, especially the oxidizing phase in the sugar metabolism, while the anaerobic phase remains undisturbed. This inhibition of the oxidizing phase can be relieved by insulin. The rabbit liver, on the other hand, shows an original increase in the oxidizing phase and later a reduction. The spleen remains unchanged at first and shows a decrease in the oxidizing phase only with an increased frequency of injections.

R. C. WILLSON

**The relations of the pituitary gland to the carbohydrate metabolism.** A. PICKAT. Komm. Akad., Moscow. *Med.-biol. zhurnal* 3, 40-62(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 777(1928). Extirpation of the pituitary is regularly followed by a hypoglucemia which continues for months, returning to normal only very slowly. After subcutaneous injections of an ext. of the posterior lobe of the pituitary there results in both normal and hypophysectomized dogs a temporary increase in this blood factor; this is more pronounced in the dogs deprived of the pituitary. The same effect is produced by the injury of the tuber cinereum. Glucosuria is observed only for 1-3 days after extirpation of the pituitary; P. assumes that this is due to the narcosis and the stimulation of the base of the brain. This assumption is supported by the fact that puncture of the tuber cinereum results in a prolonged glucosuria. Carbohydrate tolerance is decidedly increased in the first months after extirpation of the pituitary; later it returns to normal. The regulation of the retention of sugar is probably a function not of the pituitary but of the tuber cinereum. It is concluded that the pituitary secretion exerts a stimulating action on the sugar metabolism and its deficiency checks the sugar metabolism on account of a disorder of the hormonal equilibrium in the organism.

R. C. WILLSON

**The action of bile and the bile acids on the serum lipase.** A. BACULO AND E. LANTIRIA. *Riv. patol. sper.* 3, 52-60(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 688.—If dog or ox bile is added to dog serum, *in vitro*, its lipolytic action is inhibited. In moderate concn. it neutralizes the inhibiting action of quinine. Similar action follows the intravenous injection *in vivo*. The bile of the dog is much more active than that of the ox. If solns. of Na glycocholate or Na taurocholate are introduced into the circulation, these act the same on the serum lipase as does bile, in that they neutralize quinine. Na taurocholate is much more active than Na glycocholate which shows why the bile of the dog which is rich in taurocholic acid is more active than ox bile in which glycocholic acid predominates.

R. C. WILLSON

**The carbon dioxide tension in the blood, acidosis and their connection with the**

metabolism during pregnancy. H. R. SCHMIDT. Univ. Bonn. *Zentr. Gynäkol.* 52, 346-50(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 121.—Using the Barcroft method as modified by Verzar, S. detected a reduction in the  $\text{CO}_2$ -combining power during pregnancy, amounting to  $1/8$  to  $1/6$ , produced by the acid products of metabolism. Thus there is an acetoneemia that can be traced only to a shifting in the intermediary metabolism. In pregnancy carbohydrates are used more extensively and the liver is low in carbohydrates. There is an augmented fat migration into the liver, where the fat can be transformed into carbohydrate. To this end a certain amt. of glycogen is necessary and lacking this the synthesis is incomplete and the intermediate products, even the ketone bodies, enter the blood and seize a part of the alkali. Thus S. argues that the diet in pregnancy should consist of protein, a little fat and high carbohydrates.

## G—PATHOLOGY

H. GIDEON WELLS

**Nephrosis in children.** GLADYS L. BOYD. *Can. Med. Assoc. J.* 19, 555-8(1928).—Examn. of a no. of cases emphasizes the following points: albuminuria, absence of gross hematuria, presence in urine of large nos. of casts and frequently white blood cells and of a doubly refractile body, low blood protein with altered albumin-globulin ratio, lowered surface tension with more or less lipemia, especially cholesterolemia. The concn. test is the only functional test which gives any reliable aid to prognosis.

A. T. CAMERON

Some properties of serum albumin—its crystallization in the absence of all elementary ionogens. MAURICE PIETRE. *Compt. rend.* 188, 463 5(1929).—Serum globulin is sepd. from the whole protein by neutralization of the  $\text{Na}_2\text{CO}_3$  entrained therein with HCl. The remaining serum albumin is then given at least 4 acetone pptns. A 3.5% soln. is then evapd. in a vacuum over  $\text{H}_2\text{SO}_4$ , leaving a gummy mass which, when cooled to  $0^\circ$  and given a sudden blow, crystallizes explosively in long microscopic prisms, decompn.  $225-30^\circ$ . The purified protein is rapidly absorbed in horses and causes no anaphylaxis.

DAVID DAVIDSON

**Subacidity and duodenal ulcer.** GIANNINI GIOVANNI. Med. Univ.-klinik in Wien. *Wiener klin. Wochschr.* 42, 102-3(1929).—In 35 cases of duodenal ulcer, 8 at least occasionally showed subacidity. Subacidity therefore does not include the possibility of duodenal ulcer.

D. B. DILL

**Ammonia of normal and pathological human blood.** MARCEL LABRÉ, F. NEPVEUX AND HEJDA. *Compt. rend.* 188, 738-40(1929).—The Parnas and Heller method for the detn. of blood  $\text{NH}_3$  is shown to have an error of 1.5%. Normal blood contains an av. of 0.047 mg. per 100 cc. and this value is not increased in cirrhosis of the liver, icterus or diabetic acidosis. In pulmonary tuberculosis, blood  $\text{NH}_3$  was found to average 0.109 mg. per 100 cc. in mild cases and 0.305 mg. in severe cases. No explanation is given for this last high value, but it is probably not due to a disturbance of the acid-base balance since there is no change in  $\text{NH}_3$  content of the blood in the most severe cases of acidosis. The authors believe that the source of the blood  $\text{NH}_3$  is in some unknown nitrogenous compd. rather than in urea or amino acids, as is the general belief.

H. G. SMITH

**The colon bacillus in pernicious anemia.** A. ENGEL AND G. OLIN. *Klin. Wochschr.* 8, 552-3(1929); *Acta Med. Scand.* 70, 150-66(1929).—The serums of normal persons will seldom (6%) agglutinate colon bacilli. The serums of patients with achylia gastrica are more frequently (17%) and with pernicious anemia still more frequently (55%) agglutinating. Patients with achylia gastrica or pernicious anemia usually have colon bacilli in the stomach.

MILTON HANKE

**Protein metabolism in cystinuria.** WM. ROBSON. Dep't. Therapeutics, Univ. Edinburgh. *Biochem. J.* 23, 138-48(1929).—Neither tyrosine and leucine nor putrescine and cadaverine could be found in the urine of the patient under observation. Giving  $\text{NaHCO}_3$  (but not  $\text{Na}_2\text{HPO}_4$ ) to the cystinuric is accompanied by a disturbance in the S fractions of the urine.

BENJAMIN HARROW

**Antigen structure and specificity.** J. J. VAN LOGHEM. *Verslag. Akad. Wetenschappen Amsterdam* 37, 898-906(1928).—Bacteria have a complex antigen structure. Some components conform to the genus, while others have a sp. character. Genus antigens can predominate to such an extent that a serological test for differentiation with the species fails. There are also differences in antigen structure in members of

the same species, which can be called intraspecific differences. They are quite common and can even be found in very homogeneous kinds like the *B. typhosus*; in other kinds they show themselves in the form of serological types (*B. pneumococcus*, *B. meningococcus*, *B. tetanus*, etc.). Further can be distinguished the adaptive and regressive tendencies of the intra-clonal changes of the antigen structure. The former are physiologic reactions of individuality to normal excitations, of which the different atoxic *B. dysenteriae* and *B. coli* are examples. The regressive changes are pathological manifestations caused by abnormal excitations from outside. Numerous changes in cellular form, kind of growth, biochem. function, antigen structure, etc., lately referred to as mutation, "dauer-modifikation" and "dissociation," are better to be understood as degeneration or atrophy of mishandled individualities.

J. C. JURRIJENS

**Serum and hemoglobin precipitin reaction in blood investigation for forensic purposes.** K. FUJIWARA. Inst. Med. Fakultät zu Niigata, Japan. *Deut. Z. ges. gericht. Med.* 11, 253-63(1928).—The hemoglobin precipitin reaction may be used instead of the serum precipitin reaction when proper precautions are used. FRANCES KRASNOW

**"Filterable viruses."** A review. J. JACKSON CLARKE. *J. Trop. Med.* 31, 254-7 (1928); cf. C. A. 4621.

FRANCES KRASNOW

**Comparative study on the production of hemolysin through the injection of red blood corpuscles into the normal and pathologic tissues. I. Comparison of the production of hemolysin through the injection of red blood corpuscles into the normal and tumor tissues.** RET'SU TOYOSHIMA. *Sei-I-Kwai Med. J.* 47, No. 9, Eng. Abs. 5-6 (1928).—Sarcoma tissue was transplanted subcutaneously into rabbits which were then injected with red cells from goats' blood. The extent of formation of hemolysin was roughly measured. There was no marked difference between the amt. of hemolysin of normal and of sarcomatous rabbits.

W. D. LANGLEY

**Excretion and absorption of pigments.** IWAO MATSUO. *Acta Schol. Med. Univ. Imp. Kioto* 10, 385-453(1928).—A report on the work of the past 5 years carried out by 25 research workers on the excretion and absorption of some 300 pigments. The toxicity, ionization, diffusibility and adsorption of these pigments together with their soly. in lipoids have been carefully followed. Full details of the operative technic employed are given and the clinical aspect of the use of pigments in diagnosis of disease is discussed. Exception is taken to Rosenthal's expt. on the increased excretion of methylene blue by the liver in pathol. conditions; it is shown in this work that excretion is hindered in an organ during inflammation or degeneration and that the methylene blue in Rosenthal's expt. was excreted by the stomach and not the liver. The *absorption of pigments* is less applicable in clinical practice than the *excretion of pigments* with few exceptions.

G. H. W. LUCAS

**The gaseous exchange of tissues in inflammation.** MARIO GIANOTTI. *Arch. sci. biol.* 13, 73-95(1929).—In order to study the local changes produced by an inflammatory stimulus, the ear of the rabbit was selected as a suitable organ; the normal ear of the same rabbit served as a control. Barcroft's method was used for studying the gaseous exchange; detns. were made for the amt. of gases in the arterial and venous blood, the vol. per min. carried by the vascular area, and the wt. of the organ. Inflammation was produced by applying heat according to Samuel's technic; the ear was immersed for 5 mins. in water heated to 50°. The results are given in tabular form and include the gaseous exchange of the normal unheated ear. The data are expressed as O<sub>2</sub> consumed per min. per 100 g. of organ, the ratio CO<sub>2</sub>/O<sub>2</sub>, and the time in hrs. elapsed since the application of heat to the ear. Conclusions: (1) there is a large increase in O<sub>2</sub> consumed in an organ which is influenced as a result of a burn; (2) this increase compared to the unit of wt. of the normal ear reaches its max. during the first 8 hrs. (740 mm. O<sub>2</sub> per min. per 100 g.) and then drops, following closely a hyperbolic curve, until the value becomes const. (166 mm. O<sub>2</sub>) 72 hrs. after the beginning of the inflammation; (3) the cause of the increased exchange is due either to an increased metabolism of the tissues of the organ, or, to oxidations which take place in the edematous liquid on account of the exchange products that accumulate in the tissues. PETER MASUCCI

**Technic for the preparation of precipitating serums with heated antigens.** AMADRO DALLA VOLTA AND IDEALE DEL CARPIO. *Boll. soc. ital. biol. sper.* 3, 935-7(1928).—Human blood serum is diluted with distd. H<sub>2</sub>O 1:10, 5 g. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> added per 100 cc. of the diln., followed by a few drops (5-6) of acetic acid. The mixt. is heated on the water bath until the protein is pptd., filtered on paper, and the ppt. dried in the incubator. The dried protein is preserved under toluene until ready for use; it is then freed from toluene and emulsified in a mortar with warm physiol. salt soln. The rabbits are then given only 1 intraperitoneal injection of the emulsion contg. 1 to 1½ g. of protein. After 7 days, the animals are bled and the serum is tested. The antibodies can be

demonstrated in a titer as high as 1:1000. Later the titer then increases and may reach a value of 1:100,000. The antibodies disappear 25 to 30 days after the injection. The high titer serum is well adapted for identifying human blood serum or blood spots.

PETER MASUCCI

**The velocity of sedimentation of the erythrocytes, complement value of the serum, and the enzyme reaction in pulmonary tuberculosis.** PIETRO BERRI. *Boll. soc. ital. biol. sper.* 3, 997-1001(1928).—The velocity of sedimentation (*V. S.*) and the alexin value of the serum were detd. in 50 tuberculous patients. Although the value of the complement (*V. C.*) was low there was no relation between this and the general and local condition of the patient. There was no const. relation between *V. S.* and *V. C.* There was some relation between the enzyme reaction and *V. S.* or *V. C.* but was not const.

PETER MASUCCI

**The influence of antituberculosis vaccination on certain biochemical components of the blood.** MARIO BARBARA. *Boll. soc. ital. biol. sper.* 3, 1014-7(1928).—Children that showed an hereditary predisposition to tuberculosis were vaccinated cutaneously with Maragliano's preventive vaccine (organisms killed with heat and suspended in sol. tuberculous toxin); 30-40 days after the vaccination, the various components of the blood were detd. In the vaccinated subjects, certain biochem. characteristics remained unaltered: in 94.7% of the cases the uric acid content remained high; in 61.1% the K content and in 66.6% of the cases the Ca content remained also at high levels. Hyperglucemia was reduced in 52% of the cases. In all the subjects cholesterol was present in high concns. Therefore, the effect of antituberculosis vaccination was to decrease hyperglucemia and bring about a hypercholesterolemia. The lipoids apparently play an important role in the development of immunity. PETER MASUCCI

**Sedimentation of the blood corpuscles in various internal diseases and the result of correction of this value for the variations of the hemoglobin percentage.** H. C. GRAM. Univ. Med. Clinic B., Copenhagen. *Acta Med. Scand* 70, 242-75(1929).—Curves are published which allow an approx. correction of the sedimentation values, all being reduced to a basis at 100% hemoglobin. With this correction the highest normal sedimentation is 5 mm. for males and 11 mm. for females. The importance of this correction is shown by the following example: In 2 individuals with 96 and 117% hemoglobin, resp., which is the normal range of variation, a sedimentation of 4 mm. is found. The corrected values are 3.5 and 15 mm., resp., the latter representing a frank increase over the normal. It is thought that the sedimentation test calls attention to more or less occult blood diseases of infectious and toxic origin. S. M.

**Studies on cytolysis in carcinoma. III.** N. WATERMAN, L. DE KROMME AND J. F. LEMMENS. Lab. A. van Leeuwenhoekhuis, Amsterdam. *Biochem. Z.* 205, 1-20(1929); cf. *C. A.* 22, 628.—Lyses, which is very important as an immunity phenomenon, also plays a significant part in the biology of cancer. In the latter a certain amt. of lysis occurs spontaneously which, however, can be stimulated by various means. In infectious disease the causative factor is sometimes protected against the immune reactions of the organism, as for instance the non-agglutinability of certain typhus or cholera strains. Likewise in tumors where there is extensive lysis the peripheral cells are protected, which leads to the conclusion that there must be present some protecting substances. Experimentally it was actually shown that in the destruction of pure cancer cell suspensions substances are formed which increase the resistance of other fresh cells both toward agglutination and to lysis. Furthermore, there is also an analogy in the place of origin of both substances. It has always been assumed that immune bodies are formed in the spleen or rather in the entire reticulo-endothelial system, and the same holds true also for cancer. Lytic substances were obtained from all normal organs and serum but mostly from the organs of the reticulo-endothelial system, the lymph glands, spleen and thymus. The manner in which the lytic or the protecting factors act is not known. It is thought that the lytic substances are bound to some lipoproteins, but are not to be identified with known enzyme systems, though a certain relationship cannot be denied. The lytic power is affected in a peculiar way by x-rays, which can both activate and destroy this power. Apparently the pure lytic system is not at all or only slightly radiosensitive, the x-ray effect being greater in relatively impure preps. than in lipid-free preps. Conclusion: The therapeutic effectiveness of radiation is also an indirect action, since this causes cell death when either lytic factors have been activated or protective factors destroyed in the system. S. MORGULIS

**The behavior of the blood sugar in experimentally produced adrenaline insufficiency.** HERMANN LANGE AND ERICH GROSSMANN. Med. Universitätsklinik, Leipzig. *Biochem. Z.* 205, 306-17(1929).—Removal of one adrenal does not cause a lowering of the blood sugar in cats which prior to the expt. were on a const. diet and during the

expt. were fasting. Removal of both adrenals under similar exptl. conditions leads to a permanent fall in the blood sugar to 0.05% and even lower. The convulsions occurring at this stage can generally be controlled with intravenous glucose injections.

S. MORGULIS

Basal metabolism and the specific dynamic action following adrenalectomy in rats. A. V. ARVAY. *Physiol. Inst. Univ. Debreczen. Biochem. Z.* 205, 441-8(1929).—Expts. on rats with double adrenalectomy show that the basal metabolism diminishes until the sixth day, the max. diminution being 26%. It then rises again and, provided that the animal survives, returns to the normal level. The specific dynamic action likewise diminishes to about half its original value, reaching a max. reduction in about 3 days. It then also increases and returns to the normal condition at about the same time when the normal basal metabolism is restored.

S. MORGULIS

The origin of epileptic attacks. K. A. EFIMOV. *Inst. Chirurg. Neuropathology, Leningrad. Zhur. expil. Biol. Med.* 10, 458-68(1929).—Subarachnoid injections of undiluted Sepia ink call forth in dogs clonic and tonic contractions which are very similar to epileptic attacks, which is not the case when the material has been subjected to a preliminary dialysis.

S. MORGULIS

Blood nitrogen in sensitized animals. Z. M. DIENERSTEIN AND S. GUENES. *Physiol. Lab. Ukrglavnauki, Chaskow. Zhur. expil. Biol. Med.* 10, 520-9(1929).—Anaphylactic shock does not of itself produce a marked disturbance in the N balance of the blood. A slight rise in the non-protein N at the height of shock is not specific, neither can the increase in the total N be attributed to the small quantity introduced into the blood stream with the serum injection (0.25 cc.) No matter what disturbance in the N of the tissues may occur, it is not reflected in the total or non-protein N of the blood.

S. MORGULIS

The effect of heated cholera bouillon cultures on the vessels of the isolated rabbit ear. A. M. SKORODUMOV. *Bacteriol. Inst., Irkutsk. Zhur. expil. Biol. Med.* 10, 540-6(1929).—Heated cholera bouillon cultures cause constriction of the ear vessels. Perfusion of the isolated rabbit ear with cholera bouillon cultures of different ages causes no alteration in the vessel walls which are manifested in the pharmacodynamic effect of adrenaline and caffeine.

S. MORGULIS

Transmission of acquired immunity against hydrophobia through the germ plasma. O. A. HERMAN. *State Clinical Inst., Kasan. Zhur. expil. Biol. Med.* 10, 547-56(1929).—Rabbits frequently lose their acquired immunity sooner than their young in whom, even  $6\frac{1}{2}$ - $8\frac{1}{2}$  months after birth, there is still relatively good immunity. Females have occasionally transmitted their acquired immunity even when pregnancy occurred  $6\frac{1}{2}$  months after immunization treatment, while males have transmitted their immunity  $1\frac{1}{2}$ - $7\frac{1}{2}$  months later. When both parent rabbits are immune there seems to be a greater no. of immune young than when only one of the parents is immune. It seems that the immunity can be transmitted also to the third generation. S. M.

Amines as antigens. Z. YERMOLYEVA AND I. BUYANOVSKII. *Biochem. v. Inst., Narkomzdrav, Moscow. Zhur. expil. Biol. Med.* 10, 641-6(1929).—Expts. show that many amines possess antigenic properties.

S. MORGULIS

The condition of antigens in phagocytosis. G. V. VIGODCHIKOV. *Microbiol. Inst., Narkomzdrav, Moscow. Zhur. expil. Biol. Med.* 10, 656-63(1929).—The tropine reaction is subject to the same physico-chem. laws as is the agglutination reaction. Variations in the tropine titer and of the agglutination titer of an immune serum run parallel. Single strains which are excellently tropinogenic are poorly phagocytized in the presence of immune sera obtained by immunizing animals with other strains of the same bacteria. Both agglutination and tropine reactions are dependent upon the physico-chem property of the antigen.

S. MORGULIS

Investigations on the structure of bacterial antigens. WALTER LEVINTEAL. *Centr. Bakt., Parasitenk., I Abt., Orig.* 110, 31-44(1929).—A review with a very complete bibliography.

JOHN T. MYERS

Contributions to the knowledge of bacterial antigen functions. E. WITTEBAY AND E. KRAH. *Centr. Bakt., Parasitenk., I Abt., Orig.* 110, 44-7(1929).—During immunization with diphtheria bacilli, antibodies appear which react specifically with the lipoids of the diphtheria bacillus as shown by absorption methods, and also others which react with the lipoids of pseudodiphtheria bacilli and of tubercle bacilli. Antitoxic diphtheria serum may contain lipid antibodies. The serum of diphtheria patients contains antibodies sp. for the lipoids of the diphtheria bacilli.

JOHN T. MYERS

Investigations on the avidity (rate of reaction) of diphtheria sera. BÄCHER AND KRAUB. *Centr. Bakt., Parasitenk., I Abt., Orig.* 110, 143-6(1929).—The flocculation titration of Ramon is a useful method. Flocculation does not depend on the antitoxin

content, but on other properties of the serum, perhaps the relationship of the protein fractions. Those sera which flocculate rapidly will neutralize the larger amts. of toxin. There are differences in the *in vivo* protective power which do not parallel *in vitro* rates of reaction.

A microchemical method for the demonstration of alexin in the blood. O. HUNTE-MÜLLER. *Centr. Bakt., Parasitenk.*, I Abt., Orig., 110, 150-2(1929). JOHN T. MYERS

Specific and non-specific immunity. L. K. WOLFF. *Arch. néerland. physiol.* 12, 254-7(1927).—The injection of a bacterin is followed in a few hrs. by an increase in the non-specific resistance of an animal, perhaps because of the presence of some substance secreted by the leucocytes into the serum. This form of immunity lasts only a couple of days. It can be produced by the injection of milk, horse serum, I<sub>2</sub> solns., etc., or by the application of any of these substances to the shaved skin. A few days after the injection or application of a bacterin, an increase in the specific bactericidal power of the blood occurs due to an increase in the specific activity of the leucocytes.

M. H. SOULE

Experimental extracorporeal thrombosis. V. Influence of certain chemical substances on extracorporeal thrombosis, with special reference to the efficacy of a combination of heparin and magnesium sulfate. T. SHONOYA. *J. Exptl. Med.* 46, 963-78(1927).—Distd. H<sub>2</sub>O dialyzes through the collodion tube and causes hemolysis, the hemolyzed blood then clotting. Bile salts accelerate clotting in heparinized blood. White thrombi are formed, which contain little fibrin and are fragile, easily breaking down into platelets. Despite the no. of white thrombi, normal clotting does not occur. Surrounding the collodion tube with 1 to 2 cc. of *d*-glucose causes the formation of numerous white thrombi which are fragile but clotting is not accelerated. With 1 to 2% of CaCl<sub>2</sub> outside the tube the clotting is accelerated; white thrombi are rapidly formed; sedimentation occurs and the white thrombi quickly become red. MgSO<sub>4</sub> (10%) outside the tube retards clotting in the non-heparinized animal and also retards it in the heparinized animal by preventing white and red thrombus formation. It has a similar effect if given intravenously, 50 mg. per kg.

C. J. WEST

Blood chlorides in conditions associated with pneumonia. CARL A. L. BINGER, RONALD V. CHRISTIE, JOHN STAIGE DAVIS, JR., AND ALMA HILLER. Rockefeller Inst. Med. Research. *J. Exptl. Med.* 49, 603-14(1929).—Attempts have been made in dogs to lower the serum chlorides by means of various procedures. Of these the withholding of food, anoxemia, tissue destruction, anaphylactic shock, leucocytosis and fever yielded neg. results. Ingestion of large amts. of H<sub>2</sub>O lowered the chloride level independently of body temp. The chloride drop under these circumstances could not be accounted for by excretion and appeared to run parallel with an increase in the serum H<sub>2</sub>O content. Exptl. pneumococcus infection in 2 animals reduced the serum chloride concn.

C. J. WEST

Differentiation between some toxic substances in anaerobically produced autolyzates of pneumococci (Types I and II). JULIA T. PARKER. Columbia Univ. *J. Exptl. Med.* 49, 695-700(1929).—The necrotizing and lung-toxic principles present in certain anaerobically prepd. autolyzates of pneumococcus types I and II are similar in respect to extreme sensitiveness to heat and to oxidation and to their ability to be neutralized by the same anti-autolyzate serums. These 2 poisons differ, however, in their ability to be adsorbed or inactivated by red cells, the lung-toxic principle being adsorbed or inactivated by such procedure while the necrotizing principle is not. It is believed that the necrotizing and lung-toxic principles, and probably the pneumococcus hemotoxin also, are all sep. entities in the anaerobically produced autolyzates described.

C. J. WEST

## H—PHARMACOLOGY

A. N. RICHARDS

Peroxide treatment of mouse carcinoma. J. MAGAT. Kaiser Wilhelm Inst. Biol., Berlin. *Z. Krebsforsch.* 27, 378-9(1928).—Mice inoculated with Ehrlich's adenocarcinoma, which never retrogresses spontaneously, were treated with org. peroxides combined with phosphatides. (Details of composition and methods are not given.) Healing was obtained in about 20%, and there were marked reactions in many others. Elective localization of the peroxide was demonstrated in the tumor tissue. H. G. W.

The effect of insulin administration upon the adrenaline content of the suprarenal body in rabbits. SHIZUKA SAITO. *Tôhoku J. Exptl. Med.* 12, 263-9(1929).—Insulin was given (in amts. sufficient to cause convulsions) to rabbits whose left suprarenals had been previously denervated. The adrenaline content decreases unless the gland

is protected by denervation. Glucose simultaneously given in sufficient amts. with the same dose of insulin prevents this loss of adrenaline in the intact gland. B. C. B.

**Depilation with thallium acetate in the treatment of ringworm of the scalp in children.** GEORGE V. BEDFORD. Univ. Manitoba. *Can. Med. Assoc. J.* 19, 660-2 (1928).—Good results are claimed in 18 of 21 cases. A. T. CAMERON

**Pharmacological and toxicological aspects of thallium.** M. J. ORMEROD. Univ. Manitoba. *Can. Med. Assoc. J.* 19, 663-5 (1928).—A review. A. T. CAMERON

**Progress and results in forty-one cases of paresis and tabo-paresis treated with tryparsamide.** E. C. MENZIES. *Can. Med. Assoc. J.* 20, 242-6 (1929).—Of 41 treated with tryparsamide and Hg alone 10 have been brought back to sanity of at least 4 years' standing and have had physical health restored. Of 40 similar cases treated with malaria and tryparsamide 16 were restored to like degree and more quickly. A. T. CAMERON

**An unusual case of diabetes and gout.** I. M. RABINOWITCH. Montreal General Hosp. *Can. Med. Assoc. J.* 19, 682-6 (1928).—Insulin pptd. attacks of gout in this patient. Synthalin treatment was successful in controlling the diabetes without inducing gout, but did not reduce the high plasma cholesterolemia. A second case exhibiting both gout and diabetes did not present this idiosyncrasy even with much larger doses of insulin. A. T. CAMERON

**The glucosides of Digitalis purpurea L.** RAYMOND-HAMET. *Compt. rend.* 188, 461-3 (1929).—From toxicity tests made by intravenous injection into unanesthetized dogs, it was found that the toxic dose is the same for pure digitalin (Cloetta) and for digitalin crystg. in needles (Nativelle) or in platelets (Nativelle). D. D.

**Effect of intravenous injection of ephedrine on blood sugar and blood pressure in man compared with the adrenaline effect.** C. RADOSLAV AND C. STOICESCU. *Kliniko-Med. Inst. B. in Bukarest. Wiener klin. Wochschr.* 41, 1775-6 (1928).—Ephedrine in 1000 times the usual dose has an effect on blood sugar and blood pressure similar to that of adrenaline. The blood sugar effect has about the same duration but the blood pressure effect lasts for two hrs. with no subjective or objective disturbance. D. B. DILL

**Paraldehyde poisoning.** PHILIPP SCHNEIDER. Univ. Inst. Gerichtliche Med. in Wien. *Wiener klin. Wochschr.* 42, 357-60 (1929).—S. reviews the literature and describes the microscopic picture of portions of the gastrointestinal tract of dogs poisoned with paraldehyde. D. B. DILL

**Cholecystography: toxic effects of the dyes.** B. M. DICK AND V. G. H. WALLACE. *Brit. J. Surg.* 15, 360; *Quart. J. Pharm.* 1, 131-2 (1928). The use of Na tetraiodophenolphthalein in the radio-diagnostic investigation of cholecystic disease is not uncommonly attended with toxic symptoms such as upper abdominal pain, nausea, vomiting, diarrhea and pyrexia. Three examples of the effects of excessive doses on human subjects are described. An exptl. analysis of the effects of Na tetraiodophenolphthalein was undertaken on cats and rabbits. Some of the substance is excreted in the pancreatic juice, but only when the common bile duct is ligatured. Perfusion of the pancreas with saline solns. of the drug resulted in diffuse hemorrhagic extravasation. Injection in the pancreatic duct had similar effects. A single intravenous injection of 0.05 g. per kg. produced no abnormal appearances in the pancreas. When the common bile duct had previously been ligatured, however, such an intravenous dose usually produced acute hemorrhagic pancreatitis. Degenerative changes in the liver, following intravenous administration, were also much more extensive if the common bile duct had previously been ligatured. Only slight changes in the kidney were produced by diagnostic doses. When the biliary route of excretion was not available, the drug was almost entirely eliminated by the kidneys. Excretion was slow, continuing some 18 days. From 5 to 10% of the salt was excreted in the urine during the 1st 24 hrs. after an intravenous injection. W. O. E.

**Synthalin for diabetes.** N. PARISE. *H. Moragni* 1927, 1921; *Quart. J. Pharm.* 1, 145-6.—Sixteen cases of diabetes in out-patient practice, treated with synthalin, are recorded. Ten of these were mild; 6 were of moderate severity. Two of the latter had previously received insulin. All the patients showed a considerable diminution of polyuria under synthalin, but no marked changes were found in the chem. compn. of the urine. Thirst was much reduced and in some cases disappeared. Hunger was also modified, and the general symptoms improved. Symptoms of intolerance were not infrequent, especially at the commencement of the treatment. The author considers that synthalin can be generally of benefit only in mild cases of diabetes, and only exceptionally in those of moderate severity. It is contra-indicated in severe cases, since the necessary doses cannot be tolerated. Good results have been obtained by the

alternate use of synthalin and insulin, the latter being substituted for a period of 10 to 15 days every 30 or 40 days. Synthalin is specially suited for treatment of mild outpatient cases; it does not require medical supervision except at the start. W. O. E.

Synthalin in diabetes. R. CARRASCO. *Rev. med. (Barcelona)* 7, 246(1927); *Quart. J. Pharm.* 1, 146.—Previous reports indicating that the chief advantage of synthalin lies in its ability to act when administered orally are confirmed by C. Its toxicity, however, may give rise to disturbances, and its slow action is against its use in emergencies. It cannot be regarded as more than a partial substitute for insulin in moderate and severe cases; in mild cases of diabetes, however, it may prove to be very useful. It is thought that cases refractory to insulin will be even more so to synthalin.

W. O. E.

Sodium salicylate in large doses, alone, and associated with sodium bicarbonate. D. LIOTTA. *Rev. méd.* 1927, 985; *Quart. J. Pharm.* 1, 145(1928).—Expts. on rabbits show that Na salicylate administered alone may cause serious changes in the kidney, liver and heart, and to a less degree in the pancreas and suprarenals. The most marked changes are seen in the kidney. In animals treated with a mixt. of Na salicylate and bicarbonate none of these changes was noted.

W. O. E.

Sodium thiosulfate in arsenical poisoning. T. D. HUGHES. *Med. J. Aust.* 1927, 543; *Quart. J. Pharm.* 1, 145(1928).—In a case of arsenical neuritis following a single large dose taken accidentally, As was present in the urine 6 months later. After 16 intravenous injections of 0.75 g.  $\text{Na}_2\text{S}_2\text{O}_3$  in 10 cc.  $\text{H}_2\text{O}$  given on alternate days the urine was free from As. The patient's clinical condition rapidly improved during the treatment. The later injections were followed by a reaction which, however, passed off in about 12 hrs.

W. O. E.

Incompatibility of tincture of iodine and cherry laurel water. LEMANSKI, ROUQUIÉ AND JARMON. *L'Union Pharm.* 68, 306(1928); *Quart. J. Pharm.* 1, 118.—Allusion to the incompatibility of cherry laurel water is made in some Continental formularies. It is doubtful, however, if they are likely to be prescribed in the same mixt. The question has arisen, however, if there may not be a physiol. incompatibility, when, as frequently happens, as for instance, in the treatment of tuberculosis, a few drops of tincture of I are administered in the morning, and a mixt. contg. cherry laurel water as an ingredient is taken subsequently during the day. The possible reaction between the HCN and I,  $\text{HCN} + \text{I} = \text{ICN} + \text{H}$  is considered to be without danger, and any secondary reaction which might occur resulting in the formation of oxamide and  $(\text{NH}_4)_2\text{C}_2\text{H}_2\text{O}_4$  would result in the formation of such small traces from the therapeutic doses present, that they may be ignored. CNI itself is less toxic than its constituent. From expts. on guinea pigs, Jarmon has proved that no ill-effects follow the administration of cherry laurel water after doses of tincture of iodine given in therapeutic doses in the usual manner.

W. O. E.

Quinic acid in uremia. ARTAULT DE VEVEY. *L'Union Pharm.* 69, 16(1928); *Quart. J. Pharm.* 1, 143.—V. has obtained good results in reducing the amt. of urea in the blood by administering quinic acid in cachets, in daily doses of 4 to 16 grains, given in 2 portions, one at 10 A. M. and the other at 5 P. M. At the same time the patient takes infusion of elder flowers, or of birch flowers.

W. O. E.

The chemistry of ergot. H. LANGECKER. *Arch. expil. Path. Pharm.* 138, 117 (1928); *Squibb Abst. Bull.* 2, A-31-2(1929).—An alkaloid fraction of ergot displaying acid properties when extd. with  $\text{Et}_2\text{O}$  gives a fraction that acts upon the uterus of animals and that influences the action of adrenaline in the same way as does ergotamine. The treatment of this fraction by  $\text{H}_3\text{PO}_4$ ,  $\text{NaH}_2\text{PO}_4$  and  $\text{Na}_2\text{HPO}_4$  gave various substances that displayed the following comparative reactions: The  $\text{H}_3\text{PO}_4$  (15 mol.,  $p_H < 1$ ) ext. was  $\frac{1}{6}$  as active as the  $\text{Na}_2\text{HPO}_4$  ext. ( $p_H = 8.2$ ); the  $\text{NaH}_2\text{PO}_4$  compd. ( $p_H 4.4$ ) was  $\frac{1}{3}$  as active as the  $\text{Na}_2\text{HPO}_4$  ext. The cornutine reaction was more effective with the acid-reacting fraction than with the alk. Physico-chem. examns. indicated that the base is the active part of the compd. and not the salt and, by neutralizing or slightly acidifying, a considerable portion of the base is set free through hydrolysis; the base being lipid-sol. can penetrate the cells and there produce its action. When the alkaloid portion of the ergot ext. is sepd. from the non-alkaloid part and the 2 are compared in activity with the original fraction, there is a 30-60% loss in activity: a value beyond exptl. error; when the 2 fractions are combined, however, the resulting substance displayed its full action upon the uterus.

C. R. F.

Chronic lead poisoning. KOCKEL AND TIMM. *Centr. Gew.-Hyg.* 15, 243-5(1928); *Wasser u. Abwasser* 25, 162.—A histological study showing the differences between chronic Pb poisoning and arteriosclerosis.

C. R. F.

Lead treatment in malignant tumors. M. M. DATNOW. *Monatsschr. f. Geburtsh.*

80, 243(1928); *Squibb Abst. Bull.* 2, A-212-3(1929).—The results of Pb therapy in 227 patients with cancer are reported. Nine of these patients would not consent to intensive treatment but were able to go about as usual; in 10 the growth was stopped completely; and 31 were discharged as cured. This treatment was used only in inoperable cases of cancer, and was preceded if possible by excision of the largest part of the tumor, and examn. of the urine, the blood and the functions of the liver. The same examns. were made after each injection of Pb which was used in colloidal form. Röntgen or Ra treatment may be combined with the Pb treatment. The therapeutic effect of Pb is more certain and differs from the action of other metals because it inhibits the cellular growth but does not destroy the cells. C. R. F.

Notes on the use of certain preparations in leprosy. JOHN M. HENDERSON AND S. P. CHATTERJI. *Indian Med. Gaz.* 63, 620-4(1928).—The relative merits of Cu chloride-*p*-diazoinimbenzene hydrochloride, Succinol and Fibrolysin as remedies in the treatment of leprosy are considered. None of the preps. has any direct action on the organism causing the malady, *M. leprae*. Succinol and the Cu compd. appear to have some power inducing the onset of leprous reactions when employed in relatively small doses. Fibrolysin appears to lack this "lytic" effect. F. G. G.

Plasmochin in the treatment of malaria. PASAPUTI BHATTACHARYYA AND S. P. ROY CHOWDHURY. Police Hospital, Calcutta. *Indian Med. Gaz.* 63, 630-3(1928).—Plasmochin has its own sphere of action in the treatment of malaria, although it cannot claim to replace quinine. Plasmochin has no action on the asexual forms of malignant tertian infection super imposed upon a benign tertian or quartan infection, as has quinine. FREDERICK G. GERMUTH

A preliminary note on the action and uses of pseudoephedrine. R. N. CHOPRA, B. B. DIKSHIT AND K. VENKATACHALAM PILLAI. School of Tropical Med. and Hyg., Calcutta. *Indian Med. Gaz.* 64, 1-4(1929).—The pseudo compound is claimed to possess most of the actions and properties of ephedrine while its toxicity is much lower. Graphs are presented. FREDERICK G. GERMUTH

The treatment of filariasis. R. N. CHOPRA. Calcutta School of Tropical Med. and Hyg. *Indian Med. Gaz.* 64, 130-9(1929).—Experimentation has developed the fact that there are remarkable variations in the nos. of microfilariae circulating in the peripheral blood; these variations are quite independent of the drug that is being administered. Bismene, antimosan, stibosan, neostibosan, stiburea, novostiburea, Sb-sulfur compd., mercurochrome, plasmochin, emetine and tryparsamide produce no effect on the microfilariae circulation in the peripheral blood and, it is therefore presumed, have no effect on the adult parasites. Tryparsamide, like some of the arsenobenzenes compds., produces disappearance of chyluria, and the effect with this drug often lasts for prolonged periods. This compd. also decreases the frequency of attacks of lymphangitis. Numerous tables and several graphs accompany this most interesting report. FREDERICK G. GERMUTH

Berberine sulfate in Oriental sore. A. LAKSHMI DEVI. *Indian Med. Gaz.* 64, 139-40(1929).—Application of Sb ointment or methylene blue in the treatment of Oriental sore is of doubtful success. Acid berberine sulfate in 2% soln. is preferable in that it produces marked improvement, in the average patient, of a permanent character, in a relatively short period. Seldom are more than 3 injections necessary to effect a complete cure. FREDERICK G. GERMUTH

A new carbohydrate substitute for the treatment of diabetes. E. KAUFMANN. *Klin. Wochschr.* 8, 66-9(1929).—*d*-Sorbitol is recommended as a carbohydrate substitute in the treatment of diabetes. It is sweet, easily absorbed, can be oxidized by the diabetic organism, hence spares the protein, leads to glycogen formation and does not elevate the blood sugar. MILTON HANKE

The significance of "internal circulation" for crystalloids, particularly iodide. WERNER LIPSCHITZ. Univ. Frankfurt. *Klin. Wochschr.* 8, 116-7(1929).—The injection of NaI into dogs—20 mg. per kg. body wt.—gives an initial concn., in the blood, of 5 mg. % which slowly decreases. The I is concd. 10-15 times in the gastric secretion (Pavlov stomach) and 1.5 to 7 times in the secretion from the parotid gland. Injection of 50 to 120 mg. NaI per kg. body wt. gives rise to initial blood values of 15-30 mg. % NaI. With high blood concns. of NaI the stomach loses its ability selectively to conc. the NaI in the gastric secretion. The I concn. of the gastric juice may be identical with or only slightly greater than that of the blood. The I content of the aq. humor lags considerably behind that in the blood and, as the I content of the blood decreases, becomes higher than that in the blood. It is a case of slow transfer. Injection of 50-100 mg. Na salicylate into dogs leads to a blood concn. of 6-16 mg. %, a salivary concn. of 3-11 mg. % and none in the gastric juice. Most of the salicylic acid is excreted into

the urine. Injection of  $\text{Na}_2\text{Fe}(\text{CN})_6$  (250-300 mg. per kg. body wt.): blood concn. 55-75 mg. %; none in the gastric juice or in the saliva. 80-90% is eliminated in the urine in concns. as high as 990-1200 mg. %. Injection of Na lactate (1-2 g. per kg. body wt.): initial blood concn. 70-209 mg. %. This falls off rapidly. None is excreted into the gastric juice or into the saliva. It is concd. by the kidney. The urine may contain 285-980 mg. % lactic acid.

MILTON HANKE

**Treatment of Basedow's disease.** WILLY KÖNIG. *Klin. Wochschr.* 8, 634-6 (1929).—The buffering ability of the body tissues is reduced in Basedow's disease. The administration of alkali is recommended as an adjunct to the customary treatment.

MILTON HANKE

**Action of thyroxine on the heart.** M. NOTHMANN AND G. W. PARADE. *Klin. Wochschr.* 8, 699-700 (1929).—Thyroxine, administered either intravenously or by mouth, has no effect upon the pulse rate or upon the electrocardiographic curve. The intravenous dose was 5 mg. (duration of expt. not specified) and the peroral dose was 1 mg. 3 times a day for 2-4 weeks. The basal metabolic rate was increased.

MILTON HANKE

**Studies on the relationship between chemical constitution and physiological action.** II. The miotic activity of urethans derived from the isomeric benzyldimethylamines. EDGAR STEDMAN. Univ. Edinburgh. *Biochem. J.* 23, 17-24 (1929); cf. *C. A.* 21, 962.—The miotic activity was confined to the methylurethans of the isomeric hydroxy-benzyldimethylamines (1), the urethans of choline iodide and tropine being inactive in 2% solns. This confirms the view that activity is associated with the fact that the miotics are substituted phenyl, as distinguished from alkyl, esters of carbanic acids. The activities of (1) are estd. to be in the order *ortho*- > *para*- > *meta*-. Conversion of the tertiary basic group into the quaternary ammonium group increased the activity of the *ortho*-compound, diminished that of the *meta*- and abolished that of the *para*-.

BENJAMIN HARROW

**Action of insulin in normal young rabbits.** MAURICE W. GOLDBLATT. St. Thomas' Hospital, London. *Biochem. J.* 23, 83-98 (1929).—The glycogen content of rabbits, starved for 24 hrs. and treated with insulin, shows a large rise in liver glycogen. Treated with insulin, young rabbits may die of hypoglycemic convulsions and still possess increased liver glycogen and considerable muscle glycogen. The theory is proposed that the immediate effect of insulin is to inhibit the release of liver glycogen.

B. H

**Antistaphylococcic effects of the intraarterial injection of certain dyes.** Report of intraarterial injections of mercurochrome 330- soluble, gentian violet and acriflavine in the treatment of experimental staphylococcic infections in dogs. ZUNG DAT ZAI AND FRANK L. MELENEY. *Ann. Surgery* 88, 961-74 (1928).—Intraarterial injection of these dyes in doses of 5 mg. per kg. body weight given 24 hrs. after local injection of organisms into the leg does not affect the course of a local exptl. hemolytic *Staphylococcus aureus* infection. Injection of these dyes in larger quantities injures the kidneys and liver.

FRANCES KRASNOW

**Acute copper sulfate poisoning.** M. MEEROVICH AND L. MOISEYEV. Obukhov Netschaew-Hospital, Leningrad. *Deut. Z. ges. gericht. Med.* 11, 189-92 (1928). Case report showing gastrointestinal disturbances, icterus, anemia, kidney changes and nervous disorders.

FRANCES KRASNOW

**A case of scopolamine hydrocyanic acid poisoning.** L. VAN ITALLIE AND U. G. BIJLSMA. *Deut. Z. ges. gericht. Med.* 11, 468-77 (1928).

FRANCES KRASNOW

**The biological influence of various colloidal metals. I. The influence of these on the frog's heart.** YOSHIKIMI SASAKI. *Acta Schol. Med. Univ. Imp. Kioto* 11, 335-47 (1929).—Colloidal metals which affect the isolated frog heart act directly on muscle. Colloidal Fe, Pt and Sn in Ringer soln. without  $\text{NaHCO}_3$  up to 0.04 or 0.05% show no effect; in the same concn. colloidal Ni and Co weaken diastole while colloidal Au and Pb decrease the contractility but do not cause arrest of the beat. The smallest effective concn. of these latter is 0.005%. Colloidal Cu, Ag and Zn decrease contractility but do not change the rate noticeably. Cu and Ag bring the heart to systolic arrest but Zn causes it to stop in diastole. The min. Cu strength is 0.0002%; Ag and Zn, 0.001%. The dialyzate from these colloidal preps. acts similarly to the colloidal metals but the residue which contains the colloidal metal is much stronger in its action. 20 references are given. II. **The influence of these on the vessels.** *Ibid* 349-58.—Perfusion expts. on frog vessels with colloidal metals in Ringer soln. show that colloidal Cu, Ag, Zn, Ni, Co and Pb have a constricting action on the frog vessels; zinc salts, however, dilate the vessels. Expts. with atropine indicate the muscle in the vessel walls is directly affected. III. **The influence of these on the isolated rabbit intestine.** *Ibid* 359-64.—Expts. on isolated rabbit intestine according to the Magnus method

employing colloidal metals in Locke soln. less  $\text{NaHCO}_3$  show that colloidal Cu, Ag, Zn, Ni, Co and Pb increase tonus and decrease the amplitude of the movements. Colloidal Au, Pt, Fe and Sn even in high concn., 0.012%, show no noticeable effect on movement. The muscle is directly affected by colloidal Cu, Ag, Zn, Ni, Co and Pb.

G. H. W. LUCAS

The action of ions and isotonic Ringer solution on the strip of inner and outer layers of the heart ventricle. MASARU SATO. *Acta Schol. Med. Univ. Imp. Kyoto* 11, 403 23(1929).—According to Schmedberg there are inner and outer layers of heart muscle which are functionally quite different; if the outer layer, which carries the diastolic action, be affected, diastolic standstill follows and *vice versa*. Frog hearts were divided into left inner strips and right outer strips according to the Takahashi method—in the left inner portion it has been found that the impulse-conducting bundles of the frog heart are more strongly developed also into left outer and right inner strips. The movements of these strips of muscle together with the movements of undivided strips were followed when  $\text{CaCl}_2$ ,  $\text{KCl}$ ,  $\text{NaCl}$  and  $\text{NaHCO}_3$  were added to Ringer soln. and when hypotonic and hypertonic Ringer were employed. The action of the drugs, whether inhibitory or stimulant, appeared earlier and more strongly in the left inner strip or left half piece than in the right outer or right-half piece in the same concn. of drug. In the left outer layer of ventricular muscle the action of the drug appeared either later or at the same time and more weakly than in the right inner strip or equally strong with the same concn. of drug. The action of the drugs is closely associated with the no. of impulse conducting bundles present as well as with the difference in properties of the strips.

G. H. W. LUCAS

The inhibiting action of polysaccharides (starches, inulin) on the hyperglucemia of glucose. GIUSEPPE SOLARINO. *Arch. sci. biol.* 13, 31-8(1929).—Sol. rice and corn starch administered to starved dogs in 25-g quantities produced a variable hyperglucemia (0.012 to 0.048%). Inulin in 5 g quantities also produced a hyperglucemia. Rice and corn starch administered orally soon after glucose, or  $\frac{1}{2}$  hr. before, inhibited the glucose hyperglucemia; the glucemic titer was always less than that produced by glucose alone, but higher than that produced by starch alone. Inulin acted similarly except that its inhibiting action was more marked, being comparable to that of levulose.

PETER MASUCCI

The formation of lactose in the functioning mammary gland under the action of insulin. ORONZIO MACCHIARULO. *Boll. soc. ital. biol. sper.* 3, 973 6(1928).—The relation between glucemia and the concn. of lactose in milk was studied. This was done by producing hyperglucemia in a milch goat with injections of glucose. Expts. were also made to show whether a simultaneous injection of insulin would cause a greater utilization of the glucose injected and transform it into lactose. The normal glucemic titer of the animal under test was 0.09% g., and the concn. of lactose was 4.3% g. The injection of 30 units of insulin subcutaneously reduced the blood sugar to 0.046% and the lactose to 3.80%. If the hypoglucemia was sufficient to cause convulsions, the concn. of lactose decreased still more, while an intravenous injection of glucose increased the glucemic titer and also the lactose content. Hyperglucemia was first induced in the goat by injecting 200 cc. of a 15% soln. of glucose. This resulted in an increase of lactose in the milk. If, however, insulin was injected simultaneously, the glucose injected was rapidly consumed, hypoglucemia was produced, and the lactose diminished correspondingly. Expts. were then made by using artificial circulation in a functioning but isolated mammary gland. Defibrinated blood from the same animal was used as the circulating fluid. Blood sugar and lactose were detd. and later 20 units of insulin injected. The lactose decreased from 3.25% to 2.50% one hr. after the insulin was injected. These results indicate that the mammary gland can synthesize lactose in an amt. which depends on the quantity of glucose circulating in the blood, but insulin plays no part in this transformation.

PETER MASUCCI

The mechanism of action of colloidal sulfur. RENZO AGNOLI. *Boll. soc. ital. biol. sper.* 3, 992-6(1928).—The aim of this investigation was to det. whether the toxicity of colloidal S was due to other causes in addn. to the formation of  $\text{H}_2\text{S}$ . Guinea pigs and rabbits were injected with colloidal S intracardially and intravenously. In each case the animals died of symptoms typical of shock. These symptoms were attenuated if the animal was desensitized by injecting small amts. of S intraperitoneally. If the S was injected into dogs, the animals did not die from shock but presented characteristic colloid disturbances, hypotension and vasomotor reactions. The death of the guinea pigs and rabbits by colloidal S was, therefore, due to the toxic action of  $\text{H}_2\text{S}$  formed and to the colloidal state of the S.

PETER MASUCCI

Effect of insulin on the liver. ERIK FORSGREN. Karolinsches Inst., Stockholm.

*Acta Med. Scand.* 70, 139-49 (1929).—The glycogen of the liver of normal animals varies within wide limits, the chief reason for this being the fact that the liver with a rhythmic function changes from assimilatory to secretory activity. During the assimilatory phase the glycogen content increases, and during the secretory phase it diminishes. Insulin exerts no noticeable effect on the liver glycogen content and does not influence its rhythmic activity. The sensitivity to insulin seems to vary with the rhythmicity of the liver activity, and is greatest during the secretory phase when the glycogen supply is lowest.

Clinical studies on the action of synthalin. EJNAR JARLØV. *Acta Med. Scand., Suppl. XXVI*, 48-51 (1928). S. MORGULIS

Experience in the treatment of diabetes mellitus with synthalin. FINAR RUD. *Acta Med. Scand., Suppl. XXVI*, 52-4 (1928).—The use of synthalin in certain cases is recommended, though intoxication occurs frequently. S. MORGULIS

Experience with the synthalin treatment in diabetes mellitus. J. E. HOLST. Copenhagen. *Acta Med. Scand., Suppl. XXVI*, 55-60 (1928).—The favorable effect of the synthalin can best be judged by the glucosuria rather than the glucemia. S. MORGULIS

The effect of decholin on the respiratory metabolism of rats. HOKAN RYDIN. Univ. Bern. *Biochem. Z.* 200, 401-6 (1928).—Enteral or parenteral administration of decholin increases the basal metabolism of rats 12%. Decholin is a relatively innocuous substance with powerful cholagog action. This leads to the view that the observed effect it produces on basal metabolism is an argument in favor of the participation of the liver in the specific-dynamic action. S. MORGULIS

The physiological action of salicylic acid derivatives. I. K. KASE. Imp. Univ., Tokyo. *Biochem. Z.* 205, 21-6 (1929).—Esters and acid amides of hydroxybenzoic acid are more toxic than hydroxybenzoic acid itself. They have a more or less injurious effect on the kidneys and produce a phenol-like poisoning. II. K. KASE AND KAKJIRO SEKI. *Ibid.* 27-30.—The relative non-toxicity of hydroxybenzoic acid as compared to the phenol is attributed to the presence of the carboxyl group. This is proven indirectly since salicylic acid derivs. without the free carboxyl group have the same toxic effect on the organism as phenol. S. MORGULIS

Influence of amino acids and their derivatives on adrenaline hyperglucemia. M. CHIKANO. Med. Acad., Osaka. *Biochem. Z.* 205, 154-65 (1929); cf. *C. A.* 22, 266.—Certain amino acids strengthen the effect of adrenaline or produce hyperglucemia. These amino acids generally contain a benzene ring and structurally are closely related to adrenaline. In fact, their hyperglucemic action is greater the more nearly related they are to adrenaline. Especially dihydroxyphenylalanine behaves like adrenaline not only biologically but also in its color reactions with  $\text{HgCl}_2$  or  $\text{HIO}_4$ . S. M.

The effect of adrenaline on the creatine-phosphoric acid content of muscles. O. FEINSCHMIDT AND D. FERDMANN. Ukraina Biochem. Inst., Charkow. *Biochem. Z.* 205, 325-8 (1929).—Adrenaline causes an increased destruction of creatine-phosphoric acid in muscles. The amt. of  $\text{H}_3\text{PO}_4$  after adrenaline injection is greatly increased but this could not come entirely from the creatine- $\text{H}_3\text{PO}_4$  compd. In pigeons adrenaline causes a great rise in  $\text{H}_3\text{PO}_4$  compds. which are split into inorg.  $\text{H}_3\text{PO}_4$  in a 2-hour autolysis in 2%  $\text{NaHCO}_3$  at 40-45°. The injection of adrenaline causes increased lactic acid formation at the same time as it promotes the cleavage of the creatine- $\text{H}_3\text{PO}_4$ , but apparently there is no direct relationship between the 2 phenomena. S. MORGULIS

Stimulation of resorption by yeast extract. III. HSTER V. KOKAS AND GEORG GAL. Physiol. Inst. Univ., Debreczen. *Biochem. Z.* 205, 380-7 (1929).—Yeast ext. (Harris' powder) stimulates strongly the contraction of intestinal villi and it also greatly promotes the resorption of glucose. Thus, whereas 37.3% was absorbed per hr. from a definite amt. of glucose, 46.8% was absorbed in the presence of the yeast ext. or actually 56 mg. more. Still more striking was the effect of resorption of peptone solns. (increase in  $\frac{1}{2}$  hr. from 31.5% to 57.6%). S. MORGULIS

Toxic properties of the active principle of the beetle *Paederus fuscipes* (fam. Staphylinidae) in relation to human skin. E. PAVLOVSKII AND A. STEIN. State Inst. Med. Sci., Leningrad. *Zhur. ekspl. Biol. Med.* 10, 440-7 (1929).—The autumn beetles are as poisonous as spring beetles, causing a vesicular dermatitis. Rapidly dried beetles retain their toxicity, but heating the beetles for 30 min. at 100° destroys this action. The active principle can be extd. with alc. and  $\text{CHCl}_3$ , and a soln. of the dry residue in oil is poisonous to the human skin. The extd. beetle no longer contains substances injurious to the skin. Reasons are given for regarding the toxic substance of *Paederus* as different from that of *Lytta vesicatoria*. S. MORGULIS

Changes in the alkali reserve of the blood in nicotine poisoning. S. W. WOLTER.

Ukraina State Inst. for Hygiene and Pathology of Labor, Odessa. *Zhur. expl. Biol. Med.* 10, 470-83(1929).—See C. A. 23, 1682. S. MORGULIS

**Bismuth therapy in Weil's disease.** UHLENHUTH AND SEIFFERT. *Centr. Bakt., Parasitenk.*, I Abt., Orig., 110, 47-53(1929).—Bi has a sp. effect on the spirochetes of Weil's disease in exptl. guinea pig infections. The preps. tried were: bismuto-yatren, Bismogenol, and the French tryparsol preps. The effect seems to be indirect. *i. e.*, a mobilization of natural defenses. Bi is stored in the liver and spleen, and its slow liberation continues its effect. JOHN T. MYERS

**Non-specific therapeutic experiments on trypanosome-infected animals, and the possibility of increasing the effect of germanium.** PFANNENSTIEL AND B. SCHARLAU. *Centr. Bakt., Parasitenk.*, I Abt., Orig., 110, 84-7(1929).—Dried human serum has a trypanocidal effect in dourine-infected mice. This effect is enhanced when combined with Ge. JOHN T. MYERS

**Procedures for the choice of substances in the chemotherapy of tuberculosis.** HESSE. *Centr. Bakt., Parasitenk.*, I Abt., Orig., 110, 170-2(1929).—There are special affinities between tubercle bacilli and chem. substances in the sense of Ehrlich. The cultivation method of Wright is satisfactory. JOHN T. MYERS

**The trypanosomes of the marmot, *Cricetus frumentarius*.** CARLOS ZOZAYA. Inst. für Schiffs- und tropenkrankheiten zu Hamburg. *Centr. Bakt., Parasitenk.*, I Abt., Orig., 110, 187-9(1929).—These trypanosomes respond to the same chemotherapy as does *Tr. lewesi*, *i. e.*, arsenophenyglycine but not Bayer 205, Sb, or neosalvarsan. They seem identical in other ways also. JOHN T. MYERS

**The reticulo-endothelial system and chemotherapy.** H. SCHLOSSBERGER. *Centr. Bakt., Parasitenk.*, I Abt., Orig., 110, 210-19(1929).—Studies based on splenectomy, and on blocking the reticulo-endothelial system do not prove that chemotherapeutic effect depends on activation of this system. JOHN T. MYERS

**Determination of the coefficient of carbon monoxide poisoning in blood undergoing putrefaction.** C. SIMONIN. *Ann. méd. légale criminol. police sci.* 9, 11-4(1929); cf. C. A. 22, 820.—Blood taken from a corpse 3 days after death from CO poisoning, in which putrefaction had set in, gave a coeff. (ratio of CO actually present in the blood to that present after satn. with CO) 0.85. As the putrefaction gases were partly counted as CO in consequence of their reducing action, they were eliminated by placing the sample under vacuum for 1 min., and the detn. was then carried out in an atm. of CO, and gave a coeff. of 0.77. A. PAPINEAU-COUTURE

**The action of lecithin in the metabolism of the carbohydrates.** A. CRUTO. *Nat. Med. Pharmacol. Inst. "Serrano," Rome. Rass. clin. terap. sci. affini* 28, 24-6(1929).—Three groups (II, III and IV) of male rabbits of the same age and wt. received subcutaneous injections of an emulsion of lecithin, lutein and cholesterol esters in physiol. serum; another group (I) served as the control. For the different groups the total doses of lecithin injected during a period of 54 days were: 1.24 g., 6.20 g., and 12.40 g., resp., while the total doses of lutein and cholesterol esters amounted to 0.5 g., 2.50 g. and 5.00 g., resp. Blood samples taken at various intervals revealed the presence of a slight hyperglucemia in the animals receiving the lipid mixt. After 54 days the av. glycogen contents of the liver were I 4.317%, II 1.172%, III 0.657%, IV 0.650%; of the muscles I 0.480%, II 0.467%, III 0.388% and IV 0.402%. Conclusion: Lecithin injections caused an increase in the catabolism of the carbohydrates. G. SCHWOCH

**Variation of acetone bodies in the living organism.** KAKUZO WATANABE. *Aichi Med. Col. Aichi J. Med.* 35, 381-534(1928).—In normal rabbits the concn. of acetone bodies in blood is increased on administering butyric, valeric and isovaleric acids, and the acetone bodies make their appearance in urine. The influence of isovaleric acid is especially large, accompanying the increase in the blood sugar concn. Poisoning by yellow P also causes an increase in the acetone concn. in blood and in urine, but no remarkable change in the concn. of blood sugar. When fat is given to the phosphorus-poisoned rabbit, the concn. of acetone bodies is a little smaller than when given to a normal rabbit, the influence of isovaleric acid being most remarkable also in this case. Adrenaline alone has no effect on acetone bodies in blood. The increase in the content of acetone bodies by the combined use of adrenaline and butyric acid is especially marked when the butyric acid injection is made in 2 hrs. after the injection of adrenaline. With seriously poisoned rabbit no change of blood sugar concn. appears, the concn. of acetone bodies remaining the same as in the normal rabbit. The effect on the content of acetone bodies is not changed when adrenaline is given during the period of poisoning and then butyric acid is injected after 2 hrs. Adrenaline decreases the acetone concn. which had been increased by fatty acid, and also the excretion of acetone in urine. A comparatively large quantity of insulin decreases the concn. of blood sugar and acetone.

But by the combined use of fatty acid and insulin an increase of acetone concn. can be obtained which compares very well in amt. with the case of the injection of a fatty acid alone, the excretion in urine being small. Insulin does not inhibit the formation of acetone bodies. When a mixt. of Na butyrate and glucose is injected into the vein in the normal rabbit there is an increase of acetone bodies similar to that caused by Na butyrate alone, although the recovery is more rapid. In phosphorus-poisoned rabbit, the velocity of increase in the blood acetone is retarded, its excretion in the urine being small. Since the formation of acetone bodies is not much retarded during the phosphorus poisoning, W. concludes that the acetone body formation is not a function peculiar to the liver.

K. SOMEYA

The toxicity of cocaine and borocaine for the isolated heart. J. BOER. *Arch. néerland. physiol.* 12, 284 (1927).—Cat hearts were perfused by means of Langendorff's app. The drug soln. was injected into the inlet tube; 1:500 cocaine or 1:50 borocaine reduced the amplitude of the beats 50%; 1:1000 or 1:100, respectively, 80%; 1:200 borocaine 98% while 1:4000 cocaine and 1:200 borocaine increased the amplitude 150%. The toxicity of cocaine was reduced by diln. much more slowly than that of borocaine.

M. H. SOULE

Studies of the uric acid elimination through the kidneys and observations on the salt and water elimination. I. KAJ LINDBERG. *Finska läkaresällskapets handl.* 69, 899–936(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 716.—The elimination of endogenous uric acid in man is lowest during the night and attains its max. between 3 and 6 p. m., at which time the amt. of urine and the output of NaCl are also greatest. Polyuria was observed after the intramuscular injection of 0.1 or 0.3 mg. *adrenaline*; this continued as long as the blood pressure was decreased. When the blood pressure returned to normal oliguria appeared. Immediately after the injection NaCl elimination was reduced; this continued for 6 hrs. The *adrenaline* injection had no influence on the elimination of uric acid. When 1 mg. *atropine* was injected subcutaneously at 9 a. m., an abnormally small elimination of endogenous uric acid was observed during the 3 hr. period from 12 noon to 3 p. m. In an expt. in which no diuresis occurred slight, transient increase in uric acid was observed 90 min. after the intramuscular injection of 3 cc. of *pituglandol*. After injections of 2 and 3 cc. *pituglandol* a slight initial increase in uric acid elimination was observed. In another expt. in which increased diuresis was observed before the injection, the injection of 1.4 cc. *hypophysin* effected an expressed oliguria persisting at least 6 hrs. An influence on the elimination of endogenous uric acid was not noted. II. Experiments with intravenous calcium chloride injections and with cinchophen. *Finska läkaresällskapets handl.* 69, 993–1023(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 717.—In 3 expts.  $\text{CaCl}_2$  was injected intravenously into human subjects; in 2 of these 1 g. cinchophen had been given 4 hrs. before the  $\text{CaCl}_2$  injections. In each case there followed an increase in blood pressure (12–16 mm. Hg) lasting 8–9 mins. and a bradycardia which persisted for several hrs. A polyuria or short duration appeared at the same time as the blood pressure increase and was followed by a period of low urine elimination which in turn was followed by a large increase in the diuresis. In 2 cases the injection was followed by a large influx of  $\text{H}_2\text{O}$  from the tissues into the blood and in all cases by a large increase of the NaCl elimination which in 2 cases reached a remarkable amt. In the case which had not received cinchophen there was a slight increase in the uric acid elimination lasting for 30–60 mins. which was followed by a 5-hr. period in which this value sank below normal. In 4 expts. 1 g. cinchophen alone was given. Even in the first hr. following the ingestion of the drug higher values of the endogenous uric acid in the urine were observed. The serum during the first hr. after the cinchophen showed an increased uric acid content which gradually decreased so that in 1 case 9 hrs. after the cinchophen had been given the uric acid content of the serum was only 50% of the pre-exptl. value.

R. C. WILLSON

Pharmacological study of the adnexa uteri in different physiological conditions, with consideration of the attending uterus. MASAO FUJITA. Univ. Okayama. *Okayama-Igakkaï-Zasshi* 39, 2025–48(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 539.—F. examd. the freshly isolated ligamentum rotundum, tube and uterus of virgin, non-virgin non-pregnant rabbits, animals in the first and last stages of pregnancy and those in puerperium. Locke's soln. was used as the base soln. to which the following substances were added: *adrenaline*, *pilocarpine*, *quinine*, *nicotine*, *pituitrin*, *strophanthin*, *morphine*, *eserine*, *atropine*, *cocaine*, *Ba*, *papaverine* and *Ca* and *K* salts. *Adrenaline* nearly always had an irritating effect on the lig. rot. during the puerperium, in the last stage of pregnancy and usually in the first stage of pregnancy. On the virgin and non-virgin non-pregnant ligament its effect was inhibiting. The action of *adrenaline* on the

tube and uterus differs only in the virginal condition; the virginal tube is inhibited by a small amt. of adrenaline and is stimulated by a large amt.; adrenaline usually stimulates the uterus in every stage except in the puerperium. In the tube and the lig. rot. the inhibiting sympathetic fibers during virginity are much more sensitive, while later the proportion is inverted and becomes the same as in the tube and uterus. Effects on the lig. rot. in every condition: pilocarpine, Ca and papaverine, inhibiting; atropine, strophanthin, eserine, Ba and morphine, irritating. On the tube, adrenaline, quinine, cocaine and K have different effects in the different physiological conditions. Eserine, atropine, morphine, Ba, papaverine and strophanthin have the same action on the tubes and uterus as they have on the lig. rot. The effects of the other substances that were studied were varying, although those of adrenaline, quinine, nicotine, and cocaine did not differ very much from each other. In the virginal condition the inhibiting sympathetic fibers are sensitive while during pregnancy and puerperium the reverse is true. In the adnexal organs there is either no supply of parasymphathetic fibers present or these are less sensitive than those in the uterus. Eserine seems to exert an action on the muscles in addition to that on the nerves. R. C. WILLSON

The rhizome of iris (NIGRISOLI) 17. *Terminalia arjuna*; its chemistry, pharmacology and therapeutic action (CHOPRA, GHOSH) 17. The solubilities of Pb phosphates (MILLET, JOWETT) 2. O<sub>2</sub> formed by ultra-violet rays (DADLEZ) 3. New results of the chemistry of curare (FIRBAS) 10.

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

**Food preservation by canning.** C. O. BALL. Am. Can Co., Maywood, Ill. *Food Industries* 1, 262-3(1929).—A brief survey of the application of chem. and phys. factors to the com. canning industry. C. R. F.

**Food packing in glass.** S. HENRY AYERS. Glass Container Assoc., New York. *Food Industries* 1, 264-5(1929).—Chem. and phys. factors are described as applied to the preservation of food in glass containers. C. R. F.

**Cold packing of small fruits.** P. F. NICHOLS. Univ. Calif. *Food Industries* 1, 252-5(1929).—Fruits such as peaches, cherries or berries are packed with sugar in the ratio by wt. of 2:1 or 3:1, in bbls. or tins, quickly frozen at a temp. of about -13°, and maintained below -9.3° until used in such products as ice cream, jams, jellies, preserves or pies. C. R. F.

**Hygroscopy in flour ash and a discussion of direct ash weighing.** L. URNER LINDEL. *Cereal Chemistry* 6, 134-9(1929).—Uniformity of results is the aim of every analyst. The elimination of factors interfering with this is desirable. Variations in the weight of crucibles introduce errors. Direct weights of the ash would eliminate this, if direct weights are reliable. The reliability of these weights is shown in graphs and tables. The hygroscopic tendencies of flour ash affect the results very little in the period of time required for weighing the ash. L. thinks there is the possibility of the development of a rapid and accurate method of technic in the detn. of ash in flour by direct weighing. L. H. BAILEY

**The relation of hydrogen-ion concentration and buffer value to the baking quality of flour.** II. E. A. FISCHER AND P. HALTON. Research Assoc. Brit. Flour Millers, St. Albans, England. *Cereal Chemistry* 6, 97-115(1929); cf. C. A. 23, 1693.—Extensive baking tests have been carried out with a great variety of flours over wide ranges of H-ion concn. (from  $p_{H}$  7.80 to 4.20) and varying periods of fermentation. The results of the work appear to confirm the conclusion reached in an earlier investigation that H-ion concn. is not a factor of great importance in detg. dough or loaf quality. Alterations of H-ion concn., brought about in doughs by addns. of acid several times greater than those brought about by prolonged over-fermentation, appear to have singularly little effect on dough or loaf characters. Moreover, the effects observed are not always in the same direction, e. g., slight improvement of some characters and slight damage to others may result from increased H-ion concn. The effects most commonly but by no means invariably noticed are: (1) Increased dough toughness. Stability appears to be little affected, if at all. (2) More pronounced flavor (taste). (3) Often an improved color of crumb. L. H. BAILEY

**Correlation between diastatic power of flour and crust color in the test loaf and its significance.** M. J. BLISH, R. M. SANDSTEDT AND H. PLATENIUS. Univ. Nebraska, Lincoln, Neb. *Cereal Chemistry* 6, 121-7(1929).—When all flours are experimentally baked by the same specified and fixed procedure, in which all environmental factors are

precisely controlled, depth of crust color is positively and definitely correlated with residual sugar in the baked loaf on the one hand and with relative diastatic power and fermentation tolerance of the flour on the other.

L. H. BAILEY

Correlation studies with diverse strains of spring and winter wheats, with particular reference to inheritance of quality. H. K. HAYES, F. R. IMMER AND C. H. BAILEY. Minn. Agr. Expt. Sta., St. Paul, Minn. *Cereal Chemistry* 6, 85-96(1929).—The data from milling and baking trials of wheats of diverse nature were studied by means of correlation coefficients. Inter-annual correlation coefficients were computed for protein content, loaf volume, flour percentage, color score and texture score of loaf and kernel texture. Neither protein content nor kernel texture was significantly and consistently related to loaf vol. as detd. by calcd. correlation coeffs. With wheats of diverse nature, there was no indication of a significant positive relation between protein content and kernel texture.

L. H. BAILEY

Manganese in cereals and cereal mill products. JERHIEL DAVIDSON. Bur. of Chemistry and Soils, U. S. Dept. Agr. *Cereal Chemistry* 6, 128-33(1929).—Mn, ash and protein were detd. in 5 varieties of each of the following cereals: hard winter wheat, soft winter wheat, red spring wheat, white spring wheat, rye, corn, rice, oats and barley. Similar detns. were made on some of their extrn. products. No correlation was found between the Mn and the ash content either in the varieties of one cereal or in different cereals. Neither was any correlation found between Mn and protein except when the types of wheat are considered collectively. In that case, the relation was inverse, the hard winter and red spring wheats being higher in protein and lower in Mn than the 2 types of soft wheat. The Mn content of Red Rustproof oats grown in Arlington was several times higher than that of oats of the other varieties studied. There was no distinct correlation between the Mn content and the protein content of the cereal products, with the exception of the milling products of wheat. The products having a low ash content also had a low Mn content, both being due to the low degree of extrn. The results indicate that there is no correlation between the Mn content and the diastatic properties of the cereals studied. Corn and uncoated rice, which are assocd. with nutritional deficiency diseases, were both low in Mn.

L. H. BAILEY

The nutritive value of peanut meal. MAURICE BOIGEY. *Bull. acad. méd.* [3], 101, 284-6(1929).—Peanut meal has the following compn.:  $H_2O$  9.40, protein 58.20, fat 6.09, glucose 5.05, other carbohydrates 17.25, cellulose 0.49, ash 3.52. Comparative tables show that the digestibility is equal to that of meat. B. recommends that it be mixed with other flours.

A. E. MEYER

The effect of dry skim milk upon the water absorption of doughs and the plasticity of flour suspensions. J. L. ST. JOHN AND C. H. BAILEY. Agr. Expt. Sta., St. Paul, Minn. *Cereal Chemistry* 6, 140-50(1929).

L. H. BAILEY

Something about the constitution of Balata milk from Suriname. W. SPOON. *Ber. Afdel. Handelsmuseum Ver. Koloniaal Inst.* 33, 3-12(1927).—The sample of Balata milk received was preserved with  $NH_3$  water which gave it a slight pink color. The total solids were 53.8% on this sample and 56.0% without the diln. with the preservative. In general the  $H_2O$  content varies with the atm. at the time of tapping. The dry residue had the appearance of a dark brown skin of a rather tough texture, although more pliable than, e. g., Tjipetr gutta-percha. Analysis showed: ash 0.88, acetone ext. 41.5,  $H_2O$  ext. 11.7, total N 1.23, water-sol. N 0.26, xylene insol. 14.5, gutta 39.2, albuminoid substances 6.1%. The ash contained  $SO_4$ ,  $P_2O_5$  and Cl about in equal proportions, Ca, Mg and a little Na.

J. C. JURRIENS

Provisional definitions for preserved milk products. F. E. NOTTBOHM, Z. *Untersuch. Lebensm.* 56, 63-72(1928).—Criteria and methods of evaluation of preserved milk products are discussed. The provisional definitions drawn up by the Commission of the Ver. deut. Nahrungsmittelchemiker and the Verbands deut. Dauermilchfabrikanten are given.

C. R. F.

Evaporated milk a ready source of supply. FRANK E. RICE. Evapd. Milk Assoc., Chicago. *Food Industries* 1, 258-9(1929).—No new data are presented. It is claimed that the Ca and P in evapd. milk are assimilated as readily as these minerals in fresh milk. The protein and fat of evapd. milk are more readily digested than if obtained from fresh milk.

C. R. F.

The estimation of fat in malted milk. C. W. BALLARD. *J. Am. Pharm. Assoc.* 18, 122-3(1929).—Of several methods tried the Rose-Gottlieb method modified gave the best results. Because of the difficult and imperfect soly. of malted milks and the difficulty of measuring aliquot portions accurately the official method gives erroneous results. The app. is modified by using a Röhrig tube larger than the standard size and having the lower 25 mm. detachable and fitted on with a ground-glass joint.

The detachable portion is used as a weighing tube or capsule. One g. of the sample is weighed in the detachable tube and 10 cc. of warm  $H_2O$  is added. The tube is shaken thoroughly to insure soln. of the material and the assay completed by the A.O.A.C. method for milks. Four samples yielded from 0.44 to 0.90% of fat.

L. E. WARREN

**Improving the quality of cheddar cheese by pasteurizing the milk.** J. C. MARQUARDT. *Food Industries* 1, 305-7(1929).—In 186 comparisons of cheddar cheese made from raw and pasteurized milk, there was slight but distinct improvement in score in favor of the pasteurized product. Both flash and holding methods of pasteurization were successfully used. Besides the technical advantages which render the quality of milk for cheese purposes more nearly uniform, pasteurization of milk for cheese-making purposes possesses the addnl. advantage of being conducted at a temp. high enough to destroy pathogenic organisms present in milk.

C. R. F.

**The chemical constitution of buffalo flesh (*Bos bubalus*).** C. COLELLA AND M. NAPOLI. *Arch. sci. biol.* 13, 235-40(1929).—Buffalo flesh contains in %:  $H_2O$  75.96, total solids 24.04, ash 1.15, total N 3.49, fatty acids 1.11, total P 0.186, inorg. P 0.142, lipid P 0.033, and nucleic acid P 0.11. The fat m. 36-37°, I no. 41-42, sapon. no. 198. According to these results, therefore, there is no marked differences between the nutritive value of bovine and of buffalo flesh.

PETER MASUCCI

**Infected ice causes discoloration of halibut.** F. C. HARRISON AND W. SADLER. McGill Univ. *Food Industries* 1, 308-12(1929).—Yellow discoloration of halibut was proved to be due to the growth of *Ps. fluorescens*. The principal source of this bacteria was infected ice, and fresh wash water on the fishing boats. The organism was not present in sea water or on freshly caught halibut. Chlorination of water for ice-mfg. purposes is advocated.

C. R. F.

**The determination of roasted sugar beet in a mixture with chicory.** J. VONDRÁK. *Listy cukrovar.* 47, 363-4(1929).—Ten g. of dried sugar-beet powder was boiled with 50 cc. water, made up to 100 cc. and left standing overnight. The vol. was corrected to 100 cc. and filtered. Ten cc. (1 g. of solid matter) was dild. to 100 cc. and the degree of coloring was read on a Stammer colorimeter. The coloring matter in the ext. increases with the roasting, passes through a max., and decreases with overroasting. The N present in chicory as total N per specimen, total N in ext., N in betaine and N in choline was detd. As roasting progresses, the extractable N decreases and is distributed to volatile N compds. or to coagulated albumins, etc., whose N increases correspondingly. The N content of combined choline and betaine mixts. remains const. for chicory, but is 7 times as high for beets. The chicory showed no betaine and 13 mg. choline N per 100 g. of original chicory. Beets showed 91. mg. N as betaine and 4 mg. N as choline per 100 g. of original beet. The betaine results are quant.; the choline does not represent the total choline present, for not all of it is pptd. V. considers the detection of betaine as an indication of the presence of roasted sugar beets in chicory; the quantity of betaine is not an index as to the quantity of beets added, for the betaine content of beets changes with seasons. Raw sugar contains betaine and will give betaine tests if used in the adulteration of chicory. Roasted carrots are free of betaine and cannot be detected by this method.

FRANK MARESH

**New grape beverages.** H. B. FARLEY. Fruit Products Lab., Univ. Calif. *Glass Packer* 2, 163-6(1929).—Carbonated, blended grape juices, concd. grape sirups for soda fountain and table use, and grape-citrus juice beverages were prepd. from Calif. grown fruits. Some of these products possess merit and are being investigated more thoroughly.

C. R. FELLERS

**How maple sirup is made.** F. S. MEYER. *Glass Packer* 2, 160-2(1929).—The standard wt. for maple sirup is 11 lb. per gal. Approx.  $\frac{1}{2}$  of the total production is crystd. into maple sugar. A huge amt. of the low-quality sugar is used for tobacco curing.

C. R. FELLERS

**Processing and packaging California raisins.** P. D. V. MANNING. *Food Industries* 1, 316-8(1929).

C. R. F.

**Self-emptying suction flask for sugar determinations (PITMAN) 1.** Rennin action in relation to enterokinetic phenomena (RICHARDSON, PALMER) 11A. Physiological shrinkage of potatoes in storage (APPLEMAN, et al.) 11D. Caffeine [removal from bean] (Swiss pat. 128,984) 17. Drying cellulosic tubing [sausage casings] (U. S. pat. 1,708,937) 23. Apparatus for carbonating beverages or other liquids (U. S. pat. 1,709,579) 1.

**Food product from vegetable oils.** ROBERT B. CHAMBERLAIN (to Vegetable Products Inc.). U. S. 1,710,403, April 23. A product which is suitable for use in cooking foods

comprises a suitable vegetable oil such as coconut oil in aerated condition and having a relatively high m. p. and a minor proportion of another vegetable oil such as peanut oil also aerated and having a lower m. p.

**Preserving foods.** C. MOHRENWEISER AND J. MOHRENWEISER (trading as C. Bertram). Brit. 298,061, Feb. 4, 1928. Various food products such as fruits, sausages, hams, eggs, cheese, chocolate and confections are coated or sprinkled with a "base material" such as paraffin, neat's-foot oil, beef tallow or a powdered material such as lime, chalk, dolomite or talcum to which is added a small quantity of a mixt. of colophony, Na benzoate, benzoic acid, salicylic acid, spiraein and  $(\text{NH}_4)_2\text{CO}_3$ . The treating substances may be washed off the food before use.

**Apparatus for preserving foods in sealed containers in closed retorts by steam treatment.** GEORGE W. MULLEN (to Anchor Cap and Closure Corp.). U. S. 1,709,481, April 16.

**Process, apparatus and products for the preparation, coating and wrapping of foodstuffs for their preservation.** P. T. VENAIL. Belg. 353,641, Sept. 30, 1928. The products (e. g., pieces of meat) are placed in a cylindrical, hermetically sealed container filled with an atm. of  $\text{CO}_2$ , which can be recovered in the course of the treatment. The  $\text{H}_2\text{O}$  contained in the meat is entrained by the  $\text{CO}_2$  and is removed by a chem. absorbent. The dried and sterilized products are coated with a mixt. of  $\text{H}_2\text{O}$ , gelatin, NaCl, gum arabic, glycerol, alkali salicylate and a coagulant.

**Extraction and transformation of harmful substances contained in foodstuffs.** G. ORESPIN. Belg. 352,826, Aug. 31, 1928. The foodstuff is placed in contact with a liquid which is very sol. in water, preferably an acid or a neutral liquid; e. g., raw coffee beans are immersed in hot benzoic acid, preferably at  $50^\circ$ .

**Heat treatment of flour.** CHARLES W. CHITTY and DOUGLAS W. KENT-JONES (to Woodlands, Ltd.). U. S. 1,710,472, April 23. By heating flour (suitably at about  $85^\circ$  or somewhat lower for 8-10 hrs.), a product is obtained which forms a plastic mass when mixed alone with water but which is suitable for admixture with ordinary flour to increase the "strength" of the flour for baking purposes. U. S. 1,710,503 specifies a generally similar heat treatment of wheat previous to manuf. of flour from it.

**Ferments for bread making.** THE BRITISH ARKADY CO., LTD. Fr. 648,077, Feb. 1, 1928. A ferment for bread making is prepd. by mixing yeast and an enzyme-producing fungus such as *Aspergillus oryzae* or *Penicillium*. Yeast cultivated on a paste of wheat, maize or rice flour may be incorporated in the fungus, or the fungus cultivated on rice, barley, etc., may be added to yeast.

**Apparatus for pasteurizing milk or other liquids in bulk.** CREAMERY PACKAGE MFG. CO. Brit. 298,379, Sept. 23, 1927.

**Apparatus for sterilizing liquids such as milk by heating in cans.** FREDERIC C. HUYGEN. U. S. 1,709,175, April 16. Structural features.

**Device for heating milk to ripen it for churning.** OLIVE B. STRANGE. U. S. 1,709,287, April 16.

**Fermented food product from milk.** GUSTAV WINKLER (to Alfred Zierer). U. S. 1,710,133, April 23. Milk is fermented with yoghurt bacteria, acid- and rennet-producing cocci and yeasts which do not produce alc. or  $\text{CO}_2$ .

**Beverages formed with milk, cocoa and agar, etc.** CHARLES E. NORTH (to Dairy Drink Co.). U. S. 1,710,504, April 23. A mixt. comprising milk, cocoa and agar is heated under pressure to coagulate the milk and effect such a correlated thickening by the heating and by the agar that a product is produced of such viscosity as to hold substantially all the cocoa particles in suspension. U. S. 1,710,505 relates to a similar compn. in which a vegetable gum such as gum arabic or tragacanth is used instead of agar. U. S. 1,710,506 specifies the use of milk, cocoa and gelatin. U. S. 1,710,507 specifies milk, cocoa and a thickener such as corn starch. U. S. 1,710,508 specifies heating milk to about  $115^\circ$  under a pressure of about 15 lbs. per sq. in. for about 30 mins. to coagulate and thicken and increase the normal friction of the milk, and then adding cocoa and sugar; the cocoa is held in suspension. Cf. C. A. 23, 1185.

**Butter and margarine.** E. GFELLER. Brit. 297,457, Sept. 22, 1927. To improve their keeping qualities, butter and margarine are melted by heat which is applied to destroy bacteria; sepg. of watery constituents incidental to the melting is prevented by energetic agitation which is continued until the melted fat has resolidified.

**Cheese.** L. H. STEDFORD. Brit. 298,174, July 1, 1927. Curd formed as in ordinary cheese manuf. which may be ripened for about 24 hrs. is ground and then pasteurized and simultaneously emulsified while mechanically agitated in a thin layer (with or without addn. of an emulsifying salt). A product is obtained which on cooling and solidifying in packages assumes a condition which permits heating or melting with-

out material sepn. of butter fat. Sour milk, ground mature cheese or lactic acid culture may be added to modify the flavor. An app. is described.

**Cereal meal.** WALTER N. BOYES. Australia 13,142, May 4, 1928. Cereal meals are produced by cooking cleaned air-washed grain in a digester at 212–215° F. for 2 2½ hrs. at a pressure of 4–15 lbs. per sq. in., cooling to 60° F., mixing with 6% NaCl, drying and baking at 135–145° F. for 1¼–1¾ hrs., cooling to 60° F., grinding and sifting.

**Preserving sugar and confectionery compositions by adding a small proportion of ethyl alcohol.** H. MAUTNER. Brit. 297,338, June 15, 1927. Ordinary crystd. "starch sugar" may be re-crystd. from alc. or a normal starch-sugar soln. may be thickened and mixed with EtOH, seed crystals added and the mass stirred and allowed to solidify. The process is applicable to crystd. invert sugar, levulose, maltose and to sugar solns. mixed with flavoring substances. Volatilization of the alc. may be prevented by coatings such as chocolate, icing sugar, fondant paste, tragacanth or gelatin, or by molding under pressure so that the surface of the sugar melts and forms a non-porous coating.

**Packaging jelly powders with flavoring materials.** W. M. SHIRKIFF, F. W. SHIRKIFF and C. H. SHIRKIFF. Brit. 298,123, Oct. 3, 1927. A flavoring material such as a coned, highly flavored sugar sirup may be dropped into molds made of starch or similar material to form coated globules suitable for placement in a package of unflavored jelly powder.

**"Crystallized fruits."** B. GERNHARDT. Brit. 297,927, Aug. 15, 1927. Fruit is stewed with water in a closed vessel and then treated in the same vessel with CO<sub>2</sub> under high pressure and with a sugar soln. contg. 66 percent sugar and formed by dissolving sugar in cold water. An app. is described.

**Conditioning tea by suitable heating and air treatments.** CARRIER ENGINEERING CO., LTD. and K. J. R. ROBERTSON. Brit. 297,900–1, July 7, 1927. App. and various details of procedure are described.

**Artificial production of coffee aroma.** INTERNAT. NAHRUNGS- U. GENUSSMITTEL A.-G. Swiss 128,720, Sept. 16, 1926. The colorless oil produced by the action of furfuryl-2 mercaptan on diacetyl has a coffee-like aroma. Cf. C. A. 23, 916.

**Foods for animals.** C. N. KJÆRGAARD. Brit. 297,596, Nov. 23, 1927. Waste materials contg. binding or adhesive substances such as waste from breweries, sugar factories or canning factories or stalks and roots of plants are dried until they contain not more than about 16% water and are then compressed under high pressure and heated to about 55° to form a solid cake which is held together by the binding or adhesive substances. Cf. C. A. 23, 1968.

### 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**The theory of dust removal from gases by dry methods.** BRUNO WAESER. *Metallbörse* 18, 1573–4(1928).—The literature and patents for mech. and electrostatic dust removal methods are reviewed in detail.

E. M. SYMMES

**Purification of gases, particularly chlorine, by repeated liquefaction.** ROLAND WASMUTH. *Chem. Fabrik* 1929, 145–7, 158–9. Cl b. –33.5°. Since this point is higher than the point at which impurities such as CO<sub>2</sub>, HCl, O<sub>2</sub>, CO, N<sub>2</sub> and H<sub>2</sub> boil, evapn. of liquid Cl at low temp. and re-liquefaction purify it to a point where no traces of foreign gases can be detd. by absorption in Hg in a Winkler buret or by passing it at 1150° over dried, de-aerated charcoal, with detn. of loss of wt. of the charcoal. Other gases can be purified similarly. An app. is described.

E. M. SYMMES

**Storage of acetylene.** J. HAUSEN. *Metallbörse* 18, 593–4, 706–8, 930–1(1928).—A review of literature, safety tests and regulations governing acetylene cylinders.

E. M. SYMMES

**The use of the Degea carbon monoxide apparatus.** KARL WOLLIN. *Gas u. Wasserfach* 72, 210–13(1929).—The construction and use of the Degea CO mask are described. The canister incorporates a warning agent which gives warning of the approaching exhaustion of the active agent (metallic oxides). This mask can be used in atms. contg. up to 1.8% CO and as low as 18.5% O. Novel methods of fitting the mask to the individual face are described.

R. W. RYAN

**Method for the classification of the hazards of liquids.** A. B. NUCKOLLS. *Underwriters' Labs.*, Mar. 1929, 20 pp.—The hazard of a liquid is obviously dependent on the various chem., phys. and physiol. properties it possesses. The relative hazards of different liquids depend on the differences of their various properties. Evidently rating these liquids from comparison of such numerous and varied data requires unusual expert

knowledge but the appraiser and others rating a fire risk must take account of such relations. N. has, therefore, devised a plan of rating through which the results are entered on an arbitrary scale for use of the appraiser. The method is described and discussed at length.

CHARLES E. MUNROE

**Dewatering and drying in some manufacturing processes.** MARTIN L. GRIFFIN. *Am. Dyestuff Repr.* 18, 29-33(1929).—Possible research problems and desirable operating conditions are suggested in connection with the use of squeeze rolls and driers.

ARTHUR K. JOHNSON

**Collected colloid references. VIII. Flotation.** KARL KELLERMANN. *Kolloid Z.* 47, 268-78(1929).—A literature survey with numerous references. General theories are mentioned and the role of capillary and surface forces is discussed. Foam-producing materials and foam stabilizers are reviewed, and the mechanism of foam production from both practical and theoretical viewpoints is discussed.

L. F. MAREK

**Infringement solids.** GHEURV DE BRAY. *Chemistry and Industry* 48, 332-4(1929).—Sometimes—especially in the interpretation of patent specifications—it is necessary to delineate the boundary sepg. certain limiting proportions in which 3 substances are brought together to form a mixt., compd. or alloy, from all other possible proportions. A graphic solution of this problem is offered, the final figure taking the shape of a solid. Not always can one tell at a glance whether a given proportion of a certain component would be within the specified limits, and then a second field would have to be mapped out within the first; the intervening shell then constitutes the author's "infringement solid."

W. C. EBAUGH

**Can cheaper power be obtained by pretreating coal?** WALTER R. KNAPP AND PAUL McMICHAEL. E. L. Phillips Co., N. Y. City. *Power* 69, 665-9(1929).—On the basis of 8 studies the following conclusions were reached: (1) With a combined coke-oven power-generating plant it is possible to generate power with coke and breeze more cheaply than in a straight steam-generating plant but the returns on addnl. investment are only 5 to 10%. (2) With a combined complete gasification retort power-generating plant it is possible to generate power more cheaply than in a straight steam plant but not so cheaply as in a combination coke-oven power-generating plant using coke and breeze. (3) Any combined gas-elec. plant depending on sale of by-product coke is unprofitable because of a large increase in capital investment and difficulty in disposition of coke. (4) Building a combined gas-elec. plant dependent on the sale of gas as a by-product is unsound because of the large increase in capital expenditure. (5) A combined gas-elec. plant is profitable only when its cost equals or only slightly exceeds the cost of a straight steam-generating plant. (6) The capital required for any combined gas-elec. plant where provision is made for recovery of all by-products so greatly exceeds that required for a straight steam-generating plant that the possibility of cheapening elec. power generation by processing bituminous coal appears remote. Also in *Chem. Met. Eng.* 36, 281-5(1929).

D. B. DILL

**Waste heat recovery.** W. GREGSON. *Proc. Inst. Mech. Eng. (London)* 1928, 169-236; cf. *C. A.* 22, 3281, 3938.—G. discusses the main aspects of waste heat recovery by steam-raising in connection with steel plants, the carbonizing industry and marine oil engines. Typical performance figures are given.

D. GORDON

**The conversion of batch into continuous processes.** J. V. N. DORR. *Ind. Eng. Chem.* 21, 465-71(1929).—Dorr equipment made the conversion feasible not only in metallurgy but also in the chem. manuf., sewage and water treatment, in the sugar, iron and paint manuf.

R. D. BUMBACHER

**Untreated fabrics for electrical purposes.** A. R. DUNTON AND A. W. MUIR. *Electrician* 102, 439-41(1929).—Special needs of the elec. industry are discussed and the characteristics of some materials available enumerated. There has been an increasing use of fine silks and asbestos. The ideal elec. fabric would have min. thickness, abs. uniformity, sufficient mech. strength to ensure tight and clinging application and good aging properties, even at high temp. Standard specifications are suggested.

C. G. F.

**Renaissance of the absorption refrigeration cycle.** FREDERICK G. KEYES. *Mass. Inst. Tech. Ind. Eng. Chem.* 21, 477-80(1929).—Different types of absorption cycles are, (a) gas-liquid; (b) gas-solid: (1)  $\text{NH}_3 + \text{BaCl}_2 \longrightarrow \text{BaCl}_2 \cdot 8\text{NH}_3$ ; and (2) gas-gel. The advantages and disadvantages of each type are discussed. Curves giving the cost of operation of standard manufactured units are given.

J. H. FERRY

**WALLER, PETER:** *Probleme der deutschen chemischen Industrie.* Halberstadt: H. Meyer. 241 pp.

**Purifying gases.** **KALI-INDUSTRIE A.-G.** Fr. 649,220, Feb. 17, 1928. Gases are passed through a vessel in which hollow cylinders are caused to rotate and through which cooling liquids pass. Impurities from the gases condense on the cylinders and are withdrawn at the base.

**Purification of gases.** **GEORGES L. É. PATART.** Fr. 648,516, Feb. 7, 1928. S compds. contained in gases to be used in catalytic reactions, particularly CO gases, are removed by washing the gases by means of the liquid products obtained by the catalytic reaction, such as alcs. or liquid CO<sub>2</sub>.

**Liquefaction of gases.** **JOSEPH BLERVACQ.** Fr. 649,361, Feb. 22, 1928. In the liquefaction of gases a part of the liquefied gas is evapd. to produce further condensation by difference of pressure.

**Treating gases with finely divided substances.** **METALLBANK UND METALLURGISCHE GESELLSCHAFT A.-G.** Fr. 648,525, Feb. 8, 1928. See Brit. 285,038 (C. A. 22, 4678).

**Separating oil from gases.** **H. A. FRAGER, W. L. PRICE and J. HETHERINGTON.** Brit. 297,622, Jan. 12, 1928. Gases such as those carrying lubricating oil are passed over small sheet-metal baffles on which the oil deposits and whence it passes to a collection chamber. An app. is described.

**Heat-transfer system for separating gases by liquefaction.** **GES. FÜR LINDE'S EISMASCHINEN A.-G.** Brit. 297,842, Sept. 30, 1927. A system is described in which, for the rectification of a mixt. of methane, ethylene and propylene, an auxiliary mixt. of CH<sub>4</sub> and C<sub>2</sub>H<sub>6</sub> may be used which by condensation and vaporization conveys heat to and from the gas mixt. undergoing liquefaction and rectification. Cf. C. A. 23, 2023.

**Revaporizing liquefied gases.** **GES. FÜR INDUSTRIEGASVERWERTUNG.** Brit. 297,384, Sept. 20, 1927. To produce gas under a pressure greater than the critical pressure, the container is heated internally or externally. An app. is described.

**Separator system for removing dust from blast-furnace gases, etc.** **C. T. MORSE and E. L. HOGAN** (to American Blower Corp.). Brit. 297,446, Sept. 22, 1927. Various structural details are given of a system comprising at least 2 dust separators and an intervening disintegrator into which water is sprayed.

**Gas storage.** **FIRM OF P. LECHLER.** Brit. 297,671, Sept. 24, 1927. In storing gas in liquid-sealed gasometers, contamination of the gas with the vapor of the sealing liquid is prevented by coating the liquid with a soln. of a solid bitumen, ozokerite, paraffin or the like in a mineral oil.

**Cyclic system for recovering oil vapors from gases by adsorption.** **SAKAO YAMAMOTO.** U. S. 1,710,284-5, April 23. Both patents describe various details of app.

**Producing foam from liquids and gases.** **R. SCHNABEL, J. JACOBSON and EXCELSIOR FEUERLOSCHGERÄTE A.-G.** Brit. 297,782, May 24, 1927. Both the gas and soln. used are subdivided and intermingled by passing them under pressure, preferably together, through porous material such as ceramic material, stacked sieves or plates of asbestos, textile fabric, sponge, gravel, or other filtering materials. An app. is described.

**Grinding horn, casein, resins, cellulose derivatives, glass and other materials.** **H. OERMANN.** Brit. 297,841, Sept. 30, 1927. A flour-fine product is obtained by intermittent dry grinding. Various mech. details are described.

**Moldable composition comprising asphalt and rubber.** HERBERT A. WINKELMANN (to Philadelphia Rubber Works Co.). U. S. 1,709,241, April 16. A compn. suitable for molded insulators or battery jars is prepd. by heating and blowing with air a mixt. comprising an asphalt, an oil flux and rubber.

**Closed-circuit respirators.** DEUTSCHE GASGLÜHLICHT-AUER-GES. AND HANSEATISCHE APPARATEBAU GES. FORM. L. VON BREMEN & Co. Brit. 297,808, Sept. 29, 1927. Structural features.

**Refrigerators.** WILLIAM A. McNUTT and RICHARD P. LAWRENCE. Australia 10,815, Dec. 9, 1927.

**Refrigerating machine.** GEBRÜDER SULZER A.-G. Swiss 129,379, Aug. 11, 1927.

**Refrigerating plant with multi-stage condenser.** AKT.-GES. DER MASCHINEN-FABRIK ESCHER WYSS & CIE. Swiss 129,380, Oct. 1, 1927.

**Absorption refrigerating apparatus.** WILLIAM M. BAXTER (to Wayne Home Equipment Co.). U. S. 1,708,998, April 16.

**Absorption refrigerating machine.** GEBRÜDER SULZER A.-G. Swiss 128,818, Aug. 6, 1927.

**Absorption refrigerating machine with intermittent action.** GEBRÜDER SULZER A.-G. Swiss 128,557, Dec. 8, 1926. Details of construction.

**Refrigerating system of the absorption type.** PLATEN MUNTERS REFRIGERATING SYSTEM AKTIEBOLAG (to Electroflux, Ltd.). Brit. 297,836, Sept. 29, 1927. Structural features.

**Refrigerating apparatus of the absorption type.** SULZER FRÈRES SOC. ANON. Brit. 297,451, Sept. 22, 1927.

**Refrigerating system of the absorption type.** MAX ALEX. U. S. 1,710,333 4, April 23.

**Refrigerating system of the absorption type.** ANDREW J. SWEENEY U. S. 1,710,438, April 23. Structural features.

**Refrigerating system of the absorption type.** ALVAR LENNING (to Electroflux Servel Corp.). U. S. 1,709,588, April 16. A liquid such as  $\text{NH}_3$  is vaporized in the presence of a non-condensable gas such as H by a mixt. of refrigerant such as  $\text{NH}_3$  and entrained vapor of absorption liquid such as water to sep. the absorption liquid from the refrigerant while maintaining the first-mentioned liquid and refrigerant in sep. closed systems. An app. is described. Cf. C. A. 23, 2514.

**Refrigerating system of the compression type.** WILLIAM DUNKERLEY U. S. 1,710,300, April 23.

**Condenser for refrigerating apparatus.** ROLLIN M. HYDE (to McCord Radiator & Mfg. Co.). U. S. 1,709,176, April 16. Structural features.

**Insulating material.** EMIL HAEFELY & CIE A. G. Swiss 128,831, July 19, 1927. Artificial resin and wood shavings are subjected to pressure and heat to make hard, porous, damp-free insulating material.

**Insulating materials.** GEORG J. MEYER. Ger. 473,111, Feb. 7, 1928. In prepg. plates, tubes, etc., for insulating purposes from synthetic resins, the resin is caused to harden from within outwards by periodically cooling the outer parts relatively to the inner parts.

**Electric insulation.** I. G. FARRENIND. A. G. Brit. 297,749, Sept. 26, 1927. Insulation suitable for use on wires is prepd. by satg. paper or textile material with a soln. of a cellulose ester of a higher aliphatic acid (suitable as an acid contg. over 10 C. atoms). Mixed esters, ether-esters, or insol. esters which are plastic under pressure when warmed also may be used.

**Insulating and protective coverings for electric cables.** SIEMENS BROS. & Co., LTD. and A. E. FOSTER. Brit. 298,318, Aug. 9, 1927. Cables, the cores of which are insulated by paper or similar hygroscopic material, with a covering of Pb or Pb alloy, have the latter further covered with layers of a rubber compn. or "rubber bitumen" which are sepd. from each other by layers of adhesive material, consolidated by heat and pressure. Various details are described.

**Composition suitable for insulators or battery jars comprising asphalt, rubber and pine tar.** HERBERT A. WINKELMANN (to Philadelphia Rubber Works Co.). U. S. 1,709,242, April 16. A heated mixt. comprising a petroleum-oil flux, pine tar, an asphalt and rubber is blown with air.

**Joining metal veneers to thick slabs or tiles for heat or sound insulating, etc.** A. A. MEAD and MEAD, McLEAN & Co., LTD. Brit. 297,867, June 29, 1927. Veneers such as thin iron sheets are united to thick tiles or the like by an intermediate layer such as paper impregnated with glue or cement. Various structural details are described.

**Plastic substances.** PAUL E. BASSET. Fr. 649,152, July 8, 1927. A plastic

substance having heat and elec. insulating properties is prepd. by condensing glutens, or generally, vegetable proteins, with simple or substituted phenols in the presence of catalysts. Residues from starch works and ordinary phenol dissolved in formol may be used, and the most suitable catalysts are NaOH or  $ZnCl_2$  or the hydrate obtained by treating  $ZnCl_2$  with excess of NaOH.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**A troublesome water supply.** R. H. ALEXANDER. *Zentr. ges. Hyg.* 18, 323(1928); *Wasser u. Abwasser* 25, 170. — A 320 ft. well from which water was raised by air pressure yielded a dirty, peat-colored water. Filters quickly clogged with the fine particles of suspended matter, thus seriously cutting down their efficiency. Treatment with  $Al_2(SO_4)_3$  and filtration corrected the trouble. C. R. F.

**Water-supply chemistry on the Florida East Coast Railroad—its cost and benefits.** W. H. HOBBS. *J. Am. Water Works Assoc.* 21, 337–45(1929).—One of the greatest results of the use of water chemistry has been the discovery of improved supplies. Most of the waters are soft and of good quality and the problem of further treatment is not a serious one. D. K. FRENCH

**Operating experiences with the water purification plants of the East Bay Water Company.** WILFRED F. LANGELIER AND JOSEPH D. DeCOSTA. *J. Am. Water Works Assoc.* 21, 318–30(1929).—The 2 plants under discussion supply impounded waters of high mineral and org. content. Plankton and algae grow readily.  $CuSO_4$  treatment is necessary. The methods of coagulation, filter handling and sedimentation are described, as well as rearrangements of the flow, which have greatly increased the plants' efficiency. D. K. FRENCH

**City of Hamburg waterworks.** W. HOLTHUSEN AND R. SCHIRÖDER. *Separate from "Industrie Bibliothek"* in 25 vols. M. Schroder, Berlin. 14 pp; *Wasser u. Abwasser* 25, 168–9(1929).—An historical survey of Hamburg's water supply from 1370 to the present time.  $Cl$  is added to the sedimented water at the rate of 0.4–0.8 g. per cu. m. and also to the filtered water at the rate of 0.15–0.6 g. per cu. m. The purified water is often sterile and is always of excellent bacteriol. and phys. quality. Cf. C. A. 23, 224. C. R. F.

**Suitable and simple methods of potable water analysis.** J. KABELIK AND H. KABELIKOVA. *Centr. Bakt. Parasitenk.* 1 Abt., Ref. 90, 130–40(1928); *Wasser u. Abwasser* 25, 161(1929).—A treatise on water analytical methods including treatment, classification and disinfection rules. C. R. FELLERS

**New method for determining small amounts of dissolved oxygen.** F. R. McCURM AND W. R. KENNY. *J. Am. Water Works Assoc.* 21, 400–7(1929).—A colorimetric method, using *o* tolidine as the indicator, is described. The reasons for its development, as well as some of the problems encountered, are given in considerable detail. D. K. FRENCH

**Determination of dissolved oxygen in water.** BACH. *Gesundh. Ing.* 52, 36–7(1929).—The detn. of dissolved O is becoming very important in modern water analysis. The following method was devised to simplify the detn. so that non-chemists might use it. The probable error is not more than 0.25 mg. per l. The theory of this method is relatively simple. A dye which is decolorized by reducing agents is employed. At first the reducing agent is oxidized by the dissolved O. When all of the O has been used, the dye is decolorized. Hence the dye serves as an indicator. The reducing agent is  $Fe(NH_4)_2(SO_4)_2 \cdot 7H_2O$ , and the dye is phenosafranine. Five cc. of alk. tartrate soln. (350 g. Rochelle salt and 100 g. pure NaOH dissolved in water and diluted to 1 l.) and 2 or 3 drops of phenosafranine (0.5 g. per l.) are added to 50 cc. of water. Standard ferrous  $NH_4$  sulfate (2.15 g. per l.) is added until the dye is decolorized. Care should be taken to prevent absorption of O. One cc. is equiv. to 0.05 mg. O. W. L. D.

**Spray aerator for filtered water at Waterford, N. Y.** R. G. YAXLEY. *Eng. News-Record* 102, 498–9(1929).—Installation of a 1.5-mg. d. spray-type aerator at Waterford, N. Y., has reduced tastes and odors in the filtered water and also reduced the amt. of  $Na_2CO_3$  required to render the water non-corrosive. The supply is drawn from the Hudson River and is soft, highly-colored and badly polluted with paper-mill waste and sewage. The high dosage of alum required for coagulation, together with 4–5 p. p. m. free  $CO_2$  in the river water, renders the water unsuitable for use without treatment to reduce its corrosiveness. The reduction in  $CO_2$  effected by aeration is shown graphically, the percentage removal varying from 56 to 84%, being lower with cold water. It is

reported that the "soap hardness" of the water is reduced as the water passes through the aerator, the reduction being as high as 37%. R. E. THOMPSON

**Mechanical agitators for the Knoxville water works.** W. W. MATHEWS. *J. Am. Water Works Assoc.* 21, 235-40(1929).—The Knoxville supply is taken below the junction of 2 rivers, one of which is soft, colored and turbid. Tannery wastes are largely responsible. The other is hard and clear. The mixed waters are easier to handle than either one separately. Mech. agitators are used to simplify control in treatment and to make uniform the mixt. to be treated. D. K. FRENCH

**The stability of mineral waters.** K. HARPUDE. *Z. wiss. Bäderkunde* 2, 968-70 (1928); *Wasser u. Abwasser* 25, 165.—Losses in storage result from (1) loss of certain volatile constituents such as CO<sub>2</sub> and Ra emanation; (2) chem. reactions like oxidations, decompn. of sulfides and formation of insol. compds.; (3) phys.-chem. processes such as the formation of colloidal particles or visible ppts. and the formation or splitting up of complex compds.; (4) the absorption of foreign substances like atm. O and bacteria; and (5) certain phys. influences as, for example, temp. The stability is dependent upon several factors. Insol. carbonates of Ca or Ba as well as Cu, Mn, or Fe salts may ppt. or lose their catalytic properties on long storage. Loss of Ra emanation is sometimes very marked in long stored samples of radioactive mineral water. C. R. F.

**A survey of the important mineral water groups.** P. PICCINI. *Giorn. reale soc. ital. d'igiene* 50, 66-73(1928); *Wasser u. Abwasser* 25, 165.—A description and classification of the mineral water sources of Italy and Europe. C. R. F.

**Mineralogy of Caucasian mineral water districts.** N. PLATONOW. *Verh. Balneolog. Inst. nordkaukas*; *Mineralwasser* 5, 38-43(1927); *Wasser u. Abwasser* 25, 165.—A description of the minerals commonly found in the plains and mountains of N. Caucasus. Their close relationship to the compn. of the mineral waters is pointed out. C. R. F.

**The mineral waters of Salins-Moutiers and of Bride-les-Bains (Savoie).** D'ARSONVAL, F. BORDAS AND F. TOUPLAIN. *Ann. fals.* 22, 70-6(1929).—The compn. has not varied appreciably since the analysis published by Willm in 1888. The most important characteristic of these waters is the fact that in contact with the atm. there seps. out a highly ferruginous deposit, contg. 8-9% As and 0.1% Li<sub>2</sub>O, while the water itself contains only very slight traces of these two elements. A. PAPINEAU-COUTURE

**Chlorination of drinking water.** G. NACHTIGAL AND P. KEIM. *Tech. Gemeindeblatt* 30, 329(1928); *J. Am. Water Works Assoc.* 20, 444.—Chlorination practice in Europe and America is reviewed. Prechlorination of raw water is commended and the effect of temp. on the chlorination process is pointed out. A. I. ELDER

**Accidental over-chlorination of water.** ULSAMER. *Z. Desinfektionswesen* 20, 182-3 (1928); *Wasser u. Abwasser* 25, 175.—Melting snow may cause over-chlorination because of the low org. content of snow water. Since a slight excess of free Cl in water readily unites with org. matter in the stomach, no harm results to the human organism. It is better to err on the side of safety than to allow infected water to be used. C. R. F.

**Chlorination of deep well supply for taste and odor removal.** M. F. TRICE. *J. Am. Water Works Assoc.* 21, 255-7(1929).—Iron bacteria in the distributing system were found to be responsible for the taste and odor complained of. As flushing was ineffective, the mains were sterilized with Cl, the work being done at night. D. K. FRENCH

**Chlorination of coagulated water.** J. S. WHITENER. *J. Am. Water Works Assoc.* 21, 258-61(1929).—Prechlorination is considered to have been responsible for many savings in filter operation as well as for improvements in the quality of the treated supply. D. K. FRENCH

**Chlorophenol tastes and abnormal absorption of chlorine in the Chicago water supply.** H. H. GERSTEIN. *J. Am. Water Works Assoc.* 21, 346-57(1929).—During a short period in the winter of 1927-8, unusual wind conditions carried a large area of contaminated water by the cribs supplying water to Chicago. Prompt recognition and warning to the pumping stations on shore are considered to have prevented a serious typhoid outbreak. Details of the situation are recorded. D. K. FRENCH

**A simple apparatus for the sterilization of water by Caporit or by chlorine.** C. P. MOM. *Waterslaats-Ing.* No. 5, page not stated (1928); *Wasser u. Abwasser* 25, 44.—The use of Cl gas and also Caporit for water purification in the Dutch East Indies has given excellent results. A simple concrete dosing tank with a guarded outlet is described. C. R. FELLERS

**Judging the purifying effect of biological clarification plants on the basis of chemical tests.** E. REMY. *Metalibryse* 18, 120-1, 232-3(1928).—A large no. of chem. methods are available for the detn. of the clarifying effect of biologically purified effluent waters, which make it possible to follow the course at any time and simultaneously to test the

efficiency of any biological installation. In continuous works control the technique of analysis has been simplified by experience. The question as to which method is most suitable in practice depends mainly upon the av. observed compn. of both raw and purified effluent. The finer the technical methods of chem. tests the more closely is the judgment of the biological purifying effect connected with the utility of the purified effluent for industrial purposes.

E. M. SYMMES

**Algae in filtration plants and their effect on the oxygen balance.** P. KEIM. *Techn. Gemeindeblatt* 30, 332-36, 346-51 (1928); *J. Am. Water Works Assoc.* 20, 444.—A review of American and European studies of water-works algae; fluctuations in oxygen content of water filtrates; and O balance in filters.

A. L. ELDER

**Automatic water works and deferrization plant.** O. KOHLER. *Techn. Gemeindeblatt* 30, 336 (1928); *J. Am. Water Works Assoc.* 20, 444.—Water from wells showed 1.9% of  $\text{Fe}_2\text{O}_3$ . A deferrization filter is described and the cost of deferrization is discussed.

A. L. ELDER

**Protozoa in the water tanks of steamships.** N. L. WIBAUT-ISEBREE MOENS. *Nederl. and Tijdschr. Hyg., Microbiol. Serol. Leyden* 2, 24, 43 (1927); *Pub. Health Eng. Abstr.* E-785c, 44.—Epidemics of gastro-intestinal infections occur much more rarely on board large steamers, where drinking water is stored in huge tanks for a long journey, than on board small boats, which have small reservoirs from which the water is usually consumed at once. An investigation of the water from the tanks of 5 steamers of a Dutch line showed that the self-purification which occurred was due to the presence of bacterioplagic protozoa, including *Cyclidium glaucoma* and *Glaucoma scintillans*. The period required for self-purification depends on the temp. of the water and on the relation between the no. of bacteria and the type and number of protozoa. As further multiplication of bacteria often occurs in chlorinated water, while protozoa are nearly always killed by that process, the author's opinion is that it would be better not to chlorinate the water in the tanks, but to treat only the quantity of water used daily.

C. R. FELLERS

**Design and practical test of integrating flume meter.** J. W. LEDOUX. *Eng. News-Record* 102, 428-30 (1929).—An illustrated description of a meter designed by L. for measuring the discharge through flumes by means of a function of depth of water in the flume. When checked with measurements by a rectangular weir with end contraction the max. apparent error was about 6% and the av. error throughout the range of the expts. was 0.55%. The only limitation occurs when conditions downstream from the meter are permitted to cause backwater.

R. E. THOMPSON

**Combining the zeolite softener and deconcentrator gives improved boiler water.** LUCIUS A. FRITZE and ELWOOD W. SCARRIT. Elgin Softener Corp., Elgin, Ill. *Power* 69, 392-5 (1929); cf. *C. A.* 23, 1973.—Use of zeolite alone increases alk. and concn. of Na and K. Deconcentrator equipment is designed to mix zeolite softened water from the boiler with raw water in suitable proportion to form a sludge. After settling of the sludge, the clarified water is returned to the boiler. Four charts and a figure illustrate the application of the plan.

D. B. DILL

**Softening of water for boiler purposes.** W. J. PITT. *Chem. Eng. Mining Rev.* 21, 188-90 (1929).—Ca is pptd. in a sample of the boiler water with a known wt. of  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ . The  $\text{CaC}_2\text{O}_4$  is filtered and washed and the filtrate titrated with  $\text{KMnO}_4$  soln. which has been standardized against  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ . Formulas are given for the total wt. of  $\text{Ca}(\text{OH})_2$  to be added to the boiler supply. Mg is weighed as  $\text{MgO}$  after its pptn. with  $\text{NH}_4\text{OH}$  in another sample and formulas for the wt. of  $\text{Na}_2\text{CO}_3$  are given. Ca is then detd. by  $\text{KMnO}_4$  soln. as above in the same sample and the wt. of  $\text{Na}_2\text{CO}_3$  needed is combined with that used for Mg and added to the supply.

C. H. BADGER

**Scale formation in central heating plants.** W. BLEYERT. *Gesundh. Ing.* 52, 58-61 (1929).—Boiler scale results in a loss of heat because it conducts heat only  $\frac{1}{2}$ , as well as Fe. In this work removal of boiler scale has been effected by solvents. The action of "Groeck boiler scale solvent" and HCl has been compared. This solvent was found to be as effective as HCl in removing scale and its corrosive action on Fe was much less than HCl.

WAYNE L. DENMAN

**Scale formation in hot and cold water.** M. GROECK. *Gesundh. Ing.* 52, 97-102 (1929).—Scale formation in cold and hot water is dependent on the disturbance of the equil. between  $\text{CaCO}_3$  and  $\text{H}_2\text{CO}_3$ , on the presence of O and on the reactivity of the metal present.

WAYNE L. DENMAN

**A practical investigation of corrosion for the heating industries.** H. BALCKE. *Gesundh. Ing.* 52, 49-53 (1929).—The older or acid theory is incorporated in the modern electrochem. theory of corrosion. According to this theory, the metal goes into soln. in the form of ions by virtue of its soln. pressure. The presence of acid merely increases the rate of soln. Fe goes into soln. in the form of ferrous ions, which are oxidized to the

insol. ferric Fe by O. Hence O is an important factor in metallic corrosion. The temporary hardness of a boiler-feed water is rapidly pptd. under the influence of heat. However, the mineral-acid hardness is not removed and concentrates in the boiler and often causes much damage. The salt blamed more than any other is  $MgCl_2$ . It is claimed that  $MgCl_2$  hydrolyzes, giving  $Mg(OH)_2$  and HCl. The HCl reacts with the Fe, forming  $FeCl_2$ . HCl is sometimes added to prevent carbonate scale. Such a practice is to be discouraged because much  $MgCl_2$  is formed from the Mg present as  $Mg(HCO_3)_2$ .

WAYNE L. DENMAN

**Purification of sewage and drinking water in the United States.** W. H. BITTERFELD. *Gesundh. Ing.* 52, 182 (1929).—Biological and chem. processes are used in sewage treatment. Among the biological processes may be mentioned the decompn. of org. matter while the conversion of S to sulfate and N to nitrate are chem. processes. For sewage treatment, one must differentiate between filtration processes and activated sludge. The filters are made of coke, stone, etc., and the org. material is removed by filtration and biological action. In the activated-sludge process, air is blown through the sewage. Cl, when used in conjunction with sewage treatment, results in (1) freedom of odor (oxidation of  $H_2S$ ), (2) disinfection of the sewage, and (3) prevention of septic action for some time. Many American cities simply dil. sewage by passage into a flowing stream. Chief among the American cities using activated-sludge process are Indianapolis, Milwaukee and Chicago. In Milwaukee the sludge is dried and disposed of by selling as a com. fertilizer. It contains 6.5 to 7.5%  $N_2$  and 2.5% phosphoric acid. Activated sludge usually contains about 99% water. Treatment with  $FeCl_3$  or  $Al_2(SO_4)_3$  will lower this figure to 82% and greatly increase the rate of filtration.  $pH$  is also important in the case of filtration. Several cities obtained their drinking waters from impounding reservoirs in mountains, lakes, etc. Usually this is merely chlorinated. However, most cities must use clarification and filtration processes. The chemicals most commonly used in these are  $FeSO_4$ ,  $Al_2(SO_4)_3$  and CaO. Cl is always used in connection with these processes. For purification of cu. m. of water (from the Missouri River), St. Louis used 81 g. CaO, 18 g.  $FeSO_4$ , 20 g.  $Al_2(SO_4)_3$  and 67 g. Cl. W. I. D.

**The problem of sewage purification.** P. M. GREMPF. *Stadtereinigung* 20, 453-4 (1928); *Wasser u. Abwasser* 25, 51.—A discussion of modern methods of sewage disposal.

C. R. FELLERS

**Economical use of the settling room of a two-storied treatment tank.** F. PREUSS. *Gesundh. Ing.* 52, 37-8 (1928); cf. *C. A.* 22, 2019.—This type of treatment tank may be constructed with a free water surface or submerged under the surface. Illustrations of both types are given. It is claimed that the submerged structure is better.

WAYNE L. DENMAN

**Economic features in design of sewerage systems.** GEORGE O. CONSOER. *Eng. News-Record* 102, 463-4 (1929).—A general discussion.

R. E. THOMPSON

**Edmonton's (England) successful sewage scheme.** ANON. *Munic. Eng. Sanit. Record* 82, 339-41 (1928).—The original works and farm occupied 230 acres. The new works provide for a dry-weather flow of 4,000,000 gals. daily, including 50,000 gals. of waste gas liquor for considerable periods. A 4-ft. deep level outfall sewer discharges into 2 detritus tanks, used alternately; it is emptied by an elec. grab crane. The sewage passes through 2 screening chambers provided with inclined bar screens 8 ft. wide with  $5/8$ -in. openings. The screenings are raked directly into tip wagons. Four sedimentation tanks, each contg. 500,000 gals., are operated on the continuous-flow principle. No chemicals are used. The sludge is dried on 5 acres of prep. land. A 3-ft. main leads from the sedimentation tanks to 4 rectangular filter beds, each contg. 12,500 cu. yds. of graded clinker, av. depth 6 ft. Four humus tanks of the inverted type, each contg. 60,000 gals., are arranged in 1 block with division walls.

C. H. BADGER

**The utilization of city sewage under special conditions and the collection of gas from the sludge tanks.** A. HEILMANN. *Z. Kommunalwirtsch.* No. 19, 1911 (1928); *Wasser u. Abwasser* 25, 185.—It is only under exceptional conditions that reclamation of sewage can be made to yield a profit. Since the cost of collection of gas from digestion tanks is small, this operation is usually profitable. By mixing ripe and fresh sludge and warming up the sludge chambers, good yields of gas having a heating value of 7000-8000 cal. per cu. m. were obtained. This gas was suitable for light, heat, or power. In Stuttgart, with 350,000 population, approx. 1 million cu. m. of gas is produced per yr. Approx. 3-8 cu. m. of gas is obtained per capita per yr. An av. cost of the gas for domestic purposes is 5 Pf. per cu. m.

C. R. FELLERS

**Sludge-cake production at Tri-Cities activated-sludge plant.** W. C. EARLE. *Eng. News-Record* 102, 512 (1929).—The output of the sludge drier at the sewage works in Pasadena, Cal., has been increased from 4 to 10-12 tons per 24 hrs., without increase

in labor or fuel, by the use of diatomaceous earth. The earth is applied at the rate of 11 lbs. per 1000 gals. of sludge in 2 mixing tanks providing 3 hrs. agitation by compressed air before the sludge is discharged on to the filters. The moisture content of the filter sludge cake is reduced from about 80% to approx. 5% in the drier. A contract has been made to sell the entire output of dried filter cake, f. o. b. at \$25.25 per ton, which is expected to yield a revenue of \$75,000 per year. All the sludge produced can now be handled by the drier, whereas in 1927 the cost of burying the excess sludge totaled approx. \$37,000.

R. E. THOMPSON

**Imhoff and activated-sludge treatment of sewage in the last 22 years.** F. FRIES. *Gesundh. Ing.* 52, 92-3(1929); cf. C. A. 22, 4689.—A short review of sewage treatment during this period.

WAYNE L. DENMAN

**Purification of swimming pools by chlorine.** W. HILLAND. *Gesundh. Ing.* 51, 510-1(1928); *Wasser u. Abwasser* 25, 43.—The usual brownish color of swimming-pool water was entirely removed by the use of Cl. Although  $\text{Ca}(\text{OCl})_2$ ,  $\text{NaOCl}$ , Caporit, Cl gas and chloramine were all good water disinfectants, the hypochlorites gave a troublesome and objectionable turbidity. Chloramine has 3 times the bactericidal efficiency of Cl gas and is particularly efficient in destroying organisms of the colon group. Chloramine is less odorous and is handled more readily than Cl gas. C. R. F.

**The hygiene of bathing, swimming ponds and waters.** A. L. THOMSON. *Munic. Eng. Sanit. Record* 82, 253(1928); cf. C. A. 23, 1708.—A pond, capacity 100,000 gals., contained 500 bacteria per cc. when freshly filled but after use by 380 bathers, the count was 342,000 per cc. Intelligent control of a continuous purification plant together with the systematic cleansing of filters will maintain swimming-pond water in a hygienic condition.

C. H. BADGER

**Smoke pollution.** W. A. BRISTOW. *Munic. Eng. Sanit. Record* 82, 291-2(1928).—Atmospheric pollution in metric tons of solid impurities is given for certain mfg. towns; London (City) 18,594, Burnley 34,880, Newcastle-on-Tyne (City) 34,247, and St. Helens 22,876.

C. H. BADGER

**Treatment of industrial residues.** MARTINO B. FRONTINI. *Chimica industria* 3, 504-6(1928).—The following residues are prejudicial to fish life: cotton fibers, jute, paper, dairy waste, meat and fish preservation products, vegetables, flour, gelatin, margarine, amyl acetate, metallurgical and mineral products, sugar, etc. Putrescible substances remove O from waters; this is vital for fish and aquatic plants. S. L. B. E.

**Bleachery waste water purification.** GEIJA. *Z. ges. Textil Ind.* 31, 174-5(1928); *Wasser u. Abwasser* 25, 56.—Chem. treatment and disposal methods are considered.

C. R. F.

**Sewage pollution (of a stream) punishable if contrary to legal stipulations.** J. GENNERICH. *Mitt. Fischereier. Prov. Brandenburg* No. 17, 395(1928); *Wasser u. Abwasser* 25, 178.—Following the bestowal of right for the use of water from a brook, an industrial manuf. plant discharged acid waste into the streams thus destroying several hundred fish. The Court held that this action constituted a negligent transgression of the Water Laws and imposed a fine.

J. J. SKINNER

**Chemical properties of forest-soil profiles.** ANTONIN NEMEC AND KAREL KVAPIL. *Z. Forst. Jagdwesen* 58, 461-9 (1926); *Wasser u. Abwasser* 25, 58.—The acidity, humus (org.) content, and N were detd. in various forest-soil profiles and found to be always higher than in corresponding meadow soils. The N content is highest at the surface. Increase in total acidity parallels increased H-ion concn. and low  $\text{NO}_3^-$  in the org. matter. There was a definite relation between the H-ion concn. and org. content in the humus layers of soil overgrown with pines or firs. C. R. F.

**The flora of soils derived from rocks containing iron carbonate.** FELIX GOHLERT. *Biol. generalis* 4, 333-6 (1928).—The analysis of the soil of the Erzberg (Steiermark) revealed that by weathering the siderite is quantitatively converted into  $2\text{Fe}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ ; no Fe ions could be detected in the filtrate sepd. by filtration through an Ostwald collodion filter. Since calcite was always present, the flora of these soils was typical for lime soils. Algae, lichens and mosses contg. Fe as well as iron bacteria were absent. G. S.

**The employment of radioactive substances in agriculture.** JOSÉ A. DE VERA. *Quim. e ind.* 6, No. 62, 55-61 (1929).—Monazite worked up as a radioactive fertilizer is better than one contg. U salts. The latter are as poisonous as As salts, are very dear, and difficult to obtain. V. suggests the addn. of monazite during the manuf. of superphosphate. Th does not have a direct action on plants but favors assimilation of nutritive elements, and makes plants invulnerable to attack by microorganisms. Expts. on potatoes, vines, tomatoes, wheat, barley, oats, beet and maize are given where the fertilizer used has a U mineral base with pure Th salts as the radioactive material. The effects of monazite fertilizer upon the growth of maize, winter cabbage, pimiento, kidney beans, potatoes and lettuce are described. The economics of the proposal is discussed in some detail. S. L. B. EHTERTON

**Nitrification of calcium cyanamide in some Indian soils.** J. H. WALTON. *Mem. Dept. Agr. India, Bacteriol. Ser.* 2, 35-64 (1928).—A comparative study was made of the rate of nitrification of Ca cyanamide in various types of Indian soils. When cyanamide was applied at the rate of 30 mg. of N per 10 g. of soil, nitrification started in 8 weeks in some soils while in others it was delayed for more than 30 weeks. Nitrification of  $(\text{NH}_4)_2\text{SO}_4$  and of mustard cake was always more rapid than that of Ca cyanamide except in an acid soil where good nitrification of Ca cyanamide was obtained while there was practically no nitrification of the other N materials. This was apparently due to the effect of the lime in the Ca cyanamide in correcting soil acidity. When the amt. of Ca cyanamide was reduced to 5 mg. of N per 100 g. of soil more rapid nitrification was obtained in all soils. The Ca cyanamide used in the expts. was free from dicyanodiamide. K. D. J.

**The anaerobic spores found in earth.** JOSEPH BIRGER. *Klin. Wochschr.* 8, 598-9 (1929).—The anaerobic spores of the soil appear to be identical in all sections of central Europe. The soil at Altona contained *B. welchii*, *B. tertius*, *B. oedematiens*, *B. bifurmentans*, *B. sporogenes*, tetanus bac. and *B. cochlearius*. From this it is clear why gas edema may occur at any time and any place. MILTON HANKE

**The chemical investigation of the leaves as a diagnostic means for the determination of the nutrient requirements of grape vines.** A. JACOB. *Z. angew. Chem.* 42, 257-62 (1929).—The grape yield is related to the total nutrient content of the leaves as well as to the mutual relation of the quantity of these nutrients during the course of the growth period. The quant. relation of the nutrients is chiefly of influence on the grape yield, while the abs. quantity of the absorbed nutrients stands in closer relation

to the general development of the vine. If 1 of the 3 nutrients in the fertilization is missing, while the other 2 are supplied by fertilizing, then the absorption of the latter will be increased beyond the amt. which is absorbed when the plant receives an appropriate complete fertilizer application suited to the needs of the vines. Such excess is always of harm either to the yield or the sound development of the vine. If in fertilizing the vine one nutrient is omitted, then the vine can utilize the supply of this nutrient in the soil only in a lesser degree than it would if it were not fertilized at all. The most favorable relation of nutrients for the production of grapes prevails then, when the  $K_2O$  content of the leaves during the entire period of development exceeds the N content. E. F. S.

**Influence of the nitrate-ion-concentration of nutrient solutions on the growth of summer wheat.** M. A. J. GOEDEWAAGEN. *Proc. Acad. Sci. Amsterdam* 32, 135-50 (1929).—Good growth of wheat plants is possible in nutrient solns. with strongly divergent  $NO_3$  content. The max. N concn. for good growth was found between 182 and 238 p. p. m. while the lowest concn. which permits of rather good growth appeared to lie below 5 p. p. m. In order to det. this min. concn. more accurately one must account for the decrease experienced by the  $NO_3$  concn. of the solns. with an amt. of N of 5 p. p. m. during the intervals of growth. This decrease was not detd., but from the table it may be inferred that the N content of these solns. has decreased during the 2 last intervals of growth at least to 2.5 p. p. m., i. e., to a value below the initial concn. of the adjacent cultures with lower N content. As with the plants cultivated in solns. with an initial N concn. of about 5 p. p. m. rather good growth was stated, it may be approx. accepted, that the min. N concn. for satisfactory growth lies below 2.5 and probably above 1.5 p. p. m. The nitrate N concns. which render good or at least satisfactory growth possible cover a broad range, the limits of which were found at an amt. of about 2 and about 200 p. p. m. of nutrient soln. in the exptl. conditions described. E. F. SNYDER

**The phosphorus of grains.** J. E. GREAVES AND C. T. HIRST. *Agr. Expt. Sta., Logan, Utah. Cereal Chemistry* 6, 115-20 (1929).—The P content of wheat, oats, and barley progressively increases as the irrigation water applied increases. The extra P removed from the soil by a 50-bushel crop of wheat was 4.9 lbs., by a 100-bushel crop of oats 2.9 lbs., and by a 75-bushel crop of barley 4.2 lbs. The production of irrigated grains removes greater quantities of P from the soil than does the production of a similar quantity of dry-farm grain. From a consideration of the P-Ca ratio and the P-N ratio it may be concluded that the increase in P due to irrigation water is primarily inorg. There is a marked uniformity between the increase in Ca and the increase in P. The wheat showed an increase in total P as the irrigation water applied increased up to 35 in. Between 5% and 6.3% of the total P of wheat is inorg. The oats also increased in P as the irrigation water applied increased. In oats an av. of 11.2% of the P is in the inorg. form. The inorg. P in barley varied from 6.3% to 9.4% of the total. From 12.2% to 15.6% of the total P in the corn kernel is in the inorg. form. The total P of grains also varies with the soil on which the grain was grown. The addn. of barnyard manure to soil increases the proportion of inorg. P in the corn kernel. L. H. BAILLY

**The influence of the hydrogen-ion concentration of the culture media on the development of the coffee tree (*Coffea arabica* L.).** THEODURETO DE CAMARGO, R. BOLLIGER AND PAULO CORREA DE MELLO. *Compt. rend.* 188, 878-80 (1929).—Five months' old plants of the variety *C. Bourbon* which had been grown on quartz sand were transferred to water cultures and grown for 7 months at  $pH$  7.2, 6.8, 5.8, 5.1 and 4.2. The optimum degree of acidity as detd. by the wt. of the plants was between  $pH$  4.2 and 5.1. Under field conditions the soils rarely have an acidity lower than  $pH$  6.5 and an addn. of lime has harmful effects. The absorption of Ca, Mg and Na ions was not influenced by the  $pH$  of the media. The K absorbed was greater in the acid range and decreased with increasing acidity. J. T. SULLIVAN

**Foot-rot and wilt of antirrhinums caused by *Phytophthora pini* var. *antirrhini*, n. v.** S. SUNDARAMAN AND T. S. RAMAKRISHNAN. *Memoirs Dept. Agr., India, Botanical Ser.* 16, 83-100 (1928).—The best growth of the fungus was obtained on French bean agar having an acid reaction of +5 to +15 on Fuller's scale. No growth was obtained in cultures exposed to direct sunlight while good growth was obtained in cultures exposed to diffused light or kept in the dark, and low temps. favored growth. There was a progressive decrease in the no. of sporangia formed when the percentages of  $CaCl_2$ ,  $MgCl_2$ , or NaCl in the media were increased from 0.25 to 2.0. Numerous sporangia were formed when bits of culture were placed in 0.5 and 1.0% lactose solns. but none was formed in the same strengths of glucose and maltose. K. D. JACOB

**Problems with artificial manures. III. Phosphoric acid fertilizer.** A. V. SABASHNIKOV. *Mill. modernen landw. Technik* (Russia) 1927, No. 6, 166-70.—A review of the value of the different phosphoric acid carriers as fertilizers in Germany for the post-

war period. IV. Liming soil. A. V. SABASHNIKOV. *Ibid* No. 7, 194-9.—A discussion of the lime problem in Germany, and a review of the subject of the influence of lime on the chem., phys. and biol. properties of the soil.

J. S. JOFFE

The phosphoric acid question in the cultivation of sugar cane in Java. O. ARRHENIUS. *Arch. Suikerind.* 37, 77-96(1929).—The necessity of  $P_2O_5$  fertilization in Java is detd. by the combined results of soil analyses ( $P_2O_5$  in 2% citric acid) and field tests. In this way the empirical formula is found: soil contg. less than 0.009%  $P_2O_5$  is poor in phosphoric acid; soils between 0.009 and 0.027 will sometimes react on phosphoric fertilization and sometimes not; and soils above 0.027% do not require fertilization. The very large no. of field tests during the latter years has shown that this law is valuable in only 90% of the cases. To come to a closer relation between soil analysis and field tests A. has detd. the  $P_2O_5$  content in a great number of soils by water extrn. Three hundred g. soil is shaken 48 hrs. with 1500 cc. 1% NaCl soln. and 3 drops of  $H_2SO_4$  added. In 50 cc. of the filtrate  $P_2O_5$  is detd. by the molybdenum blue method. The results are given in tables. The figures indicate 0.01 mg.  $P_2O_5$  per 200 g. soil. All soils giving a positive reaction on fertilization have a content of 7 or lower. Soils not reacting on fertilization show high results for a part and low results for a part, and soils rich in phosphates show high results by water extrn. Pot tests with sand, water and varying  $P_2O_5$  concns. are made.

P. R. P.

The use of coal as a fertilizer. A. D. KISSEL. *Palmira Tropen* 10, 169-74(1929). Field expts. show that the introduction of finely powd. (0.25 mm.) brown coal into layers of loam stimulates plant growth. No changes in the chem. compon. of the soil were noted, but the temp. of the upper layers of the soil did not fluctuate as in untreated control soil. The addn. of 10,000-20,000 kg. coal per hectare increased the yield of the grains 54-55%; a further increase to 30,000-40,000 kg. per hectare lowers this increase in yield to 20-30% above the control, an addn. of 1400-2500 kg. per hectare increases the yield 2-10%. Exts. of humin substances were added to soils and showed a favorable influence in grain, beets, grapes and hops. When the soil was treated with a carbo. humin prepn. the sugar content was increased 1%.

Mixed fertilizers. STOCKHOLMS SUPERFOSFAT FÄBRIKS ABTEDELING. Brit. 298,196, Oct. 5, 1927. A mixed fertilizer contg.  $NH_4NO_3$  and  $NH_4$  phosphate, with or without a third  $NH_4$  salt such as the sulfate, is prepd. by simultaneously pptg. the salts from a soln. contg. them, by evapn. of such a soln., or by passing  $NH_3$  into a mixt. of  $HNO_3$  and  $H_3PO_4$  so concd. that a solid mixt. is obtained directly, or by passing  $NH_3$  into a soln. of  $NH_4$  phosphate in  $HNO_3$  or of  $NH_4NO_3$  in  $H_3PO_4$ .

Fertilizer comprising potassium nitrate and diammonium phosphate. I. G. FARBERNIND, A.-G. Brit. 297,900, Sept. 15, 1927.

Fertilizer from spent sulfite liquors. GEORGE A. RICHTER (to Brown Co.). U. S. 1,710,272, April 23. A fertilizer is prepd. from the spent liquor resulting from the digestion of cellulosic material such as wood in a sulfurous acid soln. of  $NH_4$  salts, contg. substantially all the org. matter removed from the cellulosic material.

Nitrophosphates. ELEKTIZITÄTWERK LONZA and EMIL LÜSCHER. Swiss 129,011, July 14, 1927. Nitrophosphates suitable for scattering on land are prepd. by decomposing crude phosphates by  $HNO_3$  and adding 2% of urea.

Nitrophosphates. ELEKTIZITÄTWERK LONZA, EMIL LÜSCHER and SAMUEL RUOSCH. Swiss 129,891, July 14, 1927. Nitrophosphates suitable for agriculture are prepd. by treating the crude phosphates with  $HNO_3$  under conditions such that the crystals contain less water than normally.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Furfuroles in fermentation products.** MASAKAZU YAMADA. *Bull. Chem. Soc. Japan* 4, 31-5(1929).—Furfurole is not found in the Et<sub>2</sub>O ext. of the saké, soy sauce or other fermented liquids at the end of fermentation, but occurs after pasteurization or distn. Starch, maltose and glucose were found to yield hydroxymethylfurfurole on heating their aq. solns. Repeated distn. transformed this product to furfurole. Pentosans and pentoses gave furfurole directly, while methylpentosans and methylpentoses gave methylfurfurole on heating. The furfurole of fermented products is a mixt. of furfurole, hydroxymethylfurfurole and methylfurfurole. In saké, beer, soy sauce and some distd. wines the main component is hydroxymethylfurfurole; in impure alc. and fusel oil the main product is furfurole. J. G. McNALLY

**Alcohol in solid form.** F. WEISS. *Apoth. Ztg.* 44, 423-4(1929).—The earlier forms of so called solid alc. are discussed, together with the various vehicles proposed or used in making the product, as soaps, nitrocellulose, or acetylcellulose, stearin, paraffin, shellac, rosin, Na silicate, etc. The product under immediate consideration is that under D. R. P. 461,303 and consists of a soln. of K diacetonefructosesulfate in alc. Suggestions are given for detecting the several components, as acetone, fructose and sulfuric acid. W. O. E.

**Drying of hops in vacuo.** K. BEHRENDT. *Wochschr. Brau* 46, 86-7(1929).—Hops, which were dried for 5-8 hrs. at 100 mm. and about 25°, contained the same amount of humulone and resin as samples dried in air for 2-3 days and 3-30% more than kiln-dried ones. A. SCHULTZ

**Structure and semipermeability of the testa of the barley corn.** J. GRÜSS. *Wochschr. Brau* 46, 61-6, 71-80(1929). The testa of the barley corn is semipermeable, which prevents diffusion of acids and salts used in steeping. Steep waters diffuse through a small opening at the base of the corn or dents and fissures in the pericarp caused by variations of temp. and moisture. A. SCHULTZ

**Influence of formaldehyde on the germination of steeped grain.** B. LAMPE. *Z. Spiritusind.* 51, 343-4(1928). Steep water contg. 0.15-0.20% of formalin did not lower the germination of the grain. A. SCHULTZ

**Defective attenuation of the mash.** E. LÜHDEY AND B. LAMPE. *Z. Spiritusind.* 51, 335-6(1928). Incomplete fermentations of mashes made with malt and potatoes may be due to a deficiency of amylase in the malt, to using a too highly coned mash or to bacterial infection. A. SCHULTZ

**Formation of ammonia during brewing processes.** W. WINDISCH AND P. KOLBACH (WITH K. BAUMANN). *Wochschr. Brau* 46, 41-5(1929).—Ammonia N was detd. by distg. with excess Al(OH)<sub>3</sub> *in vacuo* at 40°. Calculated on the original dry matter of the barleys there was found in the barleys 0.0053, 0.0054, malts 0.0063, 0.0053; unboiled worts 0.0083, 0.0090, boiled worts 0.0207, 0.0196; and beers 0.0133, 0.0168% ammonia N. By prolonging the mashing period at 15° from 0.5 to 3 hrs. the ammonia N obtained by boiling increased uniformly. This increase did not result when the mash was previously boiled and thus the action is enzymic. A. SCHULTZ

**Separation of fusel oil from the first distillate.** B. LAMPE AND W. KILP. *Z. Spiritusind.* 51, 351-2(1928). The factors which govern the sepn. of fusel oil from low wines by the addition of water are the relative vols. of water and alc., the proportion of EtOH to fusel oil, and the temp. of the mixt. The best results are obtained by adding equal vols. of cold water to the cooled distillate, which should not contain a greater ratio of fusel oil to EtOH than 1:3.1. A. SCHULTZ

**Adaptation of the cuprometric method to the determination of sugars and dextrin in beers in three different operations.** MARIO TAVEIRA. *Rev. chim. pharm. militar* (Rio de Janeiro) 4, 53-6(1928).—Evap. 1% of 100 cc. of beer on a water bath, add 10 cc. of Courtonne's soln. (30% Pb acetate), eliminate excess of Pb with Na<sub>2</sub>SO<sub>4</sub>, and fill to 100 cc. Treat part with animal charcoal, filter and fill in a buret. Titrate in Fehlings soln. in the usual way. The result gives the maltose calcd. as glucose. Evap. 50 cc. of beer, add EtOH to make 70%, filter, wash with EtOH, evap. to sirup consistency, dissolve in H<sub>2</sub>O, evap. again, invert with 2 cc. of HCl for 20 mins., neutralize with NaHCO<sub>3</sub>, and titrate with Fehlings soln. This gives maltose and saccharose. For the detn. of dextrin, evap. 50 cc., dil. and invert with 15 cc. HCl during 2 hrs. Titrate the total of sugars and calc. the dextrin by subtracting the sugars. A. E. MEYER

**Determination of nitrogen in yeast and molasses.** M. S. FILOSOFOV. *Nauchniss. Zapiski* 7, 185-7(1928).—The detn. of N by the Kjeldahl method is not always conven-

ient and F. gives a new method: 0.3-0.5 g. of yeast thoroughly mixed with 1 g. NaOH and 2 g. Na acetate is placed in a brass retort 18 cm. long and 2.5 cm. in diam. The retort is connected with an Erlenmeyer flask contg. 25 cc. 0.1 N  $H_2SO_4$  by a bent glass tube. When the retort is heated 20 mins. all  $NH_3$  and  $CH_4$  pass into the receiving flask. The app. must be thoroughly washed with distd. water into the receiving flask, then excess of 0.1 N  $H_2SO_4$  is titrated by NaOH with litmus as indicator. For the molasses the design of the retort used is somewhat altered. V. E. BARKOW

Generation and regeneration of warm-stored bottom- and top-fermentation yeasts. F. WINDSCH. *Wochschr. Brau.* 46, 71-4, 81-6(1929).—A top- and bottom-fermentation yeast whose fermentative and reproductive powers were weakened by four successive periods of storage under beer at 18-20° fully regained its former strength by three days' storage under beer at 2-6°. The weakened condition of the warm-stored yeast is not due to the slightly higher proportion of dead cells. A. SCHULTZ

DES OMBIAUX, MAURICE: Le vin. Paris: La nouvelle société d'édition. 116 pp.

Alcohol from burned sugar-cane stalks. JOAQUIN J. DE LA ROZA (to Bagasse Products Corp.). U. S. 1,709,610, April 16. Alc. is distd. from the fermented extd content of burned green sugar cane which has been exposed to ordinary atm. conditions in cane-growing localities until an inversion of the sugar content has occurred.

Enzymes by bacterial action. KALLE & Co. A.-G. Brit. 297,684, Sept. 24, 1927. Lactose, maltose or dextrin (or substances such as milk contg. them) is added to mashies such as those prep'd. as described in Brit. 16,198 of 1914. The enzymes may be sepd. as described in Brit. 251,405 (C. A. 21, 1282).

Malt extract. AUGUST E. NIENSTADT (to A. F. STOEGER, INC.). U. S. 1,709,366, April 16. A heavy, viscous and not readily sol. malt ext. is converted into a potable form easily sol. in aq. media by dissolving in water an edible albuminous material coagulable at moderate temps. (such as whites of eggs) and mixing with the malt ext. of about 40° Bé., heating to about 70°, and filtering.

Yeast. ZELLSTOFFFABRIK WALDHOF and OTTO LÜHRS. Fr. 648,151, Feb. 3, 1928. See Brit. 287,052 (C. A. 23, 472).

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

On the stability of adrenaline hydrochloride and epinephrine extracted from bovine suprarenal medulla by Folin in various media and of epinephrine liberated from suprarenal glands of dogs and cats in defibrinated blood. TADASHI SUGAWARA. *Tohoku J. Exptl. Med.* 12, 97-118(1928); cf. C. A. 23, 2199.—Deterioration took place most rapidly in Tyrode's fluid, less rapidly in Locke's fluid and in dogs' defibrinated blood. B. C. BRUNSTETTER

Microchemical reactions for cinchonidine. M. WAGENAAR. *Pharm. Weekblad* 66, 261-4(1929).—The sensitivity of various reactions in terms of min. concn. and min. quantity of alkaloid detectable is: pptn. of free base, 1:1000, 2 mg.;  $K_2CrO_4$ , 1:1000, 5 mg.; aliphatic acids, 1:1000, 5 mg.;  $BzOH$ , 1:500, 10 mg.;  $o-HOC_6H_4CO_2H$ , 1:1000, 2 mg.; phenols, 1:500, 10 mg.;  $NH_4SCN$ , 1:100, 50 mg.; picric acid, 1:1000, 2 mg.;  $PtCl_4$ , 1:2000, 2 mg.;  $C_6(CO_2H)_6$ , 1:1000, 5 mg.;  $p-O_2NC_6H_4CH_2CH_2CO_2H$ , 1:2000, 2 mg.;  $K_3Fe(CN)_6$ , 1:1000, 5 mg. A. W. DOX

The behavior of arspenamine and neoarsphenamine toward aldehydes. H. W. VAN URK. *Pharm. Weekblad* 66, 297-8(1929).—The color reactions may be performed (1) by evapn. of the substance with an alc. soln. of the reagent contg. a little  $H_2SO_4$ , (2) by warming the substance with a  $H_2SO_4$  soln. of the aldehyde, (3) as a ring reaction by dissolving the substance and the aldehyde in EtOH and allowing  $H_2SO_4$  to flow to the bottom. The following aldehydes give yellow, orange, or red colors:  $o$ -,  $m$ - and  $p$ - $O_2NC_6H_4CHO$ ,  $CH_2O$ ,  $p-HOC_6H_4CHO$ , furfural,  $BzH$ , vanillin,  $p-Me_2NC_6H_4CHO$ . Arspenamine and neoarsphenamine may be distinguished by their color reactions with  $o-O_2NC_6H_4CHO$ ; the 1st gives a yellow, the 2nd a fiery red color; also by their reactions with furfural, the 1st giving a yellow-red, the 2nd a brown-yellow color. For the  $o-O_2NC_6H_4CHO$  test the substance is added to a 1% soln. of the aldehyde in dil. EtOH.  $H_2SO_4$  is added to make 2%, and the soln. evapd. on the water bath; for the furfural test the substance is warmed with  $H_2SO_4$  contg. a few drops of 1% furfural. A. W. DOX

New reactions for cantharidin. H. W. VAN URK. *Pharm. Weekblad* 66, 313-7

(1929).—Color reactions for cantharidin are not very characteristic, the best thus far described being that of David (*C. A.* 21, 1328) in which the sample is nitrated and then treated with vanillin-HCl, whereupon an orange-red to brown-red color develops. Two new reactions are now described. The 1st consists in nitrating the cantharidin, reducing to the  $\text{NH}_2$  deriv., diazotizing with  $\text{NaNO}_2$  and coupling with  $\alpha\text{-C}_6\text{H}_4\text{OH}$ , whereby a violet-red azo dye is formed. The 2nd is a condensation of the  $\text{NO}_2$  deriv. with  $p\text{-Me}_2\text{NC}_6\text{H}_4\text{CHO}$  in the presence of 2%  $\text{H}_2\text{SO}_4$ , the product having a yellowish red color. The 1st will detect 0.1 mg., the 2nd 0.5 mg., whereas the David reaction requires 5 mg. of cantharidin. The 2 tests are performed as follows: (1) Evap. the sample in a porcelain dish with 5 cc. of 50%  $\text{HNO}_3$ . Treat the residue with 2 drops of freshly prepd.  $\text{SnCl}_2$  in concd.  $\text{HCl}$  and warm 2-3 min. on the water bath. Cool, add a few drops of 1%  $\text{NaNO}_2$ , 1 more drop of  $\text{SnCl}_2$ , destroy the excess  $\text{NaNO}_2$  with a little urea or by careful evapn., and add a freshly prepd. 1% soln. of  $\alpha\text{-C}_6\text{H}_4\text{OH}$  in 10%  $\text{NH}_4\text{OH}$ . A violet-red color indicates the presence of cantharidin. (2) Evap. the sample with 5 cc. of 50%  $\text{HNO}_3$ . Add 10 drops of 1%  $p\text{-Me}_2\text{NC}_6\text{H}_4\text{CHO}$  in dil.  $\text{EtOH}$  and sufficient  $\text{H}_2\text{SO}_4$  to make 2%. Evapn. on the water bath leaves a yellowish red residue which dissolves in  $\text{H}_2\text{O}$  with an intense yellow color.

A. W. DOX

An improvement in the Dafert method for the estimation of essential oils in drugs. R. FISCHER. Univ. Innsbruck. *Apoth. Ztg.* 44, 435-7(1929).—In detg. the essential oil content of drugs *via* Dafert, the addn. of  $\text{NaCl}$  or satd.  $\text{NaCl}$  soln. may be advantageously employed. The method thus modified is applicable to essential oils having a d. = to or greater than 1; the sepn. of  $\text{H}_2\text{O}$  is more quickly effected and soly. therein measurably decreased. The results obtained compare favorably with those obtained by the official German method.

W. O. E.

Estimation of theobromine in diuretin, calcium diuretin, iodocalcium diuretin and rhodan-calcium diuretin. HEINRICH BOER AND ALOIS LINDNER. Ludwigshafen a/R. *Pharm. Ztg.* 74, 418-20(1929).—The method and technic developed by Emery and Spencer (cf. *C. A.* 12, 1907) and modified by Brukeleveen (cf. *C. A.* 21, 2165) are followed by B. and L. The essential modification consists in dissolving the sample in normal  $\text{NaOH}$  soln. instead of glacial  $\text{AcOH}$ , prior to the addn. of  $\text{HCl}$ .

W. O. E.

Cystinol. C. A. ROJAHN AND MAX HERTER. Univ. Halle-Wittenberg. *Apoth. Ztg.* 44, 424(1929).—A liquid prepn. contg. among other ingredients about 20% indifferent plant exts. (including *Succus Juniperi*), 10-17% alc. and the remainder  $\text{H}_2\text{O}$ .

W. O. E.

Sediment formation in citrate of magnesia prevented. H. A. BARNBY AND E. L. VOIGHT. Research Lab., Glass Container Assn., N. Y. *Glass Container* 8, No. 6, 10-22(1929).—A troublesome sediment or deposit  $\text{Mg}_2(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot 14\text{H}_2\text{O}$  settles out during storage of this U. S. P. prepn. Expts. proved that this ppt. is caused by a lack of excess citric acid necessary to hold the  $\text{Mg}$  citrate in soln. In order to reclaim unsalable  $\text{Mg}$  citrate, it is recommended that the clear supernatant liquid be decanted and carbonation effected by the use of a small hand outfit.

C. R. FELLERS

The pentavalent antimony compounds in tropical medicine. HANS SCHMIDT. *Indian Med. Gaz.* 63, 643-50(1928).—A complete and comprehensive historical review with bibliography.

FREDERICK G. GERMUTH

*Terminalia arjuna*: its chemistry, pharmacology and therapeutic action. R. N. CHOPRA AND SUDHAMOY GHOSH. Calcutta School of Tropical Med. and Hyg. *Indian Med. Gaz.* 64, 70-3(1929).—The liquid ext. of the bark of *T. arjuna* is recognized as a cardiac tonic. It contains tannins, org. acids, an ester and sugars, but no alkaloid glucoside or essential oil. No physiol. action could be detected either in animals or patients.

FREDERICK G. GERMUTH

Does antirrhincic acid exist in digitalis? A. FOURTON. *Bull. sci. pharmacol.* 35, 689-91(1928).—Antirrhincic acid, prepd. first by P. L. Morin (*J. Pharm. chim.* [3], 7, 294(1845)) from digitalis leaves, was split up by fractional distn., giving the following acids: formic, acetic, butyric and isovaleric.

A. E. MEYER

The neutralization of hydrogen peroxide for therapeutic use. V. ZOTIER. *Bull. sci. pharmacol.* 36, 17-20(1929).—The addn. of 4% of  $\text{NaHCO}_3$  causes complete decompn. within less than 1 hr., smaller quantities in 1-6 hrs.  $\text{Na}$  borate causes decompn. of 50% in 66-90 days, and 100% in 100-164 days.

A. E. MEYER

The most important methods of determination of the total alkaloids in cinchonas. R. DUBREUIL. *Bull. sci. pharmacol.* 36, 20-5, 79-85(1929); cf. *C. A.* 23, 668.—The method of Yvon gives low results to the limit of 40% less. The extn. should be made with hot  $\text{HCl}$ . The  $\text{Et}_2\text{O}$  should be substituted by  $\text{Et}_2\text{O} \cdot \text{CHCl}_3$ . In the method of the Belgian Pharm., the extn. is incomplete if the powder is not dried. By the use of hematoxylin in the titration and back titration, the method is inexact. The method of the

Swiss Pharm. is considered as the most reliable. The French Pharm. makes use of Et-OH; this is inconvenient, as the rosins are dissolved. It causes an incomplete extn. and the alkaloids, when weighed, are not pure.

A. E. MEYER

**The determination of pilocarpine.** P. BOURGET. *Bull. sci. pharmacol.* **36**, 26-7 (1929).—Twenty-five g. Jaborandi leaves are passed through a sieve of 30 meshes per cm., moistened with 200 cc. of 10% soln. of  $\text{Na}_2\text{CO}_3$  and extd. with benzene in a Soxhlet app. for 3 hrs. The cooled soln. is shaken out with 1%  $\text{H}_2\text{SO}_4$ ; the acid soln. is filtered, neutralized against Congo red with  $\text{NH}_3$ , and oxidized with 1% soln. of  $\text{KMnO}_4$ . Add more  $\text{NH}_3$  and shake out 10 times with  $\text{CHCl}_3$ . Filter the  $\text{CHCl}_3$  soln. over anhyd.  $\text{Na}_2\text{CO}_3$ , neutralize exactly with very dil.  $\text{HNO}_3$ , evap. to dryness. Ext. the impurities with acetone and collect the pilocarpine in a Gooch crucible. It melts not below 165°. In certain lots of leaves, the benzene soln. deposits pilocarpine when left standing. A previous extn. with petroleum ether or benzene, followed by the regular treatment with  $\text{Na}_2\text{CO}_3$ , will avoid this difficulty.

A. E. MEYER

**The most important active constituents and the biologic titration of digitalis.** JEANNE LEVY. *Bull. sci. pharmacol.* **36**, 28-51 (1929). A survey of the different compds. isolated from digitalis including phys., chem. and physiol. properties is given. The different methods of biologic assay are described and discussed.

A. E. MEYER

**The chemical composition of the ash of the flower of the fig tree of the Berbery.** H. WUNSCHENDORFF. *Bull. sci. pharmacol.* **36**, 133-6 (1929).—The flowers of *Opuntia vulgaris* Mill. without ovary. Against enteritis. The ash of the flower contains:  $\text{SiO}_2$  29.88%,  $\text{CaO}$  14.30,  $\text{MgO}$  5.62,  $\text{Fe}_2\text{O}_3$  1.68,  $\text{MnO}$  0.45, total ash in the flowers 8.837%. In the ovary total ash 18.75, in the ash of its  $\text{SiO}_2$  11.12,  $\text{CaO}$  22.98,  $\text{MgO}$  4.20,  $\text{Fe}_2\text{O}_3$  0.76,  $\text{MnO}$  0.80. Mn and Fe vary much in the different parts of the plant.

A. E. MEYER

**The preparation of pure emodin.** R. DUPONCH and C. ROCHER. *Bull. sci. pharmacol.* **36**, 136-9 (1929).—The drug is extd. with  $\text{CHCl}_3$  according to Danc's method (C. A. 7, 4042). Wash the soln. with 10% soln. of  $\text{NaHSO}_4$  and a 1%  $\text{HCl}$  filter and evap. to 2% of the original vol. After 24 hrs. crystals are formed. Wash with cold  $\text{CHCl}_3$ . The product is sol. in 3% soln. of  $\text{NaOH}$ . M.p. 254°.

A. E. MEYER

**Tests on some samples of commercial cod-liver oil.** M. S. GUNDEL. *chim. pharm. militar* (Rio de Janeiro) **4**, 8 (1928). *Bol. Assoc. Brasil. p.* Aug. 1927.—Identification tests from several pharmacopoeias and phys. consts. are compared. Some reactions are not obtained with oils prep'd by modern methods; others vary with the age of the oil, provenience and methods of conservation. More than one test should always be made.

A. E. MEYER

**Detection of antipyrine in pyramidone.** The cause of a grave error in the French Pharmacopoeia. VIRGILIO LUCAS. *Rev. chim. farm. (Rio de Janeiro)* **4**, 140-1 (1928).—The detection of antipyrine in pyramidone is based on the formation of diantipyrine-methane. Before the compd. is pptd. with  $\text{NH}_4$  water should be added, as otherwise a compd. of  $\text{NH}_4\text{Cl}$  with pyramidone is pptd. As more reliable, the method of Bourget (U.S.P.) is described.

A. E. MEYER

**Visnagol.** LUIS FLORES. *Rev. farm. (Buenos Aires)* **3**, 2, 14-5 (1929). Visnagol is the oily principle from *Amma visnaga* L. Umbelliferae. The powder fruit was extd. with petroleum ether. The purified oil has the following const.: color yellow, not drying,  $d_{20} 0.9125$ ,  $n_D^{20} 1.47$ , f.p. 4°, neutral reaction, sapon. value 188, I value 2.21, acidity as oleic acid 2.21%, Heydenreich's reaction yellow, turning into reddish yellow, Hauchecorne's reaction dirty green.

A. E. MEYER

**Atlas cedar (*Cedrus atlantica*) and the therapeutic products which it gives.** R. A. MASSY. *Parfumerie moderne* **22**, 177-97 (1929), cf. C. A. **23**, 1993. A review with bibliography of 62 references.

A. PAPINEAU-COUTURE

**Decolorizing essential oils with ultra-violet rays.** A. QUILICO. *Rivista ital. essenze profumi* **10**, 148-68 (1928). Distd. lavender oil (*Lavandula officinalis*) and eucalyptus oil (*Eucalyptus globulus*) were exposed in an enameled-iron container to the rays from a Bach lamp using a c. at 110-30 v. The lavender oil had  $d_{20} 0.885$ ,  $[\alpha]_D^{20} 5.3^\circ$ ,  $n_D^{20} 1.4661$ , esters as linalyl acetate 27.5%, soly. at 20° 1-2.3 in 70% alc., and was dark yellow. Twenty cc. of the oil after exposure to the light for 1 hr. was equiv. in a Duboscq colorimeter to 19.5 cc. of the original oil. After 7 hrs. it was equiv. to 11.5; after 14 hrs. to 2.5; and after 21 hrs. to 0.5 cc. The decolorized oil maintained its original fragrance.

decolorization of the lavender oil. The eucalyptus oil contained besides cineole (53%) traces of alcs., eudesmol, etc.

**The rhizome of iris.** VITTORIO NIGRISOLI. *Boll. chim. farm.* 68, 203-8(1929). — Notes on the therapeutic effect of the rhizome of iris, the chem. properties of the compds. isolated from it and the compn. of some preps. contg. it.

**The nicotine content in fresh tobacco leaves.** SHIYOJI NISHIYAMA. *Bul. Sci. Fakultato Terakultura, Kjusu Imp. Univ.* 3, 10-5(reprint). — Green leaves were selected and the nicotine content was detd. in various parts of the stems by the method of Shedd. In order to avoid the loss of nicotine during the drying process the leaves were ground with gypsum and desiccated in *vacuo*. Conclusions: The nicotine content increases from the lower to the higher leaves.

**Comparison of methods for the determination of nicotine in tobacco.** MUNEKUMA SAMEJIMA AND KITARO KATAI. *Bul. Sci. Fakultato Terakultura, Kjusu Imp. Univ.* 3, 112-6 (reprint). The methods of Toth, Kissling, Chapin, and Fodor-Reifenberg for the detn. of nicotine were compared with the method of Okuda. The methods of Kissling, Chapin and Okuda were similar in accuracy. Toth's method gave high results and the Fodor-Reifenberg method gave low results.

**The stability of anesthetic ether.** F. W. NITARDY AND F. W. TAPLEY. E. R. SQUIBB AND SONS. *J. Am. Pharm. Assoc.* 17, 966 8(1928). See C. A. 23, 1215.

**An interesting emulsion.** W. L. SCOVILLE. Parke, Davis and Co. *J. Am. Pharm. Assoc.* 17, 1119 20(1928). — An emulsion of cod-liver oil was encountered that was much more limpid and capable of diln. with H<sub>2</sub>O than expected. Its reaction was slightly acid; EtOH broke up the emulsion only partially, but HCl broke it readily. The usual emulsifiers, such as gums, soaps, saponin, or albuminous substances, were absent. The ash contained SiO<sub>2</sub>. Many expts. were conducted in an effort to duplicate the product. The best results were obtained with cod liver oil 40 cc., soln. of Na<sub>2</sub>SiO<sub>3</sub> 2 cc., Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> 0.9 g. and H<sub>2</sub>O to make 100 cc.

**Differential characters of three common Chinese species of Ephedra.** J. C. LIU AND B. E. READ. Peking Union Medical College. *J. Am. Pharm. Assoc.* 18, 328-34 (1929). The three chief species of *Ephedra* collected for medicinal purposes are *Ephedra sinica*, *E. distachya* and *E. equisetina*. The gross and histological structures are given in detail and the distinguishing difference for each indicated. The ash also affords some differential evidence. *E. sinica*, ash 9.77%, acid insol. 2.73, *E. distachya*, 8.20 and 0.42, *E. equisetina* 6.55 and 0.28%.

Muck odor and ring ketone condensation (DEYSON) 11A. Incompatibility of tincture of I and cherry laurel water (LI, ANSKI, *et al.*) 11H. Ketonic compounds [for intermediates in making pharmaceutical compounds] (Brit. pat. 297,756) 10.

MALMANCHEL, M. **Formulaire des pharmaciens français.** Paris: Association Générale des Syndicats Pharmaceutiques de France. 340 pp. Paper, F. 7; bound F. 10. Reviewed in *Chimie et Industrie* 21, 673(1929).

WHITA, R. **Formulaire des médicaments nouveaux, pour 1929.** Paris: J. B. Baillière et Fils. 444 pp. F. 24. Reviewed in *Chimie et Industrie* 21, 674(1929).

**Medicines.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 129,489, Aug. 23, 1927. Addn. to Swiss 105,814. A solvent for medicines which are insol. in water is prepd. by mixing water sol. alkylated urea with the water sol. amides of fatty acids and their derivs. Thus, ethylurea acetamide or ethylurea acetiethylamide forms a good solvent for derivs. of barbituric acid and other insol. medicines.

**Therapeutics.** ALBERT AMREIN. Swiss 129,729, Mar. 14, 1927. A specific for leucorrhoea is prepd. by heating CH<sub>3</sub>O soln. with insufficient H<sub>2</sub>O<sub>2</sub> for complete oxidation to 75-80°, and cooling to 60°.

**Therapeutics.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 128,855, Feb. 23, 1927. Therapeutic preps. are made by extg. pulverized female inner secretory organs, such as the ovary, placenta, or corpus luteum. The fresh organs are cooled to temps. low enough to cause them to congeal before pulverizing. Cf. C. A. 23, 483.

**Therapeutic salts of aromatic bases.** I. G. FARHENND, A.-G. Brit. 298,240, Oct. 6, 1927. Examples are given of the combination of 3 phenylidihydroquinazoline with *p*-hydroxybenzoyl-*o*-benzoic acid, 2,4-dihydroxybenzoyl-2'-benzoic acid and 4-hydroxy-naphthoyl-2-benzoic acid; combinations of hydrastinine, orexin and quinine with the same or similar acids are also referred to. The products may be made by melting the

components together, by interaction in mol. proportions in an org. solvent, or by double decomn. of their compds.

**Therapeutic antimony compounds.** I. G. FARBENIND. A.-G. Brit. 298,234, Oct. 6, 1927. *N*-Methylsulfitcs of Sb aminoaryl compds. are prepd. by treating the Sb compd., e. g., pure *p*-aminophenylstibonic acid, dissolved in NaOH, with CH<sub>3</sub>O and bisulfite. Stable products are obtained, which are suitable for use by interjection. Partially deacylated acylaminoarylstibinic acids or compds., such as aminoarylstibinoxides, also may be used as starting materials.

**Therapeutic mercury compounds.** MAX BOCKMÜHL and ADOLF SCHWARZ (to Winthrop Chemical Co.). U. S. 1,693,432, Nov. 27. Therapeutic compds. are prepd. by mercurating aromatic substances which contain an unsatd. alkyl radical and a group which renders the substance sol. in water, so that addn. compds. are formed with the Hg and the double bond is opened. The products may be converted into their salts. Examples are given of the production of Hg derivs. from eugenolacetic acid, Na *p*-allyloxybenzenesulfonate, 4-allyloxy-3-bromobenzoic acid, 3-chloro-4-allyloxybenzoic acid, 3,5-dibromo-4-allyloxybenzoic acid, *N*-allylacetylsalicylamide, 1-allyl-4-diethylaminoethoxy-5-methoxybenzene, *N*-methyl-8-hydroxytetrahydroquinoline allyl ether, allyl *p*-diethylaminoethoxybenzoate and the tartrate of the allyl ether of *p*-hydroxybenzoic acid diethylaminoethyl ester. Numerous details of procedure are described. Cf. C. A. 23, 1995.

**Therapeutic composition comprising iron and yeast.** CORNELIUS MASSATSCH (to Matro, G. m. b. H.). U. S. 1,710,584, April 23. A colloidal basic Fe salt soln. such as liquor "ferri oxychlorati" is introduced into an aq. suspension of yeast; the solid substances are filtered out and are dried.

**Solvent for quinine.** CARL WEILL. Swiss 129,123, Mar. 4, 1927. A solvent for basic quinine is prepd. by mixing quinine-dissolving agents sol. in oil with oil. Thus, benzyl alcohol is mixed with olive oil or oil of eucalyptus.

**Caffeine.** FRITZ KÜNDIG, SR. Swiss 128,984, Dec. 8, 1927. Caffeine is extd. from the coffee bean by subjecting the steeped beans to pressure and heat and by treating with a solvent, the last traces of which are removed by an air current contg. a little steam.

**Alkaloids from ergot.** CHEMISCHE FABRIK VORM. SANDOZ. Ger. 473,151, Mar. 18, 1926. Addn. to 439,042. Ger. 439,042 describes the extn. of the total alkaloid content of ergot by means of a 45-60% acetone soln. This method is now modified by substituting 45-60% EtOH soln. for the acetone soln.

**Ergosterol from fungi.** SOC. ANON POUR L'IND. CHIM. A BÂLE. Swiss 129,870, June 14, 1927. The fungi are heated under pressure with aq. solns. of alk. substances, and the ergosterol is extd. from the product.

**Iodine values from seaweeds.** PAUL GLOESS. U. S. 1,710,255, April 23. Seaweeds are repeatedly leached with water with intermediate pressing sufficiently rapid not to allow time for absorption and swelling; an I-contg. org. substance is pptd. from the liquid obtained by the use of Cu or Pb salts; the ppt. is then treated with Fe filings to form an Fe salt and the latter is treated with Na<sub>2</sub>CO<sub>3</sub> to form an I-Na salt, which is suitable for therapeutic uses.

**Tuberculosis serum.** REISBACH & Co. Ges. Brit. 297,675, Sept. 24, 1927. In prepg. a serum for the prevention or treatment of tuberculosis, living tissue such as lung or other tissues of infected cattle, which has been disintegrated by the action of tubercle bacilli, is used for prepg. an inoculation material for treating animals to obtain blood or milk serum for therapeutic purposes. Various details are given.

**Hormones.** SOC. ANON POUR L'IND. CHIM. A BÂLE. Brit. 298,080, Sept. 30, 1927. Extracts of male organs such as testicles are treated by a process employing a saponifying agent with exclusion of O such as that described in Brit. 265,567 (C. A. 22, 261).

**Hormones.** SOC. ANON POUR L'IND. CHIM. A BÂLE. Brit. 298,092, Sept. 30, 1927. Two physiologically active substances, one water-sol. and the other lipid-sol., are obtained from male generative glands such as bull testicles by extg. the glands with water-sol. and water-insol. solvents, preferably after concg. the water-sol. ext., and sepg. the mixt. into 2 layers (adding water if necessary). Alc. and ether may be used as solvents; details of procedure are given. Cf. C. A. 23, 1474.

**Ointment or pomade.** J. PERRET. Brit. 298,167, Oct. 4, 1927. An ointment suitable for use on the hair as a pomade or for greasing the hoofs of animals is formed by melting together olive oil, lard, soap, white pitch and virgin wax.

**Disinfectant.** S. EDLMAN. Brit. 298,393, Nov. 16, 1927. A disinfectant suitable for use in veterinary medical practice against intestinal parasites and which is a deriv. of 1-methyl-3-hydroxy-4-isopropylbenzene is obtained by heating for several hrs.

under reflux in a water bath equimol. proportions of 1-methyl-3-hydroxy-4-isopropylbenzene and freshly distd. and neutralized trichloroacetaldehyde.

"Latherless" shaving cream. CHARLES H. CASHEAT. U. S. 1,709,460, April 16. A mixt. is formed of swollen starch, water and a thick, viscous mixt. of hydrocarbons such as vasoline. A small proportion of borax and soap may be added.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

Hydrochloric acid synthesis. B. WASSER. *Metallbörse* 18, 1182-3(1928).—A literature review of methods of HCl synthesis, with cost estimates, with particular reference to the coke process used in the United States (Gibbs, *C. A.* 14, 2238; Hirschkind, *C. A.* 19, 3382).

Production of nitric acid from ammonium nitrate and attempts to use ammonium hydrogen sulfate for the manufacture of ammonium superphosphates. JOZEF ZAWADZKI AND TADEUSZ KISLANSKI. Warsaw Polytech. *Przemysl Chem.* 11, 121-34(1927).—By treating 1 mol.  $\text{NH}_4\text{NO}_3$  with at least 1 mol.  $\text{H}_2\text{SO}_4$  under a pressure of 400 mm. Hg, 98% yield of  $\text{HNO}_3$  can be obtained, of which 85% will be 99% strength, and the balance over 80% strength, provided the reaction is conducted slowly and unnecessary superheating and pressure variations are avoided. Heating too high, about  $200^\circ$ , as well as an insufficient supply of  $\text{H}_2\text{SO}_4$  tends to lower the yield and the strength of acid produced. Diminution of pressure helps increase both the purity and strength of acid obtained, principally because they lower the temp. applied. The more concd. the  $\text{H}_2\text{SO}_4$  used in the reaction the more concd. the  $\text{HNO}_3$  produced. Under the exptl. conditions studied here the action of the acid sulfates on the powdered phosphates is not so rapid as that of  $\text{H}_2\text{SO}_4$ . It would be possible to obtain products with no free acid, and with  $\text{P}_2\text{O}_5$  practically completely sol. in  $\text{H}_2\text{O}$  by better mixing and longer digestion. A. C. ZACHLIN

Silicic acid gels and silica gel. I, II. KUNO WOLF. *Metallbörse* 18, 453-5, 789-90 (1928). III, IV. KUNO WOLF AND MAX PRAETORIUS. *Ibid* 1293-4, 2245-6.—A detailed review of the different processes and products.

Nitrogen oxides. F. RASCHIG AND W. PRAHL. *Z. angew. Chem.* 42, 253-7(1929).—In an old controversy between Lunge and Berl (*Z. angew. Chem.* 17, 1659(1904)) and the authors in which the theory of the Pb chamber was discussed, the claim was made that in the red gases, with O in excess, there were present higher oxides of N, like  $\text{ON}_2\text{O}$  (isomeric nitrogen tetroxide) up to  $\text{N}_2\text{O}_7$ . These gases were said to act differently when dissolved in NaOH or  $\text{H}_2\text{SO}_4$  than when treated with  $\text{SnCl}_2$ . To test the latter point the present investigation has been made, using Ti sulfate (ous) as an absorbent, and  $\text{N}_2\text{O}_4$ ,  $\text{NaNO}_2$  and  $\text{H}_2\text{SO}_4$ , and nitrous gases, i. e., equimol. mixts. of NO and  $\text{NO}_2$ , as oxidants. Results show that the anomalous behavior of the oxides is due to the action of free O in the mixts., and is catalytic in nature. The existence of the assumed higher oxides of N is therefore disproved, and references to them are to be stricken from the literature. The thermal disocn. of  $\text{N}_2\text{O}_4$  into  $2\text{NO}_2$  by Bodenstein's measurements (*C. A.* 3, 2079; 16, 1896) was checked by a much simpler method involving the use of weighed amts. of  $\text{N}_2\text{O}_4$  volatilized in a closed tube heated in an elec. furnace, and later expelled into NaOH soln. for the absorption of acid and detn. of residual O, much like the detn. of N by the abs. method. Results checked to temps. of  $320^\circ$ , but showed deviations above that point, probably due to the fact that the products of decompn. had an opportunity to recombine before they reached the absorption tube. Early investigators showed that equimol. mixts. of NO and  $\text{NO}_2$  acted always as though  $\text{N}_2\text{O}_4$  were present, in spite of Avogadro's law. Attempts to find a reaction in which these two oxides acted as a mixt. rather than as a compd. gave Schaarschmidt (*C. A.* 21, 3055) one with  $\text{C}_2\text{H}_4$  in the presence of  $\text{AlCl}_3$ , for only the  $\text{NO}_2$  reacted to form complex compds. Because of the similarity of the reactions of  $\text{NO}_2$  and the halogens—especially Br—expts. were carried out with  $\text{NO}_2$ ,  $\text{KNO}_3$  and HCl, and  $\text{NO} + \text{NO}_2$  in the presence of KI, with varying  $p_{\text{H}}$  conditions, e. g.,  $\text{N}_2\text{O}_5 + 2\text{NaOH} = 2\text{NaNO}_3 + \text{H}_2\text{O}$  and  $\text{NO}_2 + \text{NO} + \text{KI} = \text{KNO}_3 + \text{I} + \text{NO}$ ; actual detns. showed that an equimol. mixt. of NO and  $\text{NO}_2$  reacts with KI soln. not as  $\text{N}_2\text{O}_5$  but as  $\text{NO}_2$  and NO.

The effect of gas admixtures upon the volumetric and equilibrium relations in ammonia synthesis. R. NITTSCHMANN. *Metallbörse* 18, 341-2, 679-81, 846-7(1928); cf. *C. A.* 23, 1997.—Mathematical and graphical treatment.

Vapor pressure of salt solutions important in the ammonia-soda process. BRAN-HARD NEUMANN, RICHARD DÖRKE AND ERNST ALTMANN. *Z. anorg. Chem.* 42, 279-83 (1929).—A slight  $\text{NH}_3$  pressure exists at  $30^\circ$  above the triple salt mixt., 12.9 mg. per l.

E. M. SYMMES

E. M. SYMMES

measured in air, 6.4 mg. per l. in a  $\text{CO}_2$  current. With increasing temp. the  $\text{NH}_3$  content of the gas phase rises rapidly. Detn. of the pressure of  $\text{H}_2\text{O}$  vapor shows that undissoc.  $\text{NH}_4\text{HCO}_3$  is in the gas phase, which begins to dissoc. strongly above  $35^\circ$  in measurements in air or above  $30^\circ$  in  $\text{CO}_2$ ; in both cases dissocn. is almost complete at  $40^\circ$ . Previous detns. have shown that 1.2 atm.  $\text{CO}_2$  pressure was the point at which  $\text{NaHCO}_3$  and  $\text{NH}_4\text{Cl}$  were in soln. at  $25.9^\circ$ . Below this there was also  $\text{NaCl}$ ; above it  $\text{NH}_4\text{HCO}_3$ . At 2.5 atm.  $\text{CO}_2$  pressure this point became  $27.8^\circ$ . In the temp. region below these limits there should be no partial  $\text{NH}_3$  pressure in the gas phase. The present detns. under  $\text{CO}_2$  show that from  $30^\circ$  up there was a rapid rise of  $\text{NH}_3$  content in the gas phase; at  $0^\circ$ ,  $10^\circ$  and  $20^\circ$  the  $\text{NH}_3$  content was 0.4, 0.8 and 1.7 mg., resp. Since in these cases only  $\text{NaCl}$ ,  $\text{NaHCO}_3$  and  $\text{NH}_4\text{Cl}$  were in equil. in the soln. the only salt responsible for the  $\text{NH}_3$  content was  $\text{NH}_4\text{Cl}$ . Tests gave direct proof of the partial  $\text{NH}_3$  pressure at  $20^\circ$  over satd  $\text{NH}_4\text{Cl}$  solns. In practice pptn. of  $\text{NH}_4\text{HCO}_3$  must be done at as near  $30^\circ$  as possible. Above this temp.  $\text{NH}_3$  is increasingly volatile; below it there is more and more undecompd.  $\text{NH}_4\text{HCO}_3$  in the gas phase, leading to stoppages. E. M. SYMMES

**Production of ammonium chloride by evaporation from a sal ammoniac solution in an ammonia-soda factory.** ALFONS KRAUSE. Poznan Univ. *Przemysl Chem.* 11, 625-8(1927).—The relation of the temp. of satn. ( $t$ ) to the ratio  $\text{NaCl}/\text{NH}_4\text{Cl}$  ( $a/b$ ) expressed in % in  $\text{NH}_3$ -free soln. can be represented by the parabola  $t = 5(23 - 12\sqrt{3(a/b - 0.247)})$ . The solubilities of  $\text{NaCl}$  and  $\text{NH}_4\text{Cl}$  at  $18-115^\circ$  are shown in a table, with the aid of which, together with the above equation, the temp. of satn. can be calcd. Max. yield, about 69%, can be obtained only when  $a/b$  is 0.247 at most. In such a case from 100 kg. soln.  $100 - [a + (173/73)b]$  kg. of  $\text{H}_2\text{O}$  must be evapd.

A. C. ZACHLIN

**The conversion of cyanamide to ammonia.** HEINRICH MOLITOR. *Metallhorte* 18, 397-8, 506-7(1928).—A review of the many methods of conversion. The final solution of the question has not yet been reached, because decompn. proceeds slowly and a certain high temp. is required, which must not be exceeded to avoid decompn. of a substantial part of the  $\text{NH}_3$  formed. Also dusting of the cyanamide plugs up the app., requiring special construction. Production of  $\text{NH}_3$  from cyanamide has therefore not reached the quantities desirable in the interests of agriculture. The residue may be made into portland cement (Baumann, C. A. 14, 3304). Recently cyanamide has been converted on a large scale into urea:  $\text{CaCN}_2 + \text{H}_2\text{O} + \text{CO}_2 = \text{CaCO}_3 + \text{C}(\text{NH}_2)_2$ ,  $\text{C}(\text{NH}_2)_2 + \text{H}_2\text{O} = \text{NH}_2\text{CONH}_2$ . Fusion of urea with  $\text{NaCl}$  forms cyanide.

E. M. SYMMES

**Calcination of metallic salt hydrates in theory and practice.** M. A. RAKUZIN. *Metallhorte* 18, 2357-8(1928).—A review of the literature, with particular reference to borax.

E. M. SYMMES

**Salt beds, brine wells and caving in the district between Kassel and Karlshafen.** O. VON LINSTOW. *Kali* 23, 54-6, 71-4, 86-8(1920).—Zechstein salts are known in the northern part at Karlshafen. This may be connected with the presence of salts further east at Volpriehausen and in the north at Laintal. The large cavings at Treudelburg point to salts which are or were at depths. On the other hand, there are probably no Zechstein salts at Wilhelmshöhe near Kassel, certainly not at Sooden Allendorf in the Werratal further east. The southern part contains brine wells. Tests show definitely that not all impurities in the Weser River district originate in the potash industry in the upper Werra and Fulda fields, but that there are natural flows from brine wells through faults, as shown by the Cl content of the Weser. There is a 1% brine well in the Weser bed.

E. M. SYMMES

**Natural Glauber salts in Canada.** ANON. *Chem.-Ztg.* 53, 226(1929).—Many million tons of crude Glauber salts are available very cheap in Canada at a purity of 96.5%; on calcining they give a salt contg. 98-99%  $\text{Na}_2\text{SO}_4$ . Solar evapn. is used. Extension of railroads and proximity of fuel are advantages. The process  $\text{Na}_2\text{SO}_4 + \text{BaCO}_3 = \text{Na}_2\text{CO}_3 + \text{BaSO}_4$  has long been known, but equil. is reached at 50% conversion. Use of a catalyst (not stated) makes possible a 90% yield. Then  $\text{BaSO}_4$  reacts with C to produce BaS and CO; CO is oxidized in air to  $\text{CO}_2$ ; BaS reacts with  $\text{H}_2\text{O}$  and  $\text{CO}_2$  to give  $\text{H}_2\text{S}$  and  $\text{BaCO}_3$ ;  $\text{H}_2\text{S}$  and air give S or  $\text{SO}_2$ . The  $\text{BaCO}_3$  acts as a carrier.

E. M. SYMMES

**Manufacture of Epsom salts.** N. N. EFREMOV AND M. M. NARKEVICH. Northern Chem. Trust. *J. Chem. Ind. (Moscow)* 5, 1179-83(1928).—In the manuf. of Epsom salt often instead of the standard crystals,  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ , other hydrates are apt to be formed, which give crystals of the same degree of purity but of different shapes and cause the product to have a different appearance. While crystals contg.  $7\text{H}_2\text{O}$  do not weather at ordinary temp., other hydrates are apt in course of time to lose most of the  $\text{H}_2\text{O}$  of crystn. and turn into powder. The latter really ought to be preferred in the manuf., since by

losing  $H_2O$  they lower the freight cost, but as the demand is for the product contg.  $7H_2O$ , expts. were instituted to find the most favorable conditions of producing the latter. Solns. of  $MgSO_4$  should be prepared at  $80-82^\circ$  and should at this temp. be concd. to 33.5° Bé., then be put into crystallizers and cooled as slowly as possible, particularly after the temp. has dropped to  $30-35^\circ$ . During cooling the hot solns. down to beginning crystn., viz.  $35^\circ$ , stirring is advisable in order to cool uniformly the whole liquid and obtain crystals of homogeneous compn.; below  $35^\circ$  stirring should be discontinued. When the soln. reaches  $30^\circ$  a few large crystals from a previous batch should be introduced to form centers of crystn. After completion of the crystn. it is advisable to leave the crystals in the mother liquors a few more days, as during this period small crystals have a tendency to agglomerate into larger ones.

BERNARD NELSON

The influence of temperature on the precipitation of nickel carbonate. M. SERGEYEV. *Oil and Fat Ind.* (Russia) 1928, No. 11, 15.—A soln. of  $NiSO_4$  contg. 6.47 g. Ni per l. and a 10% NaOH was used in various proportions to det. the most favorable conditions for  $NiCO_3$  pptn., which proved to be when a small excess (equimol.) of NaOH was present and the liquid was kept at boiling temp. The ppt. was then reduced for use as catalyst.

A. A. BOEHTLINGK

Continuous or intermittent carbide nitrogenation? HEINRICH PINCASS. *Metallbörse* 18, 1181-2(1928).—A review of the various processes and patents, showing the pros and cons of each. The problem of continuous cyanamide production still awaits solution.

E. M. SYMMES

Rational cyanamide manufacture. R. KAHN. *Metallbörse* 18, 1295-6, 1406-8, 1463-5(1928).—A detailed review of literature and patents for various processes.

E. M. SYMMES

The Dutoit process. HEINRICH PINCASS. *Metallbörse* 18, 2189-90, 2246-7 (1928).—The Dutoit (cyanamide) granulating process comprises treating finely ground cyanamide with about 7%  $H_2O$  at a max. of  $160^\circ$  for 1-2 hrs., spreading it out in a layer 15 cm. thick to cool at room temp., mixing it with 10-20%  $H_2O$  to a homogeneous mass, and granulating it at a pressure of 300 kg./sq. cm. between rolls, one of which is perforated. The first moistening converts the free CaO almost completely into  $Ca(OH)_2$ , giving 2%  $NH_3$  loss according to Dutoit, more according to others. Higher pressures than 300 kg./sq. cm. cause more dicyanodiamide formation; lower pressures give more fragile grains. Drying temp. should not exceed  $85^\circ$ , and an inert atm. is used. The cyanamide should contain no  $CaCl_2$  catalyst, because decompn. is thus favored. Formation of dicyanodiamide should not exceed 1-1.5% of the N present.

E. M. SYMMES

A few applications of ozone. A. VOSMAER. *Compagnie de l'Ozone, Bruxelles. Chem. Weekblad* 26, 184-6(1929).—An enumeration of the well-known uses of ozone, particularly as a bleaching agent.

G. CALINGAERT

Antichlor. (I), (II). WILHELM KOLB. *Metallbörse* 18, 1237-8, 1294-5, 1351-2, 1408, 1461-2, 1518-9, 1743-5(1928).—Antichlor,  $Na_2S_2O_4$ , is produced mainly by the Ba industry, absorbing the  $H_2S$  evolved from BaS by HCl in  $NaHSO_3$ . All steps of the process are described in great detail.

E. M. SYMMES

Pressure in containers filled with phosgene. R. NITZSCHMANN. *Metallbörse* 18, 1517-8(1928); cf. C. A. 22, 4330.—As soon as the residual space in a container is filled with gaseous  $COCl_2$  the pressure corresponds to the tension at that temp. Detn. of this pressure at subsequent temp. rise is more difficult if foreign gases are present in the residual space, which is a possibility. This question is solved by a mathematical treatment.

E. M. SYMMES

The mechanical separation and flotation of Koureika's graphite. V. I. TRUSHEVICH. *Trans. Inst. Econ. Mineral. Met.* (Moscow) No. 39, 47 pp.(1928).—A study of the conditions of elimination of S and ash from graphite of the Touroukhansk region of Siberia by wet concn. and flotation methods. Pyrite, calcite and quartz are the most undesirable mineral impurities. All-flotation of 150-mesh material, flotation of coarse material, and tabling and flotation of high-S graphite were studied. The all-flotation process, after necessary recleaning, gave a concentrate with 6.5% ash and 0.35% S. Flotation of coarser material showed that Koureika's graphite is easily floatable in grains up to 1 mm. size. Other graphites with higher S content should be concd., ground and then floated. The general flowsheet for Koureika's graphite is (1) crushing to —1.5 mm., (2) screening to sizes +0.5 mm., +0.15 mm. and —0.15 mm., (3) tabling of each size, (4) grinding rough table concentrates, of sizes 0.5 mm., +0.15 mm., —0.1 mm., (5) tabling of material —0.1 mm., with size —0.15 mm., (6) flotation of rough table concentrate of size —0.15 mm. with following recleaning. With high-grade concentrates of 1-2% ash content and 0.1% S, dry-air sepn. methods may be necessary for final flotation concentrates.

W. H. BOYNTON

**Regeneration of decolorizing agents.** BATAAFSCHE PETROLEUM MAATSCHAPPIJ. *Petroleum Z.* 25, Special section No. 12, 11(1929).—A process to regenerate decolorizing powders such as fuller's earth, decolorizing C, silica gel, etc., has been worked out in the labs. of the Bataafsche Petroleum Maatschappij. The absorbents were treated with a mixt. of one or several chlorinated hydrocarbons and one or several other solvents at ordinary or elevated temps. The chlorinated compds. used were  $\text{CH}_2\text{Cl}_2$ ,  $\text{CH}_2\text{ClCH}_2\text{Cl}$ ,  $\text{CHClCCl}_2$ ,  $\text{CCl}_4$ , etc.; the second part of the mixt. consisted of various hydroxylated compds. such as light aliphatic alcs.,  $(\text{CH}_3)_2\text{CHOH}$ , benzyl alc., terpene alcs., etc. Particularly good results were attained when the extn. with a mixt. of chlorinated hydrocarbons and other solvents was followed by extn. with the other solvents only. The regenerated decolorizing materials are almost as good as new ones. Extn. at higher temps. is recommended. A. A. BOERTLINGER

**Diatomaceous earth.** J. H. FRYDLENDER. *Rev. prod. chim.* 32, 145-50, 181-7 (1929).—The sources, prepn., properties and uses of these products are discussed. P. THOMASSET

**Chemical protection against fire.** A. EICHENGRÜN. *Z. angew. Chem.* 42, 214-7 (1929).—Of the many materials proposed as "fire-proofing chemicals" some cause destruction or discoloration of the materials treated; others dust out or sep. as crystals, leaving the material unprotected; and some of the best fire-proofing agents will protect only against low temps. and not against the intense heat of a conflagration. Among the better known agents are Na silicate, stannate, tungstate, etc. The author's "Celon-Feuerschutz" is proposed as the best. Bromides, especially  $\text{NH}_4\text{Br}$ , have proved especially valuable for fire-proofing all kinds of flammable substances. Ger. pats. 355,107 and 390,840 claim the use of  $\text{NH}_4\text{Br}$ , alone and admixed with other substances. W. C. EBAUGH

**Rennin action in relation to enterokinetic phenomena (RICHARDSON, PALMER) 11A.** The rate of oxidation of HBr by chromic acid in the presence of salts (BOBTELSKY, ROSENBERG) 2. Reducing gases (Brit. pat. 298,190) 21.

BLANC, F.: Étude analytique et comparative des charbons au point de vue de leurs impuretés. Paris: Ch. Béranger. 65 pp. F. 10. Reviewed in *Rev. gen. chemins fer* 1928, 377.

**Niter-oven for producing nitrogen oxides for sulfuric acid manufacture.** EDMOND B. RUPARD (to Armour Fertilizer Works). U. S. 1,709,880, April 23. An oven compartment is connected by a conduit to a combustion flue and has in its lower part a refractory vessel below the conduit adapted to contain  $\text{NaNO}_3$  and  $\text{H}_2\text{SO}_4$ ; this vessel has a safety overflow passage through the wall of the oven at a level below the conduit with an automatically outwardly-opening valve normally closing the outer end of the passage.

**Solid carbon dioxide.** WALDEMAR HESSLING. Swiss 129,688, Oct. 15, 1927, and 129,690, July 27, 1927. Liquid  $\text{CO}_2$  is subjected to reduced pressure to produce solid  $\text{CO}_2$ . The arrangement of the app. for producing the reduced pressure is described.

**Alkali metal and ammonium phosphates.** I. G. FARBENIND. A. G. Brit. 297,546 July 27, 1927. Di-Ca phosphate is agitated with  $\text{NH}_4\text{F}$  or an alkali metal fluoride in the presence of water, the soln. is filtered and the filtrate is concd. and may be treated with MeOH to ppt. the alkali metal or  $\text{NH}_4$  phosphate or may be treated with  $\text{H}_3\text{PO}_4$  or an alkali to obtain a phosphate of the desired compn. The mother liquors are returned to the process after sepn. of the phosphate.

**Decomposition of complex salts of hydrofluoric acid.** ALBERT F. MEYERHORN. Swiss 128,463, Feb. 12, 1927. The salts are heated with volatile fluoride and metal fluoride with diminution of the partial pressure of the volatile fluoride.

**Treating lithia-containing silicates.** CONWAY VON GISESWALD. U. S. 1,710,556, April 23. Li-contg. silicates such as lepidolite are treated with a neutral alkali metal salt such as  $\text{K}_2\text{SO}_4$  or  $\text{KCl}$  at a temp. of 600-950°, in order to form a sol. Li salt.

**Treating cobalt solutions.** S. C. SMITH. Brit. 298,301, July 25, 1927. Solns. contg. a Co salt such as the sulfate are treated with  $\text{PbO}_2$  in the presence of a sol. Ni compd. The Co and Pb together form a ppt. which is sepd. and leached with  $\text{H}_2\text{SO}_4$  to dissolve the Co and the residus is reconverted into  $\text{PbO}_2$  for further use. The process may be used for sepg. Co and Ni from solns. obtained from ores.

**Rapid evaporation and dedecation of natural salt waters by concentration of solar rays.** C. MARÉCHAL. Belg. 353,051, Aug. 31, 1928. The evap. basin is covered by a

tunnel, the top of which is covered with glass to conc. the rays of the sun. The evaporative surface is increased by means of a sailcloth supported on rolls that are alternately immersed in the salt water and at some distance above it. When sufficient concn. has taken place the top of the tunnel is removed and the sailcloth is wound on a mandrel and at the same time scraped with a metal blade.

**Phosphates.** I. G. FARBERIND. A.-G. Fr. 648,231, Feb. 4, 1928. Ammoniacal phosphates are obtained by treating mono- or dicalcium phosphates with  $\text{NH}_3$  in the presence of water, whereby a mixt. of  $\text{Ca}_3(\text{PO}_4)_2$  and  $(\text{NH}_4)_2\text{HPO}_4$  is obtained, the latter being sol. is filtered off and the  $\text{Ca}_3(\text{PO}_4)_2$  is reconverted with acids to the mono- and di-phosphates which are added to a fresh charge. Fr. 648,232 describes the prepn. of alkali or ammoniacal phosphates from Ca phosphates by reacting with the latter and alkali or  $\text{NH}_4\text{F}$ .

**Alumina.** JEAN SEAILLES. Fr. 649,027, July 5, 1927. See Brit. 203,392 (C. A. 23, 1727)

**Ammonium alum.** CHARLES M. BROWN. U. S. 1,709,166, April 16. Aluminous material contg. Fe is heated to a temp. (suitably about  $450^\circ$ ) at which sulfuric acid salts of Fe are unstable and then mixed with previously melted acid  $\text{NH}_4$  sulfate and further heated to prevent the temp. from falling sufficiently for formation of sol. Fe salts.

**Calcining limestone.** KISSAG M. NAHIKIAN, ROBERT W. FOSTER and EDGAR T. BELDEN (to Brewer & Co.). U. S. 1,709,226, April 16. A spray comprising water together with an alk. earth metal oxide or hydroxide such as  $\text{Ca}(\text{OH})_2$  is introduced into the bottom of a kiln so as to come into contact with the products of combustion from the fuel before these products reach the limestone to be treated; hard and non-plastic products are pptd. by this method and do not contaminate the lime produced.

**Magnesium chloride and hydroxide from dolomite.** I. G. FARBERIND. A.-G. Brit. 297,381, Sept. 20, 1927. Dolomite is calcined sufficiently to convert all of its Mg content to  $\text{MgO}$  and then treated with  $\text{CaCl}_2$  soln. and  $\text{CO}_2$  to obtain a soln. of  $\text{MgCl}_2$  and a residue of  $\text{CaCO}_3$ .  $\text{Mg}(\text{OH})_2$  may be prepd. from the  $\text{MgCl}_2$  soln.

**Magnesium sulfate.** SHELDON B. HEATH (to Dow Chemical Co.) U. S. 1,709,398, April 16. In making  $\text{MgSO}_4$  from  $\text{Mg}(\text{OH})_2$  contg. chloride impurities, an excess of  $\text{H}_2\text{SO}_4$  is intermixed with concd.  $\text{MgSO}_4$  mother liquor from a previous run and the acid and liquor are heated; gaseous  $\text{HCl}$  is evolved, and the liquid mixt. is added to  $\text{Mg}(\text{OH})_2$ .

**Potassium manganate.** SOC. CHIM. DES USINES DU RHÔNE. Fr. 648,968, June 29, 1927. See Brit. 292,991 (C. A. 23, 1480).

**Sodium bicarbonate and ammonium chloride.** WILHELM GLUUD and BERNHARD LOPMANN. U. S. 1,710,636, April 23.  $\text{NaHCO}_3$  and  $\text{NH}_4\text{Cl}$  are formed by acting first with  $\text{CO}_2$  and  $\text{NH}_3$  and then with  $\text{NaCl}$  on a soln. contg. bicarbonates and chlorides of Na and  $\text{NH}_4$  together with a readily sol. auxiliary salt (other than a chloride or carbonate) such as  $\text{NaNO}_2$ .

**Sodium perborate.** ROESSLER & HASSELACHER CHEMICAL CO. Brit. 297,777, Sept. 27, 1927. A borax soln. is treated first with  $\text{Na}_2\text{O}_2$  (suitably at a temp. of about  $15^\circ$ ) until metaborate and some perborate are formed, and then further treated with  $\text{H}_2\text{O}_2$  (preferably at a temp. of about  $10^\circ$ ) to complete the oxidation. The mother liquor, after sepn. of the perborate formed, may be used in a succeeding operation.

**Caustic soda.** GRUSPEPE DONAGEMMA. Fr. 648,584, Feb. 9, 1928.  $\text{NaOH}$  formed as a residue in chem. treatments, particularly in the artificial silk industry, is purified from org. material by osmosis through diaphragms formed of volcanic stone or conglomerates of volcanic stone.

**Porous silica.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 649,390, Dec. 31, 1927. A porous  $\text{SiO}_2$  is obtained by heating  $\text{SiO}_2$ , e. g., quartz sand to  $1700^\circ$ , cooling and mixing with an org. material such as shellac soln. The mixt. is molded and heated slowly to  $400^\circ$ , then rapidly to  $1750^\circ$  to expel any residue of the binder and to seal the outer surface. The material has a sp. gr. of 0.6 or less and may be used as a heat insulator for refrigerators, etc.

**Carbon disulfide.** I. G. FARBERIND. A.-G. (Eberhard Legeler and Paul Esselmann, inventors). Ger. 473,189, Nov. 16, 1927. In the manuf. of  $\text{CS}_2$  by passing superheated S vapor over wood charcoal, the latter is maintained at an approx. const. temp. in a reaction retort to which S vapor from a sep. superheating retort is supplied as required. Suitably, a furnace comprising 3 sep. retort spaces is used, the end spaces enclosing the reaction retorts and the middle space the superheaters, which may comprise tubes of elliptical cross section made of cast steel and lined with brick and contg. fillers resistant to S. Cf. C. A. 23, 1481.

**Treating chromite.** HUNT, HARR. Fr. 648,658, Feb. 11, 1928. Chromite is attacked by mixing it with  $\text{NaOH}$  or  $\text{KOH}$  in such proportions that absorption of O from

the surrounding air takes place automatically, the mixt. being heated to above  $800^{\circ}$ , under pressure or not. The operation may be repeated, Fe being eliminated between the operations.

**Bleaching raw heavy spar.** KARL FIBERS. U. S. 1,709,612, April 16. White heavy spar is prepd. from the raw material by treating it with  $H_2SO_4$  in the presence of  $CaF_2$  and washing with water. Cf. C. A. 22, 1659.

**Precipitating hafnium and zirconium on incandescent bodies.** JAN H. DE BORR and ANTON E. VAN ARKEL (to Naamlooze Vennootschap Philips' Gloeilampenfabrieken). U. S. 1,709,781, April 16. Hf and Zr, in ductile form, are deposited from an atm. contg. their iodides and substantially free from impurities, on an incandescent body such as a W wire.

**Mercury.** WALTER GLAESER (to Glaeser Research Corp.). U. S. reissue 17,276, April 23. See original pat. No. 1,637,481 (C. A. 21, 3040).

**Phosphorus, etc.** I. G. FARBERIND. A.-G. Brit. 297,416, Sept. 21, 1927. The process described in Brit. 285,055 (C. A. 22, 4738) for producing P,  $H_3PO_4$  and a slag having latent hydraulic properties is modified by forming the charge of a mixt. of crude Al phosphate and crude Ca phosphate in such proportions that, without addn. of other mineral substances, a slag having a compn. similar to blast-furnace slag is produced.

**Sulfur from gases containing carbonyl sulfide.** RAYMOND C. BENNER and ALFRED P. THOMPSON (to General Chemical Co.). U. S. 1,710,141, April 23. Gases contg. carbonyl sulfide together with an oxidizing gas such as O or  $SO_2$  are brought into contact with activated bauxite.

**Active carbon.** JULIUS DRUCKER and HEINZ THIENEMANN (to I. G. Farbenind. A.-G.). U. S. 1,709,611, April 16. Carbon such as that prepd. from pine wood is activated by treatment with S vapors at a temp. of about  $800^{\circ}$  ( $1000^{\circ}$ ).

**Activation of carbon.** SOCIÉTÉ ANON. DES CHARBONS ACTIFS ÉDOUARD URBAIN. Fr. 649,043, July 7, 1927. Activated C is obtained by treating a C from a simple calcination, preferably at a temp. below  $600^{\circ}$ , either (1) by vapors of phosphoric anhydrides or metaphosphoric acid dild. or not by inert gases at a temp. between  $500^{\circ}$  and  $700^{\circ}$  and washing the C obtained to eliminate phosphoric acid, or (2) by a mixt. of vapors of phosphoric acid and P and steam, dild. or not, at a temp. between  $500^{\circ}$  and  $700^{\circ}$  and washing C already activated by any other process may be so treated. Cf. C. A. 23, 2000.

**Decolorizing carbon.** ÉDOUARD URBAIN. U. S. 1,709,503, April 16. Finely powdered vegetable material such as pear, wood, vegetable ivory nuts or starch is mixed with powdered di-Ca phosphate and  $H_2SO_4$ , and the mixt. is shaped and calcined with elimination of H, P and H phosphide. Cf. C. A. 23, 1492.

**Revivifying, purifying, filtering or decolorizing materials such as decolorizing carbon.** JOHAN N. A. SAUER (to Naamlooze Vennootschap Algemeene Norit Maatschappij). U. S. 1,709,284, April 16. Material such as carbon which has been used for decolorizing sugar solns. is heated sufficiently to effect carbonization of at least some of the adsorbed substances and the carbonization products are then extd. with an alk. liquid such as a 10% NaOH soln.

**Catalysts.** MONSANTO CHEMICAL WORKS. Brit. 298,142, May 25, 1927. Catalysts are prepd. by forming by a wet process a complex silicate contg. V in non-exchangeable form (of which at least part is less than pentavalent), with or without other chem. groups such as boric, phosphoric, tungstic, molybdic and other weak acids, and stearic and plumbic acids and Zn, Al, Cr and other amphoteric hydrates, and subjecting the solid complex silicate to the action of an acid and an oxidizing agent to convert the V into  $V_2O_5$  and pyrovanadates embedded in the rigid framework of the silicate. Catalysts thus prepd. are suitable for the oxidation of inorg. substances such as S oxide and of org. substances such as toluene to produce benzaldehyde and benzoic acid, cresol to produce salicylaldehyde and salicylic acid and MeOH or EtOH to produce  $CH_3O$  or acetaldehyde. Numerous details and examples are given.

**Artificial gems.** FRITZ FROELICH. Swiss 128,888 to 128,891, Sept. 20, 1925. Addns. to Swiss 125,709. Chrysoberyl and magnesia-spinell of the formulas,  $BeO \cdot Al_2O_3$  and  $MgO \cdot Al_2O_3$ , resp., are prepd. by heating the Be and Al, or Mg and Al sulfates to a temp. sufficiently high to decompose the sulfates and melt the oxides with the aid of a flux. Beryl of the formula,  $3BeO \cdot Al_2O_3 \cdot 6SiO_2$ , is prepd. by heating the sulfates of Be and Al with  $H_2SiO_3$ ; and sillimanite of the formula,  $Al_2O_3 \cdot SiO_2$ , by heating  $Al_2(SO_4)_3$  with  $H_2SiO_3$ .

**Dispersion agents.** J. R. GRIGY. A.-G. Swiss 128,441, June 3, 1927. Preps. which disperse in water are prepd. by milling org. substances which are not readily sol. in water with a dispersion agent such as soap, for a considerable time. Examples of the org. substances are aminoazobenzene, dianisidine and phenol.

**Detergents.** R. R. CRITCHLOW. Brit. 297,508, June 28, 1927. Detergents suitable for use with water in washing pottery, tiles, marble, domestic utensils, etc., may comprise: (a) borax 2 and soda 1 part; or, (b) borax 24, "common soda" 8 and NaOH 1 part; or, (c) borax 24, NaOAc 8 and NaOH 1 part. The compn. may be pressed into tablets.

**Polishing composition for use on glass, metal, furniture or other surfaces.** WILLIAM BREITZKE. U. S. 1,709,819, April 16. A dil. mixt. of the juices of partly decayed oranges, lemons, pineapples and bananas is mixed with small proportions of borax, HCl and ether.

**Polish for metals.** H. F. DOWNS. Brit. 297,566, Sept. 9, 1927. Neuberg chalk is mixed with a hydrocarbon distillate such as "white spirit," "petrol" or "Glico" and "brown soap oil" (which consists of a mixt. of hydrocarbon oils and fatty oils or free fatty acids).

**Plastic compositions.** LÁSZLÓ BOLGÁR. Swiss 129,309, April 11, 1927. Bituminous material, such as asphalt, is mixed with an inorg. acid, such as  $H_2SO_4$ , and heated to above its m.p. till the acid is decomposed and the mass is homogeneous. Filling material, such as sand, is then stirred in.

**Plastic compositions.** JACQ GREUTERT. Swiss 129,495, Jan. 22, 1928. Finely ground cork sawdust, peat fibers and similar org. materials are stirred into pitch or asphalt thinned with benzene, or xylene. The mass is then thickened and molded.

**Decorating plastic substances.** SOC. CHIM. DES USINES DU RHÔNE. Fr. 648,152, Feb. 3, 1928. A decorative effect is obtained on sheets of plastic substances by uniting one or more colored or decorated cloths made of threads of cellulose material which is plastic when heated, to one or more sheets of substances plastic when heated, so that the structure of the cloth disappears completely into the complex sheet obtained.

**Moldable plastic compositions containing urea-formaldehyde condensation products, etc.** K. RIPPER. Brit. 297,433, Sept. 21, 1927. Casein may be added to a urea- $CH_2O$  condensation mixt. or to a urea- $CH_2O$  product still contg. free  $CH_2O$ , or urea or its derivs. such as thiourea may be mixed with a casein paste which is then molded and treated with  $CH_2O$ , or a casein paste may be simultaneously treated with a reagent such as thiourea and a solid polymer of  $CH_2O$  and the mixt. shaped by pressure, with or without heating. Condensing agents, fillers and coloring substances may be added.

**Ornamenting buttons, etc., formed from powdered plastic materials.** H. OEXMANN. Brit. 298,135, Oct. 3, 1927. Powdered substances such as albuminous material, cellulose derivs., horn, bone, ivory or wood are mixed with coloring materials before pressing and hardening and may be subsequently further decorated as by spraying with addnl. coloring materials.

**Casein compositions ("artificial horn").** I. G. FARBENIND. A.-G. Brit. 297,483, May 23, 1927. Casein is treated with a small proportion of compds. such as cyclohexylmonoethanolamine or cyclohexyldiethanolamine or mixts. of these compds. or their salts or acyl derivs. or similar compds. and the mixt. is moderately heated under pressure. Cf. C. A. 23, 1729.

**Phenol-aldehyde condensation products.** LEONHARD DEUTSCH and ISAK THORN (to Selden Co.). U. S. 1,710,045, April 23. Materials such as  $PhOH$  and  $CH_2O$  are subjected to condensation in the presence of an alkali such as  $Na_2CO_3$ , and then hardened by the action of a phosphoric compd. of hygroscopic character such as Na phosphate and lactic acid. Cf. C. A. 22, 3498.

**Coating composition containing celluloid in solution.** MICHELE BLANCATO (to Kent-Blancato Co.). U. S. 1,709,056, April 16. A coating compn. which is suitable for use on cinematograph films or documents is formed of celluloid, HOAc, acetone,  $Et_4SO_4$ ,  $MgCl_2$  and  $AmOAc$ .

**Foliated material.** BAKELITE CORP. Fr. 648,962, Feb. 14, 1928. Fibrous sheets of paper, asbestos, cloth, etc., are impregnated with a resin of the glycerol-phthalic anhydride type, dried, placed together with interposing layers of a reactive phenolic resin and solidified under heat and pressure. The material may be used for silent gearing, tight linings, piston segments, clutch linings, etc.

**Laminated boards formed with sodium silicate adhesives.** CHARLES D. WOOD (to Grasselli Chemical Co.). U. S. 1,709,893, April 23. In cementing together plies of material such as paper under pressure, a concd. Na silicate soln. is applied to the material at a temp. substantially above room temp. but not exceeding  $65^\circ$ .

**Sound records.** C. BANCAREL. Brit. 297,866, Oct. 31, 1927. In a process of making disk sound records as described in Brit. 295,228 (C. A. 23, 2258), wood or open fibrous sheet material such as woven fabric is used instead of cardboard in forming the record blanks.

Gramophone records. H. OEXMANN. Brit. 297,358, Sept. 19, 1927. Disk records are formed of finely powdered horn to which may be added a binder such as natural or artificial resins, casein, cellulose derivs. or albuminous substances and fillers such as cotton, asbestos or BaSO<sub>4</sub>. The entire record may be formed of such compns. or they may be used as a facing on cardboard or other suitable backing.

Use of a juxtaposed annular disk of nitrocellulose composition to modify the tone of metal sound-reproducing diaphragms. HAROLD W. MOURAR. U. S. 1,709,276, April 16. Structural features.

Metal transfer material for hot stamping. WILLIAM F. GRUPE (to Peerless Roll Leaf Co.). U. S. 1,710,309, April 23. A paper carrier is coated with a continuous coating of material such as beeswax and resin of adherent character and metal particles such as bronze powder are placed over this coating.

Protective covering for sheet metal. BELL'S UNITED ASBESTOS CO., LTD., E. R. HARRAP and J. A. CANN. Brit. 297,336, May 17, 1927. Sheet metal for constructional work is covered with asbestos sheeting contg. a cementitious material formed by the interaction of a Zn salt with an alkali metal silicate. The asbestos and Zn salt may be applied to the metal, then moistened with the silicate soln. and subjected to hot pressing.

Friction clutch ring. LESTER KIRSCHBRAUN (to Raybestos Co.). U. S. 1,710,004, April 23. A substantially incombustible unwoven facing which may be formed of asbestos is satd. with a material such as a heavy Mexican asphalt and treated (suitably by baking) to render it substantially insol. in usual asphalt solvents, to give it a hardness in excess of 15 and a tensile strength above 2000.

Casting brakeshoes. JOHN D. HAY (to Bendix Brake Co.). U. S. 1,709,129, April 16. Friction material such as a flexible brake lining is placed in a mold so that the body of the brake shoe, which may be formed of an Al alloy, may be simultaneously cast and united with the friction material.

Paper hood cap for bottle tops, etc. WILBUR L. WRIGHT (to Oswego Falls Corp.). U. S. 1,709,511, April 16. A rubber emulsion or soln. is deposited on the annular radially expandible hood-cap skirt and permitted to cure to form an elastic permanent adhering binder.

Fumigating candles. COÖPERATIVE WHOLESALE SOCIETY, LTD., and C. W. COUCHE. Brit. 297,489, June 22, 1927. Carbolic acid, cresol, thymol or their mixts. suitably with a solvent or substance assisting volatilization, are incorporated in the wax or other material of which candles are mainly composed; e. g., carbolic acid 1.5% together with a light mineral oil may be used.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KERR

Corner and auxiliary firing in glass-melting furnaces. ERICH FELSNER. *Keram. Rundschau* 35, 126-7(1927).—Methods of auxiliary heating for pot furnaces are described. The purposes for which such methods are needed are, (1) continuous heating of specific spots in the furnace during the working out, (2) periodic heating of furnace corners during the melting and working out, and (3) continuous heating of furnace corners or specific spots during the melting and working out.

The plasticity of clays. GUSTAV KEPPELER. *Keram. Rundschau* 35, 157-8 (1927).—A general discussion of the colloidal properties of clays. Clays depend not only upon their fineness of grain for their plasticity, since quartz ground to the same fineness is much less plastic, but also upon the shape and nature of the grains. The platy character of the crystals probably has a marked effect on the plasticity.

The question of plasticity of clays. W. MISER, H. IMMER AND J. KRAVETZ. *Sprechsaal* 61, 319-21(1928); cf. C. A. 22, 3503.—The two views held at present as to the cause of plasticity are: that it is due to (1) chem. reactions between the clay and certain impurities and (2) a phys. reaction. The authors discuss a theory based on (2).

Should plastic pyritic clay be wintered? ANON. *Tonind.-Ztg.* 53, 315(1929).—If pyritic clay is not weathered, the pyrite burns at 600-700° and forms black pits in the brick. It is necessary to burn with an excess of air. If firing is done rapidly, too much gas may be developed. All these disadvantages can be overcome by weather-

ing and in addn. several advantages are gained. Although sol. sulfates of Fe are formed, they are broken up in the firing. With lime-free, plastic, pyritic clay, weathering is, without exception, necessary. R. F. F.

The properties of clay and its preparation for use in brick making. HANS HIRSCH. *Tonind.-Ztg.* 53, 407. R. F. F.

Researches on the vitrification and burning of ferruginous clays. PIERRE BÉMOND. *Brit. Clayworker* 37, 422-3(1929).—The results show marked differences in vitrification of 3 clays and 2 sands, high in  $\text{Fe}_2\text{O}_3$ , under reducing vs. oxidizing conditions of firing. R. A. HEINDL

Effect of water vapor and sulfur dioxide on the firing of clays. J. KONARZEWSKI AND B. KRYNSKI. *Trans. Ceram. Soc. (Eng.)* 28, 18-25(1929).—See C. A. 22, 4217. H. F. K.

The manufacture of dry press face brick. ANON. *Tonind.-Ztg.* 53, 428(1929). R. F. FERGUSON

Coöperative research on crushing strength of fire brick at room temperature. GROOTHOFF. *Tonind.-Ztg.* 53, 430-4(1929); cf. C. A. 22, 3503. R. F. FERGUSON

S-cracks and how to overcome them. F. NIEBLING. *Tonind.-Ztg.* 53, 409(1929). R. F. FERGUSON

The procedure incident to the drying of unfired ceramic articles. W. PUKALL. *Sprechsaal* 61, 430-2, 450-3(1928).—Conclusions. (1) The drying of clay and clay bodies at ordinary temps. is essentially carried on from the surface with non-uniform drying of the inner layers. (2) Under these circumstances strains are introduced. (3) These strains are measurable and were found in both lean and fatty clays. (4) They are independent of the strength of the wares and as a rule reach their max. before the ware is completely air-dried. R. A. HEINDL

The resistance to fracture (breaking strength) of unburned ceramic bodies. OTTO BARTSCH. *Keram. Rundschau* 35, 121-4(1927).—In general, bodies of different types show the following av. breaking strengths: stone ware bodies, 7-8; porcelain bodies, 4-5; saggars, 5-7 kg per sq. cm. Cast bodies generally show somewhat higher values. Hand-made glass pot bodies average 10-19 kg. per sq. cm. while cast bodies average about 40% higher. The breaking strength is of theoretical importance because it is one of the few consts. measurable in the unburned state which are suitable as a basis of classification of clays. The method of drying has a great effect on the strength. The method giving the highest values is drying for 7 days in air, drying to const. wt. at 70° and finally drying at 110°. Heating above 110° gives low values. The usual stationary lever app. for measuring cross-breaking strength is described. Aging of the clay has considerable effect, the cross-breaking strength generally reaching a max. after 10 to 30 days' aging. The breaking strengths of clays appear to show some parallelism with their plasticities but there appears to be no close relation between breaking strengths and content of fine clay (as measured by elutriation), ignition loss, porosity, drying shrinkage, or  $\text{H}_2\text{O}$  content at normal consistency. There appears to be some relation between breaking strengths and water vapor adsorption. Addn. of non-plastic material generally causes a decrease in breaking strength although the curve is very irregular. H. INSLAY

The importance of the glaze as affecting the quality and breakage in manufacture of porcelain insulators. H. HANDREK. *Keram. Rundschau* 35, 144-7(1927).—The glaze has little effect on the electrical properties of glazed insulators. Insulator test pieces having a thickness of 2.3 mm. comprising a body thickness of 2.0 mm. and a glaze thickness of 0.3 mm. showed a break down voltage of 27.6 kv./mm. An unglazed body of the same thickness gave 31.1 kv./mm. and a piece of glaze of the same thickness, 19.0 kv./mm. For resistance to flash-over the nature of the surface of the glaze is of much more importance than the compn. of the glaze. The nature of the glaze has much greater effect on the mech. than on the electrical properties. The relative tensile strengths of glazed and unglazed insulators depend to a great extent upon the character of the surface layer. Transverse strength is related to tensile strength and those glazed insulators which have a higher tensile strength than unglazed will also show a higher transverse strength. Compressive strength is usually markedly higher on glazed than on unglazed insulators. The glaze is of great importance in the resistance to change in temp. The tensile strength and elasticity of the glaze and the relative coeff. of expansion of glaze and body are mainly responsible for the resistance to temp. changes. H. INSLAY

The significance of iron oxide in the firing losses of ceramic bodies. FRIEDRICH DERRMANN. *Sprechsaal* 61, 318-9(1928).— $\text{Fe}_2\text{O}_3$  is not stable above 1300°; it is converted to  $\text{Fe}_3\text{O}_4$  with loss of O. Since most ceramic bodies contain  $\text{Fe}_2\text{O}_3$  and are sintered at

this temp. a swelling will result (air pockets). Since the O compds. of Fe are reducible to the lower (ous) form by means of excess gases, it is possible through reduction at the proper time to avoid the gas pockets in pottery. C does not color ceramic bodies yellow, but will sometimes lead to small blisters. S has an active coloring power especially for glasses and glazes; bisqueware (bodies), on the contrary, is only slightly affected with the exception of certain susceptible porcelain bodies. R. A. HEINDL

The homogenizing of frit. F. H. ZSCHACKE. *Sprechsaal* 61, 321-4, 344-5, 367-70, 386-7 (1928).—A study of a series of commercially prep'd. glaze mixts. gave frits which exhibited inhomogeneities caused by: deficient mixing; faulty weighing or measuring of the raw materials; influence of moisture present in the raw materials; variable sp. gr. and particle size; variations in wt. per vol. and tendency to pulverize; too short mixing periods. R. A. HEINDL

A standard valuation of the common stoneware tiles. OTAKAR KALLAUNER. *Sprechsaal* 61, 485-90 (1928).—The less the absorption, the less as a whole the abrasion loss. Of different colored tiles, the gray ones appear to be most dense, strongest, most resistant to abrasion and most resistant to acids. R. A. HEINDL

Some problems encountered in roofing-tile manufacture. L. TIMMIS. *Trans. Ceram. Soc. (Eng.)* 28, 1-5 (1929). H. F. K.

The periodic kiln. R. NIEBLING. *Tonind.-Ztg.* 53, 353 (1929). R. F. F.

The present state of operation control in the German refractory industry. H. KNUTH. *Tonind.-Ztg.* 53, 316, 331 (1929); cf. C. A. 23, 2261. R. F. F.

The testing of refractory materials under load at high temperatures. BERNARD LONG. *Science & Ind.* 13, 75-7 (1929).—L. describes a new type of load test furnace which operates on the high-frequency induction principle and is direct loading. The tests and results fall into 3 classes: (1) *Silico-aluminous refractories*.—Two bricks were tested. Brick A contained:  $\text{SiO}_2$ , 69.10;  $\text{Al}_2\text{O}_3$ , 27.80;  $\text{Fe}_2\text{O}_3$ , 1.50;  $\text{TiO}_2$ , 1.30;  $\text{Na}_2\text{O}$ , 0.23%. Brick B contained  $\text{SiO}_2$ , 53.92;  $\text{Al}_2\text{O}_3$ , 42.00;  $\text{Fe}_2\text{O}_3$ , 1.95;  $\text{TiO}_2$ , 1.85; alkalis, 0.28%. The results are expressed by stating the temps. at which the settling or bending attains 2, 5 and 10% of the length of the specimen just before deformation begins. Brick A had been burned to 1220° and brick B to 1200°. Both carried a load of 2 kg. per sq. cm. The temps. and amts. of settle were: Brick A—2%, 1430°; 5%, 1450°; 10%, 1470°; Brick B—2%, 1430°; 5%, 1480°; 10%, 1530°. To det. the effect of temp. of burning, a sample of brick A was fired to 1320°, another to 1460°. Brick B was given a similar treatment. The results were: Brick A, 1320° burn—2%, 1455°; 5%, 1475°; 10%, 1485°; 1460° burn—2%, 1480°; 5%, 1490°; 10%, 1500°; Brick B, 1320° burn—2%, 1440°; 5%, 1490°; 10%, 1540°; 1460° burn—2%, 1480°; 5%, 1500°; 10%, 1550°. The results show that resistance to deformation under load at high temps. is increased by burning the refractory to a higher temp. (2) *Siliceous refractories*.—Brick I had a true sp. gr. of 2.34 and was well inverted. Deformation started at 1580° and crushing occurred at 1585°. Brick II had a true sp. gr. of 2.45 and contained considerable free quartz. The expansion increased suddenly at 1425° and continued at the same rate to 1525°, showing the inversion of the quartz. Crushing took place at 1590°. Brick III had a true sp. gr. of 2.32 and was well inverted. Deformation started at 1645° and crushing occurred at 1650°. Siliceous products are preferable to silico-aluminous refractories for temps. above 1450°. However, loads of 2 kg. per sq. cm. are rare in industrial furnaces and when lower than 2 kg. it is possible to use silico-aluminous refractories. (3) *Special refractories*.—A bauxite brick (61.20  $\text{Al}_2\text{O}_3$ , 6.95%  $\text{Fe}_2\text{O}_3$ ) showed a deformation of 5% at 1400°. A SiC brick bonded with clay and burned to 1200° showed a deformation of 5% at 1470°. Another SiC brick made of 75 parts SiC and a special bond, and burned to 1450°, showed a 5% deformation at 1780°, crushing following soon after. A zircon brick showed 5% deformation at 1550°. A. J. MONACK

Highly refractory silicon-free crucibles. R. WEBER. *Glas. u. App.* 9, 117 (1928); *J. Soc. Glass Tech.* 12, 288.—Suitable Si-free materials are  $\text{ZrO}_2$ ,  $\text{Al}_2\text{O}_3$ , and  $\text{MgO}$  or spinel, but the working of these presents great difficulties because of their lack of plasticity. H. L. D.

The use of electric furnaces for the enameling of large and small articles. HANS NATHUSIUS. *Keram. Rundschau* 35, 124-6 (1927).—Modern furnaces use an 80% Ni-20% Cr alloy as the resistor. H. INBLEY

Studies on hydrated Al silicates. I. The rehydration of metakaolin and the synthesis of kaolin (VAN NIEUWENBURG, PIETERS) 8. New developments in gas-works carbonizing plant, with special reference to refractory materials (GRIJL) 21. Artificial stone (Fr. pat. 648,544) 20. Disintegrating and mixing apparatus for soft

masses such as peat and clay (Ger. pat. 473,029) 21. Crucibles for electric induction furnaces (Fr. pat. 649,371) 4.

Ceramic Products Cyclopedica, 1928. Chicago: Industrial Publications, Inc. \$12. Reviewed in *Ceramic Abstracts* 7, 730(1928).

Owens type apparatus for making glass bottles. LAX & SHAW, LTD., J. F. SHAW and J. E. BRANFORD. Brit. 297,481, April 21, 1927.

Apparatus for forming glass bottles or similar articles. S. HUNT. Brit. 297,763, June 22, 1927. Structural features.

Apparatus for making blown glass articles. S. HUNT. Brit. 297,490-1, June 22, 1927.

Apparatus for making bottles or similar blown glass articles. S. HUNT. Brit. 297,700, June 22, 1927.

Glass-melting furnace with a channelled fore-hearth through which the glass is circulated by a paddle. UNITED-GLASS BOTTLE MANUFACTURERS, LTD., and T. C. MOORHEAD. Brit. 297,856, June 1, 1927. Various structural details are described.

Rotary suction-gathering apparatus for making glassware. S. HUNT. Brit. 297,340, June 17, 1927.

Furnace for making plate-glass. JEAN HENRI LEMAIRE. Fr. 648,225, Feb. 4, 1928.

Glass furnace with movable hearth. MARCEL FOURMENT and JEAN J. LADURÉE. Fr. 648,943, July 1, 1927.

Muffle leer for annealing glassware. BRITISH HARTFORD-FAIRMONT SYNDICATE, LTD., T. WARDLEY and H. V. F. M. RENN. Brit. 297,865, June 29, 1927. Structural features.

Colored glass. SOC. ANON. DES MANUF. DES GLACES ET PRODUITS CHIM. DE SAINT-GOBAIN, CHAUNY ET CIREY. Fr. 648,999, July 2, 1927. Violet colored glass is made by adding  $TiO_2$  to glass having a base of phosphoric oxide, or of oxides of P and B,  $SiO_2$  being absent. The color is deeper if C or a C compd. is added. A light filter with a nearly constant transparency for all the visible rays is made by combining a violet glass as above with a silicate glass colored green by oxide of Fe.

Silvering glass. CARL GRAMBACH. Swiss 129,233, Jan. 14, 1928. Plate glass is silvered by first coating it with a layer of liquid enamel, drying, and coating with a layer of readily fusible metal.

Composite spectacle lenses. K. MARTIN. Brit. 297,627, Jan. 20, 1928. Multifocal lenses comprise a "distance piece" of lower softening temp. than the "reading piece" and the latter is formed of highly refractive baryta glass which has been previously treated for removal of blisters or bubbles.

Uniting sheets of glass, etc. RÖHM & HAAS A.-G. Brit. 297,413, Sept. 21, 1927. In uniting glass sheets to form "splinterless" composite sheets or in uniting other materials, there is used a polymerized or polymerizable material such as methyl cinnamate (which may be polymerized by the action of light after placement between 2 glass sheets) or a sheet of polymerized ethyl crotonate (which may be united with 2 glass sheets by pressure at a temp. of  $90^\circ$ ). Azo dyes, metal powders or other suitable substances may be added to the compns. used.

Uniting glass sheets to a sheet of cellulose acetate or similar composition. N. B. MATTINGLEY and A. REA. Brit. 298,423, Jan. 27, 1928. Joining of the sheets is effected by use of an adhesive comprising rubber with or without gum dammar and gum mastic and suitable volatile solvents, with gradually increasing heat and pressure in a hydraulic press, the platens of which are heated by steam or hot water. Various details are given.

Non-splintering glass. JOHN NEWTON. Fr. 648,085, Feb. 2, 1928. One face of each of 2 glass sheets is coated with a soln. of albumin in distd. water and dried. Pyroxyl in ether, alc. or amyl acetate is applied and dried, and the coated surfaces are united to a celluloid sheet which has been immersed in a soln. of dimethylamine in spirit. The edges of the compd. sheet may be sealed by celluloid or collodion soln.

Reinforced glass. PERCY H. HEAD and SAFETY GLASS AND METAL PRODUCTS, LTD. Fr. 648,301, July 2, 1927. In making reinforced glass of several sheets cemented together, 3 or more of the sheets have a thickness which contrasts with the other sheet or sheets. Thus, 2 thin sheets are joined to one thick middle sheet.

**Reinforced glass.** JACQUSS DUCLAUX. Fr. 648,990, July 1, 1927. Between 2 sheets of glass is placed a layer of cellulose, methyl- or ethyl-cellulose or caroubine. If celluloid is used a layer of a substance which will prevent access to the celluloid of light rays having a wave length less than 0.00033 mm. is interposed. Such substances include stannates, molybdates, tungstates, colloid salts of Pb, Hg or Bi, benzophenone, aromatic hydrocarbons such as stilbine or dibenzyl. PrOH, iso-PrOH, BuOH or AmOH is used instead of MeOH or EtOH in the baths into which the celluloid is passed.

**Coatings for vignetting or shading glass, celluloid, etc.** J. J. ROWS. Brit. 297,699, June 22, 1927. A coating for preventing "glare" or dazzling effects is formed by spraying the surface with a cellulose deriv. contg. a dye or other sol. coloring substance and, after drying, applying to the surface a clear soln. of a cellulose deriv. to dissolve or disperse globules of coloring matter which are caused to flow and unite. The inner faces of glass sheets used in forming "non-splintering" glass may be coated with the clear soln. and the interposed sheet such as cellulose deriv. or clear rubber with the colored soln.

**Rotating disk fuel charger for brick kilns.** INGENIEUR GAIRING, MASCHINEN-FABRIK G. M. B. H. Ger. 473,079, Oct. 6, 1926.

**Pottery kiln.** ALBERT C. WARD. U. S. 1,710,558, April 23.

**Drying and burning clayware.** WILLIAM E. CRAMER (to Harrop Ceramic Service Co.). U. S. 1,709,063, April 16. A plant is described comprising drying units of successively increasing height, and a tunnel kiln, with tracks extending through them, so that a partial setting of ware in the plastic state can be sent on kiln cars through the drying unit of lesser height, addnl. ware then set on the ware so dried, the dried and undried ware sent through the drying unit of next greater height, and the whole setting then sent through the kiln for burning.

**Ceramics.** MAX HAUSER. Swiss 128,404, April 28, 1926. A mixt. of powd. metals or alloys and ceramic raw material, such as silica, alumina, kaolin or quartz, is molded and burned to produce durable ware.

**Ceramics.** SCHEIDHAUER & GIESING A.-G. Swiss 129,228, Dec. 13, 1926. Ceramic objects are formed from aluminiferous binding material to which a colloidal electrolyte is added together with a sufficient quantity of granular deplasticizing agent to render the mixt. uncastable. The substance is mechanically molded. The electrolyte may be alkali, alkali carbonate or alkali silicate.

**White ceramic products.** I. G. FARBENIND. A.-G. Brit. 297,939, Aug. 29, 1927. Ceramic products (e. g., a vessel of unglazed clay) having pure white shades are obtained by heating the shaped ceramic materials to redness (or suitably to 1000°) in Cl or a gas contg. Cl.

**Ornamenting pottery surfaces.** J. F. GIMSON and BAKER & Co., LTD. Brit. 298,018, Jan. 18, 1928. The surfaces are made with slight indentations, recesses or irregular cavities, painted in ceramic colors while the articles are in the clay or bisque state and then glazed and fired. A preliminary glazing also may be followed by painting in colored slip and further glazing.

**Abrasive wheel bonded to face plates with vulcanized rubber.** JOHN R. GAMMETER (to George W. Perks Co.). U. S. 1,709,820, April 16.

**Clouded enamels.** I. KRIDL. Brit. 297,724, Sept. 26, 1927. Substances are added to enamels which produce a clouded effect by evolution of finely distributed gas bubbles during the firing of the enamel. Formic or acetic acids or their salts, naphthol, benzdine, starch, flour or other suitable org. substances, or "inorg.-org." substances, or mixts. such as C and an oxidizing agent, may be used, and the use of carbides also is mentioned. Addn. of an oxidizing agent such as KNO<sub>3</sub> may be made to prevent discoloration of the enamel due to the presence of C or C compds. Clouding of glass may be similarly effected. Brit. 297,725 specifies addn. of inorg. substances such as "metals, metalloids, and their compds."

**Clouded enamels and glasses.** I. KRIDL. Brit. 297,737, Sept. 26, 1927. Clouding is effected by adding substances such as org. compds. of Sn, Ti, Zr or Sb which effect clouding during melting by forming fine gas bubbles within the molten mass.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Testing of small samples of cement. HANS KÜHL, Hochschule, Berlin. *Tonind.-Ztg.* 53, 374-7(1929); cf. C. A. 22, 2042.—The carborundum furnace is now being used, and in addn. to small bars for flexure tests, small cubes are being made for compressive strengths. F. O. A.

Measurement of the expansion of cement at high temperatures. SHICHIRO UCHIDA, Sendai Higher Tech. School. *Bull. Reconstruction Bureau* [II], 10, 1-25(1927).—In a mixt. of cement and volcanic ash a second expansion in the first heating does not occur, a marked contraction taking place instead. The linear expansion depends upon the volcanic ash content, there being no marked variation of the expansion up to 20%. Above 30% the linear expansion decreases. The linear expansion extending over the temp. range of 0-900° was measured with various samples contg. up to 50% of the ash; the results are shown by curves and tables. In blast-furnace cement the second expansion is not pronounced in the first heating, but the expansion coeff. is great at higher temp., being almost the same as that of portland cement. In Onoda white cement the second expansion does not appear at the first heating, and the expansion coeff. is greater the higher the temp., being little higher than that of portland cement. For cement, mortar and concrete, up to 100° the expansion coeffs. are almost the same as that of iron, so that they are thermally safe when used in an iron-frame building. K. SOMEYA

Influence of the waterproofing material (asphalt emulsion) upon the time of setting and the strength of cement. SHICHIRO UCHIDA, Sendai Higher Tech. School. *Bull. Reconstruction Bureau* (Tokyo) [II], 9, 106-10(1927).—When the soln. made by dilg. asphalt emulsion with H<sub>2</sub>O is used instead of H<sub>2</sub>O in gaging cement, some increase in the setting time and a 0.4% decrease of strength are brought about. The effect of preventing the penetration of water at 1 atm. pressure is sufficiently great when the gaging soln. is made by dilg. asphalt emulsion with 15 vols. of water; when the emulsion is dild. with 20 vols., the penetration of water is entirely prevented under 2 atm. pressure, and for a considerable length of time even under 4 atm. pressure. K. SOMEYA

Weathering test of portland cement and blast-furnace cement. KOJI OHAZAMA, JIRO KASAWARA AND SAKAE SAGAWA, Reconstruction Bureau (Tokyo). *Bull. Reconstruction Bureau* [II], 10, 108-9(1927).—The change of the properties of portland cement (A) and of blast-furnace cement (B) due to weathering has been measured for 6 months, the measurements mentioned below being made 16 times within that period. The ignition loss increased with weathering, from 2.14 to 7.98% in A, from 1.16 to 6.5% in B. The tensile strength of A changed from 30.1 kg./cc. to 32.3 kg./cc. in 28 days, of B from 34.6 kg./cc. to 20.8 kg./cc. The resistance to pressure showed almost no decrease in A, while in B the decrease was remarkable, i. e., from 238 kg./cc. to 41 kg./cc. While the setting time in B is sometimes markedly lengthened, no such phenomenon is observed in A. B is inferior to A in many respects, especially in strength. K. SOMEYA

Mechanical tests of solidit and blast-furnace cement. KOJI OHAZAMA, JIRO KASAWARA AND SAKAE SAGAWA, Reconstruction Bureau (Tokyo). *Bull. Reconstruction Bureau* [II], 10, 97-9(1927).—Tests on 1:3 mortar using solidit, blast-furnace cement and portland cement, after one year, show that the first is weakest and the third is strongest. K. SOMEYA

Action of acids upon cement and mortar. SHOICHIRO NAGAI, Tokyo Imp. Univ. *J. Ceramic Ind. (Japan)* 36, 382-94(1928).—A portland cement (from Iwaki), a blast-furnace cement and "solidit" were compared as to their resistance to the action of H<sub>2</sub>SO<sub>4</sub>, (COOH)<sub>2</sub>, AcOH and HCl. The strength of samples after dipping in the acids was compared with that of samples dipped in H<sub>2</sub>O. The degree of corrosion as expressed by the decrease of resistance is 46% for blast-furnace cement, 94.2% for "solidit" and 78% for Iwaki cement. In "solidit" the attack extends to the innermost portion, while in portland cement there is first formed a thin layer of CaSO<sub>4</sub>, which retards the penetration of the acid soln., but this layer finally falls off and the corrosion continues. In blast-furnace cement the CaSO<sub>4</sub> layer is also formed but it does not fall off. In 0.3 N H<sub>2</sub>SO<sub>4</sub> less corrosion is obtained than with 0.1 N H<sub>2</sub>SO<sub>4</sub>; this is explained as due to the greater protecting action of the layer formed by the more conod. acid. With HCl, sol. Ca salts are formed, so that the corrosion is greatest with portland cement and least in the blast-furnace cement. When the basic slag is added to the clinker to obtain greater strength so that the compn. approximates that of iron-portland cement, susceptibility toward salts and acid becomes less pronounced. K. S.

Old mortars. KARL BIEHL. Wickings Inst., Lengerich i. W. *Towind.-Ztg.* 53, 449-51 (1929).—Analyses of Roman mortars from the St. George wall in Cologne and from the crypt of the minster in Bonn showed that the Romans used both high-Ca and high-Mg limes in 1:3 mortars together with trass. A mortar from a Dresden fortification erected in 1760 had similar properties. F. O. A.

Physico-chemical correlation between aggregate and cement in mortar and concrete. G. KATHREIN. *Mitt. staatl. tech. Versuchsanst. (Wien)* 17, 106-13 (1928).—The amt. of mixing water is the most important factor in detg. setting time, strength, absorption, shrinkage, etc. Portland cements tend to shrink while aluminous cements tend to expand on storage. Kaolin promotes marked shrinkage and expansion when added, while finely ground marble has little effect. Portland cement specimens shrink in lime water, while those made from aluminous cements expand. Brimstone and, to a lesser extent, kaolin, combine with the lime set free from portland cement, lying intermediate between the reactive trass and the inert quartz. At higher temps. orthoclase, quartz and augite react with lime, while calcite, even at the temp. of the autoclave, remained inactive. Lack of sufficient water during storage often has an adverse effect on the reaction with lime. F. O. ANDERREGG

Concrete. NATHAN C. JOHNSON. I. Difficulty of standardization. *Eng. News-Record* 102, 128-30 (1929). II. Commercial production of concrete. *Ibid* 172-5. III. Simplifying quality production. *Ibid* 263-8. IV. Effecting economies by study of cements. *Ibid* 314-8.—A lengthy discussion of the factors affecting the quality and uniformity of concrete, the adequacy of present standards and the reliability of specimen cylinder strength tests as an index of the quality of field concrete, together with suggestions for prepg. more uniform concrete. The following outline specification is considered suitable: 1 part of cement, not over 2 parts of sand if the sand is coarse and less if the sand is fine, as much stone as the mix will carry and only sufficient water to give a workable consistency without sepn. A study of the properties of the "cement pulp" between the sand grains of concrete indicates economies and improvements which may be effected. This cement pulp absorbs water regardless of phys. pores. Concrete exposed to water should therefore be protected irrespective of the quality of the product. Oil is ineffective for this purpose, as it will penetrate only the phys. pores of the mass and not the pulp itself and the latter will continue to absorb water. Evapn. of the absorbed water brings to the surface dissolved salts and results in the efflorescences frequently observed on concrete. Set and hardened cement pulp will not bond with new cement mixts. except for a very limited time. If the surface of the aggregate of set concrete is washed free of cement pulp a reasonably effective bond may be expected. In the "mother liquor," a strongly alk. soln., which is formed as soon as cement and water are mixed, the secondary products of the hydration of cement diffuse and spread. Much depends on the concn. of this mother liquor. If pure mother liquor is added to a normal cement-sand-stone mixt., the rate of hardening can be increased 300-400%. The alk. mother liquor attacks the resins of wooden forms, causing warping and weakening. Application of an impermeable coating retards this action and considerably increases the life of the forms. R. E. THOMPSON

Composition of concrete. JUNKICHI KATO AND YAJIRO NAGAYAMA. Reconstruction Bureau (Tokyo). *Bull. Reconstruction Bureau* [II], 10, 26-40 (1927).—N. and K. have prepd. a table showing the relation between the strength of concrete and the water-cement ratio. The relation between the materials required and the compn. as well as that between the compn. and cost are shown graphically. K. SOMEYA

Protection of concrete. R. GRÜN. *Bauingenieur* 9, 350-2 (1928); *Wasser u. Abwasser* 25, 204; cf. C. A. 22, 3030.—Clinker facings give very little or no protection to concrete unless the former are laid in asphalt plastered on the surface. Various methods of detg. quality of asphalt for protective purposes are described. Artificial aging of coating materials is attained by irradiation with ultra-violet light or by ozone treatment. C. R. F.

Corrosion of concrete. CHUICHI HARI. *Kogyoshiyo* (Miscellaneous Data for Mining Industry) 16, 1340-52 (1928).—When a suitable amt. of  $H_2O$  is used and care is taken in gaging to make a compact concrete, the penetration of  $H_2O$  and gas is made difficult and corrosion is lessened. The corrosion of the concrete used in the walls of a building, gas pipe, irrigation canals, etc., is chiefly due to the porosity of the material. By virtue of the difference of pressure or humidity on the two sides,  $H_2O$  flows from one side of the wall to the other, and in all cases the  $H_2O$  which has passed through the cement is alk. On coming into contact with  $CO_2$ ,  $H_2SO_4$ , and  $HCl$ , it forms carbonates, chlorides or sulfates, which deposit at the surface or in the pores. In the case of reinforced concrete buildings, the concrete deteriorates when  $H_2O$  and gas penetrate

to the steel. The rusting of reinforcing steel at the seashore is probably due to the entrance of sea water, while in tunnels it is due to the action of  $\text{CO}_2$  and  $\text{H}_2\text{SO}_4$ . To prevent corrosion H. recommends that a mixt. of petroleum benzine and 30-40% paraffin be blown on to the surface to make a thin coating. When the color is not important an asphalt solution is also good. In sewer pipe, coal tar is sometimes recommended but it is not effective, because the coating is removed by the mechanical action of flowing  $\text{H}_2\text{O}$ . K. SOMEYA

Concrete's 15-year record on New York subways. GEO. L. LUCAS. *Eng. News-Record* 102, 380-5(1929).—Records of 15-years' concreting practice on New York City subways are presented graphically and discussed in some detail. The mix employed is 1:2:4, proportioned by vol. on the basis of  $7/8$  cu. ft. per 94-lb. bag of cement, the max. amt. of water permitted, including moisture in aggregates, being  $6\frac{1}{4}$  gals. per bag of cement, equiv. to a water-cement ratio of 0.875. Although the specified proportions of cement and aggregate have been changed in only a minor degree since 1914, improvements in practice as a result of research have increased 89% the yearly av. strength of the concrete produced since that date. Practice has shown conclusively that, other factors being equal, the water-cement ratio is the controlling factor in the strength of the concrete produced. Tests have indicated that 55-min. haul after mixing in revolving drums mounted on motor trucks reduces the strength of the concrete 10%. The graphs given include: grading requirements of fine and coarse aggregates, yearly av. strength of concrete for the periods 1914-8 and 1926-8, characteristics of the cement used during the period 1913-27, effect of time of haul on the strength of concrete and influence of type of sand on the strength of concrete. R. E. THOMPSON

Study of mixing action in large concrete mixers. A. N. TALBOT. Univ. of Illinois. *Eng. News-Record* 102, 394-6(1929).—Data are given from an extensive report to the Kochring Co. of Milwaukee, for details of which the original must be consulted. Two forms of mixing action are necessary: (1) intermingling of the ingredients, and (2) rubbing or scrubbing action among the particles themselves. The slower speeds of rotation give a better mixing action; dry and medium mixes need a slower speed than do wet ones. A fine sand mixt. requires more vigorous action than one of coarse sand. R. E. THOMPSON

Effect of sugar on concrete in large-scale trial. MILES N. CLAIRE. *Eng. News-Record* 102, 473(1929).—Data are given on tests made on a large floor slab in which 0-1 lb. of sugar per bag of cement had been added to retard setting. The deleterious effect of the sugar was very apparent for 0.5 lb. of sugar and over, the concrete at the age of 25 days being easily scratched with a blunt instrument. The concrete to which about  $1/8$  lb. of sugar had been added was only slightly less hard than the slab without sugar. After 8 months, examn. of the slab showed appreciable wear on the section contg. 0.5 lb. sugar, slight wear on the 0.25-lb. section and none elsewhere, the slabs with greater amts. of sugar than 0.5 lb. having been replaced. R. E. THOMPSON

Tensile test of centrifugal reinforced concrete pipe. YAJIRO NAGAYAMA AND JUNKICHI KATO. Reconstruction Bureau (Tokyo). *Bull. Reconstruction Bureau* [II], 10, 57-75(1927).—Seven samples were tested. The d. and the strength are greater than those for ordinary concrete pipe. K. SOMEYA

A source of error in determination of the plasticity of hydrated lime. FRANK C. MATHERS AND EVERETT C. GOSNELL. *Ind. Eng. Chem., Anal. Ed.* 1, 59-61(1929).—Present specifications for the use of the Emley plastometer do not fix the time of stirring of the sample to be tested. This factor is important and the time of 2 mins. is recommended. Other possible factors are discussed. EUGENE C. BINGHAM

Indiana limestone. I. Efflorescence and staining. F. O. ANDEREGG, H. C. PFEFFER, PAUL R. JUDY AND LEE HUBER. *Eng. Expt. Sta., Purdue Univ., Bull. No. 33*, 84 pp. (1928).—A study of the nature, causes, consequences, prevention and removal of efflorescence and staining that sometimes appear on Indiana limestone. The nature of the efflorescence was detd. by analyzing numerous samples from various parts of the country and it was found that sulfates of Ca, Mg and Na predominated. For efflorescence to occur, sol. salts, moisture and capillary passage through the wall must be present. As most building materials contain an appreciable amt. of sol. salts the best way is to design and build the wall so as to keep moisture out. That means that all capillary contact with the ground, open porches, etc., must be broken. Rain water alone contains sol. salts during most of the year and, in addn., free  $\text{H}_2\text{SO}_4$  in the winter, so that it must not have the opportunity of soaking into the wall. Efflorescence is best removed by washing, especially with a steam jet, at intervals. Several kinds of stain may appear on Indiana limestone. A brown stain giving the most trouble is caused

by sol. Na and K salts coming in contact with org. matter in the stone, residual from the original organisms. The  $\text{CaCO}_3$  forms  $\text{Na}_2\text{CO}_3$  or  $\text{K}_2\text{CO}_3$ , which peptizes some of the partially oxidized org. materials, which then are carried to the surfaces as moisture evaps. and deposited as an unsightly varnish. This will gradually disappear on exposure to the weather. It is similar to and usually accompanied by efflorescence, the chief difference being the Na or K salt action. These salts come most often from the cements used in setting the stone or backing, so that the prevention requires the use of cements low in sol. alkalis, of which there are several, in addn. to the usual methods of efflorescence prevention. Soot stains and soil stains are best removed by use of a steam jet. Green Cu stains are sol. in NaCN soln. Tannic acid stains from hardwoods may be removed with formic acid. Rust stains usually yield to hot oxalic acid. The removal of the brown alkali stains is difficult. In the hands of a skilled operator, it is possible to remove them from the dry wall by treatment first with  $\text{Na}_2\text{CO}_3$  soln. or pulp followed by a formic acid and washing. The most important thing for long life is to build and maintain the wall dry.

F. O. ANDEREGG

Tar and asphalt, the best means of combating dust. ED. SCHNEIDER. *Städt. Tiefbau* 19, 129-34(1928); *Wasser u. Abwasser* 25, 64.—Asphalt roads produced the least amt. of dust while macadam produced most. Crushed stone or macadam highways may be made dust-free by treatment with asphalt or tar.

C. R. F.

Use of mixtures of petroleum products and creosote for preservation of timber. A. I. VORONOV. *J. Chem. Ind. (Moscow)* 5, 1227-30(1928).—Bateman and Henningsen (*C. A.* 19, 3578) having shown that satisfactory wood preservers can be obtained by using mixts. of hydrocarbon oils and creosote provided these liquids form, on mixing, not more than 1 1/2% of tarry ppt., an investigation was made of the conditions of formation of this ppt., particularly when Russian heavy oils and mazouts are utilized. Exptl. data show that the stability of different creosote fractions in benzene increases with the decrease of the b. ps. of these fractions; thus the creosote fractions which boil below 350° dissolve in benzene without forming a noticeable ppt., whereas higher-boiling creosote fractions produce pptn. When hydrocarbon oils heavier than benzene are used it is found that the higher the b. p. of the petroleum product the greater the stability of its soln. in creosote. As the miscibility of the 2 liquids depends not only on the b. p. of the fractions but also on their chem. compn., and as the latter is not known, various mixts. of Russian petroleum product are prepd. and the percentages of tarry pptn. were detd. in each particular case. It was found that purely naphthenic petroleum, as well as hydrocarbon oils of the  $\text{CH}_4$  series, give, on being mixed with creosote, the largest quantity of tarry ppt. Naphtheno-aromatic petroleum give, on the contrary, the least pptn. Thus the best petroleum for this particular purpose are those which consist largely of aromatic and naphthenic hydrocarbons and contain no hydrocarbons of the  $\text{CH}_4$  series. The presence in petroleum of a large quantity of aromatic compds. and of tars contributes to the stability of its mixts. with creosote, whereas a large content of  $\text{CH}_4$  hydrocarbons and of naphthenes in the absence of aromatic compds. and in the presence of but a small quantity of tars are factors causing tarry pptn. Timber is permeated by these mixts. in autoclaves at 90-100°, the pressure being 10 atm. Different kinds of wood are permeated at a different rate of speed; thus pine is permeated twice as easily as oak. As a whole, Russian mazouts and heavy oils are very well applicable for use in mixt. with creosote as wood preservers and give no more than 1 1/2% of tarry ppt. Exptl. data are presented in form of 2 tables.

BERNARD NELSON

Lumber treating by non-pressure process. T. A. WILSON. *Elec. World* 17, 823-6 (1929).—It is possible by the non-pressure process to secure full sapwood penetration in practically every species of wood in com. use. The equipment described consists of a large cold-storage tank, a hot-storage tank, 2 open-top treating tanks for butt-treating of poles, and one for treating lumber and timbers. The latter tank has a removable cover and a motor-driven derrick handles the material in and out of the tank, and a gasoline crawler-crane performs the yard work. Steam is supplied by a 50 h. p. boiler to a circulating heater, the preservative, creosote, is forced by motor pump through the heater to the hot-storage tank and each of the treating tanks, as required. A uniform and const. temp. is assured during the treating cycle, with thorough agitation of the preservative. By substitution of water for steam the heater is converted to a cooler for the cool treatment with preservative, without exposing the material to the air. With uniform temps. under pos. control, it has been possible to det. the most desirable temp. to be used for a given charge.

W. H. BOWYER

Tests of the reagents used for preventing the decay of wood. III. KAWAKUCHI TANAKA, SHINJI SHOJI AND NAMIO FUKAKOSHI. *Reconstruction Bureau (Tokyo).*

*Bull. Reconstruction Bureau* [II], 2, 125-7(1927).—The corroding action upon iron of the reagents used for prevention of decaying of wood was studied for 10 kinds of the reagents sold in the market. A definite quantity of Fe was suspended in the liquid reagents and the increase of the Fe content in the soln. was taken to indicate the degree of corrosion of iron. Of the reagents tested, creosote was found to be least corrosive.

K. SOMEYA

**Test of fire-resisting reagents for wood.** KATSUJI TANAKA AND SHINJI SHOJI. *Reconstruction Bureau* (Tokyo). *Bull. Reconstruction Bureau* [II], 9, 111-8(1927).—Among the reagents tested the mixt. of  $(\text{NH}_4)_2\text{HPO}_4$  and  $\text{H}_3\text{BO}_3$  (I),  $\text{Mg}_2(\text{BO}_3)_2$ , (II) and the mixt. of  $(\text{NH}_4)_2\text{SO}_4$  and  $\text{H}_3\text{BO}_3$  (III) were found to be most effective as fire-resisting material. But since I has a tendency to dissolve when the wood is placed in  $\text{H}_2\text{O}$  after it is soaked in the soln. of I, its effect decreases on keeping the wood in  $\text{H}_2\text{O}$ . (II) is free from such defect, and the wood which has been soaked in II may be employed outdoors.

K. SOMEYA

On the relationship between the various forms of  $\text{CaSO}_4$  at high temperatures (Lashchenko, Kompanski) 2. The conversion of cyanamide to  $\text{NH}_3$  (MOLTOR) 18. Biochemistry of dry-rot in wood (BARTON-WRIGHT, BOSWELL) 11D. Purifying petroleum oils and distillates [for wood preserving] (Brit. pat. 297,414) 22.

SCHNEIDER, EDUARD: *Modernen Strassenbau; Steinstrassen, Teer- und Asphaltstrassen*. 2nd ed. Berlin: Allgemeiner Industrie. 479 pp. M. 15. Reviewed in *Eng. News-Record* 101, 928(1928).

**Oxy-sulfate cements.** E. R. HARRAP, J. A. CANN and BELL'S UNITED ASBESTOS CO., LTD. Brit. 298,270, July 7, 1927.  $\text{FeSO}_4$  is used for all or part of the sulfate component with an oxide such as  $\text{MgO}$ . Retarders such as  $\text{H}_3\text{BO}_3$  or accelerators such as alum may be added. The mixt. can be prepd. and kept dry ready for admixture with water when desired for use.

**Apparatus for forming cellular cement composition by use of a froth-flotation agent.** G. B. HINTON. Brit. 297 638, Feb. 27, 1928.

**Enameling fibro-cement.** N. ZAVARO and A. SPLINQUEZ. Belg. 351,025, June 30, 1928. Two coats are applied by spraying, the first having a turpentine vehicle and the second being mixed with water before application. After the application of each coat the object is heated progressively, baked and then cooled very gradually.

**Molding concrete.** CHEM. FAB. GRÜNAU LANDSHOFF & MEYER A.-G. Ger. 473,022, Nov. 6, 1927. The appearance of molded concrete objects is improved by smearing the interior of the mold with a soln. of decompn. products of albuminoids, e. g., a soln. of alkali salts of protalbinic and lysalbinic acids.

**Waterproofing mortars and plasters.** O. SIMON and M. KÖLLER. Brit. 298,034, Feb. 29, 1928. A waterproofing paste for addn. to mortars and plasters is prepd. by reacting on limestone, marly limestone, marly clay, a mixt. of white limestone and white clay or other suitable lime-contg. material with  $\text{HCl}$  and then incorporating paraffin oil or other light-colored oil or fat with the product while heating.

**Treating slag to form plaster, etc.** M. ODLING and A. A. STRAGER. Brit. 298,141, May 4, 1927. Blast-furnace slags or natural rocks or slags of similar character are crushed or granulated and heated with relatively concd.  $\text{H}_2\text{SO}_4$  with or without addn. of oxidizing agents such as nitrates or peroxides. The product is then lixiviated to remove  $\text{Al}_2(\text{SO}_4)_3$  and the residue, consisting mainly of silica and  $\text{CaSO}_4$ , may be used as a *fertiliser* or calcined at a relatively low temp. to produce a hard *wall plaster*. The soln. of  $\text{Al}_2(\text{SO}_4)_3$  may be evapd. or lime or limestone may be added to it to produce basic Al sulfate.

**Artificial stone.** ROBERT H. ABREY. Fr. 648,544, Feb. 8, 1928. Raw or calcined magnesite is heated with a flux such as  $\text{Na}_2\text{SiO}_3$  or borax and the resulting clinker is ground and mixed with a soln. of  $\text{MgCl}_2$ ,  $\text{AlCl}_3$  and  $\text{BaCl}_2$  as well as waterproofing materials, and filling materials may be added. Tiles, basins, etc., may be produced by molding.

**Artificial marble.** GEORGES MOLLIER-BILLIET. Fr. 648,186, June 13, 1927. Objects resembling marble are made by mixing  $\text{MgO}$ , powd. quartz and  $\text{BaSO}_4$ , treating the mixt. with a soln. of  $\text{MgCl}_2$  to which  $\text{Pb}(\text{AcO})_2$  has been added, and molding.  $\text{CH}_3\text{O}$  and glycerol may be added to render the final product impermeable.

**Bricks, etc.** EUGENIO D. ROLANDO. Fr. 649,248, Feb. 18, 1928. Bricks, etc., are made from powd. stone and granulated stone and cement or lime or other binding agent.

**Laminated blocks for building purposes.** CALEB PAYNE (to Gypsum Engineering & Mfg. Co.). U. S. 1,709,035, April 16. Blocks are formed with thin side walls of gypsum stucco or other veneer bonded to a central layer of foamaceous cellular material.

**Bituminous compositions for paving blocks, etc.** MUSAG GES. FÜR DEN BAU VON MÜLL- UND SCHLACKEN-VERWERTUNGSANLAGEN A.-G. and A. GROTE. Brit. 298,159, Oct. 4, 1927. An aggregate of graded grains of hard slag of various sizes up to 6 mm. (mixed to reduce voids to a minimum) is used with a bituminous binder. The slag may be prepd. by sintering house refuse.

**Compositions for flooring, paving, etc.** J. MACDONALD (representative of D. Macdonald) and R. F. MACDONALD. Brit. 298,290, July 15, 1927. A granular material is made from a mixt. such as silica 25, Fe oxide 3, alumina 15, CaO 35, MgO 12 and coloring material 10 parts, by fusing the mixt. to form a brick-like product and grinding to the desired size. Dolomite may be used in making the compn. if desired and it may be otherwise varied but the Ca content must not be sufficiently high to cause the material to set like cement when mixed with water. The particles may be further colored with a glaze-like coating compn. which is hardened by firing.

**Floor composition.** K. SCHNEBLE. Brit. 297,750, Sept. 26, 1927. A compn. for covering floors is formed of cork 40, pumice stone 40 and kieselguhr 20 parts, with a binder formed of cement and water. Various modifications are described.

**Flooring.** LOUIS M. CHESSEX-CORBAZ. Swiss 128,659, Nov. 28, 1927. Reinforced concrete flooring has blocks which have interfitting flanges with grooves for the iron rods.

**Flooring.** JAKOB RÜGG and FRITZ SCHMUTZ. Swiss 128,658, Jan. 13, 1927. Flooring is made from magnesite-free mineralized sawdust, sand and portland cement pressed between boards and placed between the beams.

**Floor covering.** PIERO COLOMBI. Swiss 129,312, Jan. 9, 1928. Cork waste is cemented together by a soln. of casein in  $\text{NH}_4\text{OH}$ , or in  $\text{NaOH}$ , or by an aq. soln. of silicate.

**Process and autoclave for impregnating wood by forced rising circulation of the impregnating agent.** C. DE ZUTTERE. Belg. 353,076, Aug. 31, 1928. Constructional features.

**Drying lumber and similar materials.** H. W. COWAN. Brit. 297,480, Sept. 23, 1927. The material is treated in a chamber, suitably of a temp. of about  $95^\circ$ . At first the temp. falls somewhat due to evapn. of moisture from the material but is then raised to about  $95^\circ$  after which the air is withdrawn from the chamber and replaced by fresh heated air. Various structural features of a kiln contg. a turntable on which the lumber is stacked are described.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

**Different methods for calculating the calorific power of solid fuels.** PAUL JARRIER. *Chaleur et ind.* 10, No. 107, 107-12(1929).—The bomb calorimeter must be used when accuracy is desired but it is often sufficient to calc. the calorific power from the elementary or from the proximate analysis or from Berthier's method based upon the amount of  $\text{O}_2$  necessary to burn the fuel. Let  $C$ ,  $H$ ,  $O$  and  $S$  be the percentage wts. of these elements, let  $a$ ,  $b$ ,  $c$ ,  $d$  be the heats of combustion of  $C$ ,  $H$ ,  $S$  and  $\text{CO}$ , resp., in kg.-cal./kg. Then from six equations the general formula may be written  $Q_d = aC + bH + cS - dO$  kg.-cal./kg. Values are given for the consts. and values of  $d$  are discussed. The formulas of Mahler, Dulong, Mendelyeev, and Langbein, Steuer and Vondracek and their applicability to different types of solid fuels are discussed. Dulong's formula is good enough for coals, much less satisfactory for lignites and inexact for peat, wood and cellulose.  $S$  and  $M$ . formulas are too high;  $V$ 's formula is most exact. The three formulas ( $S$ .,  $M$ . and  $V$ .) give results within 1%. The formulas of Goutal, Kent, Saillard and Schmit are discussed for calorific value calcd. from proximate analysis and this method is often quite satisfactory. A formula for Berthier's method is given.

S. L. B. ETHEARTON

**Reduction of fuel values to standard conditions of temperature and pressure.** W. C. BUELL, JR. *Fuels and Furnaces* 7, 559-62, 571(1929); cf. C. A. 23, 2327.—Oil and gas fuels when being tested should be corrected for changes in sp. heat, temp., pressure and vapor tension. The standard is taken as  $32^\circ\text{F}$ ., 30 in. Hg and 100%

satn. For liquid fuels the formula  $V_{22} = V_1 \left( \frac{1}{1 + \frac{K(t - 32)}{(10)}} \right)$  may be used for temps. above 32°F., while  $V_{22} = V_1 \left( \frac{1}{1 - \frac{K(32 - t)}{(10)}} \right)$  will be used for temps. below 32°F.  $V_{22}$  = vol. at 32°F.,  $V_1$  = vol. at metered temp.,  $t$  = fuel temp. at meter,  $K$  is a const. = 0.0033 (Bé - 10) 0.00004. For reducing gas vols. to the standard conditions the formula  $V_{22/30} = V_1 P \left( \frac{1}{1 + \frac{(t - 32)}{(492)}} \right) \left( \frac{P \cdot a}{(30 - 0.164)} \right)$  is used, in which  $V_{22/30}$  = vol. of satd. gas at standard conditions,  $V_1 P$  = vol. of gas as metered,  $t$  = temp. of gas as metered,  $P$  = abs. pressure of gas as metered in in. Hg,  $a$  = vapor pressure at observed temp. and pressure and 0.164 = vapor tension at 32°F. To correct to a dry gas basis the formula becomes  $V_{22/30} = V_1 P \left( \frac{1}{1 + \frac{(t - 32)}{(492)}} \right) (P/30)$ . Tables and charts accompany the paper.

J. W. SHIPLEY

The national interest in low-temperature distillation of fuels. CH. ROSZAK. *Chaleur et ind.* 10, No. 107, 119-28(1929).—The Salerno furnace consists of a series of adjacent troughs, heated from below, with scrapers rotating 14 times per min. moving the fuel to the adjacent trough. The heating gas dries the incoming fuel, which is on an endless chain. A rich gas and an excellent tar are obtained. The capacity is great and the vol. of the plant is relatively small and the cost of the installation is relatively moderate. The Cantieny furnace is discussed in some detail and the financial considerations are taken up. The Pintsch and the Merz and McLellan retorts are adapted for use in central power stations. In the first, the hopper of a mechanical grate is transformed into a carbonization chamber by leading back part of the hot waste gas from the boilers. Condensable matter is removed and uncondensed gas is led below the boilers. The semi-coke falls upon the chain grate from the hopper and is immediately burned. The process is simple but the tar yield is 60% of the theory and recovery of spirit is very difficult because of the large vol. of gas. In the Merz and McLellan process, the coal, dried at 120°, and preheated by combustion products from the boiler, falls into a hopper where it is distd. by a mixt. of steam and burnt gases generated in a sep. and small combustion chamber. Other details and a balance sheet are given. The André Aereng (French) processes are discussed with diagrams and photographs. The coal is dried and is distd. by internal heat and various combinations can be carried out; e. g., the semi-coke and rich gas may be burned and the tar and spirit extd., or the gas may be also removed or the coke may be removed in the pulverized or in the briquetted form. A discussion of the economics of these processes is added.

S. L. B. ETHERTON

The Bussey coal distillation process. H. B. CRONSHAW. *Engineering* 127, 409-11(1929).—The low-temp. coal distn. plant at Glenboig, near Glasgow, Scotland, said to be the largest erected so far, is described. It will have a throughput of 500-600 tons of coal per day, and a daily output of 300-400 tons of smokeless fuel (semi-coke), 15,000 gal. crude oil and 15,000,000 cu. ft. of gas. The Bussey retort is of the stationary, vertical shaft and internally heated type. It consists of a simple steel shaft lined with fire brick, supported on a concrete base. Its form is that of a truncated cone of oval cross section 30 ft. high, 2 ft.  $\times$  2 ft. at the top and 8 ft.  $\times$  3 ft. at the bottom. The grate or multiple tuyère is hollow and divided into sections through which air, gas and steam in controlled amts. are injected into the charge. A cutter-bar above the grate pushes the coke off from either end of the grate alternately, allowing it to fall into cooling hoppers where it is steam-quenched, and then passes to a second hopper below and finally discharged through a chute. As mech. charging devices are used, the operator's duty is mainly that of controlling temp. and pressure at various parts of the retort. Incoming coal is heated to about 150° by gaseous products from below, and in it some oil condensation occurs; this oil is revaporized when the charge descends. In the second zone the temp. ranges from 150° to 425°, and distn. takes place. In the third zone hardening of the residue occurs, combustion goes on and the semi-coke is then discharged. Floor space for each 50-ton unit is 425 sq. ft. W. C. EBAUGH

The Yorkshire, Nottinghamshire and Derbyshire coal field. South Yorkshire area. The Parkgate seam. C. H. LANDER. *Department of Scientific and Industrial Research* (London) 1928, 64 pp.—Results of analyses, phys. and microscopic examn. and carbonization assays of samples from 16 different locations in the Parkgate seam. No marked gradations in the property of the seam are found. The values are as follows, all in %: (a) proximate analysis—moisture 1.7, volatile matter (less moisture) 31.7, "fixed C" 59.6, ash 7; (b) ultimate analysis—(dry coal) ash 7.1, C 79.7, H 4.7, N

1.5, S 1.8, P 0.0078; (c) calcd. to dry ashless coals C 85.75, H 5.15, N 1.63, S 1.94, calorific value (air-dried) 14,470 B. t. u./lb., m. p. of ash 1325°. Carbonization assay at 600° gave the following yield per 100 g. dry coal: coke 78.25, tar 10.85, liquor 3.3, gas at 60°F. and 30" (satd.) 9080 cc., temp. of decompn. 425°, type (a) coke is a weak, friable, swollen coke; type (b) is a firm, shrunken coke; and type (c) is between (a) and (b). The analysis of the banded structure of coal is given. The S is never below 1% and may rise to 3%. Some samples are high in P; it varies between 0.0035 and 0.03%. High calorific value is uniform at 14,000 B. t. u./lb. The m. p. of the ash is high at 1300–1400°. Cokes are uniform. Tops contain less volatile than bottoms; moisture is fairly const. from top to bottom; and the ash and volatile matter are generally higher in tops and bottoms than in middles. Hards have less S than tops or bottoms but the reverse is the case for P, an important fact in metallurgical operations. Fusain usually has higher ash and perhaps S; therefore the removal of fines improves the coal for coking. Observations are made in coking, gas making, steam raising, low-temp. carbonization, special metallurgical processes and locomotive fuels. The tables of index, diagrams and photographs are excellent. S. L. B. ETHERTON

**Hydrogenation:** The hydrogenation of coals in the presence of catalysts. BŘETISLAV HLAVICA. Inst. for the Economic Utilization of Combustibles, Prague. *Paliva a Topeni* 9, 57–61, 74–81, 89–97, 105–111, 117–26(1927); *Brenstoff-Chem.* 9, 229–31 (1928).—H. studies the action of catalysts upon the hydrogenation of coals with the view of reducing the reaction time, lowering the optimum temp., and decreasing the pressure of H<sub>2</sub>. The mols. of coal crack into numerous products which in the nascent state attack H<sub>2</sub>, but the rate of hydrogenation is not only increased by true hydrogenating catalysts Ni, Co, etc., but also by those which hasten the cleavage of the mol. and are used for cracking the heavier oils as AlCl<sub>3</sub>, FeCl<sub>3</sub>, ZnCl<sub>2</sub>. Hydrogenating catalysts accelerate the decompn. of org. mols. at a high temp., while the cracking catalysts favor the hydrogenation of aromatic compds., providing the optimum temp. is not exceeded. Five varieties of coal were studied and catalyzed with Fe<sub>2</sub>O<sub>3</sub> for controls. The elementary analyses and yields at a low (550°) temp. distn. are given. A 1.8 l. rotating autoclave was filled with 150–200 g. of dry coal, a catalyst and steel balls. H was allowed to enter until the pressure of H<sub>2</sub> remained const. After the autoclave was cooled the gas within was measured and analyzed. A portion of the H<sub>2</sub> is fixed to the gas; the remaining H is attached to the solid and liquid residue. The H attached to the gas is computed from the gas analysis. In the course of hydrogenation, the catalysts influence not only the H absorbed but also the distribution between the gas, liquid and solid. After hydrogenation, the liquid and solid residue was sepd. into 3 fractions by distg. at 450°: (1) fraction contg. H<sub>2</sub>O, (2) an oil distg. below 300° and (3) a residue. The phenols in the oil were detd. with the aid of 5% NaOH and the pyrimidine bases with 10% H<sub>2</sub>SO<sub>4</sub>. The oil freed of phenols and bases was rectified, and the sp. gr. and refractive indices of all fractions are given. The residue which distd. over above 300° was sepd. into 2 fractions with petroleic ether: (1) that sol. in the ether and upon which the paraffin was detd., (2) an asphaltous residue insol. in ether. Another sample of hydrogenated coal was extd. with alc. and CHCl<sub>3</sub> and sepd. into sol. and insol. portions. In some cases, 70% of the org. bodies was dissolved in CHCl<sub>3</sub>, but the proportion of org. bodies sol. in CHCl<sub>3</sub> is no indication of the amt. of tar. All coals were hydrogenated with Fe<sub>2</sub>O<sub>3</sub> for a control. Dried lignite from the mine Karolina in Northern Bohemia contg. 8.2% ash was hydrogenated with Fe<sub>2</sub>O<sub>3</sub>, the mixts. Fe<sub>2</sub>O<sub>3</sub> + anhyd. ZnCl<sub>2</sub>, Fe<sub>2</sub>O<sub>3</sub> + ZnCl<sub>2</sub> + AlCl<sub>3</sub>, and Co<sub>2</sub>O<sub>3</sub> + CuO being used as catalysts. Calling the activity of Fe<sub>2</sub>O<sub>3</sub> = 1, that of Fe<sub>2</sub>O<sub>3</sub> + ZnCl<sub>2</sub> = 1.43, and Co<sub>2</sub>O<sub>3</sub> + CuO = 1.65. The phenol and crude oil content was increased 33% in these last 2 cases. The addn. of AlCl<sub>3</sub> to the catalytic mixt. produced a deep cleavage of mols. in which the yield of tar compared to that of Fe<sub>2</sub>O<sub>3</sub> alone is not increased, but the coke and gases increased greatly. The Co<sub>2</sub>O<sub>3</sub> + CuO mixt. yielded 6.8% gasoline and 5.0% of oil, b. p. above 300°; it shortened the time of reaction from 16 to 9 hrs. The ZnCl<sub>2</sub> yielded the best quality of lubricating oils; Co<sub>2</sub>O<sub>3</sub> increased the formation of phenols in the crude oil. Lignite from the mine Hedvika contg. 9.0% ash was hydrogenated with FeCl<sub>3</sub>, anhyd. NiCl<sub>2</sub>, anhyd. CuCl, the mixt. ZnO + KOH, and CaO + Fe<sub>2</sub>O<sub>3</sub> being used as catalysts. The NiCl<sub>2</sub> was best fitted for hydrogenating this lignite, for after a const. H<sub>2</sub> pressure the residual product was entirely liquid, the absorption of H<sub>2</sub> was maximal, and the liquid yielded good lubricating oils. The product contained 8.7% gasoline, 9.7% oil, b. p. above 300°. The CuCl is less influential than NiCl<sub>2</sub>; the absorption of H<sub>2</sub> is lower; the quality of the oil is poorer; more cracking occurs; and the yield of gas is higher and that of paraffin is lower. The ZnO + KOH mixt. is inferior to CuCl but is better than Fe<sub>2</sub>O<sub>3</sub> used alone; the KOH has no effect upon the hydrogenation of phenols. CaCl<sub>2</sub>

has no effect upon the hydrogenation of coal. Lignite from the mine Handlova located in Slovakia contg. 5.1% ash was hydrogenated with  $\text{Fe}_2\text{O}_3$ , the mixts.  $\text{ZnCl}_2 + \text{NiCl}_2$ ,  $\text{ZnO} + \text{NiO} + \text{NaOH}$  and  $\text{CoCl}_2 + \text{CuCl}$  being used as catalysts. With the  $\text{ZnCl}_2 + \text{NiCl}_2$  mixt. of catalysts,  $\text{H}_2$  was introduced in 8 phases. During the 1st stage, lignite absorbed 3.7%  $\text{H}_2$  on the basis of org. matter, of which 1.8% remained in the solid and liquid residue. In the 2nd stage, 1.5%  $\text{H}_2$  was absorbed; 0.6% was absorbed by the solid and liquid residue. In the 3rd stage 0.68%  $\text{H}_2$  was absorbed and 0.65% was absorbed by the gas. During the 2nd and 3rd periods, a deep cleavage of molecules occurred with the formation of gaseous and liquid hydrocarbons having a low b. p. During the 3rd period, hardly any hydrogenation occurred. The activity of the catalysts is:  $\text{Fe}_2\text{O}_3 = 1$ ,  $\text{ZnCl}_2 + \text{NiCl}_2 = 1.12$ ,  $\text{ZnO} + \text{NiO} + \text{NaOH} = 1.31$  and  $\text{CoCl}_2 + \text{CuCl} = 1.66$ . In a 9-hr. period the  $\text{ZnCl}_2 + \text{NiCl}_2$  catalytic mixt. yielded 7% gasoline, 2.3% oil, b. p. over  $300^\circ$  and paraffin 0.06%. The coal Prago from Kladno in Northern Bohemia was hydrogenated with the catalysts  $\text{Fe}_2\text{O}_3$ , the mixt.  $\text{NiO} + \text{Al}_2\text{O}_3$ , the mixt.  $\text{Fe}_2\text{O}_3 + \text{SnCl}_4$ , anhyd.  $\text{ZnCl}_2$  at 93 atms. pressure and anhyd.  $\text{ZnCl}_2$  at 114 atms. The relative activities are 1.00, 1.33, 1.27, 1.54, 2.21. The  $\text{SnCl}_4$  shows an excessive tendency toward cracking. The  $\text{ZnCl}_2$  functions best at high pressure and yields the highest amount of gasoline (14.1%) of all expts. and absorbs 6.5%  $\text{H}_2$ .  $\text{ZnCl}_2$  favors hydrogenation more than  $\text{SnCl}_4$ . The optimum temp. for hydrogenating coal is much higher for coal than for lignite; for brown coal  $430^\circ$  is a satisfactory temp. coal from the mine Jaroslav located in Moravian Ostrava was not fitted for hydrogenation on account of a high C content. The relative activity of the catalysts tried was  $\text{Fe}_2\text{O}_3 = 1$ ,  $\text{FeCl}_3 \cdot 4\text{H}_2\text{O} = 1$ ,  $\text{MnCl}_2 = \text{below } 1$  and  $\text{SnO} + \text{NaOH} = 1.3$ . In one attempt  $\text{H}_2$  was replaced by  $\text{N}_2$ . This process is useless for liquefying coal, for the catalysts are without any action upon the decompn. of mols. when subjected to a  $\text{N}_2$  pressure. The hydrogenation works in 3 phases: (1) A rapid absorption of  $\text{H}_2$  is accompanied by a reduction and conversion of the coal to an asphaltous mass. (2) The asphaltous mass becomes soft and plastic (almost a fluid). (3) Cracking of the hydrocarbons occurs with the formation of gases and liquids. The best catalysts tried were:  $\text{ZnCl}_2$ ,  $\text{ZnO}$ ,  $\text{NiCl}_2$ ,  $\text{NiO}$ ,  $\text{CoCl}_2$ ,  $\text{Co}_2\text{O}_3$  and  $\text{CuCl}$ ; all of these were better than  $\text{Fe}_2\text{O}_3$ ; they doubled the yield of tar and diminished the time of reaction by  $1/2$ . These catalysts do not permit the temp. or pressure to be lowered without affecting the yield of products but influence (1) the intensity of the reaction, (2) the rate of decompn. of the coal mols. and (3) the rate of hydrogenation only secondarily. All expts. were made without a previous addn. of oils; oils hasten and favor hydrogenation and increase the yield of gasoline. In general, the yields obtained in hydrogenating coal by a continuous process with an addn. of tar oils having a high b. p. and  $\text{Fe}_2\text{O}_3$  are the same as those obtained with the above catalysts without the previous addn. of oils. F. M.

The present condition of low-temperature carbonization of coal and lignite in different countries. DAVID BROWNLEE. *Chaleur et ind.* 9, 222-33(1928). S. L. B. E.

Low-temperature carbonization of Brazilian bituminous coals. F. W. FRIGSE. *Brennstoff-Chem.* 9, 385-7(1928).—Proximate and ultimate analyses are given of coals from 12 Brazilian mines. These coals are carbonized in a rotary retort (after Fischer) holding 15 kg. of coal. Analyses of the coke, tar and gas are given. J. D. DAVIS

The swelling of bituminous coal (on coking). G. LAMBRIE. *Brennstoff-Chem.* 9, 341-6(1928).—The swelling of coals as judged by their behavior during the detn. of volatile matter by various available methods is discussed. Different methods give different degrees of swelling and L. proposes a thermal explanation of this. If the heating conditions are such that the coking mass is quickly and uniformly enclosed in an envelope of coke, this tends to keep the plastic mass within from expanding. If, however, heat does not penetrate uniformly—if the heating of the crucible, e. g. is one sided—the coking mass will grow in the direction opposite to the slowly heated side. L. proves this by insulating the bottom of his Pt crucible (Bochumer method) with a layer of kieselguhr. The degree of swelling with kieselguhr is 35.7 as compared with 7.6 when the Bochumer method as ordinarily applied is used. L. uses other substances than kieselguhr and finds that the degree of swelling is inversely proportional to the cond. of the material used. J. D. DAVIS

Low-temperature coking of Chelyaba brown coals. N. N. ROGATKIN. *Ural Polytech. J. Chem. Ind.* (Moscow) 5, 1278-9(1928).—Tests show that in the coking of Chelyaba coals the yield of liquid products has but a slight increase above  $400^\circ$  and that the max. is attained at  $470^\circ$ . The yield of gas begins to grow rapidly above  $450^\circ$  at the expense of the yield of coke. The speed of heating the still has no essential influence on the yields of the decompn. products. Twelve kg. of Chelyaba brown coal contg. 15.52% moisture, 7.31% ash and 1.20% S were coked in a F. Fischer's revolving

furnace, the max. temp. reached being 450°, and the total duration of the distn. being 4 hrs. Under those conditions the liquid distillate represented 17.8% of the dry coal (7.6% being tar); the coke represented 72.5% of the dry coal; and the gas amounted to 7150 l. per 100 kg. of coal. The coke contained 0.55% moisture, 12.95% ash and 0.5% S. The gas, after being freed from H<sub>2</sub>S, had the following compn.: CO<sub>2</sub> 16.6%, unsatd. hydrocarbons 2.4%, CO 8.6%, H 12.5%, CH<sub>4</sub> and homologs 46.1%, O 2.5% and N 11.3%. The calorific capacity of the gas was from 6589 to 7089 cal. B. N.

**Primary tar of Chelyaba brown coals.** I. YA. POSTOVSKII. *J. Chem. Ind. (Moscow)* 5, 1279-80(1928).—The tar obtained by Rogatkin (cf. preceding abstr.) with an av. yield of 6.5% on the weight of crude Chelyaba coal had the following characteristics: solidification point below 0°, d<sub>25</sub> 1.0350, mech. impurities 4.6%, moisture 12.3%, ash 2.46%, phenols 40.0%, calorific capacity 8873 cal. The elementary compn. was C 73.36, H 7.86, N 1.42, S 0.25 and O 17.11%. The chief characteristics of the tar are the low paraffin contents and the high phenol contents. The tar water, which was obtained in the quantity of 23.5%, is brown colored and is characterized by an unusually high NH<sub>3</sub> content, namely 0.3%. BERNARD NELSON

**How to sample coal from unit pulverizers.** R. S. JULESRUD. *Paper* 62, 673-4 (1929).—Various types of sampling methods were tried but with discordant results. A standard type of sampler and of procedure should be adopted. D. B. DILL

**Average composition of the ash of Ruhr coals.** D. J. W. KREULEN. *Brennst.-ff. Chem.* 9, 399(1928).—Ash residues from 4000 com. samples of Ruhr coals were combined, sampled and analyzed. The compn. of the composite sample was: SiO<sub>2</sub> 41.5, SO<sub>3</sub> 0.4, P<sub>2</sub>O<sub>5</sub> 0.5, Fe<sub>2</sub>O<sub>3</sub> 18.4, Al<sub>2</sub>O<sub>3</sub> 31.5, MnO 0.7, CaO 1.2, H<sub>2</sub>O-sol. (mainly CaSO<sub>4</sub>) 4.8%. In CO atm. an ash cone began to fuse at 1180°, bent over at 1215° and was wholly fused at 1230°. 4.8% of the ash was sol. in H<sub>2</sub>O, 41.0% in HCl and 54.2% insol. in HCl. J. D. DAVIS

**Chart for determining loss by combustible in refuse.** C. A. KULMANN. 69, 712-3(1929).—A d'Ocagne nomograph is devised based upon the relation, loss in B. t. u. per lb. dry fuel = 14,600 .1C (1 - C), where .1 is the ash content per lb. of dry coal and C the carbon content of the refuse. D. B. DILL

**Notes on peat bitumens.** G. I. STADNIKOV AND N. G. TITLOV. *Brennst.-ff. Chem.* 9, 357-8(1928).—Various peat samples are extd. with C<sub>2</sub>H<sub>5</sub> EtOH soln., a yield of 8.0 to 20% of bitumen, on the basis of org. peat substance, being obtained. This bitumen can be sepd. into cryst. wax and insol. amorphous resin by extn. with alc. ether soln. Successive extn. with benzine and benzene also serves to sep. waxes and resins. Bitumens consist of about 45 pts. wax and 55 pts. resin. The resins are easily polymerized by heating to 180° and rendered insol. in CS<sub>2</sub> and CHCl<sub>3</sub>. Comparative distn. of the peat and bitumens indicates that in the initial stages of destructive distn. of peat polymerization of the resins is involved. J. D. DAVIS

**Comparative activity of bromine on cellulose, lignin, wood, brown coal and bituminous coal.** W. FUCHS. *Brennst.-ff. Chem.* 9, 348-50(1928).—Br in CCl<sub>4</sub> soln. acts on lignin, wood and brown and bituminous coals both by addn. and substitution, but not at all on cellulose. It does not, however, act on wood that has been completely dried over P<sub>2</sub>O<sub>5</sub>. Total Br taken up (air-dried substances) was 9.2, 11.4, 0.0, 10.8, 12.0 for pine wood, lignin, cellulose, brown coal and bituminous coal, resp. J. D. DAVIS

**Modern views on the evaluation of gas coal; the specific quality index.** G. A. BRENDER A BRANDIS AND H. J. A. DE GOEY. Lab. Gemeentelijk Gasbedrijf's Gravenhage. *Het Gas* 49, 91-103(1929). The method of Geipert (*C. A.* 21, 196) was examd. and compared with the crucible method and the one of B. and Vlugter (*C. A.* 22, 2651). It detcs. the volatile in coal samples under approx. technical conditions (cold coal dropped in a hot oven) and at the same time allows detn. of tar and gas qualities and quantities. Five or 6 little briquets (total wt. about 10 g.) of pressed powd. coal are dropped in a quartz tube kept at 1100°, the tar is caught in a tube with cotton wool and the gas is collected in a graduated cylinder. The expt. takes 12 mins.; by repeating it twice enough gas (10 l.) is gathered to permit a direct detn. of calorific value and an analysis. From the results obtained and tabulated for 12 gas and coke coals it is found that the "quality index" of them (calorific value of gas times vol. produced per g. coal) in cal. per g. does not run parallel at all with the volatile matter, detd. as usual per crucible. This indicates an inferiority of the latter method; for certain classes of coal (Yorkshire, Ruhr) the ratio of the 2 figures seems to be more or less const. For volatile matter, gas yield, quality index and ratio of quality index and volatile matter was found, resp.: for German gas coal (all results on dry coal) 32.6%, 0.2764 cu. m. per kg., 1273 cal. per kg., 39.0; in Yorkshire coals: Hatfield 39.0, 0.3286, 1700, 43.6; mixed 36.2, 0.3126,

1630, 45.0; Firbeck, Markham 37.6, 0.3205, 1704, 45.3; Rossington mixt. 26.3, 0.3242, 1715, 47.2; Firbeck 35.8, 0.3215, 1751, 48.3; in Ruhr coals: Bismarck nut 35.0, 0.3342, 1805, 51.6; Constantin der Grosse nut 33.8, 0.3560, 1860, 55.0; Mt. Ceniz nut 32.8, 0.3400, 1830, 55.8; in Natal coal (S. Africa) 25.5, 0.3278, 1539, 60.4; in coking coals: Emma fat fine 23.5, 0.3334, 1597, 68.0; Shamrock fat fine 23.2, 0.3494, 1683, 72.5. Similar variations were previously observed with the modified Bähr method. Gasification expts. were further made with several other materials: for cellulose was found (cotton wool) volatile matter 92.8%, gas yield 0.6041, quality index 2603; for lignite 51, 0.5216, 1737; and for anthracite 6.64, 0.2859, 891. The quotient of quality index and volatile matter both related to dry coal is named the "specific quality index"  $\Omega$  and indicates the no. of calories per hundred volatile, i. e., the quality of the volatile of the coal. It varies considerably with the type of coal; its value is for cellulose, lignite, German gas coal, Yorkshire coal, Bismarck nut, Emma coke coal, Shamrock coal and anthracite, resp.: 29.1, 34.2, 47.7, 58.3, 64.4, 76.7, 84.3 and 129.1. The value of  $\Omega$  is found by  $\Omega = W_D/V_D = W_v/(V_v - f)$  for  $W_D$  and  $W_v$  the quality index on dry and moist coal, resp., as detd. by the Geipert method,  $V_D$  and  $V_v$  the corresponding values for the volatile matter,  $f$  the percentage moisture. Obviously the value of  $\Omega$  is independent of the ash content of the coal. Generally  $\Omega$  decreases with increasing  $V_R$  (volatile of ash-free), as shown in a curve. The cause for the considerable variation in the  $\Omega$  values for various coals is found in their O content. Data of St. Claire Deville and of the author, the latter by direct O detn. in the coal (ter Meulen method), show this relation conclusively. For the same 8 samples as used before the O on ash-free was 49.4, 26.58, 12.7, 6.4, 5.6, 4.2, 2.9 and 1.50, the O/H quotient: 8.00, —, 2.41, 1.15, 1.00, 0.93, 0.63, —. It is apparent that coals of high volatile can at the same time have a low quality index due to excessive  $H_2O$  production. Anthracite compares in this respect favorably with gas coal; coking coal with 22% volatile gives the same quality index as Yorkshire gas coal with 33% volatile. For economic reasons considering the coke yield, this difference is very significant and should be carefully considered in the purchase of coals. The "isotherm" of  $\Omega$  versus the O/H quotient is discussed and several theoretical cases are considered. It is finally remarked that the Geipert method cannot be used for detn. of the caking quality of coal; the crucible test is necessary for that.

B. J. C. VAN DER HOEVEN

Study of gasification and practical operation of producers. H. GUILLON *Chaleur ind* 10, 37-43 (1929), cf. C. I. 23, 2272. A discussion of the use of charcoal, anthracite coal and coke in gas producers, and their operating characteristics.

S. L. B. ETHERTON

Welded pipe for long-distance gas transmission. LIPPERT *Gas u. Wasserfach* 72, 267-71 (1929). Various types of welded joints used on steel tubes for high-pressure gas transmission are illustrated and discussed. Welded joint failures are usually due to poor welding of the lower part of the joint. Oxy acetylene flames are used and soft pure (Swedish) iron welding rods were found to be most satisfactory. Five men lay about 4000 ft. of 4 in. pipe per week. Pipe over 10 in. in diam is welded in place, but smaller pipe is welded outside the ditch. Pipe lines are tested under 5 to 10 atm. pressure with compressed air. Above 6 atm. pressure a whistling sound is noted at leaks. The use of compressed O for the test caused several accidents. Joints are asphalted and covered with jute. Drips are constructed by welding short pipe sections. Naphthalene appears to be efficiently removed by the lubricating oil used in the compressor. Expansion bends are not used but pipes are laid at least 3 ft. deep to avoid violent temp. changes.

R. W. RYAN

New developments in gas-works carbonizing plant, with special reference to refractory materials. G. M. GILL. *Trans. Ceram. Soc. (Eng.)* 28, 7-14 (1929).—The general practices are discussed; the tendency is toward higher carbonizing temps. Siliceous and fireclay refractories are giving way to silica linings for the hotter zones.

H. F. K.

Cleaning gas for flue-gas testers. CARL HÜTTER *Feuerungstech.* 16, 214 (1928).—Stoppages in  $CO_2$  recorders due to  $H_2S$ , which corrodes the lines and the Hg, may be avoided by putting 2 wash bottles, contg.  $CuSO_4$  and  $H_2SO_4$ , respectively, in the line.

ERNEST W. THIELE

Modern methods for producing illuminating gas. R. GEIPERT *Gas u. Wasserfach* 72, 169-74, 205-10 (1929). Methods for producing the largest vol. of gas from a given oven or retort system are discussed. Such methods are: increasing inerts, adding water gas directly or steaming in the retorts. The ash of the larger coke sizes is only slightly increased by steaming as the greatest effect is on the fines. Condensing, waste heat boilers, water gas generators and the addn. of water gas to coal gas are

discussed, as well as the influence of water gas production on the amt. of salable coke. R. W. RYAN

**Water-gas practice.** W. SCHWEDER. *Gas u. Wasserfach* 72, 261-3(1929).—Although gas analyses are essential in maintaining water-gas generators at peak efficiency automatic gas analysis app. requires so much supervision as frequently to render their use impractical. An app., consisting of 6 or more water-jacketed gas-measuring burets, attached to manifolds, and provided with suitable absorption pipets, is described; it permits the rapid procurement of successive samples. This app. is especially adapted to CO<sub>2</sub> detns., and a series of results is given. The efficiency of the water-gas operation can best be studied by sampling directly at the generator. Difficulties due to tar and undecompd. water vapor as well as dust are encountered. A small baffle plate tar separator is described and illustrated. This is said to permit almost complete removal of tar fog. In a typical case analytical results indicated that the valve between superheater and boiler did not close tightly. When this was remedied the efficiency of gasification was increased from 62 to 67%. R. W. RYAN

**Synthesis of high hydrocarbons for water gas.** BENITO A. BUYLEA AND J. M. PERTIERRA. *Anales soc. españ. fís. quim. (tecnica)* 27, 23 38(1929).—In the catalytic reduction of CO contained in water gas by CuO, Co<sub>3</sub>O<sub>4</sub> and MnO<sub>2</sub>, a test was made at 254°, lower than any previous temp. Here the contraction was less than at higher temp. but the yield of liquid and solid hydrocarbons was higher. The necessity of extreme purification of water gas to maintain activity of a catalyst activated by successive oxidations and reductions is shown. E. M. SYMMES

**Improvement in the recovery of benzene from coke-oven gases.** M. MINOT. *Chimie et industrie* 21, 252(1929).—Benzene-extrn. efficiency can be appreciably increased by continuous purification of the oil by centrifuging before returning into the extrn. cycle. The merits of this improvement are briefly discussed. A. P.-C.

**Continuous distillation of tars or crude mineral oils by means of superheated steam.** HENRI J. V. WINKLER. Cie. des Mines de Vicoigne, Noeux et Drocourt. *Chimie et industrie* 21, 466-72(1929).—A description of the Abder Halden process (C. A. 16, 1498; Brit. pat. 239,841, C. A. 20, 2244). A. PAPINRAU-COUTURE

**Formation of sulfur-rich carbons by the action of sulfur dioxide.** F. FISCHER AND A. PRANSCHKE. *Brennstoff-Chem.* 9, 361 3(1928). Low temp. cokes prepd. at 500° from briquets, pine wood, cellulose and activated charcoal were treated at 300° to 500° in a stream of SO<sub>2</sub>. The product contained from 1.4 to 37.5% S which could not be extd. by solvents. With wood and filter paper where the carbonization was carried out in SO<sub>2</sub>, 37.5 and 35.5% S were found, resp., in the carbonaceous residues. When the precarbonized material was treated with SO<sub>2</sub>, the S taken up was 1.4 and 2.7%, resp. Carbon pptd. from CO took up 8.1% S at 450°. F and P state that while the S may not be in true chem. combination with the C it certainly does not behave as though it were physically adsorbed. J. D. DAVIS

**Apparatus for briquetting fuel.** LUCIEN LIAIS. Fr. 649,070, Feb. 15, 1928.  
**Method of delivering liquid fuel to vapor burners.** JOSEF FETTER. Fr. 649,245, Feb. 18, 1928.

**Destructive hydrogenation of coal.** KARL SCHÖENEMANN. U. S. 1,709,957, April 23. Liquid products obtained by treatment of coal with H are freed from water and components of relatively low b. p., admixed with an aliphatic hydrocarbon material

such as gas oil and the pptd. mixt. of asphalt and solid insol. substances is sepd. from the dissolved mixt. of coal oil and pptn. oil.

**Apparatus for drying coal or other materials.** MICHAEL D. JONES (to Fuller-Lehigh Co.). U. S. 1,709,351, April 16. An app. is described in which the material to be dried is passed downwardly while heated by drying gases.

**Apparatus for distilling coal or other solid materials by conveying them adjacent to the surface of a bath of molten lead or similar material.** EMIL PIRON and VIRGINIUS Z. CARACRISTI (to Piron Coal Distillation Systems, Inc.). U. S. 1,709,370-1, April 16.

**Still for distillation of gases from coal or other materials with steam.** ELMER H. RECORDS. U. S. 1,710,070, April 23.

**Oven for the carbonization of coal or lignite at high or low temperature.** H. HARDY. Belg. 353,484, Sept. 30, 1928. Constructional features.

**Cooler for dried brown coal.** "EINTRACHT" BRAUNKOHLENWERKE UND BRIKETT-FABRIKEN. Ger. 473,028, Dec. 2, 1928.

**Plant for drying peat and similar fuel.** FRABA A.-G. Swiss 129,794, Feb. 3, 1928. Addn. to Swiss 124,804.

**Disintegrating and mixing apparatus for soft masses such as peat and clay.** EDWARD W. C. PIERING. Ger. 473,029, Feb. 21, 1922. Addn. to 353,739.

**Distillation of wood or coal.** GASPARD JAKOVA-MERTURI. Fr. 648,978, June 30, 1927. Heated deoxygenated air along with steam is passed through the charge. A suitable app. is described.

**Production of a combustible vegetable agglomerate from wood or other ligneous material.** C. DEMOULIN and A. DETOMBAY. Belg. 353,367, Sept. 30, 1928. Ground charcoal or other fuel is mixed with a binder such as ground pitch obtained by the carbonization of wood. The resulting mixt. is pressed into the desired shape.

**Treating carbonaceous matters for the production of distillation products such as hydrocarbons, metallized coke, etc.** FABRIQUE NATIONALE PROD. CHIM. ET D'EXPLOSIFS. Belg. 353,599, Sept. 30, 1928. Improvement on 344,817. Before carbonization the carbonaceous material is mixed with oxidizing agents such as nitrates, carbonates or oxides. The product of carbonization is used as fuel in water-gas producers. The resultant gas is made to react with the volatile carbonization products after the latter have been passed through a condenser to remove the tar, which is similar to crude petroleum.

**Process and apparatus for the production of light hydrocarbons (benzine, gasoline) during the low-temperature carbonization of solid fuels.** A. MEIRO. Belg. 353,736, Sept. 30, 1928. The powdered fuel is passed successively by means of horizontal worm conveyors through 5 horizontal retorts, which are maintained at increasing temps., and then through an unheated inclined retort, which discharges it into a hermetically sealed container. The distn. products are passed through a condensing tower. Part of the uncondensed gases are burned in the furnace supplying heat to the retorts, and the remainder is sent back into the retorts. The products condensed in the lower portion of the tower are sent back to the first retort (which is at the lowest temp.). Cf. C. A. 22, 313.

**Bleaching montan wax.** I. G. FARBENIND. A.-G. Fr. 648,230, Feb. 4, 1928. Montan wax is put in suspension in a soln. of a chromic salt and afterward treated with chromic acid in the presence of  $H_2SO_4$ , preferably a  $H_2SO_4$  soln. of chromic acid which has already been used for oxidation is used for suspending the wax. A soln. of chromic acid which has been regenerated by electrolysis is used in the process, in which a temp. above  $100^\circ$  is used. Cf. C. A. 23, 1253.

**Drying fuel gas.** C. COOPER, D. M. HENSHAW and W. C. HOLMES & Co., LTD. Brit. 208,097, May 2, 1927. Gas such as city gas is dried, preferably by contact with hygroscopic material in the liquid state, while under a pressure (suitably up to 50 lbs. per sq. in. or higher) higher than that necessary for securing its delivery at suitable pressure to distant points of the distributing system. The gas also may be cooled to dissipate compression heat or to a further degree as described in Brit. 285,936 (C. A. 23, 265), and the drying agent may be concd. for reuse, periodically or continuously as described in Brit. 248,841 (C. A. 21, 815). After treatment with the liquid drying agent, the gas may be brought into contact with a solid drying material such as  $CaCl_2$ , which forms a gas by reaction with water. Cf. C. A. 23, 2278.

**Combustion gases.** VINCENT SCHOBHENS. Fr. 649,213, Feb. 17, 1928. Gases such as  $C_2H_2$  or  $CH_4$  to be used as motor fuel are improved by bubbling them through liquids such as  $MeOH$ ,  $EtOH$ , masout, petroleum, tar,  $C_6H_6$  or  $C_{10}H_8$ .

**Reducing gases.** KALI-INDUSTRIE A.-G. and T. THORSSALL. Brit. 208,190, Oct. 5, 1927. To enable poorer gases, such as coke- or blast-furnace gases, lignite-

distn. gases or waste-reducing gases from the process, to be used as reducing gases in the process of prepg. gases for  $\text{NH}_3$  synthesis described in Brit. 288,154 (C. A. 23, 486), the gases are passed through a layer of glowing carbonaceous material such as coke so that the ratio  $\text{CO}_2:\text{CO}$  in the treated gases is at most 0.4 and the ratio  $\text{CO}:\text{CH}_4$  is at least 1.5. Various details and modifications are described.

**Water gas.** CHARLES W. ANDREWS. U. S. 1,709,107, April 16. In making water gas from a fuel bed in a dry bottom-closed chamber having a stationary grate, with alternate blasting of the fuel bed by air and steam, there are maintained upper fuel zones, an intermediate clinker formation zone and a lower ash zone; the walls of the clinker formation zone are water-cooled and large masses of clinker which form are broken up by grinding them against each other and against the walls of the chamber by up and down agitation of the fuel and ash beds and continuous agitation of the ash bed from the center outward. An app. is described.

**Water-gas producer with a distillation zone above the main fuel bed and with fuel agitators.** A. V. TULLY. Brit. 297,568, Sept. 12, 1927. Various structural details are described.

**Automatic gas producer.** A. JADOUX. Belg. 352,779, Aug. 31, 1928. Constructional features.

**Generating gas.** CHARLES W. ANDREWS and WILLIAM B. CHAPMAN (one-half each to H. A. Brassert & Co. and Western Gas Construction Co.). U. S. 1,709,335, April 16. In making water gas in a generator having a relatively thin firebed, the firebed is air-blasted and an intermediate zone in it is maintained at a sufficiently high temp. to liquefy a substantial portion of its ash content; the liquefied ash is passed downwardly to a solidifying zone and an agitating device is passed through the solidifying zone to break up the clinkers before large masses are formed; steam passed through the heated firebed serves to form water gas. An app. is described.

**Gas generator.** CHARLES W. ANDREWS and WILLIAM B. CHAPMAN (one-half each to Chapman Engineering Co. and Charles W. Andrews). U. S. 1,709,334, April 16. A generator is described having a grate to support an ash bed, a pressure equalizing chamber underlying the grate, inlet and outlet connections for gases leading to the chamber, and an ash pit surrounding the pressure chamber.

**Apparatus for discharging the contents of gas retorts.** GAS, LIGHT & COKE CO. and S. HOLDWAY. Brit. 298,093, March 28, 1927.

**Synthetic tar.** ANTHIME J. DURIEUX. Fr. 648,985, July 1, 1927. A tar is made by mixing empyreumatic oil, resin oil and black pitch with or without colophony.

**Separating phenols and hydrocarbon materials from low-temperature tar.** ADOLF CORRELL (to Zeche Mathias Stinnes). U. S. 1,709,309, April 16. Low temp. tar or tar distillates after being mixed with dil. alc. are treated with  $\text{NH}_3$  gas while cooling until the mixt. is satd. with  $\text{NH}_3$ ; on settling, 2 layers are formed; the upper layer consists mainly of neutral oils and the lower layer contains the phenols. These layers are sep'd.

**Apparatus for emulsifying tars or bitumen.** JONAS H. DUSSEAUX. Fr. 648,275 and 648,276, Jan. 3, 1928.

**Process for treating coke-oven gases and the like.** UNION CHIMIQUE BELGE. Belg. 353,020, Aug. 31, 1928. The cold gases from the tar and ammonia water condensers are washed with a soln. rendered alk. by absorption of  $\text{NH}_3$ . They are then washed with a cold neutral liquid which may consist of  $\text{H}_2\text{O}$  or of  $(\text{NH}_4)_2\text{SO}_4$  soln.

**Coke-oven by-product recovery system.** S. P. MILLER (to Barrett Co.). Brit. 298,153, Oct. 4, 1927. Recovery of pitch from hot coke oven gases is effected by cooling them to such a temp. that particles of pitch of a desired compn. are formed and scrubbing the gases at such temp. with hot pitch of similar compn. to that carried in suspension in the gases. The gases are then further cooled to effect direct recovery of oils. An app. and various details of procedure are described.

**Coke-oven structure with transverse regenerators and vertical flues.** SIMON CARVES, LTD. and J. H. BROWN. Brit. 298,285, July 14, 1927. Various structural details are described.

**Coke-oven construction with a steam injection device.** LOUIS WILPUTTE (to Wilputte Coke-Oven Corp.). U. S. 1,710,464, April 23.

**Universal oven for the production of semi-coke in graded sizes.** A. F. A. CHAROT. Belg. 352,923, Aug. 31, 1928, and 353,482, Sept. 30, 1928. Constructional features.

**Method of charging coke furnaces.** PAUL TRIGRET. Fr. 648,535, Feb. 8, 1928.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. P. FARAGHER

**Formolite analysis of petroleum.** JAROSLAV HOŠEK. *Chem. Obzor* 4, 67-70 (1929). A critical analysis of the Nastukov reaction (*Zhurnal Russ. Fiz. Khim. Obshchestva* 36, 881 (1904); *C. A.* 6, 150; 20, 496).

**Cracking in the petroleum industry.** LEOPOLD SINGER. *Metallbörse* 18, 901-2, 1014-5, 1071-2 (1928). An elementary description of distn. and the most common cracking processes.

**Standardization of conditions for measuring the detonation characteristics of motor fuels.** R. STANSFIELD AND F. B. THOLE. *Ind. Eng. Chem., Anal. Ed.* 1, 98-105 (1929). Tests made by the Engine Research Department of the Anglo-Persian Oil Co. in an effort to standardize the methods for measuring detonation show that comparable results can be obtained from any of the different types of engines if comparisons are made in terms of equiv. blends of standard spirits and if test conditions are suitably controlled. Of the latter the most significant variables are the air-fuel and the compression ratios. There is urgent need for the development of manufg. methods for a pure and cheap detonating hydrocarbon to replace the costly heptane now used as a reference fuel, and for the international adoption of a standard method for making the detonation tests.

**Knock ratings of pure hydrocarbons.** S. F. BIRCH AND R. STANSFIELD. *Nature* 123, 490-1 (1929). Commenting on the statement of Nash and Howes (*C. A.* 23, 2561) that pseudocumene is proknock in tendency, B. and S. point out that it is only less antiknock than benzene, which is also true of Edlar's octane (1,1,3-trimethylpentane). Objection is also made to Nash and Howes' figures ranking diamylene above trimethylethylene in antiknock properties. All previous refining experience confirms the authors' findings by engine tests, that polymerization tends to lower the antiknock properties. The rating of cyclohexene depends upon whether cyclohexene peroxide has formed in it or not. Ultra violet light favors the formation of peroxide. Cyclohexene contg. peroxide does not deposit gum. The more compact the mol., the better the antiknock quality of the hydrocarbon. Conjugated double bonds are accompanied by high antiknock properties. Diolefins, in which the double bonds are not conjugated, as diallyl, are not good antiknock compds. It is well recognized that increase in length of a side chain reduces antiknock properties, yet the contrary is true for benzene itself.

EMMA E. CRANDAL

**The cracking of paraffin oils and crude petroleum of Gbely in the presence of catalysts.** J. KORDIČEK. *Petro. i. Tvor.* 10, 115-9, 135-41, 145-7 (1929). K. studied the effect of numerous catalysts upon the cracking of paraffin oils with special attention to the Czechoslovakian crude petroleum from Gbely. Three apps. were built for the purpose. The best results were obtained in an inverted sheet-iron cone 11 m. high, upper diam. 30 cm. and lower diam. 8 cm. with a cock at the bottom. A conical cover was fitted with a cylindrical column 50 cm. high and 10 cm. in diam. that connected with a condenser. The oil for cracking was introduced through a ring of perforated tubing so placed at the top that the oil dripped down the wall of the cone and cracked in vapor phase. The catalyst was contained in a conical, perforated iron basket, which fitted into the outer cone so that the walls were 0.75 cm. apart. Into the column above the cone was inserted a smaller cylinder with a perforated bottom, which was filled with reftning earth so that the cracked oil vapors left the apparatus refined. The conical portion was placed in a furnace and heated so that the apex of the cone was at 500° and the base at 250°. The temp. of the vapors leaving the app. was usually 100°. The process is carried out at atm. pressure. The app. cracks 2 l. of crude oil per hr. Investigations were made on the following oils: paraffin oil, crude petroleum of Gbely, and a low temp. tar from Zahořany. The properties of the oils follow:

Oil	Sp. gr. at 15°	First drop at	Engler Distn.				
			200	250	300	Percent to C.	400
Paraffin oil	0.865	297	—	—	—	24.8	64.2
Gbely crude	0.933	218	—	8.2	34.1	64.4	97.2
Low-temp. tar from Zahoř. any brown coal	1.037	35	22.5	25.6	35.7	residue above 300	68.8

The runs were carried out at different temps. in order to find the optimum temp. for each catalyst; the optimum for the paraffin oils and the crude was 500°, and for the low-temp. tar, 450°. Among the most satisfactory catalysts were  $\text{Ni}_2\text{O}_3$ ,  $\text{SnO}_2$ , and a compn. of Pflbram Ag-slag mixed and roasted with clay and burned fireclay, and ground fine. From 60 expts., the following are typical:

Oil for cracking	Catalyst	Temp.		Engler distillation										Gasoline or cracked oils in vol % of in-going material
		In the cracking vessel	Vapors leaving cracking vessel	Yield of cracked prod in vol. % of input at °C.	Volume percent to °C.									
1 Crude of Ghely	SnO <sub>2</sub> + SiO <sub>2</sub>	500	125	75	60	1.1	5.7	20	0	28.6	—	to 220°	21.5%	
2 Residue b above 220° from Expt 1	SnO <sub>2</sub> + SiO <sub>2</sub>	500	120	72	4	68	1.4	7.7	14.4	15.8	—	to 220°	11.4	
3 Residue b above 220° from Expt 2	SnO <sub>2</sub> + SiO <sub>2</sub>	500	120	62	5	80	1.6	5.1	10	1	13.9	to 220°	8.7	
4 Crude of Ghely		500	120	43	2	60	7.5	23.2	53.6	65.3	—	to 220°	24.2	
5 Residue b above 220° from Expt 4	Ag-slag, clay, and burned fire clay 1:1	500	120	53	6	60	2.2	8	8	22	6	to 220°	16.3	
6 Residue b above 220° from Expt. 5		500	120	58	3	75	1.4	6.2	10	5	16.3	to 220°	9.5	
7 Paraffin oil	Pumice	500	100	85	4	56	2	7	30	6	53	to 300°	70.9	
8 Crude of Ghely		500	100	45	2	55	6.8	37.0	68	8	86.2	to 220°	38.0	
9 Paraffin oil	Ag slag and burned fire-clay 1:1	500	100	82	3	55	3.0	30	6	53	0	to 300°	70.1	
10 Crude of Ghely		500	100	46	1	50	5.9	42.7	77	3	85.1	to 220°	39.2	
11 Low temp. tar from Zahofany Residue above 200°	Ag slag and burned fire-clay 1:1	410	105	83.1	62	1.5	3.5	9.0	—	—	—	to 200°	7.4	
12 Residue b above 200° from Expt. 11		410	110	86	5	67	0	4	1.4	2.0	—	to 200°	1.4	
13 Low-temp. tar from Zahofany Residue b above 200°	Ag slag and burned fire-clay 1:1	450	100	61	5	55	5	7	16	5	26	to 200°	16.2	
14 Residue b above 200° from Expt 12		450	100	64	7	58	3.2	9	5	17	5	to 200°	11.3	
15 Low-temp. tar from Zahofany Residue b above 200°	Ag slag and burned fire-clay 1:1	500	100	39	5	57	4	7	20	0	34.0	to 200°	13.7	
16 Residue b above 200° from Expt 15		500	100	47	2	60	3.3	9	3	21	0	to 200°	5.26	

Other catalysts tried were: crushed fireclay bricks; pumice before and after burning; coke; Ag slag, clay, and fireclay in the ratio 2:1:1; org. Sn +  $\text{SiO}_2$ ; Ni pptd. upon pumice;  $\text{SnO}$  deposited upon pumice from the oxalate;  $\text{Al}_2\text{O}_3$  pptd. upon pumice;  $\text{B}_2\text{O}_3$  pptd. on pumice;  $\text{Ni}_2\text{O}_3$  +  $\text{B}_2\text{O}_3$  pptd. on pumice;  $\text{MnO}$  +  $\text{SnO}$  +  $\text{B}_2\text{O}_3$  on pumice;  $\text{CN}_2\text{O}_2$  +  $\text{NiO}$  on pumice,  $2\text{SnO}_2 \cdot \text{P}_2\text{O}_5 \cdot 10\text{H}_2\text{O}$  on pumice;  $\text{Na}_2\text{SnO}_3$  on pumice; the products were refined by the Gray method. These refined products remained water-white even after 4 yrs.

The production of gasoline by cracking. F. KOUDELAK *Paliva a Topeni* 10, 119-26(1929); cf. *C. A.* 23, 694.—Numerous commercial processes and installations are reviewed.

The present methods of determining the constituent classes of hydrocarbons in gasoline. DONALD A. HOWES. *J. Inst. Petroleum Tech.* 15, 101-4(1929).—A review of the chem. agencies proposed for sepg. the 4 main classes of hydrocarbons, with reasons for the unsatisfactory results produced.

The refining of oils in the vapor phase. F. KOUDELAK. *Paliva a Topeni* 10, 148-53(1929).—A review of present-day processes.

Constitution of certain Japanese pine oils. I. SABURO AKIYAMA. *Osaka Ind. Research Inst. Bull. Osaka Ind. Research Inst.* 9, No. 10(1929).—By fractional distn. of pine tar A. obtained the following fractions: I, 0-150° (yield about 4-8%), II, terpene fraction, 150-200° (yield about 40-70%), III, terpene-alcohol fraction, 200-230° (yield

about 4-5%), IV, sesquiterpene fraction  $b_{1.5}$  100-140° (yield about 10-25%) and V, higher terpene fraction  $b_2$  above 120° (yield about 10-30%).  $I_a$ ,  $d_4^{20}$  0.8689,  $n_D^{20}$  1.4756, and  $I_b$ ,  $d_4^{20}$  0.9135,  $n_D^{20}$  1.4986, were again fractionated and the following constituents were found: benzene, toluene, furan, methylfuran,  $\alpha,\alpha'$ -dimethylfuran, diacetyl, acetylpropionyl, etc. Among the chief constituents of II are *l*- $\delta$ -pinene, dipentene,  $\beta$ -pinene, camphene and limonene.  $\alpha$ -Terpineol seems to be the only constituent of III. IV was washed with alkali and distd. under reduced pressure with Na. Certain sesquiterpenes were found. V was treated like IV and abietene, retene, or *methylinisopropylphenanthrene* and resin seem to be the chief constituents. The results of further study are to be published.

F. I. NAKAMURA

**Transformer oils and their hydrogenation.** ERWIN FERBER. Tech. Hochschule, München. *Metallbörse* 18, 2301-2(1928).—Transformer oil is hydrogenated over a Ni catalyst under 10 atm. at 170-190°. All the properties of the oil are practically unchanged, except that the I no. is lowered from 16 to 7. The hydrogenated oil is more resistant to heating than the original; it remains transparent and free from tar after heating for 110 hours at 105°.

G. CALINGAERT

**Methods for evaluating used transformer and switch oils.** TYPKE. *Brennstoff-Chem.* 9, 346-8(1928).—Available phys. and chem. methods are discussed. The breakdown voltage (not less than 80 kv./cm.) and the acid no. (upper limit 1.0%) are the values that give most information about the condition of the oil.

J. D. DAVIS

**The properties and analysis of used crank-case oils.** D. G. PIDGEON AND H. E. TESTER. *J. Inst. Petroleum Tech.* 15, 91-99(1929).—The results of a study of the effects of diluents in crank-case oil are given. Samples of a medium-grade oil diluted in use were distd. with slightly superheated steam at 150°. This gave the amt. of diluent. A composite of diluent made up from a no. of such distns. had a sour smell, contained 0.13% of S, and boiled at 108-300°. Considerable unsatn. was shown by its absorbing the Br from half its own vol. of satd. Br water. Portions of new oil were blended with 3, 5, 7½, 10 and 15%, resp., of the combined diluent, and sp. gr., flash pt., C residue, and viscosity at 70°, 100°, 140° and 200°, of the blends were detd. Diln. flash p., diln.-sp. gr. and diln.-viscosity curves were plotted. From the last, change in viscosity from diln. alone could be read. Thus, a used oil whose actual viscosity at 140° was 127 sec. would have had a viscosity of 90 sec. had not the effect of diln. been counteracted in part by oxidation. Data from the examn. of 37 samples of used crank-case oil from 9 engines as to diln., viscosity, sp. gr., flash pt., etc., are given for comparison with the curves.

EMMA E. CRANDAL

**Cylinder stocks of high quality from lubricating-oil residues.** V. L. GURVICH AND M. A. PENGU. *Neftyanoye Khozaystvo* 15, 55-64(1928).—A residue, warmed by steam coils, was pumped through a tube still heated by an oil burner, without direct contact of the flame with the coil, at a rate of flow so adjusted as to prevent the oil from being over 400°. The hot residue was injected and atomized by superheated steam (420-440°) into the upper part of an electrically heated (about 10-20° below the temp. of the mixt.) vertical cylindrical evaporator with the lower end open. The evaporator was placed in a jacket that had plates acting as a dephlegmator. The atomized hot mixt. passed the evaporator downwardly and the dephlegmator upwardly. The heavy part of the residue was collected on the bottom and discharged into a container after passing through a condenser. The light fraction was sent through an opening in the top cover into an air-cooled dephlegmator connected to an air and water cooler and finally discharged into a receiver. Up to 60% of the distillates could be recovered by this operation. The distillates on treatment with 3%  $H_2SO_4$  at 50-75° lost 5-10%, depending on the sp. gr.; they were blown at 260-270° and acid-free oils were obtained. They are superior to the "viskosines" of the "Azneft;" they are green in reflected light, low in carbon, free from asphalts and have a higher flash. The other qualities are equal to those of the standards. A similar run was made without atomizing the hot residue in the evaporator; the yield on distillates was less than one-half of the previous runs, the distillate being of a lower sp. gr., and the amount of steam used was twice as much calcd. on the distillate obtained. The residue left from this distn. was not suitable for a second distn., since it is easily decompd. at 400°; when it is mixed with solar-oil distillate, a quite satisfactory fuel oil of a viscosity of  $E_{40} = 12.5$  is obtained. A sepn. of oils was tried on a mfg. scale, with a vacuum equipment for the evaporator and addnl. dephlegmators with filling elements. Three different fractions could be sepd. A yield of 20-25% was obtained with the first and 55% with the second; distn. was at the rate of 2.5-2.8 metr. tons per hr. 225% and 150-200% of steam calcd.

on the distillate obtained and 1.6% and 1.8-2.0% of fuel calcd. on the residue heated were used. Distillates of similar high quality were obtained. Tables of phys. properties of various cuts and products at different stages of refining are given; also, a layout for the equipment are given.

**The determination of free sulfuric acid in light-oil sludge.** F. S. BACON. *Ind. Eng. Chem., Anal. Ed.* 1, 89-92(1929).—Five methods have been developed for estg. the  $\text{H}_2\text{SO}_4$  in light-oil sludges. (1) The sludge is extd. with  $\text{H}_2\text{O}$  and the  $\text{H}_2\text{SO}_4$  pptd. in the cold with  $\text{BaCl}_2$  strongly acidified with  $\text{HCl}$ . It is uncertain whether the sulfuric esters are hydrolyzed in the operation or not. (2) The sample is weighed on a very thick pad of asbestos in a Gooch crucible. The tar and alkyl esters are washed through with  $\text{CHCl}_3$ , leaving the  $\text{H}_2\text{SO}_4$  in the asbestos to be washed through with hot  $\text{H}_2\text{O}$  and titrated with standard alkali. The acid which escapes with the  $\text{CHCl}_3$  is also titrated and the 2 results are combined. (3) The sludge and  $\text{CHCl}_3$  are thoroughly mixed and the mixt. is emptied into ice water and titrated. This gives the free  $\text{H}_2\text{SO}_4$  plus 1 unreplaced H atom in the alkyl sulfuric acid. The neutralized soln. is boiled 30 mins. or more and again titrated. The result is the equiv. of one replaceable H set free in the hydrolysis. Subtracting this from the previous figure gives the figure for free  $\text{H}_2\text{SO}_4$ . (4) The heat of diln. of the  $\text{H}_2\text{SO}_4$  present is measured and the concn. estd. from a curve obtained by plotting against concn. the rise in temp. from dilg. various known concns. to twice the original vol. The results are fairly accurate for high percentages of acid. A correction must be made for the tar present, and it is assumed that the sp. heat of the tar is 0.5 and the sp. gr. 0.9; and that the  $\text{H}_2\text{SO}_4$  after diln. is 30% of the mixt. (5) Aniline sulfate is formed by treating the sludge with 10% of  $\text{C}_6\text{H}_5\text{NH}_2$  in boiling  $\text{CHCl}_3$ . The ppt. is collected on a Gooch crucible and dissolved with boiling  $\text{H}_2\text{O}$ . The  $\text{C}_6\text{H}_5\text{NH}_2$  in an aliquot of this filtrate is titrated with 0.5 N  $\text{KBr-KBrO}_3$  soln. Careful expts. showed that only aniline sulfate is formed when  $\text{C}_6\text{H}_5\text{NH}_2$  in boiling  $\text{CHCl}_3$  is added to acid sludge, and that only the free acid reacts. The results obtained by methods (1), (3) and (5) agree very closely. E. E. C.

**Naphthene sulfonic acids.** STANISLAW PILAT AND E. DAVIDSON. *Lwow Polytech. Przemysl Chem.* 11, 141-6(1927).—In the acid refining of oils, compds. approaching the formula  $\text{C}_{24}\text{H}_{33}\text{SO}_3\text{H}$  are formed. These compds. do not lose the sulfo group even on prolonged boiling with alcoholic alkali; their Ba salts are sol. in ether but can be pptd. from this soln. by alc. The Na salts of these compds. show an exceptional propensity to produce very permanent foam in water soln., a property which they retain even in fairly acid solns.

A. C. ZACHLIN

**The desulfurizing action of silica gel.** III. H. I. WATERMAN AND M. J. TUSENBROEK. *Brennstoff-Chem.* 9, 397-8(1928); cf. *C. A.* 21, 1540.—The following S. compds. were separately dissolved in kerosene: 1.012%  $(\text{C}_6\text{H}_5)_2\text{S}$ , 1.117%  $(\text{C}_6\text{H}_5\text{CH}_2)_2\text{S}$ , 0.794%  $\text{C}_6\text{H}_5\text{CH}_2\text{SH}$ . The solns. were treated with 20% silica gel for 6 hrs. at 31-32° with removal of S as follows: 0.138, 0.300 and 0.225%, resp. Silica gel removed neither colloidal (suspended) nor dissolved S from kerosene.

J. D. DAVIS

**Graphite as a lubricant.** H. KARPLUS. *Z. Maschinenbau* 5, 1122-8(1928).—There are 3 stages of lubrication: (1) the perfect fluid-film stage, (2) the broken-film stage, and (3) dry friction. Close to the crit. point between 1 and 2, the friction is a minimum. Current specifications are faulty in that they apply only to the first stage. For the 2nd stage, improvements could be made by means of substances ruled out in current specifications. Near the crit. point *adhesion* is much more important than *viscosity*. The adhesion may be measured calorimetrically as the heat of moistening of a surface. Oils of good lubricating quality have a high heat of moistening. Fatty acids increase the heat of moistening. Colloidal graphite forms a thin film of excellent lubricating quality. Steel balls on a babbitt-metal surface show a friction of 0.515, but on graphite, 0.140. The film of colloidal graphite builds up slowly, first on the "high" places where the friction is greatest. It is found that the heat of moistening of graphite is greater than that of metals; the heat of moistening of good oils is 7-10 times higher on graphite than on copper. Additions of graphite cause good and bad lubricating oils to have the same heat of moistening. It is claimed that much thinner oil layers can exist on a graphite surface than on a metal. The result is that higher pressures, thinner oils and a smaller quantity of oil of inferior grade may be used. Several bearings were tested on a Richle machine. A normal motor oil ran hot at 7.03 kg. per  $\text{cm}^2$ ; it ran cool when graphite was added to the same oil. Finally, with 0.25% of colloidal graphite, the load was increased to 12.66 kg. per  $\text{cm}^2$ .

E. C. B.

**New asphalt theories.** F. J. NELLENSTEYN. *Intern. Congress Testing Materials*, 1927, II, 684-8.—The older ideas about the nature of asphalts are mentioned. The new conception that a soln. of asphalt in  $\text{C}_6\text{H}_6$  is a two-phase colloidal system is re-

viewed. The explanation of the flocculation of the dispersed phase (Asphaltmizell) of a benzene-asphalt soln. on addn. of benzene as a process involving the elec. properties of the particles and therefore similar to coagulation in an aq. emulsion, is considered untenable since pptn. of the asphalt cells occurs in a system entirely organic. An explanation is presented of asphalt pptns. and reactions based upon differences between the surface tensions of the protective bodies and other components and phases present in the system. The crit. surface tension for flocculation of the asphalt cells given is approx. 24-25 dyne/cm. Expts. on treating asphalts with  $\text{CCl}_4$ , I, Cl, O, are described briefly and the relative stability of the colloidal particles (the carbon) and the protective bodies is discussed. The possibility is suggested of sepg. petroleum asphalts from coal-tar products by utilizing differences in the surface tensions. Products obtained on treating asphalt with  $\text{KMnO}_4$  were: org. acids, always a small quantity of mellitic acid, some compds. of the aromatic series, but mostly of the aliphatic series. The "filler" and the protective bodies are held to play an important role in the technical application of asphalts through absorption, cementing together the mineral constituents in the mixts. The investigation is not sufficiently advanced to draw final conclusions, but in the discussions following the paper, the protective bodies are described as being liquid and having a fluid film over the nucleus; consequently, the asphalt can absorb a great many other materials. W. W. HODGE

**Turpentine obtained as by-product in the manufacture of cellulose by the sulfate method.** I. YA. POSTOVSKII AND V. G. PLUSNIN. *J. Chem. Ind. (Moscow)* 5, 1161-5 (1928).—In the manuf. of cellulose by the sulfate method,  $\text{Na}_2\text{S}$  formed as a by-product reacts with  $\text{MeOH}$ ; the resultant methyl mercaptan ( $\text{MeSH}$ ) and methyl sulfide ( $\text{Me}_2\text{S}$ ) contaminate the turpentine liberated as a vapor, with the result that it becomes so malodorous as to render the factory neighborhood uninhabitable. This can be prevented in part by liquefying the emitted gases with the recovery of about 11-12 kg. of oil per ton of cellulose when operating with pine wood. This impure turpentine has no commercial value. Filtration through sawdust did not completely deodorize the oil. Better results were obtained by oxidizing the S compds. by chloride of lime. When operating with concd.  $\text{Ca}(\text{ClO})_2$ , the temp. rose to  $90^\circ$  and the odor disappeared. The sp. gr. of the oil increased, however, from the original value of 0.861 to 0.9621, and the product contained but 30% of pinene, the remainder of the pinene having been oxidized. By using weaker solns. of  $\text{Ca}(\text{ClO})_2$  better results were obtained, but this method of purifying requires that action be checked as soon as the S compds. are completely oxidized. To deal with the problem on a factory scale, the main portion of the S compds. may be removed by any good method, and the traces remaining taken out by cautious treatment with very dilute  $\text{Ca}(\text{ClO})_2$ . When steam distg. the crude turpentine obtained by the cellulose-sulfate method, the first 15% which passes over contains 86% of the S impurities; when 50% of the oil has distd., the remainder contains but 2% of the impurities and they may be removed by dilute  $\text{Ca}(\text{ClO})_2$ . The purified turpentine is a colorless liquid, possessing a pleasant odor, a sp. gr. ( $15^\circ$ ) of 0.8645;  $n_D^{20}$  of 1.46728; and  $[\alpha]_D^{20}$  of 14.47. BERNARD NELSON

Use of mixtures of petroleum products and creosote for preservation of timber (VORONOV) 20. Tar and asphalt, the best means of combating dust (SCHNEIDER) 20. The theory of petroleum formation. II. Composition of primary tars of Matagonsky boghead coal (STADNIKOV, VOZHINSKA) 8. Mechanical characteristics of soft steel at elevated temperatures (SHISHCHENKO) 9. **Purifying petroleum oils.** JOHN C. BLACK, WIRT D. RIAL and RAYMOND T. HOWES (to Pan American Petroleum Co.). U. S. 1,709,203, April 16. Oil such as

lubricating-oil stock is treated with a 2-5° Bé. NaOH soln. or other relatively weak alk. soln. of suitable character under pressure and agitation with live steam; the aq. soln. is sepd. from the oil; soap-forming compds. are then removed by converting them into oil-insol. compds. as by the use of  $\text{Ca}(\text{OH})_2$ ; the oil is filtered after addn. of a suitable clay.

**Refining petroleum oils with sulfuric acid.** ERNEST B. PHILLIPS and JAMES G. STAFFORD (to Sinclair Refining Co.). U. S. 1,709,149, April 16. Streams of oil and acid are intermingled in regulated quantities and supplied to the upper surface of a rapidly rotating disk on which the mixt. spreads as a film and from which it is discharged and subjected to impact before sepn. of the acid tar from the oil. An app. is described.

**Purifying petroleum oils and distillates.** F. R. MOSER. Brit. 297,414, Sept. 21, 1927. Preliminary to purification with strong  $\text{H}_2\text{SO}_4$ , basic substances are removed from the oil by treatment with an acid which will not form a sludge, *e. g.*,  $\text{H}_2\text{SO}_4$  of less than 50% strength. The bases may be isolated from the resulting acid ext. by neutralizing with  $\text{Na}_2\text{CO}_3$  and may be used in *wood preserving or insecticidal compns.*, or the acid ext. itself may be used as a bactericide or vermicide. Cracked distillates and exts. obtained by the use of liquid  $\text{SO}_2$  yield large proportions of bases.

**Treatment of acid sludge from the refining of petroleum oils by means of sulfuric acid.** J. MAST. Belg. 353,487, Sept. 30, 1928. Improvement to 351,175 (C. A. 23, 2565). After addn. of cold  $\text{H}_2\text{O}$  or dil.  $\text{H}_2\text{SO}_4$ , cold air is passed through the sludge. The  $\text{SO}_2$  evolved is sent to a condenser to remove the water vapor and hydrocarbon vapors.

**Oily flotation agent.** BURNELL R. TUNISON. U. S. 1,709,447, April 16. A sulfurous petroleum oil such as a cracked naphtha is washed with an alkali soln. such as 18° Bé. NaOH soln.; the mixt. seps. into layers contg., resp., alkali-sol. and alkali-insol. substances; these layers are sepd. and the alkali layer is neutralized (suitably with  $\text{H}_2\text{SO}_4$ ) to cause sepn. of an oily material, which is sepd. and used as a flotation agent.

**Breaking emulsions of oil and water.** CHARLES FISCHER, JR., and WARREN T. REDDISH (to Kontol Co.). U. S. 1,710,159, April 23. Emulsions such as those of petroleum oils are treated with a reagent comprising "sludge layer mineral oil aluminum sulfonate" and NaOH.

**Flue-gas-recirculating system for petroleum-cracking stills.** HARRY A. ATWATER (to Combustion Equipment Co.). U. S. 1,709,764, April 16.

**Dissociation of hydrocarbons.** MICHAEL MELAMID. Fr. 648,625, Feb. 10, 1928. Mineral oils, tar oils and other hydrocarbons are converted into products having a slightly raised b. p. by injecting them in the state of a very fine division and mixed with H into reaction chambers contg. catalysts or dissocn. agents, or they are pulverized in the chambers by mech. means, the reaction products being submitted to the same treatment. Cf. C. A. 23, 264.

**Converting hydrocarbons into products of lower boiling point.** GUSTAV EGLOFF (to Universal Oil Products Co.). U. S. 1,710,152, April 23. Oil is heated in a still under vapor pressure; vapors thus produced are passed in relatively small sepd. streams through tubes passing through the body of oil in the lower part of the still and thence to a reflux condenser from which reflux is returned to the still. An app. is described.

**Fractionating hydrocarbons.** JOHN C. BLACK and JAMES W. WEIR. U. S. 1,709,518, April 16. Mixed hydrocarbons are vaporized and the vapors are passed through the lower part of a fractionating tower to condense the higher b.-p. fractions as the vapors rise in the tower; some of the condensed liquid hydrocarbons are withdrawn from an outlet at the bottom of the fractionating tower and the condensates are circulated back to the upper part of the tower and allowed to flow down through the tower in intimate contact with the vapors; mixed vapors are liquefied and sepd. having substantially the same compn. as the circulated hydrocarbons; resultant excess sepd. and condensed hydrocarbons not used in circulation are refluxed back to the still from which the mixed oil vapors were obtained. An arrangement of app. is described. Cf. C. A. 22, 865.

**Purifying hydrocarbon oils with liquid sulfur dioxide.** JOHN C. BLACK and MARVIN L. CHAPPELL (to Pan American Petroleum Co.). U. S. 1,710,143, April 23. Only sufficient liquid  $\text{SO}_2$  is used to dissolve a portion of the constituents to be sepd.; after sepn. of the liquids, the partly purified hydrocarbon oil is treated, at a temp. below 0°, with fuming  $\text{H}_2\text{SO}_4$ , in the presence of dissolved  $\text{SO}_2$ , to convert other constituents to be sepd. into sulfo-acids; the oil is then sepd. from assocd. substances. An arrangement of app. is described.

**Treating hydrocarbon oils with sulfuric acid and liquid sulfur dioxide.** JOHN C. BLACK and MARVIN L. CHAPPELL (to Pan American Petroleum Co.). U. S. 1,710,200, April 23. Oil contg. added liquid  $\text{SO}_2$  is commingled with a suitable quantity of  $\text{H}_2\text{SO}_4$  and the oil is subsequently sepd. from the assocd. reagents and reaction products. An arrangement of app. is described. U. S. 1,710,201 specifies treating oil with liquid  $\text{SO}_2$  at a low temp. to dissolve a portion of the constituents to be sepd., sepg. the 2 liquids and then treating the partially purified oil at low temp. with  $\text{H}_2\text{SO}_4$  in the presence of dissolved  $\text{SO}_2$ , to convert the remainder of the constituents to be sepd. into sulfoacids, and then effecting sepn. of the assocd. materials. An arrangement of app. is described.

**Fractionating hydrocarbon oils.** GUY B. BOGART. U. S. 1,709,304, April 16. Vapors from a fractionating column are taken off and led to a final condenser and while on their way to the condenser are subjected to a partial intermediate condensation, the cooled condensate from which is introduced into the fractionating column. An arrangement of app. is described.

**Cracking hydrocarbon oils.** GUSTAV EGLOFF and HARRY P. BENNER (to Universal Oil Products Co.). U. S. 1,710,153, April 23. The lower still of a pair of superimposed stills is charged with a bulk supply of oil; heating gases are passed through a closed conduit within the still; vapors generated in the lower still are passed to the upper still where they are superheated by passing the combustion gases through a closed conduit located in the upper still; a spray of preheated oil is continuously introduced into the bulk supply of oil, and vapors from the upper still are led to a dephlegmator from which reflux condensate is returned to the bulk supply of oil in the lower still; heavy residuum is continuously withdrawn from the bulk supply and the treatment is carried out under superatm. pressure. Various details of app. are described. Cf. C. A. 23, 273.

**Cracking hydrocarbon oils.** GASOLINE PRODUCTS Co. Brit. 297,949, Sept. 5, 1927. Oil in liquid phase is passed through a heating zone (such as a pipe coil in a furnace) and thence to a conversion chamber from which the cracked products pass to an evapg. chamber through a reducing valve; vapor is further treated in a dephlegmator. A cooling oil is supplied to the evapg. chamber which mixes with the cracked products and prevents excessive vaporization and formation of coke-like or asphaltic "bottoms." Various details of app. are described. Cf. C. A. 23, 2290.

**Cracking and distilling hydrocarbon oils.** ROBERT T. POLLOCK (to Universal Oil Products Co.). U. S. 1,710,068, April 23. Oil is heated in a coil under conditions of temp. and pressure which effect cracking and the heated oil is passed to a vapor chamber where vaporization is permitted; vapors are led to a dephlegmator and vapors passing from the dephlegmator are condensed and collected as a pressure distillate; the latter is returned to a zone of redistn. surrounding the dephlegmator and heated from the vapors within the dephlegmator; by-products of combustion from the cracking still and vapors from the redistn. zone are condensed and collected. An app. is described.

**Distilling hydrocarbon oils.** OTTO BEHMER (to Texas Co.). U. S. 1,709,302, April 16. An app. is specified comprising a charging line and pump for forcing oil through it and a heater for the oil, a still and a fractionating tower. A surge pump and surge line are also provided for pumping hot condensate from the fractionating tower back to the heater; a cooling medium such as fresh charging stock is introduced into the surge line of the surge pump to maintain liquid in it cooler than the oil being pumped.

**Distilling hydrocarbon oils.** ALBERT G. PETERKIN, JR., WILLIAM F. STROUD, JR., and RICHARD B. CHILLAS, JR. U. S. 1,709,874, April 23. The oil is rapidly heated to a temp. above its normal cracking temp.; vapors thus formed are sepd. immediately from liquid oil, and, before substantial cracking occurs, the liquid oil is passed into a zone substantially free of the sepd. vapors and treated with steam to effect further vaporization and to prevent cracking. An arrangement of app. is described.

**Pressure distillation of hydrocarbon oils.** EDGAR M. CLARK and FRANK A. HOWARD (to Standard Oil Development Co.). U. S. 1,710,404, April 23. A body of oil is maintained in a distn. system under pressure and at a temp. suitable for effecting distn.; evolved vapors are passed through a body of oil to heat the latter and to condense a part of the vapors. Heated oil and condensate are refluxed from the second-mentioned body of oil, and a stream of oil is passed in indirect heat-conductive contact with the second body of oil to cool the latter and to heat the stream of oil; heated oil from this stream is fed into the second body of oil. Various details of app. are described.

**Refining hydrocarbon oils.** JACQUE C. MORRELL (to Universal Oil Products Co.). U. S. 1,710,063, April 23. The S content of an oil is reduced by treatment with a

plumbite soln.; the treated oil is distd., and the recovered distillate in admixture with the residue obtained in the initial distn. is subjected to a redistn.

**Revivifying fuller's earth after use in refining hydrocarbon oils.** FRANK W. HALL (to Texas Co.). U. S. 1,709,261, April 16. Occluded asphaltic substances are removed by washing with a mixt. of gasoline and alc.

**Oxidation products of hydrocarbon oils.** GUSTAV EGLOFF and JACQUE C. MORRELL (to Universal Oil Products Co.). U. S. 1,710,155, April 23. Vapors from a hydrocarbon material, such as gas, oil, or kerosene, and wax distillate are mixed with an oxidizing medium such as ozone,  $\text{Cl}_2$ , or a N oxide; the mixt. is passed through a reaction zone where it is subjected to a high potential elec. discharge in the presence of a catalyst such as  $\text{AlCl}_3$  or  $\text{Fe}_2\text{O}_3$  under regulated pressure. An app. is described.

**De-watering hydrocarbon-oil emulsions.** IGNACY MOSCICKI. U. S. 1,710,374, April 23. An emulsion such as a natural petroleum emulsion is introduced as a continuous stream at high velocity tangentially into a heating chamber below the surface of a body of the emulsion which is maintained in the chamber; the emulsion is slowly drawn from a point slightly below the surface of this body of emulsion and passed to a separator, where water and oil are sepd. Various details of app. are described.

**Apparatus for de-emulsifying hydrocarbon oils.** GUSTAV EGLOFF and Harry P. BENNER (to Universal Oil Products Co.). U. S. 1,710,154, April 23. The oil is subjected to the action of a piston fitted within a treating cylinder and provided with restricted passageways through which the emulsified oil is forced in one direction only by check-valve control. Various details of the app. are described.

**Apparatus for treating hydrocarbon oils with hydrogen in a high-frequency, oscillating, non-discharging, non-sparking, hot magnetic field to combine with carbon.** IRA W. HENRY (to Ionizing Corp. of America). U. S. 1,709,813, April 16. A metallic catalyst may be used to facilitate the hydrogenation; various structural details of the app. are described. U. S. 1,709,814-15 also describe somewhat similar app. suitable for the hydrogenation of carbonaceous or hydrocarbonaceous materials of various kinds.

**Dissociation of oils.** MICHAEL MELAMID. Fr. 618,141, Feb. 3, 1928. Mineral oils are dissoed. at relatively low temps. in the presence of catalysts, liquid at the temp. of the reaction, and in the presence of H or protective gases contg. it, with continual flowing off of the non-dissoed. parts, so that dissoen. of the elements of low b. p. alone takes place.

**Oil cracking apparatus.** H. WOLF. Brit. 297,829, Sept. 30, 1927. A valve mechanism is described suitable for use in an oil cracking plant of the type in which expanded cracked products are directly mixed with liquid.

**Oil refining.** JULIEN CORNET. Fr. 649,203, Feb. 17, 1928. The residual acid mud obtained in refining mineral oils is distd. in enclosed vessels at progressively increasing temps., whereby  $\text{SO}_2$  and oils are obtained and the tar remaining is redistd. to obtain lighting gas and a chemically pure coke.

**Refining mineral oils.** ARTHUR LACHMAN (to Richfield Oil Co. of Calif.). U. S. 1,709,315, April 16. Heated vapor from an oil such as crude gasoline is passed into contact with  $\text{H}_3\text{PO}_4$  of high maintained concn. with continuous addn. of water; the oil vapor is then condensed. The  $\text{H}_3\text{PO}_4$  serves to produce a stable decolorized product. An app. is described. In some cases,  $\text{H}_2\text{SO}_4$  or  $\text{NaOCl}$  also may be used.

**Hydrocarbon lubricating oils.** ALBERT G. PETERKIN, JR., WILLIAM F. STROUD, JR., and RICHARD B. CHILLAS, JR. U. S. 1,710,240, April 23. In distg. a hydrocarbon oil, which leaves a residue of at least 20% when distd. to  $340^\circ$  under an abs. pressure of 10 mm. Hg, the oil is mixed with a petroleum distillate substantially all of which will distil below  $260^\circ$  under atm. pressure; the mixt. is rapidly heated to a temp. in excess of that at which substantial cracking of the oil would occur if the mixt. were permitted to remain at such temp. for a prolonged period of time; vapors are immediately sepd. from the remaining liquid portion of the oil, and then, before substantial cracking occurs, the sepd. liquid is passed into a zone free from the vapors and cooled to prevent cracking. An app. is described.

**Lubricating and insulating oils.** I. G. FARBERNIND. A. G. Brit. 297,798, Sept. 28, 1927. Hydrocarbon oils contg. dispersed particles of solid carbonaceous materials such as lignite, coal or charcoal, or colloidal or powdered metals, or metal oxides are subjected to high-frequency elec. currents (suitably in a "Voltol" app.).

**Renovating journal-box oil.** THOMAS W. POTTER, LEO C. McNAMARA, CHARLES N. LAMMERS and JOHN R. McLAVY (to Journal-Box Servicing Corp.). U. S. 1,709,230, April 16. A body of the oil is heated with steam in a closed tank under such pressure and other conditions that the oil is substantially vaporized without cracking, leaving

lint and assocd. particles in the tank; the vaporized oil is led off and condensed. An app. is described.

**Lubricant.** CHARLES B. DEHART. U. S. 1,709,311, April 16. A mixt. of jefferisite, Al stearate and a hydrocarbon lubricating oil is heated to slightly below the flash point of the oil and then allowed slowly to cool. The product is suitable for use in automobile engines.

**Extracting entrained matter from filter cakes.** HUGH H. CANNON. U. S. 1,710,343, April 23. A cake, such as clay, used for filtering lubricating oil is treated with a solvent for the entrained matter, such as petroleum naphtha, which is passed through the cake together with filtering clay or other suitable finely pulverized insol. material in sufficient quantity to fill shrinkage cracks formed in the cake by the withdrawal of the entrained matter by the solvent.

**Emulsifying agents.** MICHAEL MELAMID. Fr. 648,138, Feb. 3, 1928. Hydrocarbons, fatty substances, etc., are emulsified by means of  $\text{PhNH}_2$  or its homologs, either alone or mixed with hydrocarbons, soaps, or soap substitutes, or other emulsifying agents such as alcs., phenols, cresols, naphthols, cyclic hydrocarbons, or pyridic bases.

**Motor fuel; emulsifying agents.** MICHAEL MELAMID. Fr. 648,142, Feb. 3, 1928. The mixing capacity of alc. with hydrocarbons for motor fuels is increased by the addn. of small amts. of esters of naphthene acid, such as the amyl, cresylic, or cyclohexanolic esters. These esters also act as *emulsifying agents* for boring, milling, or textile oils in water, or for soaps or soap substitutes.

**Motor fuel.** MICHAEL MELAMID. Fr. 648,145, Feb. 3, 1928. The explosion hazard is reduced by adding to a fuel such as gasoline small amts. of carefully purified tar oil having a b. p. higher than that of  $\text{C}_6\text{H}_6$ , e. g., 215–230°.

**Apparatus for heating asphalt or similar materials to prepare them for use.** NATHAN V. HENDRICKS. U. S. 1,709,016, April 16.

**Oven for the production of charcoal by the partial combustion of wood with recovery of the by-products.** C. DEMOULIN and A. DETOMBAY. Belg. 353,457, Sept. 30, 1928. Constructional features.

**Oils from wood-spirit.** HOLZVERKOHLUNGS-INDUSTRIE. A.-G. Fr. 648,505, Feb. 7, 1928. Colored and malodorous substances are removed from oils obtained from wood-spirit by passing them at 400–500° over oxides of heavy metals such as Ni, Mn, or Fe.

## 23 - CELLULOSE AND PAPER

CARLETON E. CURRAN

**Low-viscosity nitrocellulose.** ERNST VON MÜHLENDahl. *Farben-Ztg.* 34, 1063–5 (1929).—A review with 57 references, mainly patents.

**New machines and equipment for the manufacture of celluloid.** A. BAHLS. *Celluloid Ind.* 29, 1381–3 (1929).—An illustrated review.

**Viscose silk.** J. C. MEISS. *Chem. Weekblad* 26, 170–6 (1926).—The manuf. of viscose silk is described.

**Artificial silk.** K. VENKATARAMAN. *Indian Textile J.* 30, 175–7 (1929).—A general article, reviewing the development of rayon and describing the chemical and physical changes taking place in its production.

**Comparative activity of Br on cellulose, lignin and wood (FUCHS) 21.** Application of nitrocellulose in the varnished leather industry (ALVAREZ) 29. Corrosion of machines in the viscose rayon industry, and its prevention (EGGERT) 9. The translation lattice of hydrated cellulose (WEISSENBERG) 3. Rotary pulp-straining apparatus (Brit. pat. 297,049) 1. Apparatus for testing the bursting strength of paper (U. S. pat. 1,709,638) 1. Rotary pulp-straining apparatus (Brit. pat. 298,045) 1. Filters [for substances used in the manufacture of synthetic textiles] (Fr. pat. 649,101) 1.

**SUTERMEISTER, EDWIN.** *Chemistry of Pulp and Paper Making.* 2nd ed., revised. New York: J. Wiley & Sons. 565 pp. \$0.50. Reviewed in *Pulp Paper Mag.* 27, 659 (1929).

**Cellulose from plant materials.** HORACE WALKER (one-half to Gilbert H. Walker and one-half jointly to Morris H. Epstein and Elly Marks). U. S. 1,709,824, April 16. Material such as the stems, roots or tops of potato plants or other plants of the

family Solanaceae are subjected to heating with steam at 45° for a predetd. period (suitably about 12 hrs.), then exposed to the atm. and bleached and digested (suitably for 12 hrs. more at 45°) and finally treated to sep. the cellulose from the mass, as by beating.

**Cellulose derivatives.** I. G. FARBENIND. A.-G. Fr. 648,675, Feb. 11, 1928. Elastic masses, films, threads, sizes, dressings, coatings, etc., are prepd. by drying emulsions which consist of solns. in org. solvents of cellulose derivs. insol. in water, and solns. in water of cellulose derivs. that dissolve or swell in water. Softening agents, pigments, dyes, filling materials, etc., may be added to the emulsions.

**Molded masses from cellulose derivatives.** I. G. FARBENIND. A.-G. Fr. 648,154, Feb. 3, 1928. Cellulose esters of higher fatty acids, mixed esters and ether-esters are worked up into molded articles without solvents by using mech. pressure at a raised temp., e. g., 100–150°. In examples the following materials are employed: cellulose laurate, elaidic ester of cellulose, the cellulose ester of the acid from coconut oil, cellulose acetate-stearate and ethylcellulose laurate.

**Aminocellulose derivatives.** I. G. FARBENIND. A.-G. (Max Hagedorn and Armin Ossensbrunner, inventors). Ger. 473,097, Oct. 31, 1926. Corresponds to Brit. 279,801 (C. A. 22, 3044) but gives addnl. examples.

**Drying cellulosic tubing.** CLARENCE E. COLEMAN, HAROLD F. WHITTAKER and THOMAS E. SHARPE (to duPont Cellophane Co.). U. S. 1,708,937, April 16. Wet sections such as those formed from viscose for use as *sausage casings* are closed at one end and air or other gas is introduced under moderate pressure into the sections while they are suspended and the free end of each section is weighted to prevent excessive longitudinal shrinking while drying.

**Films, artificial threads, etc., from cellulose ethers.** I. G. FARBENIND. A.-G. Brit. 297,676, Sept. 24, 1927. Coagulation of a cellulose ether is effected by use of a hydrocarbon which is readily miscible with the solvent or solvent mixt. of the cellulose ether soln. used but which does not dissolve the cellulose ether itself. CS<sub>2</sub> or ethyl ether or their mixts. may be used as the solvent and among the hydrocarbons which may be used are: paraffin oil, petroleum jelly and other petroleum fractions of high b. p., "petrol," shale oil and hydrocarbon fractions of Bergination oil. Films thus formed are repellant to water.

**Colored films, etc.** CAMILLE DREYFUS. Fr. 648,137, Feb. 3, 1928. Colored films, etc., of cellulose acetate or other ester or ether of cellulose are obtained by prepg. a mixed org. soln. of the cellulose deriv. and one or more colors insol. in water, and afterwards forming the film, etc.

**Cellulose esters.** HEBERLEN & Co. A.-G. Brit. 298,087, Sept. 30, 1927. Cellulose to be used in the production of cellulose carboxylic esters such as cellulose acetate is pretreated with acid or neutral swelling agents and after swelling has been effected the excess of swelling agent is removed by pressure, centrifuging or washing. As swelling agents there may be used concd. H<sub>2</sub>SO<sub>4</sub>, H<sub>3</sub>PO<sub>4</sub> or HCl, ZnCl<sub>2</sub> or Ca(CNS)<sub>2</sub> or mixts. of such compds. Various details are given.

**Cellulose esters of higher aliphatic acids.** I. G. FARBENIND. A.-G. Brit. 297,706, Sept. 27, 1927. The process described in Brit. 283,181 (C. A. 22, 3088) is modified by effecting the first stage of the reaction at a temp. somewhat below 100° and then heating the esterification mixt. to above 100° (suitably about 135–40°). An example is given of the use of lauryl chloride as an esterifying reagent. Cf. C. A. 23, 1749.

**Acetylcellulose.** NAAMLÖÖZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIEK. Dutch 19,509, Mar. 15, 1929. The viscosity of the soln. is greatly affected by letting the acetylation bath stand for 2 hrs. or more in a dry atm. with or without the condensing agent. An initial water content of the reagents in the bath (Ac<sub>2</sub>O + AcOH), which disappears on standing, was found to give a viscosity of the acetylated products of 65 (relative measure) if the bath was used immediately, 277 if used after 24 hrs. standing.

**Acetylnitrocellulose.** HARRY P. BASSETT and THOMAS F. BANIGAN (to Meigs, Bassett & Slaughter, Inc.). U. S. 1,709,513, April 16. An acetylizing soln. contg. acetylnitrocellulose is brought to a consistency just above the pptg. point of the acetylnitrocellulose, and then submitted to a finishing step such as extrusion to produce filaments or films.

**Cellulose nitrate plastic.** GEORGE L. SCHWARTZ (to E. I. duPont de Nemours & Co.). U. S. 1,710,078, April 23. Cellulose nitrate is used with di-Bu phthalate or other suitable non-volatile neutral ester of phthalic acid and a non-solvent softener such as Et palmitate. Other ingredients such as liquid petrolatum, castor oil, etc., may also be used.

**Viscose.** LEON LILIENFELD. Swiss 128,743, Dec. 27, 1926. Objects are made from viscose by causing the substance to pass through holes into a coagulating but non-plasticizing bath and then treating the coagulated material with a plasticizing mineral acid contg. liquid.

**Artificial silk from viscose.** I. G. FARBENIND. A.-G. Brit. 298,138, Oct. 3, 1927. To the acid-salt baths used for coagulation of viscose in manuf. of artificial silk there is added a sulfonic acid which can be made by sulfonating a mineral oil such as brown coal-tar oil or products such as yellow oil and solar oil sepd. therefrom. Addn. of the sulfonic acid avoids the necessity of maintaining an exact proportion between the acid and salt in the bath. Details of prepg. the sulfonic acids are given.

**Artificial silk.** E. HEYMANN. Brit. 297,364, March 15, 1927. See Fr. 637,309 (C. A. 23, 563).

**Artificial silk.** LEON LILIENFELD. Swiss 128,364, Dec. 23, 1926. Addn. to Swiss 122,788. Fibers of increased strength in the dry state are prepd. from viscose by treating it with a coagulating and plasticizing agent, such as a mineral acid, and arresting the action of the latter before it softens or decomposes the fibers.

**Artificial silk.** OTTO SINDL. Fr. 648,224, Feb. 4, 1928. Spinning app. is described in which the spinning nozzles are integral with the pump compressing the spinning soln.

**Centrifuge spinning-frame apparatus for manufacture of "cuprammonia silk."** J. P. BEMBERG A.-G. Brit. 297,117, Sept. 21, 1927. Structural features.

**Apparatus for making artificial silk filaments.** J. P. BEMBERG A.-G. Brit. 297,424, Sept. 21, 1927. Various structural details of centrifuge and stretch-spinning app. and assoc'd. devices are described.

**Washing and removal of acid from freshly formed filaments of artificial silk.** O. SINDL. Brit. 297,618, Jan. 19, 1928. An app. is described.

**Centrifugal box and associated apparatus for producing artificial silk by the dry-spinning process.** I. G. FARBENIND. A.-G. Brit. 297,744, Sept. 26, 1927.

**Boxes or bowls for spinning artificial silk.** NAAMLOOZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIEK. Brit. 297,450, Sept. 22, 1927. The bowl may consist of a shell of drawn Al and the usual chrome lining may be dispensed with. Various structural details are described.

**Spinning bowls or boxes for artificial silk.** NAAMLOOZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIEK. Brit. 297,468, Sept. 22, 1927. Structural features.

**Spinning nozzles for artificial silk.** HENRI COLOMB. Swiss 128,689, 128,690 and 128,691, Nov. 25, 1927. The holes for the fibers are made larger than desired and reduced to the correct size by compression of the plate. The holes may be divided into sections by partitions.

**Cellulose pulp.** I. G. FARBENIND. A.-G. Brit. 298,333, Aug. 30, 1927. Materials such as wood, straw or grasses are treated at a temp. not exceeding 45° with a quantity of alk. earth hypochlorite just sufficient for the complete oxidation of the lignin (the soln. used originally contg. at least 2% available Cl and being maintained slightly alk. as with Ca(OH)<sub>2</sub>). The raw material may be preliminarily treated with hot dil. NaOH soln. and washed. The hypochlorite treatment is continued until the product shows no lignin reaction with phloroglucinol.

**Wood pulp.** GEORGE A. RICHTER (to Brown Co.). U. S. 1,709,322, April 16. A pulp of high whiteness having an  $\alpha$ -cellulose content of 93.5-96%, a  $\beta$ -cellulose content of 2-4%, a  $\gamma$ -cellulose content of 2-3%, and a pentosan content not exceeding 2.4% (and of other specified characteristics) is obtained by a special described treatment of sulfite pulp.

**Reducing the swelling tendency of paper or other cellulosic materials.** I. G. FARBENIND. A.-G. Brit. 297,463, Sept. 23, 1927. The material is treated with aq. or alk. solns. of resinous condensation products or materials capable of forming such condensation products and the products are subsequently hardened by heat, with or without treatment with CH<sub>2</sub>O. Condensation products of S and phenol, phenol and CH<sub>2</sub>O or urea and CH<sub>2</sub>O may be used. Catalysts to accelerate the condensation or softening agents to reduce the brittleness of the products also may be added.

**Paper.** GASTON A. MOURLAQUE. U. S. 1,710,375, April 23. See Fr. 639,900 (C. A. 23, 982).

**Device for removing condensate from steam-heated rollers used for treating paper or for other purposes.** GEORGE S. JOHNSON (to C. F. Burgess Laboratories). U. S. 1,709,581, April 16.

**Use of high-frequency electromotive force to facilitate digestion in making paper pulp.** S. MULNE. Brit. 297,713, March 20, 1927. A system is described by which it

is proposed to use transmissions from broadcasting stations in producing paper pulp, *e. g.*, in digestion of raw materials such as esparto grass, for shortening the time required for the treatment, reducing the quantity of reagent used, effecting more complete removal of non-cellulosic materials and avoiding undesired reactions.

**Apparatus for shredding and screening paper stock to form pulp.** FAY KERR and MAX ZIMMERMAN. U. S. 1,709,133, April 16. Structural features.

**Apparatus for handling paper-making pulp.** HERMAN L. KUTTER (to Black-Clawson Co.). U. S. 1,709,026, April 16. Structural features.

**Devices for regulating the consistency of the "stuff" used by paper-making apparatus.** J. ARNOT. Brit. 298,337, Sept. 6, 1927.

**Paper-making apparatus.** A. ALDRICH and E. E. BERRY (to Beloit Iron Works). Brit. 298,072, Oct. 1, 1927. Structural features.

**Paper-making apparatus.** A. N. RUSSELL. Brit. 297,642, March 6, 1928. Structural features.

**Paper-making apparatus.** SYDNEY C. WENTZ (to Paper Machinery Corp.). U. S. 1,709,760, April 16. Structural features.

**Paper-making apparatus.** FRITZ WYSS (to A.-G. der Maschinenfabriken Escher Wyss & Cie.). U. S. 1,709,296, April 16. Mech. features.

**Beater roll for paper-making apparatus.** ADAM E. BRIDGE (to Black-Clawson Co.). U. S. 1,709,112, April 16.

**Color-depositing apparatus for paper-making machines.** CHARLES G. BRIGHT (to Paper Patents Co.). U. S. 1,709,969, April 23.

**Colors for wall papers, etc.** J. EHRENWERTH. Belg. 353,812, Sept. 30, 1928. The colors are dild. with a soln. of alk. silicate to which is added a salt to render it more fluid (*e. g.*,  $K_2CrO_4$  or  $K_2Cr_2O_7$ ) and glycerol.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

**High explosives.** C. J. BAIN. *Army Ordnance* 9, 269-70(1929).—Military high explosives as used in high explosives shell and drop bombs are discussed as to the requirements that render them satisfactory, the part each of the several different explosive components in these devices plays and the test of each by means of the Explosives Efficiency Testing Fixtures, a design of one being given. Formerly the efficiencies of the explosive components were believed to be detd. by the wt. employed but their test shows the form and confinement of the charge to produce a marked effect. The manuf. of tetryl has been so improved that it is produced almost *c. p.* and in a granular dustless form especially convenient in the pressing of booster pellets. C. E. M.

**The Bureau of Explosives.** BEVERLY W. DUNN. *Army Ordnance* 9, 324-8 (1929).—This is an historical review of the origin, purpose, development and functions of the Bureau of Explosives of the American Railway Assoc., which serves the I. C. C. in the formulation of its regulations governing the safe transportation of explosives and other dangerous articles and likewise serves the I. C. C. as its inspection division. Among other interesting statements it is said that just before the signing of the Armistice we were producing over 80,000,000 lbs. of military explosives monthly and that there was in transit on the railroads, during these busy days of 1918, not less than 50,000 cars bearing the explosive label at any one time.

**Report of the Chief Inspector of the Bureau for the Safe Transportation of Explosives and Other Dangerous Articles.** B. W. DUNN. 1929, 90 pp.; cf. C. A. 22, 1686.—During 1928 over 500,000,000 lbs. of explosives were transported over the railroads of the U. S. and Canada with but 12 accidents, involving a property loss of \$77, and with no loss of life or injury to person. This is the second year in succession in which the record for explosives is practically perfect. There is a decided improvement shown for  $HNO_3$  but accidents from other corrosive or inflammable liquids are much too numerous, many of them being found due to neglect to conform to the I. C. C. regulations. These many accidents are discussed statistically and in detail so that chemical manufs. have a full opportunity to become familiar with hazards of their products and how they may be safeguarded. CHARLES E. MUNROE

**The important techno-explosive properties of explosive gas mixtures and the effect of high compression on increase of explosive effect.** A. HAID and A. SCHMIDT. Chem. Tech. Reichsanstalt. *Z. angew. Chem.* 41, 1309-12(1928).—The brisance of highly compressed explosive gas mixts. reaches values closely approaching or equalling those

of solid explosives. The most effective gas mixt. may be compared in its action to liquid O explosive. Its com. use as an explosive is hindered by inconvenience and danger in handling. A spark or small flame suffices to start explosion. Values of explosion pressure are calcd., simultaneous combustion being assumed throughout the entire space. This is approx. true with gas mixts., since combustion turns to detonation only over long paths, to which the Becher formula applies. With solid and liquid explosives detonation occurs regularly with sufficient initial impulse. The brisance of uncompressed gases is small on account of the low d., below that of com. explosives. The destructiveness of gas explosions is due to the ready dissemination of the gas mixt. and the exposure of large surfaces to explosion pressures, even though the latter be low.

E. M. SYMMES

Detection and determination of nitrogen oxides in gases from explosives. L. WEIN. *Gluckauf* 64, 409-11(1928).—In gases from explosives the N oxides occurring particularly on incomplete detonation are mainly NO<sub>2</sub>. Sensitive reagents are ZnI<sub>2</sub>-starch soln., which turns violet with traces of NO<sub>2</sub>, and the Griess sulfanilic acid- $\alpha$ -naphthylamine soln., which turns red. The percent of NO<sub>2</sub> by wt. or vol. can be detd. by these 2 reagents.

E. M. SYMMES

The ignition of fire damp by explosives. A. SEGAY. *Compt. rend.* 188, 867-8 (1929); cf. C. A. 22, 1239.—The addn. of sea salt to "amatol" (NH<sub>4</sub>NO<sub>3</sub>-80 and TNT-20) lowers the temp. of the detonation flame and velocity of the reaction, but the vol. of flame and the total heat given off remain the same and the duration of the flame is lengthened. Certain explosive flames that do not ignite fire damp are of short duration. The principal factor that diminishes the capacity of explosives to cause ignition is the compn. of the gases constituting the flames following a detonation. Liquid CO<sub>2</sub> placed in a cartridge shell vaporized during detonation and had a large extinguishing effect. Therefore, in order to prevent ignition of fire damp it is essential to develop means for rapid formation of compds. like CO<sub>2</sub>, N and H<sub>2</sub>O in the gases emitted following a detonation.

H. W. WALKER

Gaseous combustion at high pressures. XI. Further experiments on the influence of hydrogen and steam on the explosion of carbonic oxide-air, etc., mixtures. WM. A. BONE, DONALD T. A. TOWNEND AND GORDON A. SCOTT. *Proc. Roy. Soc. (London)* A120, 546-63(1928); cf. C. A. 22, 3992.—The observations of Bone and Howard (C. A. 16, 189) on the influence of successive replacements of CO by H on the explosion of theoretical  $2(m\text{H}_2 + n\text{CO}) + \text{O}_2 + 4\text{N}_2$  mixts. at initial pressures of 50 atm. and room temp. have been confirmed. This effect is now shown to appear abruptly when the H content of the mixt. exceeds about 0.65%; it is of the nature of a "knock" effect, and can be eliminated by raising the bomb temp. to 100° without altering the charge-density. When such "knock" effect has been thus eliminated, effects of successive replacements of CO by H<sub>2</sub> upon explosions of the mixts. are two-fold; namely, initially and up to a certain point, which is reached when about 1.0% of H is present, the effect is definitely "catalytic," but afterward purely "additive." The second phase is attributable merely to a speeding-up of the flame propagation resulting from the concurrent combustions of a relatively fast-burning theoretical H<sub>2</sub>-air and a relatively slow-burning theoretical CO-air mixt., the O<sub>2</sub> supply being always sufficient for complete combustion in the system. The effect of successive small additions of steam to a theoretical CO-air mixt. on explosion at initial pressures of 32.2 and 64.4 atm., resp., and with the bomb chamber at 100° was to promote combustion, but without the steam intervening chemically in the sense of its being continuously decomposed and regenerated; "optimum" conditions were nearly reached in each case when but 1% of steam was present. It is the initial small addn. of steam that has the greatest effect. Actually, and apart altogether from the "knock" effect, the addn. of a small quantity of hydrogen had a greater effect than its equiv. of steam in speeding up the explosion of a CO-air mixt. at high pressures; which of the two effects of H was responsible for this result is perhaps not yet altogether certain, though the evidence seems distinctly in favor of the view that what may be termed the purely "catalytic" effect of H exceeds that of steam in like circumstances. Certainly, the reverse is not the case. Apart altogether from any influence that mere "dryness" may have during the explosion of a theoretical CO-air mixt. at high initial pressures, the progressively increasing "lag" in  $t_m$  (time in seconds for the attainment of max. pressure after commencement of the pressure rise) observed as the initial pressure rises is principally, and for the most part, an effect of N because it is not observed at all when the N is replaced by its vol. equiv. of either CO<sub>2</sub> or A.

XII. Influence of steam and temperature, respectively, upon the "explosion limits" of carbon monoxide-air mixtures. WM. A. BONE, D. M. NEWITT AND C. M. SMITH. *Ibid* 563-72.—The drying of CO-air mixts. narrows their explosion ranges at the high

initial pressures employed. The explosion range (difference in upper and lower percent of CO in the limit mixts.) at 32.2 atm. for dry gas is 44.6; for gas 80% satd. at 100°, 50. The ranges at 64.4 atm. for dry and for 80% satd. gases are, resp., 40.4 and 50.1. In the moist mixts. the influence of increasing pressure (charge density) was slightly to shift each limit downwards without narrowing the explosion range at all; but with the dry mixt. the explosion range was definitely narrowed by doubling the initial pressure. The influence of temp. *per se* is to widen the explosion range because the charge density at 18° and 25 atm. is the same as at 100° and 32.2 atm., while at 18° and 50 atm. it is the same as at 100° and 64.4 atm.

G. CALINGAERT

The spark ignition of a hydrogen-air mixture. KIVOHKO YUMOTO. *Bull. Inst. Phys. Chem. Research Tokyo* 8, 131-42 (1929); *Abstract Ed.* 2, 20-1. —The influence of the nature of the spark upon the ignition of a mixt. of 5% H and air was investigated. For the production of the spark, a d. c. through the primary of a 1-kw. transformer was interrupted by a snap-switch, and the resulting secondary high voltage was applied to the spark gap. The conditions of the secondary were varied (1) by disconnecting, (2) by connecting a capacity in parallel with the spark gap, or (3) by using the capacity and adding a variable resistance (water tube) in series with the gap. In case (1), the spark has a faint luminosity, but a greater igniting power than in case (2), which exists as a brilliant spark. In case (3), the luminosity of the spark is faint, but its igniting power is max. In this last case, the igniting power is still increased by increasing the water resistance in series with the gap.

ALBERT L. HENNE

Further experiments on the combustion of well-dried carbon monoxide and oxygen mixtures. III. WM. A. BONE, FRANK R. WESTON AND DENNIS A. WINTER. *Proc. Roy. Soc. (London)* A123, 285-91 (1929). —The results are similar to those of I and II (cf. *C. A.* 20, 2414) and show that the presence of water vapor is not essential to the ignition and explosion of  $2\text{CO} + \text{O}_2$  mixts. Highly purified gaseous mixts. rigidly dried with redistd.  $\text{P}_2\text{O}_5$  for 555 to 1005 days were exploded with flame propagation, but they required a condenser discharge of 1.0 microfarad at 1000 v. The resulting combustion was always less than 90% complete. The limit of the drying power of  $\text{P}_2\text{O}_5$  is believed to lie between 120 and 240 days. The min. spark energy required for firing depends on the character of the discharge, material and shape of electrodes, compn. of  $\text{CO}-\text{O}_2$  mixt. and the gaseous pressure.

H. W. WALKER

Apparatus for the stability test of smokeless powder at 135° or 120°. J. VON MEERSCHIEDT-HULLESSEM. *Z. ges. Schiess-Sprengstoffe* 24, 10-5 (1929). A heating bath made of Cu is provided with a reflux condenser and 2 rows of 10-12 Cu tubes soldered to the bottom of the cover, for receiving the test tubes contg. 2.5 g. samples of powder. The bath is filled with the proper glycerol  $\text{H}_2\text{O}$  mixt. to maintain the desired temp., (0.1-1.24 for 135° and 1.20 for 120°). Provision is made for simultaneously withdrawing all of the tubes for observation of the litmus paper placed above the powder and for noting evolution of  $\text{NO}_2$  fumes. A shield of heavy glass furnishes protection from possible explosions.

C. G. STORM

Gauze heating in miner's safety lamps. E. J. GLEIM, A. B. HOOKER AND P. G. GUEST. *Bur. Mines, Repts. of Investigations* No. 2013, 7 pp (1929). The results of this investigation confirmed the previously expressed opinion that a double-gauze, bonneted, flame safety lamp properly assembled, with the gauzes intact and clean, is incapable of igniting  $\text{CH}_4 + \text{air}$  atm. under any of the conditions, as to percentage and velocity, likely to be encountered and that the max. temp. reached allows a margin of safety in mines.

CHARLES E. MUNROE

A new permissible blasting device. J. E. TIFFANY. *Bur. Mines, Repts. of Investigations* No. 2920, 8 pp. (1929). —There is described a device styled Cardox, employing liquid  $\text{CO}_2$ , which has been approved as permissible for use in blasting coal. The device consists of a stout steel cylinder having at its lower end a hole which is covered hermetically with a stout steel diaphragm. There is placed in the cylinder a heater element contg. a combustible mixt. which is ignited from without by an elec. current. The cylinder is then charged with liquid  $\text{CO}_2$  and placed in the bore hole in the coal and tamped as a charge of explosion usually is. On the ignition of the combustible the heat generated expands the  $\text{CO}_2$  until the pressure becomes sufficient to shear a disk out of the steel diaphragm through which the gaseous  $\text{CO}_2$  escapes to throw down the coal. The steel cylinder is recovered, refilled, recharged and reused.

C. E. M.

The condenser chronograph. HANS RUMPF. *Z. ges. Schiess-Sprengstoffe* 24, 13-7 (1929). —The condenser chronograph described by Jones (*C. A.* 20, 3237) was modified in several respects so as to give quite consistent results in detg. the velocity of detonation of high explosives in columns only 1 to 5 cm. long. A tolerance of  $\pm 1$  mm. being allowed in measuring the distance between the 2 points which det. the length of

column, the method is accurate to 2%. Because of the impulse imparted by the initiating detonator, the rate of detonation is greatest for the first 3 cm. (approx.) of the column. TNT detonating fuse gave approx. a 6000 m./sec. rate when measured for 1–2 cm., and approx. 5000 m./sec. when measured on a column 5–6 cm. long. With such short columns the time interval measured is of the order of  $1.10^{-5}$  sec. In the usual spark chronograph method the time required for the rupture of the thin Cu wire is about  $1.10^{-4}$  sec., with a tolerance of about  $\pm 2.10^{-6}$  sec.; hence much longer columns of explosives are required.

C. G. STORM

**The delay period in spontaneous ignitions and explosions.** MAX BRUNNER. *Helv. Chim. Acta* 12, 295–304 (1929).—The delay period observed before the occurrence of actual spontaneous ignition and explosion can be explained on the basis of the modern conception of the mechanism of chain reactions in which the delay is caused by original de-activation of reaction centers by active points on the surface of the reaction vessel to such an extent that the "yield" of new reaction centers during the delay period may not rise above the value 1 without spontaneous ignition or explosion taking place. Since the activity of the de-activated points is reduced by adsorption reaction products formed during the slow reaction, the formation of new reaction centers finally overtakes de-activation, whereupon spontaneous ignition of explosion occurs. The theories developed are in accord with exptl. observations.

E. M. SYMMES

#### Method for the classification of the hazards of liquids (NUCKOLLS) 13.

**Explosive.** ERIC SORENSON. U. S. 1,709,498, April 16. An explosive which is suitable for blasting comprises  $\text{NH}_4\text{NO}_3$  800,  $\text{KNO}_3$  100, S 16,  $\text{MnO}_2$  15, paraffin 6, petroleum naphtha 6, rosin 15, potato flour 8, Al 30 and nitroglycerin 100 parts.

**Explosives.** J. P. NICHOLS. Brit. 297,365, March 17, 1927. Oil pitch or asphalt pitch or like material, with or without a substance such as charcoal, is used with  $\text{KNO}_3$  and S to form a powder suitable for fuses and for blasting or military operations where slow action is required. Proportions and details of manuf. are given.

**Explosives.** IMPERIAL CHEMICAL INDUSTRIES, LTD., and T. J. R. ALEXANDER. Brit. 297,375, June 20, 1927. A very intimate mixt. of  $\text{NH}_4\text{ClO}_4$  and  $\text{NaNO}_3$  suitable for use in explosives is obtained by double decompn. of concd. solns. of  $\text{NaClO}_4$  and  $\text{NH}_4\text{NO}_3$  at a relatively high temp (suitably about  $140^\circ$ ).

**Explosive for signalling.** WALTER O. SNELLING (to Trojan Powder Co.). U. S. 1,709,636, April 16. In signalling, a compn. is detonated which contains nitrated starch together with a non-explosive signalling material such as coloring substances. Various other ingredients may also be added.

**Propellant explosive.** ARTHUR S. O'NEIL (to Western Cartridge Co.). U. S. 1,709,868, April 23. A progressively burning charge is formed of blended grains of different characteristics such as grains of different sizes. U. S. 1,709,869 specifies blended grains, the ds of which are so chosen as to produce a progressively burning charge. U. S. 1,709,870 specifies blended grains, the compns. of which are such as to produce a progressively burning charge, e. g., nitrocellulose grains of high and low nitration.

**Electrically fired fuse heads for explosives.** W. O. LITTLEBURY and IMPERIAL CHEMICAL INDUSTRIES, LTD. Brit. 297,869, June 29, 1927. Basic dinitrosalicylates of Pb are used in fuse heads and other co-pptd. basic Pb salts also may be present. Directions for prep. the salts are given.

**Smokeless powder.** WILLIAM T. INGRAHAM. U. S. 1,710,024, April 23. After forming the powder in a usual manner, it is gelatinized, grained and dried, and the grains are then dipped in acetone or other solvent for nitrocellulose in order to reduce hygroscopicity and alter the ballistic properties.

**Composition for pyrotechnic "sparklers."** CHARLES D. MILLER. U. S. 1,709,033, April 16. A compn tip for "sparklers" is formed of glue, water,  $\text{KClO}_3$ , amorphous P, powdered glass,  $\text{MnO}_2$ , particles of metal such as Mg and Al and S.

**Detonators for blasting purposes.** NOBEL'S EXPLOSIVES CO., LTD., and G. MORRIS. Brit. 297,853, April 1, 1927. Detonators for blasting purposes and for shells, mines, etc., are provided with a main charge of explosive of high d. (such as erythritol tetranitrate or a mixt. of "tetryl" and trinitrotoluene) by loading the charge into the detonator casing in molten condition (or in powdered form followed by melting after its introduction). A priming charge of Pb azide and Pb styphnate may then be placed in the detonator on the main charge.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Interesting sources of natural dyestuffs. C. D. MELL. *Textile Colorist* 51, 257-62 (1929); cf. C. A. 23, 1507.—The production and the use are described of West African camwood, which earlier was used almost exclusively for dyeing bandana handkerchiefs. The jack tree (*Artocarpus integrifolia*), from which a yellow dye is obtained, is among the minor dye-yielding plants used in India. In South America, the bark of the Lingue tree (*Persea lingue*) is an important source of tannin. The *Mimosa mellii*, a tree discovered by the author in southern Mexico about three years ago, and the *Datura fastuosa trombeta* are described.

RUBY K. WORNER

New development in vat colors. EUGENE SCHWARZ. *Am. Dyestuff Repr.* 18, 67-70(1929).—A general survey is given of about 30 new vat colors which have been introduced in the last 10 years. Nekal BX is used to give brighter shades. The yellows as a class have a destructive influence in regard to light fastness upon the blue in a green combination. Indanthrene Yellow 3GF is the least destructive in this respect. Properties of dyeing and fastness of these colors on cotton and rayon are discussed.

E. W. CLARK

Problems in dyeing sulfur blues. WALTER F. HASKELL. *Am. Dyestuff Repr.* 18, 42-4(1929).—The faults of sulfur blue dyes as encountered by the warp, beam, package, skein and piece goods dyers are discussed.

R. HOUGHTON

Dyeing in India: vat dyes. G. H. DYER. *Leeds Univ. Indian Textile J.* 39, 135-6(1929).—General.

RUBY K. WORNER

Optical heterogeneity and its influence on the fastness to light of vat dyeings. B. WUTH. *Am. Dyestuff Repr.* 18, 117-20(1929).—Optical heterogeneity obtains when light travels to the eye from reflecting or transparent objects which contain solids, suspensions or colloids in every degree of dispersity, with varying degrees of reflection, and ordinary or selective absorption, and refraction, polarization, phosphorescence, etc. This heterogeneity varies according to the phys. or chem. state of the object, decreasing in colloidal solns. in proportion to their higher dispersion nearing mol. solus., and increasing with lower dispersion to suspensions and solids. The degree of dispersion of a body in an indifferent solvent is closely related to the mol. wt. of this body. The dividing line between mol. dispersoids and colloids of org. dyes has been drawn at a mol. wt. of about 250 to 300 and therefore with very few exceptions, all dyes in practical use are colloids. Refraction, optical resonance, interference, chromolysis, bichroism, dichroism, poikilochroism, intussusception and apposition are defined. A marked relationship exists between optical heterogeneity and the fastness to light of vat dyeings. Apposition dyeings in which the dye particles are large, because of the many and greater surfaces exposed to heterogeneous light, are less fast than those in which the dye particles are small and the surface of the mass is more even. Slow oxidation and thorough soaping favor the latter type of dyeing.

E. W. CLARK

Laboratory dyeing in relation to bulk dyeing. J. MOFFAT. *Dyer, Calico Printer* 61, 72-3(1929).—The testing of dyes for the woolen and worsted industries is discussed.

RUBY K. WORNER

The human factor in dyeing. FRANK PLATT. *J. Soc. Dyers Colourists* 45, 42-4 (1929).—This article is concerned with the relation between the dyer, the dye machine operator and quality of work.

ROBERT HOUGHTON

Apparatus for the examination of dyed materials in artificial light. ANON. *Dyer, Calico Printer* 61, 108(1929).—An instrument devised by the British Dyestuffs Corp., Ltd., has two compartments so arranged that the material can be seen simultaneously illuminated by daylight and by artificial light.

RUBY K. WORNER

Comparative outputs and costs of dyeing wool with four special process machines and with eleven open tubs. A. C. NIELSEN COMPANY. *Textile Colorist* 50, 690-2 (1928).—The installation of Franklin Process Dyeing Machines by the Worcester Woolen Mill Company has brought about a saving of \$0.01706 per lb. as compared with the tub process and a net annual return on the investment of 135%.

RUBY K. WORNER

Dyeing silk with sulfur dyes. J. CLAROU. *Russa* 4, 225, 227(1929).—F. Grove-Palmer protects the fiber from the action of the alkali in the dyeing bath by adding Na acid lactate. The results obtained can be improved by facilitating reduction of the dye by replacing part of the Na<sub>2</sub>S by Na hyposulfite, and by dyeing in the presence of a good dyeing oil to obtain better dispersion of the dye. After dyeing, it is preferable first to rinse with a soln. contg. 1 g. Na<sub>2</sub>S, 2 g. Na sulfonate and 4-5 g. coconut oil soap per l., at 35°.

A. PAPINEAU-COUTURE

Dyeing cotton yarn in the cop. H. MARSDEN. *Dyer, Calico Printer* 60, 162-3, 180-1, 224-5, 248-9(1928); 61, 28-9, 76-8, 94-5(1929). RUBY K. WORNER

The behavior of cellulose acetate toward amino derivatives of anthraquinone. HERMAN M. BURNS AND JOHN K. WOOD. *J. Soc. Dyers Colourists* 45, 12-5(1929).—Expts. are described giving evidence that the dyeing of cellulose acetate silk by means of aq. suspensions of bases such as the amino derivs. of anthraquinone is an adsorption phenomenon. T. G. HAWLEY, JR.

Indigosol resists on Prud'homme aniline black. J. BERT. *Dyer, Calico Printer* 61, 150(1929).—Formulas are given. RUBY K. WORNER

Application of Indigosols in printing. W. H. COTTON. *Am. Dyestuff Repr.* 18, 33-6(1929).—General properties and methods of application are described. In the nitrite and chromate method the oxidizing agent is included in the color paste, development taking place after printing in  $H_2SO_4$  soln. Steaming after printing gives considerably darker shades. The Indigosols may be printed in combination with Aniline Black and with the Rapid Fast Colors. The production of green, violet and chocolate shades is described. They may be resisted with  $NaOAc$ ,  $Na_2S_2O_3$  or with rongalite. The insol. azo colors, Rapid Fast colors or nitrosamines, also act as resists for Indigosols. The ordinary vat color printing pastes discharge them. They may themselves be used as resists under Aniline Black and in chlorate discharges since they stand chlorate well. They are suitable for both weighted and unweighted silk. For the former, development in dichrome and  $H_2SO_4$  soln. is recommended. Rayon and viscose are treated in the same way as cotton. Celanese differs from cotton and requires steaming for some time before developing in the acid soln. E. W. CLARK

Bleaching, dyeing and finishing, modernized. THOMAS B. EVERIST. *Am. Dyestuff Repr.* 17, 805-8(1928).—A description is given of modern machinery used in bleaching, dyeing and finishing cotton piece goods, with illustrations. H. F. LEUPOLD

The effect of  $pH$  in scouring and dyeing upon resulting shades on viscose. CHAS. E. MULLIN. *Am. Dyestuff Repr.* 18, 64-6(1929).—A paper which explains the results obtained upon sample skeins of viscose yarn dyed with direct colors, the skeins having been scoured at various  $pH$  values and temps. and dyed at const.  $pH$  values. R. H.

Discharge and resist printing on Celanese dyed with S. R. A. colors. J. BERT. *Dyer, Calico Printer* 61, 75(1929).—Formulas are given. RUBY K. WORNER

Calico printing in Ahmedabad. H. B. SHROFF. *Indian Textile J.* 39, 132-4(1929).—Methods are described. RUBY K. WORNER

Some observations on the suitability of various metals and alloys for dyeing machines. J. G. GRUNDY. *J. Soc. Dyers Colourists* 45, 39-42(1929).—The effects of various metals upon dyestuffs of the following classes are shown: acid, chrome, direct, diazo, basic, sulfur, vat and azoic. The metals tested were cast iron, wrought iron, copper, nickel, monel, lead, stainless steel, Firth Staybrite, Dyebrite, Silverite, phosphor bronze and brass. The tests were made with solns. such as would be used in the application of each class of dyes to various fibers. ROBERT HOUGHTON

Suggested method of choosing dyeing and bleaching machinery in your plant. HENRY B. BURKE. *Am. Dyestuff Repr.* 18, 1-2(1929).—An outlined system of checking the selection of equipment. STEPHEN K. FORD

The influence of light in fading tests. Use of artificial light. OTTO MERZ. *Farben-Ztg.* 34, 1117-9(1929).—M. reviews briefly the elements of light transmission, absorption, reflection, etc. The results of exposure of 16 dyes and pigments (names not given) to midday sunlight, midday diffused light and to the light from a "natural light lamp" are tabulated. G. G. SWARD

Color science applied to textiles. WALTER M. SCOTT. *Am. Dyestuff Repr.* 18, 60-4(1929).—Examples are given to prove that uniform mixts. of pigments do not necessarily produce an even progression of colors to the eye. Photometer reflection measurements are given to show the color changes on cotton produced by different concns. of caustic in the kier boil, and those produced by the various processes in the bleach house. The correlation between spectral reflection measurements and values of hue, value and chroma is pointed out. T. G. HAWLEY, JR.

Practical hints on the production of bright colors on textile fabrics. RAFFAELE SANBONE. *Am. Dyestuff Repr.* 18, 95-8(1929); cf. C. A. 23, 280.—The production of stripe effects in printing is discussed. A printing and aging machine is described. ROBERT HOUGHTON

The textiles of the north. A frontier novelty: Afridi wax cloth. SHRIPAD R. TIKKAR. *Indian Textile J.* 39, 122-3(1929).—An illustrated description is given of the making of this fabric. RUBY K. WORNER

Cross-sectioning of textiles. ARTHUR K. JOHNSON. *Am. Dyestuff Repr.* 18,

37-40(1929).—Suggestions are given to assist the operations of prep. materials for sectioning and for the cutting of sections by simple and rapid methods. A. K. J.

A study of the "direct or rational method" for the conditioning of textiles. ETIENNE BURLET. *Chambre de Commerce de Roubaix. Russa* 3, 1471-9(1928); 4, 51, 53 (1929); cf. *C. A.* 22, 1048.—In conditioning textiles by exposing to a standard atm. (18°, 65% relative humidity) to const. wt., the final wt. depends on the previous hygrometric condition of the sample and is higher when it is brought from higher to lower H<sub>2</sub>O content than conversely. The max. difference in the const. wt. attained from satn. and from oven dryness, resp., is approx. 2.5% for artificial textiles and 2% or less for natural textiles; the true normal wt. of the material lies just half-way between the two. The max. error in detg. the normal wt. by exposing to a normal atm. to const. wt. would therefore be 1-1.25%, and in practice the actual error due to this cause would generally not be more than half these values. The true normal wt. can be detd. with a high degree of accuracy by taking 2 equal samples, exposing them for 8 hrs. to air at 85-8°C and 35-40% relative humidity, resp., then exposing to a standard atm. (as above defined), plotting the wt. curves, and taking the mean. A. PAPINEAU-COUTURE

The filtration of water for textile purposes. S. R. TROMAN. *Dyer, Calico Printer* 61, 120-2(1929).—Methods of treating water are considered with regard to the type of water and the requirements of the textile process concerned. R. K. W.

Cellulose and its importance to the textile industry. JOHN E. JACKSON. *Am. Dyestuff Repr.* 17, 816-9(1928).—J. notes the numerous forms in which cellulose finds service—cotton, linters, cellulose flour, rayons and plastics, ramie, pita fiber.

A. K. JOHNSON  
Some notes on phorium (New Zealand flax). FRED. GROVE-PALMER. *Am. Dyestuff Repr.* 18, 115-6, 132-3(1929).—The good strength, luster and possible softness possessed by this fiber make its extended use desirable. Increased cultivation and continued improvements in mech. methods for sepn. of the fiber will accomplish this. The dyeing of the fiber presents no special difficulty. Preliminary treatments may include boiling out in very dil. soda ash, or bleaching under properly controlled conditions with H<sub>2</sub>O<sub>2</sub> followed by washing and then treatment with H<sub>2</sub>SO<sub>4</sub>. Direct, Acid, Basic or Sulfur colors may be used. No record of the com. application of Vat colors has been found.

A. K. JOHNSON  
Relation between cystine yield and total sulfur in wool. CLAUDE RIMINGTON. *Biochem. Dept., Brit. Research Assoc. Woolen Industries, Leeds. Biochem. J.* 23, 41-6(1929).—Wools differing in S content from 3.34 to 4.08%, and fine and coarse samples of Turkey mohair, are all capable of yielding their entire S as cystine when hydrolyzed by acids.

RUBY K. WORNER

**Structure of cotton fiber.** WACŁAW KACZKOWSKI, I. FEFERMAN AND S. ZABICKI. Warsaw Polytech. *Przemysł Chem.* 11, 205-8(1927).—Cotton is not uniform in its chem. compn. throughout, but consists of at least 3 portions: the cuticle, the inside and the outside portions. Schweitzer's reagent differentiates between the cuticle and the outside portion. The curve for loss in wt.—time of boiling in alkali rises rapidly at first, reaching 4% in the first 30 mins., then remains without change for at least 2½ hrs. and rises again after 7 hrs., showing the beginning of a new reaction. This can be checked with raw unbleached cotton.

**The shrinkage of cotton cloth.** H. D. CLAYTON. *Am. Dyestuff Repr.* 18, 40 2 (1929).

H. H. MOSHER

**Kieropon—new method for bleaching and mercerizing cotton goods containing vat, naphthol and sulfur colors.** A. R. THOMPSON. *Am. Dyestuff Repr.* 18, 5-11 (1929); cf. C. A. 22, 689.—New uses for Kieropon and some of its properties are described. Kieropon functioning as an oxidation agent protects vat and naphthol colors on cotton from bleeding while the colored stripe material is in NaOH soln. during prepn. for the bleaching process, these colors being fast to the Cl bleach and subsequent operations. It is possible to use Naphthol Reds (AS-SW with KB base and AS with TR base) to replace Turkey red when using the Kieropon-Cl bleach. The naphthol colors which are not fast to the peroxide bleach can be used with this process. The use of Kieropon in the bath prevents these colors as well as S colors from marking off or bleeding in the mercerizing process. Curves showing the stability of Kieropon-NaOH solns. are given. Kieropon may also be used as a resist for vat colors. The material is printed with the Kieropon, dried and dyed on the pad with either vat or S colors, then washed and soaped. Several formulas are given for the use of Kieropon in bleaching and mercerizing processes.

E. W. CLARK

**Influence of sodium silicate on bleaching by hypochlorite.** WALTER TAUTE. *Rev. gen. mat. color* 31, 279 80, 320 1(1927). *Chem. Zentr.* 1928, I, 415.—The addn. of Na<sub>2</sub>-SiO<sub>3</sub> to NaOCl solns. in the absence of materials to be bleached does not affect the NaOCl decompn. The presence of goods to be bleached retards the decompn. Na<sub>2</sub>-SiO<sub>3</sub>, when added to NaOCl solns. increases the latter's bleaching power and gives a whiter and cleaner fabric. This action was observed even after repeated use of the bleaching soln. NaOCl solns. rapidly destroy tissue of fabrics and Na<sub>2</sub>-SiO<sub>3</sub> acts as a distinct protection agent. Considerable silicate adheres to cloth or other material which is being bleached and thus greatly increases the ash content of the fiber. The loss in Cl during successive treatments of cellulose was 2.9-7.1% at 25° and 21.7-36.8 at 82°. The amt. of Na<sub>2</sub>-SiO<sub>3</sub> present did not greatly affect the results. The silicate that is deposited upon the fibers was shown not to affect the strength of the fibers, even when exposed to high temps. or to repeated pressings.

C. R. F.

**Investigations on the action of oxidizing agents in kier boiling.** HALLER AND PAUL SEIDEL. *Am. Dyestuff Repr.* 18, 85 9(1929); cf. C. A. 22, 4209.—The use of *Aktivin* is compared with standard practice.

STEPHEN K. FORD

**Soap applications and textile processes.** W. W. BRAY. *Am. Dyestuff Repr.* 18, 174 6(1929); cf. C. A. 22, 2468. A discussion of the function of soap in boiling-out cotton, rayon scouring and silk degumming with arguments for the superiority in these operations of an oleate type of soap.

E. M. SHELTON

**Solvents in soap and their subsequent effect on the properties of soap solution.** ROBERT W. JAEGER. *Am. Dyestuff Repr.* 17, 811 3(1928).—In tests on removal from woollen flannel samples of an artificial soil composed of ceresin, lanolin, cylinder oil, and roofing tar it is reported that effectiveness of soap soln. decreases with addn. of hexalin, tetralin and pine oil. Surface-tension lowering is less and handle of goods is not improved.

E. M. SHELTON

**Potash or soda soaps which?** W. W. BRAY. *Am. Dyestuff Repr.* 18, 24-8 (1929).—Potash and soda soaps of identical fatty acid content (particularly oleates) are compared for textile purposes. Although potash soap is slightly more sol., no advantage is found over Na oleate under conditions of use in textile processing. K soaps are hydrolyzed appreciably more than Na soaps and wool is shown to remove by preferential absorption less alkali from a Na soap than from a K soap, from which it is concluded that wool loses less in softness, elasticity and strength when processed in Na soap. There is no difference in rinsibility and ability to form stable fatty acid emulsions on acidification. Stored in an atm. of high humidity K oleate becomes rancid more quickly.

E. M. SHELTON

**Solubilized starch in finishing mixings.** W. TRAUTMANN. *Dwr., Calico Printer* 61, 83-8(1929).—Photomicrographs of cross-sections of sized thread obtained by Kraus

are reproduced and described. The effect of adding Aktivin to the mixture is shown. Formulas are given. Cf. *C. A.* 22, 2063.

Points about drying machines (for textiles). C. PRIMROSE. *Dyer, Calico Printer* 61, 4-5, 50-1, 74-5 (1929).

DARBY, WILLIAM: Rayon and Other Synthetic Fibers. A brief account of the origin, development, use and manufacture of rayon. New York: Dry Goods Economist. 65 pp.

LEHNE, A.: *Textilchemische Erfindungen*. Part II, July 1 to Dec. 31, 1927. Wittenberg, Halle: A. Ziemsen. M. 6. Reviewed in *Bull. soc. ind. Mulhouse* 95, 116 (1929).

Dye. W. SMITH, J. THOMAS and SCOTTISH DYES, LTD. Brit. 298,248, April 1, 1927. A dye which is apparently 3,3'-dichloroanthraquinonehydroazine and which dyes cotton bright reddish blue from a hydrosulfite vat is obtained by brominating 2-amino-3-chloroanthraquinone, m. 310-12° (which may be obtained by the process described in Brit. 264,916 (*C. A.* 22, 244)) and condensing the product in the presence of an acid absorber such as NaOAc, a Cu salt such as the acetate and a diluent such as o-nitrotoluene.

Dye composition. EUGENE R. SCHLATTER (to Dip-It Inc.). U. S. 1,710,076, April 23. A compn. suitable for household use comprises a glycerol soln. of acid and basic coal-tar dyes such as diamine fast yellow G, orange 2 R, orange Y and malachite green.

Dyes. J. R. GEIGY A.-G. Brit. 297,441, Sept. 21, 1927. Acid dyes fast to alkali are prep'd. by the further sulfonation of phenonaphthosafranine-16-sulfonic acids (such as those prep'd. as described in Brit. 265,986; *C. A.* 22, 503). A suitable starting material is the phenonaphthosafranine-16-sulfonic acid prep'd. by coupling 6-sulfo-3-ethylbenzylisorosinduline with Na 1-methyl-2-ethylamino-5-amino-4-sulfonate. The 6-sulfo-3-ethylbenzylisorosinduline is prep'd. by coupling 2-phenylnaphthylamine with 4-nitroso-1-ethylbenzylaniline, sulfonating with alkali sulfite and oxidizing.

Dyes. I. G. FARBENIND. A.-G. Fr. 648,633, Feb. 10, 1928. 2-Thionaphthene-3-indolindigoid dyes are prep'd. by condensing 6-aminohydroxythionaphthene with a 5,7-dihaloisatin and then introducing 2 Cl atoms into the 5,7-positions on the thionaphthene side, or by condensing 5,7-dichloro-6-aminohydroxythionaphthene (from 2-amino-4,6-dichloro-5-acetyl-amino-1-thioglycolic acid by the process of Fr. 366,611) with a 5,7-dihaloisatin. Examples are given of both methods using 5,7-dibromoisatin. The products dye cotton from the vat in fast brown shades.

Dyes. SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 128,904 to 128,913, Dec. 4, 1926. Addns. to Swiss 127,259 (*C. A.* 23, 1281). Diazotized 4-(alkyl- or arylamino)-2-amino-1-benzenesulfonic acid is coupled with pyrazolone derivs. Thus, diazotized 4-acetamido-2-amino-1-benzenesulfonic acid coupled with 1-(2'-methyl-4'-sulfo-phenyl)-5-pyrazolone-3-carboxylic acid gives a dye which colors wool a fast greenish yellow in an H<sub>2</sub>SO<sub>4</sub> bath. Also, 4-benzoylamino-2-amino-1-benzenesulfonic acid coupled with 1-phenyl-3-methyl-5-pyrazolone gives a red-yellow dye fast to light, water, washing and alkali. Other examples occur in each patent.

Dyes. SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 129,265, June 24, 1927. A dye prepn. is obtained by mixing sym. 1,2-naphthothioindigo with its sym. 2,1-isomer.

Dyes. SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 129,267, July 12, 1927. A dye prepn. is obtained by mixing isoviolanthrone with its dichloro deriv.

Dye. SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 129,472, Dec. 4, 1926. Addn. to Swiss 127,259 (*C. A.* 23, 1281). Diazotized 4-acetamido-2-amino-1-benzenesulfonic acid is coupled with the pyrazolone deriv. obtained from crude xylydine by sulfonating, diazotizing, reducing and condensing with acetoacetic ester. The resulting dye is fast to light, water and alkali.

Azo dyes. L. B. HOLLIDAY & Co., LTD., and C. SHAW. Brit. 298,008, May 28, 1927. Azo dyes are formed by condensing aminoozo compds. such as aminoozobenzene, aminobenzeneazodiphenylamine or p-nitrobenzeneazo-β-naphthylamine with phthalic

acid or a deriv. Dyes are obtained which give orange dyeings on cellulose acetate, wool, silk and cotton.

**Azo dyes.** LEOPOLD LASKA, FRIEDRICH KRECKE and FRITZ WEBER (to Grasselli Dyestuff Corp.). U. S. 1,709,989, April 23. Monoazo dyes are formed by combining 2,6-naphtholcarboxylic acid with diazotized compds. such as those of aniline, *p*-chloro-aniline-*o*-sulfonic acid, *p*-nitro-*o*-aminophenol, *o*-nitro-*o*'-aminophenol-*p*-sulfonic acid (or other components which are listed in a table of properties of the dyes formed). These dyes give yellowish red to brown tints on wool, turning to blue to violet to black when after-chromed, and dye cotton reddish to brownish shades by the chrome-printing process and are also suitable for producing good lakes. Cf. C. A. 23, 2299.

**Azo dyes.** LEOPOLD OSWALD (to J. R. Geigy Akt.-Ges.). U. S. 1,709,734, April 16. See Fr. 637,867 (C. A. 23, 286).

**Azo dyes.** J. R. GEIGY A.-G. Swiss 129,179 to 129,190, July 8, 1927. Addns. to Swiss 127,529 (C. A. 23, 1276). Monoazo dyes are prepd. by combining aminosulfocarboxylic acids of chlorobenzene or benzene with naphthol or pyrazolone derivs. Thus, 1-amino-2-sulfo-5-chlorobenzene-4-carboxylic acid and  $\beta$ -naphthol give a red dye. The same carboxylic acid with 1-(2'-chloro-5'-sulfophenyl)-3-methyl-5-pyrazolone gives a yellow dye. Also, 1-amino-2-sulfo-5-chlorobenzene-5-carboxylic acid with the same pyrazolone deriv. gives another yellow dye. Further, 1-amino-2-sulfo-5-chlorobenzene-5-carboxylic acid in acid soln. with 2-amino-8-naphthol-6-sulfonic acid gives a red dye. Other examples occur in the series of patents.

**Azo dyes.** I. G. FARBERIND A.-G. Brit. 297,362, Sept. 19, 1927. Dyes producing tints tending more toward bordeaux in color than the dyes made as described in Brit. 210,081 (C. A. 18, 1755) are produced in substance or on the fiber by coupling with an arylide of 2,3-hydroxynaphthoic acid a diazotized alkyl-, aryl- or aralkylamide of 3-aminobenzoic acid having in the 4-position an alkyloxy, aryloxy or aralkyloxy group and in the 6-position an alkyloxy, aryloxy or aralkyloxy group or halogen. Several examples are given.

**Azo dyes.** I. G. FARBERIND A.-G. Brit. 297,884, July 1, 1927. Azo dyes are produced by reducing to an azoxy or azo group the nitro groups from 2 mols. of a dye obtained by coupling diazotized 5-nitro-2-aminobenzoic acid with a component such as 2-amino-8-naphthol-6-sulfonic acid, 2-amino-5-naphthol-7-sulfonic acid, 2-phenyl-amino-5-naphthol-7-sulfonic acid or 1- $\beta$ -naphthyl-3-methyl-5-pyrazolone-6'-sulfonic acid. The products give dyeings which are rendered fast to light and to washing by after-treatment with metal salts such as those of Cu, and the dyes contg. diazotizable amino groups may be further diazotized and coupled either in substance or on the fiber. Several examples are given of dyes giving different colors.

**Azo dyes.** SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 129,473 to 129,482, Dec. 24, 1926. Addns. to Swiss 127,260 (C. A. 23, 1281). New azo dyes are produced by coupling 3-methyl-5-pyrazolone with diazotized benzene derivs. Examples of the benzene derivs. mentioned are 2-nitro-1-aminobenzene, 4-aminoazobenzene,  $\text{PhNH}_2$  and  $\alpha$ -naphthylamine.

**Azo dyes.** SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 129,790 to 129,792, Oct. 7, 1924. Addns. to Swiss 113,867. New dyes are produced by coupling 1 mol. of 2,5-aminonaphthol-7-sulfonic acid and 1 mol. of cyanurictricarboxylic acid chloride with 1 mol. of diazobenzene. The dye colors wool a wash-fast orange. Or, 1 mol. of the diazotized condensation product of 1 mol. of 1,4-phenylenediamine-3-sulfonic acid and 1 mol. of cyanurictricarboxylic acid chloride is coupled with 1 mol. of 2,5-aminonaphthol-7-sulfonic acid. The product dyes wool red. If *m*-tolylenediamine is used instead of diazobenzene, an orange dye is obtained.

**Vat dye.** SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 128,370, Oct. 20, 1926. Addn. to Swiss 125,480. A new vat dye of the anthraquinone series is prepd. by sulfonating 6,6'-dimethylviolanthrone, melting the sulfonic acid so obtained with caustic alkali and treating the product with a methylating agent. The product colors cotton a grey-blue in a red-violet bath. The color is fast to Cl.

**Vat dyes.** SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 128,648 and 128,649, Apr. 1, 1927. Addns. to Swiss 128,007 (C. A. 23, 2042). New dyes of the pyranthrone series are prepd. by condensing trichloropyranthrone or dibromopyranthrone with guaiacol in presence of fixed alkali. The dyes color cotton in very fast red-brown tones.

**Vat dyes.** SOC. ANON POUR L'IND. CHIM. A BALE. Swiss 129,589, June 8, 1927. Derivs. of vat dyes are prepd. by treating leuco thioindigo with monohaloacetic acid. The new compds. are red-brown powders which are converted back to the thioindigo on oxidation.

**Vat dyes of the anthracene series.** GEORG KRÄNZLEIN and RALF EBERT (to I. G.

Farbenind. A.-G.). U. S. 1,709,985, April 23. Purified dyes giving purer tints of a more reddish hue than the parent material are obtained by treating with strong  $H_2SO_4$  (suitably with use also of  $H_3BO_3$ ) at 75–110° the vat dyes obtainable by oxidizing the condensation products produced by fusing an  $\alpha,\alpha$ -polyanthrimide with a condensing agent, pptg. the product from the  $H_2SO_4$  soln. and oxidizing (suitably with hypochlorite).

Vat dyes of the anthracene series. HEINZ SCHEYER (to Grasselli Dyestuff Corp.). U. S. 1,709,956, April 23. Glyoxaldianthraquinone compds. in which the anthraquinone nuclei may be substituted by univalent substituents such as halogen, alkyl or aryl groups (and which may be produced as described in U. S. 1,646,782 (C. A. 22, 323)) are treated with alk. condensing agents such as KOH and EtOH, to form dyes which are red to violet powders, difficultly sol. in org. solvents, dyeing cotton fast red to violet shades. Several examples are given.

Anthraquinone vat dyes. I. G. FARBENIND A.-G. Brit. 298,284, July 12, 1927. *N*-*Bz*-1-Benzanthronylpyrazol anthrones are obtained by the action of *Bz*-1-haloben-zantrones on pyrazoleanthrones, and by alkali fusion they yield vat dyes. Several examples are given.

Dyes of the indigo series. I. G. FARBENIND A.-G. Brit. 297,376, June 20, 1927. Dihaloalkylisatins, substituted in the benzene nucleus, or their reactive  $\alpha$ -derivs. are condensed with cyclic ketomethylene compds. such as naphthols, anthrols, oxythionaphthenes, oxynaphththiophenes, indoxyls and naphthindoxyls, or the reactive  $\alpha$ -derivs. are reduced to the corresponding indigo derivs. Several examples are given.

Dyes of the thiondigo series. ERWIN HOFFA and HANS HEYNA (to Grasselli Dyestuff Corp.). U. S. 1,709,982, April 23. Dyes are formed by condensing naphthalene-3,2-(3'-acetoxy-1'-thiophene) or other compds. of the general formula  $R.C(OCOR').CH_3$  (in which R stands for an aryl residue which may be substituted

and R' stands for H, an alkyl or aryl group) with 4-methyl 6-chloro 2-dichloro-3-ketodi-hydro-1-thionaphthene, 5,7-dichloroisatin or other suitable compds. contg. a 5-membered ring at least 4 atoms of which are C and the fifth either S, N or C and of similar character. Dyes are obtained which, according to several examples given, dye cotton various bluish and red shades.

Indigoid dyes. JOSEF HALLER (to Grasselli Dyestuff Corp.). U. S. 1,709,977, April 23. Compds. such as 9-chloro 1,2-naphthhisatin, 6,9-dichloro 1,2-naphthhisatin or 9-chloro-4-bromo-1,2-naphthhisatin by reaction with thionaphthene, oxindole, indoxyl, acenaphthenone,  $\alpha$ -anthrol,  $\alpha$ -naphthol,  $\alpha$ -hydroxyanthranol, carbazole or their substitution products, form dyes of which several examples are given which dye cotton violet, olive and blue shades.

Dyes of the triarylmethane series. I. G. FARBENIND A.-G. Brit. 298,101, June 29, 1927. A basic dye of the triarylmethane series such as fuchsin hydrochloride, *p*-triaminodiphenyl *m*-tolylecarbinol, methyl violet or benzal green is combined with 2,3-hydroxynaphthoic acid or its Na salt or other suitable hydroxynaphthoic acid compd. not contg. a sulfonic group. The products are insol. in water but are sol. in alc. and are suitable for use as printing colors.

Dihydro-*p*-thiazines of the anthraquinone series. GEORG KRÄNZLEIN and MARTIN CORELL (to Grasselli Dyestuff Corp.). U. S. 1,709,986, April 23. 2-( $\beta$ -Bromoethyl-mercapto)-1-aminoanthraquinone, m. 145–8°, is heated to the b. p. in  $C_6H_5Cl$  with addn. of a small quantity of Cu and, when the color of the soln. has changed from red to violet-red, the  $C_6H_5Cl$  is distd. off with steam and the residue is recrystd. from MeOH and  $CHCl_3$ . Anthraquinone-1,2-dihydro-*p*-thiazine is thus obtained, m. 168–70°. A similar product is obtained by heating the  $\beta$ -hydroxyethyl deriv. to 70–100° with oleum, pouring into water and washing. When the ring of 2-chloro 3-( $\beta$ -hydroxyethyl-mercapto)-1,4-diaminoanthraquinone is closed a blue dye is formed and a bordeaux-red dye is produced by ring closure of *o*-bis( $\beta$ -hydroxyethylmercapto)-1,5-diamino-anthraquinone. 2-( $\beta$ -Bromoethylmercapto)-1-amino-4-*p*-tolylaminoanthraquinone when heated with  $C_6H_5Cl$ , dehydrated NaOAc and Cu forms a base contg. the dihydro-*p*-thiazine ring. Dihydro-*p*-thiazine heated with  $H_2SO_4$  and oleum forms a dye producing reddish brown tints on wool. 2-( $\beta$ -Hydroxyethylmercapto)-1-amino-4-*p*-tolylaminoanthraquinone when sulfonated by heating with oleum forms a dye giving green tints on wool in an acid bath.

Aroyl aminodiphthaloylacridones. WALTER MIEG and ALBERT JOB (to Grasselli Dyestuff Corp.). U. S. 1,709,993, April 23. Monoamino-3,4,5,6-diphthaloylacridone obtainable by nitrating 3,4,5,6-diphthaloylacridone and reducing with aq. sodium hydrosulfite solns., is boiled with  $PhNO_2$  and  $BzCl$  until the formation of the violet *Bz* compd. is complete. The benzamido-3,4,5,6-diphthaloylacridone is isolated by

filtration after cooling. It dyes cotton from the hydrosulfite vat violet-grey shades of excellent fastness, especially to light. It has the probable formula I. The monoamino compd. of 1,2,5,6-diphthaloylacridone obtainable by nitrating 1,2,5,6-diphthaloylacridone and reducing the mononitro compd. with alk. hydrosulfite, is dissolved in  $\text{PhNO}_2$  and boiled. After the addition of  $\text{BzCl}$  a cryst. benzamido-1,2,5,6-diphthaloylacridone is obtained in hone shaped (prismatic) leaflets possessing a bronze luster, sol. in concd.  $\text{H}_2\text{SO}_4$  with an orange color, and dyeing cotton from a violet vat in strong olive-grey shades of excellent fastness. It dissolves in boiling  $\text{PhNO}_2$  with violet shades. It has the probable formula II.

In the same manner the amino compds. can also be acylated with other aroyl halides for instance *o*- or *p*-chlorobenzoyl chloride. From the monoamino compd. of 1,2,5,6-diphthaloylacridone and *o*-chlorobenzoyl chloride a vat dye is thus obtained which dyes cotton from violet vat in greenish shades very fast to chlorine and to light.

**Dinitrohaloaryl compounds.** ERICH FISCHER (to Grasselli Dyestuff Corp.). U. S. 1,709,256, April 16. Halodinitrobenzenesulfonic or carboxylic acids (e. g., 4-chloro-3,5-dinitro-1-benzoic acid) are converted into the corresponding acid chlorides and the latter are condensed with secondary aromatic amines such as monomethylaniline (which is either used in excess or together with some other acid-binding substance), to obtain products which may be used as *intermediates for making dyes* or other compds. The compd.  $(\text{NO}_2)_2\text{C}_6\text{H}_3\text{SO}_2\text{N}(\text{CH}_3)\text{C}_6\text{H}_5$  when recrystd. from toluene is colorless and m.  $161^\circ$  (uncorrected). The starting materials also may be condensed with  $\text{PCl}_5$  without intermediate formation of the acid chloride.

**Dinitroarylamino diarylamines.** HERMANN WAGNER (to Grasselli Dyestuff Corp.). U. S. 1,709,292, April 16. Dyes are obtained by condensing *p*-aminodiphenylamine or a homolog or substitution product with a dinitrohaloaryl compd. such as described in U. S. 1,709,256 (cf. preceding abstract). These dyes give yellow to reddish brown tints on animal fibers and generally yield fast dyeings also on cellulose esters and ethers. Several examples are given.

**Dye intermediates.** I. B. ANDERSON, R. F. THOMSON, J. THOMAS and SCOTTISH DYES, LTD. Brit. 297,366, March 18, 1927. Pyrazoleanthrones are made by condensation of  $\alpha$ -haloanthraquinones with hydrazine or its salts in the presence of an oxide, hydroxide or carbonate of an alkali or alk. earth metal or an alkali salt of a weak volatile org. acid such as  $\text{NaOAc}$ . Examples are given of the prepn. of pyrazoleanthrone and 2-methylpyrazoleanthrone from 1-chloroanthraquinone and 1-chloro-2-methylanthraquinone, resp. Anthraquinone- $\alpha$ -hydrazines are obtained as intermediate products in the process and may be isolated if a properly limited quantity of alk. earth oxide is used; and example is given of the prepn. of 1-hydrazinoanthraquinone.

**Metal compounds of dyes.** SOC. ANON. POUR L'IND. CHIM. A BAËLE. Brit. 297,687, Sept. 24, 1927. Azo dyes contg. metals (other than Cr) such as Cu or Co are obtained by treating azo dyes contg. one or more groups capable of combining with metal, with metal compds. formed by reaction between a caustic alkali, an org. OH-contg. compd. such as glycerol and a hydroxide of the metal such as Cu or Co. Several examples are given. Cf. C. A. 23, 2579.

**Metal compounds of azo dyes.** SOC. ANON POUR L'IND CHIM. A BÂLE. Brit. 297,478, Sept. 23, 1927. Azo dyes contg. metal such as Cr and which give fast dyeings on wool and silk and are suitable for coloring varnishes are obtained by treating with reducing agents, such as an alkali soln. of Na sulfide, the products of nitrosation of a dye such as is formed from 1,2-aminonaphthol-4-sulfonic acid and  $\alpha$ -naphthol. The Cr compd. thus obtained from these components, after treatment as specified followed by neutralizing and salting out, gives fast steel-blue dyeings on wool and silk.

**Chromium dye compound.** I. G. FARBENIND. A.-G. Brit. 297,722, June 25, 1927. The monoazo dye from diazotized 4-chloro-2-aminophenol-6-sulfonic acid and 2,4-dihydroxyquinoline is converted into a complex Cr compd. which dyes fast bordeaux shades. Cf. C. A. 23, 2042.

**Solubilizing organic compounds.** DANIEL GARDNER. Fr. 648,119, Feb. 3, 1928. See Brit. 291,827 (C. A. 23, 1276).

**Dyeing.** DANIEL GARDNER. Fr. 648,120, Feb. 3, 1928. See 291,828 (C. A. 23, 1286).

**Dyeing.** I. G. FARBENIND. A.-G. Brit. 297,959, Sept. 14, 1927. In printing with vat and sulfur dyes and others requiring alkali, such as indanthrene brilliant violet 2R paste or indanthrene blue GCD double paste, a vegetable mucilage is used which coagulates with alkali, but coagulation to fix the print is effected in a sep. operation after the printing. The mucilage may be prepd. from ground carob seeds or salep bulbs. Details of procedure are given.

**Dyeing.** I. G. FARBENIND. A.-G. Fr. 649,083, Feb. 15, 1928. Blue shades are produced by treating with Cu salts fiber dyed with trisazo dyes which contain in the 1st. position an aminosalicylic acid or aminocresotinic acid or one of their derivs. and in the last position 2-amino-5-naphthol-7-sulfonic acid or one of its derivs. Thus, cotton is dyed in a bath contg. salicylic acid-azo-1-naphthylamine-7-sulfonic acid-azo-1-naphthylamine-azo-2-amino-5-naphthol-7-sulfonic acid and  $\text{Na}_2\text{SO}_4$  and after rinsing is treated with  $\text{CuSO}_4$ , giving a clear fast blue shade.

**Dyeing and printing fabrics.** DURAND ET HUGUENIN SOC. ANON. Brit. 298,088, Oct. 1, 1927. In dyeing or printing with esters of leuco compds. as described in Brit. 220,964 (C. A. 19, 1058) or Brit. 281,336 (C. A. 22, 3536), glycol, ethylglycol or a similar compd. is added to the dye bath or printing color; more uniform and intense dyeings and printings are thus obtained. Examples are given.

**Dyeing with mixed compounds of azo dyes.** SOC. ANON POUR L'IND CHIM. A BÂLE. Brit. 298,091, Sept. 30, 1927. Mixed dyes contg. metal such as described in Brit. 297,331 (C. A. 23, 2579) are produced in the dyebath or on the fiber. Several examples are given.

**Dyeing cellulose esters and ethers.** BRITISH DYESTUFFS CORP. LTD., L. G. LAWRIE, F. W. LINCH and E. H. RODD. Brit. 297,897, July 5, 1927. Cellulose esters and ethers are dyed in green shades fast to alkalies by salts such as oxalates of unsulfonated triarylmethane derivs. such as the 2,4 dimethyl deriv. of malachite green obtained by oxidizing the product of condensation of 4,4'-tetramethyldiaminobenzohydrol with *m*-xylene or similar compds. the prepn. of which is described.

**Coloring cellulose esters and ethers.** W. WHITEHEAD and C. DRYFUS (to British Celanese, Ltd.) Brit. 297,848, Sept. 30, 1927. The materials are printed or stenciled by the application of coloring pastes or preps. contg. Cl substitution products or addn. products of aliphatic hydrocarbons such as dichloroethylene, trichloroethylene or ethylene dichloride, a thickening gummy or starchy substance and a suitable azo dye soln. Colophony and Ca resinate also may be used with xylene or alc. Several examples are given.

**Dyeing threads.** CHARLES D. SILAS. Fr. 649,071, Feb. 15, 1928. Construction of bobbins.

**Printing with vat dyes mixed with cellulose esters or ethers.** ERNST PFEFFER (to Grasselli Dyestuff Corp.). U. S. 1,710,007, April 23. Fabrics are printed with vat dyes mixed with cellulose derivs. such as methylcellulose and the material is subsequently treated with a reducing agent such as "Rongalite C" and an alkali such as  $\text{K}_2\text{CO}_3$  and finished by a usual method, *e. g.*, drying, steaming, washing and soaping.

**Printing or mordant dyes.** I. G. FARBENIND. A.-G. Fr. 648,005, Feb. 2, 1928. Printing or mordant dyes are obtained by coupling 2 mol. proportions of the same or different diazo compds. of the benzene series contg. the residue of an  $\alpha$ -hydroxyaryl-carboxylic acid with 1 mol. proportion of a 1,3-dihydroxy compd. of the benzene series. Thus, (1) 1 mol. of diazotized 4-amino-1-hydroxybenzene-2-carboxylic acid is coupled with 1 mol. of the monoazo dye from the same diazo compd. and resorcinol or 1,3-dihydroxybenzene-4(or 5)-carboxylic acid, (2) 4-amino-1-hydroxybenzene-2-carboxylic

acid  $\rightarrow$  3-amino-4-methoxy-1-methyl-benzene or 1-aminonaphthalene is diazotized and coupled with 4-amino-1-hydroxybenzene-2-carboxylic acid  $\rightarrow$  resorcinol, (3) 2 mols. of diazotized 4-amino-1-hydroxybenzene-2-carboxylic acid  $\rightarrow$  3-amino-4-methoxy-1-methylbenzene is coupled with 1 mol. of resorcinol.

**Mordants.** I. G. FARBENIND. A.-G. and A. THAUSS. Brit. 298,280, July 11, 1927. PhOH or one of its homologs or substitution products (other than phenols contg. N) is heated with S and a small quantity of a salt, neutral in aq. soln. to phenolphthalein paper, of an org. carboxylic or weak inorg. acid such as Na formate, nitrate, hydrosulfite or sulfite, to obtain a nearly colorless or colorless product of good affinity for cotton and suitable for use as a mordant for basic dyes.

**Colloidal mordant bath.** LYTLE R. PARKS. U. S. 1,710,000, April 23. A mordant bath is formed comprising a colloidal soln. of a metal salt such as Al acetate and a fixing agent such as Na oleate.

**Forming azo dyes on "acetate silk."** I. G. FARBENIND A.-G. Brit. 297,374, June 20, 1927. The fabric is printed with a paste contg. a soln. of the amine and coupling component in an org. solvent (e. g., 2-naphthylamine and resorcinol in thiodiglycol, 1-methoxy-2-chloro-4-aminobenzene and 2,3-hydroxynaphthoic acid in cyclohexyldiethanolamine or dianisidine and 2,3-hydroxynaphthoic acid in cyclohexyldiethanolamine) and the print is developed in an acid bath contg. a nitrite.

**Dyeing apparatus.** MME. ESTERLÉ NEE MARIE L. MOTHU. Fr. 649,225, Feb. 17, 1928. An envelope of light metal of spiral form contains the dye bath, and a double-acting pump gives a gyratory movement to the bath in the envelope.

**Apparatus for dyeing yarn on the cone.** HERBERT T. BALLARD. U. S. 1,710,443, April 23.

**Apparatus for dyeing hanks or yarn, artificial silk, etc.** W. TREYOW. Brit. 297,774, Sept. 27, 1927.

**Hank dyeing apparatus.** K S MILLS. Brit. 297,755, March 22, 1927. Structural features.

**Dyeing vat and paddle wheel.** HARRY E. BREWIN and ALEXANDER C. MACKAY (to Smith, Drum & Co.). U. S. 1,710,607, April 23.

**Solutions for use in dyeing.** ALFRED GUENTHER, ALFRED THAUSS and GUSTAV MAUTHKE (to Grasselli Dyestuff Corp.). U. S. 1,709,976, April 23. A sulfonated fatty acid derived from wool fat is used in prep. stabilized solns. of  $\beta$ -hydroxynaphthoic arylides such as  $\beta$ -hydroxynaphthoic acid  $\beta$ -naphthalide.

**Stripping dyes from fibers.** EDWARD L. HELWIG (to Rohm & Haas Co.). U. S. 1,710,310, April 23. Wool shoddy or other fibrous material from which dyes are to be stripped is treated in a bath comprising Zn hydrosulfite and the hydrosulfite of Na or other alkali forming metal in equil. with a sol. Zn salt such as  $\text{ZnSO}_4$  and  $\text{Na}_2\text{SO}_4$  or other salt of the alkali forming metal. Cf. C. A. 23, 993.

**Preparing fibers for dyeing.** CHEMISCHE FABRIK VORM. SANDOZ. Fr. 648,026, Jan. 31, 1928. Fibers having a basis of cotton or artificial silk are prepd. for direct dyeing with acid dyes by acting on the fibers with aliphatic or aromatic sulfonylhalides (e. g., sulfonylchlorides or sulfonylbromides of toluene,  $\text{C}_6\text{H}_5$ ,  $\text{C}_{10}\text{H}_7$  or benzyl) and tertiary bases (e. g., pyridine and its homologs, quinoline, triethylamine, etc.). Thus, non-mercerized cotton is heated for 1 hr. to 110° in a closed vessel with benzenesulfonylchloride and pyridine, the resulting material being dyed fast shades with acid dyes; mercerized cotton is heated in the same way with toluenesulfonylchloride and pyridine in  $\text{PhNO}_2$ ; viscose silk is heated with toluenesulfonylchloride and pyridine and afterward dyed with lanafuchsine, acid violet, patent blue or naphthalene green.

**Dye resist for wool and silk.** I. G. FARBENIND. A.-G. (Alfred Thauss and Alfred Guenther, inventors) Ger. 469,232, June 20, 1923. Addn. to Ger. 432,111. The absorptiveness of wool or silk for acid and neutral dye baths is decreased by the employment of sulfonated rosin instead of sulfurized phenol. Thus, the wool of a wool-artificial silk fabric is treated with the dye obtained from benzaldehyde and ethylbenzyl-m-toluidinesulfonic acid, and the silk with the azo dye obtained from benzidine-2-naphthylamine-5,7-disulfonic acid and 2-amino-5-naphthol-7-sulfonic acid, with addn. of colophonylsulfonic acid. The two-color effect is heightened by the addn. of the latter acid. (Other examples are given.)

**Textiles.** CHEMISCHE FABRIK VORM. SANDOZ. Swiss 128,440, June 1, 1927. A moistening and permeating agent for use in mfg. textile and similar goods is prepd. by mixing a phenol such as cresol, with a hydrogenated phenol, such as methylcyclohexanol.

**Stretching textile threads.** OTTO SINDL. Fr. 648,127, Feb. 3, 1928. A frame is described for stretching skeins of threads, particularly artificial silk.

**Wetting agents for use with textile materials.** H. T. BÖHME A.-G. Brit. 297,382, Sept. 20, 1927. The wetting power of liquids such as those used for mercerizing or washing is increased by the addn. of a mixt. of phenols and sulfonated oils, such as a mixt. of tricresol with a product prepd. by sulfonating oleic acid with  $H_2SO_4$  in the presence of  $Ac_2O$ . Brit. 297,383, specifies generally similar compns. contg. an org. sulfonic acid, e. g., a mixt. comprising sulfonated ricinoleic acid, dipropynaphthalene-sulfonic acid and tricresol. Cf. C. A. 23, 1228.

**Finishing pile fabrics.** W. WIEGHORST. Brit. 297,727, Sept. 26, 1927. The pile of a fabric is colored differently from the base and pressed down in certain parts according to a desired design, and the upright pile is sheared off to expose the base coloring, and the pressed-down pile is then raised.

**Ornamenting pile fabrics.** H. LIVSEY, G. E. HOLDEN and J. and J. M. WORRALL, LTD. Brit. 297,607, Dec. 17, 1927. Pattern effects or other ornamentation of pile fabrics are produced by applying to the fabric a soln. such as viscose or a cuprammonium cellulose soln. and then regenerating the cellulose (suitably by use of dil. acid) upon and within the pile. The fabric may be heated or steamed before regeneration of the cellulose.

**Charging silk.** RÉNÉ CLAVEL. Fr. 648,508, Feb. 7, 1928. Natural or artificial silk is charged with metallic compds. such as  $SnCl_4$  by applying a paste of the compd. with thickeners such as gum arabic, dextrin, starch, flour or sugar on one or both faces of the cloth to cover it wholly or in a design. Substances such as phosphates or phosphoric acid for the transformation of the metallic compd. may be added to the paste as well as substances such as silicates. Fr. 648,509 describes the production of a mat surface simultaneously with charging of the silk by introducing it into solns. of metallic compds. such as  $SnCl_4$  or  $(AcO)_2Pb$ , and then into solns. of alk. earth phosphates. The silk may be first treated with acids or acid salts in the presence of protective colloids.

**Degumming materials comprising natural silk.** GEORGE H. ELLIS (to Celanese Corp. of America). U. S. 1,709,662, April 16. The goods are subjected to the action of a strong aq. soln. of the Na salt of sulfuricinoleic acid or other suitable sulfo-fatty acid salt of a univalent inorg. base and then scoured with a soap soln.

**Treating flax fibers to simulate silk.** VICKERS, LTD., and O. D. LUCAS. Brit. 298,178, July 5, 1927. The scutched fiber, which may be previously retted, is treated with a cellulose solvent (such as a cuprammonium soln.) of such strength as to exert a selective dissolving and hydrolyzing action without actually dissolving or gelatinizing the fiber. The material may be preliminarily boiled in a dil. NaOH soln. to which sulfonated castor oil or a similarly acting substance may be added. Cf. C. A. 23, 1514.

**Artificial silk.** SOC VALENCIN, CHARPY ET BESACIER. Fr. 648,973, June 29, 1927. Artificial silk is made capable of standing twisting with strong torsion to produce crêpe threads by immersing the skeins in a bath of "mousse perlée," sulfuricinate, dyers green soap (from pure olive pulp) and olive oil.

**Cellulose acetate artificial silk.** ARCHIBALD J. HALL (to Celanese Corp. of America). U. S. 1,709,470, April 16. The artificial silk is stretched in the set condition beyond the elastic limit to render it more resistant to deterioration by hot aq. liquids.

**Apparatus for pasting or sizing treatments of artificial silk.** SONDERMANN & Co. Brit. 297,778, Sept. 27, 1927.

**Ribbons formed of cellulose derivatives.** C. DREYFUS (to British Celanese, Ltd.). Brit. 297,712, July 15, 1927. A fabric of material such as cellulose acetate, formate, propionate or butyrate or methyl or ethyl cellulose is severed into strips to form ribbons and the edges of the latter are sealed to prevent fraying or ravelling by treating them with a solvent or softening agent and then permitting the edges to solidify.

**Fabric with an edging of soluble threads.** WILHELM SPONHOLZ. U. S. 1,709,887, April 23. A fabric is formed with a body of threads such as cotton insol. in org. solvents and with an edging of threads such as artificial silk sol. in org. solvents and which are caused to adhere to each other and to the body fabric by treatment with acetone or other solvent.

**Sealing the edges of cellulose derivative fabrics to prevent fraying.** C. DREYFUS (to British Celanese, Ltd.). Brit. 298,207, Oct. 5, 1927. The edges are subjected to a fusing, dissolving or softening treatment and then permitted to solidify.

**Apparatus for washing silk in scouring solutions.** CHARLES G. SARGENT (to C. G. Sargent's Sons Corp.). U. S. 1,709,158, April 16. Structural features.

**Apparatus for washing, desulfurizing and bleaching artificial silk.** GIUSEPPE DONAGEMMA. Fr. 648,622, Feb. 10, 1928.

**Apparatus for washing threads wound on bobbins.** RUDOLF HAAS. U. S. 1,709,215, April 16. Structural features.

**Gas-tight fabric.** HANS STROBL (to Luftschiffbau Zeppelin G. m. b. H.). U. S. 1,709,499, April 16. A substance such as glue is applied to animal skin and the latter is then united with a layer of fabric such as linen, cotton or silk and a substance such as glycerol is applied to render the glue elastic. The product is suitable for balloons or other aircraft. Cf. *C. A.* 23, 1860.

**Carrotting animal hair and wool.** ERICH BÖHM. U. S. 1,710,565, April 23. See Brit. 285,028 (*C. A.* 22, 4836).

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

**Paint testing.** HANS WOLFF, W. TOELDTE AND G. ZEIDLER. *Farben-Ztg.* 34, 1179-81 (1929).—In the testing of paints, precision of measurements is often so stressed that the use of the proper method is often overlooked. Since the majority of tests are not very critical, the results are better expressed in steps than continuously. *E. g.*, the authors use a sand resistance test in which 16 l. of sand are dropped through a funnel from a height of 1.30 m. onto the film. The results are expressed as one of 5 steps; (1) film made mat only; (2) film cut through to surfaces with less than 16 l.; (3) film cut through to primer with less than 16 l.; (4) film cut through to panel with 16 l.; (5) film cut through to panel with less than 16 l. A rust-evaluating test is carried out by detg. the elec. cond. of a film 0.3 mm. thick. One pole of the battery is connected to the panel, the other pole through the ammeter to Hg in contact with the film. The Hg 20 sq. cm. cross section is contained in a rubber ring. The results are expressed in 5 steps; 1 to 5 millamp., 5 to 15 millamp.; 15 to 25 millamp.; 25 to 50 millamp.; over 50 millamp. G. G. SWARD

**Natural and artificial (weathering) experiments in testing the durability of paints.** A. HIRNER. *Farben-Ztg.* 34, 1222-6 (1929). Natural weathering tests are subject to the accidental variations of climate and weather. Artificial tests, on the other hand, are capable of exact control and may be varied to correspond to the climate in which the product being tested is to be used. G. G. SWARD

**Determination of chromate in paints.** EDWARD J. DAVIS. *Chem. News* 138, 214 (1929).—The following method is valuable for chromate in the presence of sublimed lead and Prussian Blue. After sepn. from the vehicle, a 1-g. sample is extd. by boiling for 5 mins. with 6 g. of KOH in 50 cc. H<sub>2</sub>O, dild. to 300 cc., filtered and washed with hot H<sub>2</sub>O. The filtrate is dild. to 400 cc., heated to 60°; HOAc is added to 15 cc. in excess of neutrality. PbO<sub>2</sub> remains in soln. while PbCrO<sub>4</sub> is pptd.; after 30 mins. it is filtered off through a Gooch crucible, washed, dried and weighed. When ZnCrO<sub>4</sub> is originally present, 2 g. of PbCl<sub>2</sub> is added before the HOAc. The method is accurate to  $\pm 0.1\%$ . A. S. CARTER

**Addition of lead oxide to paints.** W. VAUBEL. *Farben-Ztg.* 34, 563 (1929).—Free glycerol in white lead paints tends to induce rusting. This condition may be prevented by the addn. of litharge or red lead, which combines with the glycerol. White lead, lead carbonate, lead sulfate and basic lead chloride do not react in this way. G. G. S.

**The red lead question.** HANS WOLFF AND GERHARD ZEIDLER. *Farben-Ztg.* 34, 1309-10 (1929).—Polemical with Junk (cf. *C. A.* 23, 1291). Particle-size detns. should be made in the vehicle in which the pigment is to be used. *E. g.*, the polar liquid linseed oil disperses red lead to a greater extent than does the non polar liquid paraffin oil. Photomicrographs illustrating this point are shown. G. G. SWARD

**Examination of red lead.** W. LÖTV. *Farben-Ztg.* 34, 1310-3 (1929).—Polemical with Junk (cf. *C. A.* 23, 1291, also preceding abst.). G. G. SWARD

**The lithopone industry.** WALTER BARNARD. *Chemistry and Industry* 48, 335-8 (1929).—A general statement concerning the compn., prepn., mfg. processes and uses of lithopone. Among more modern forms of this pigment are "zinc anhydride" or "zinc barytes," made by heating equiv. quantities of chalk, or witherite (BaCO<sub>3</sub>), and finely divided ZnSO<sub>4</sub> in a specially designed furnace; "sulphophone," in which CaS instead of BaS is used as a precipitant for ZnSO<sub>4</sub>; and "cadmium lithopone," in which Cd replaces more or less of the Zn, with corresponding alterations in color from white to yellow. W. C. EBAUGH

**The fading of aniline dyes in the presence of titanium white.** EBERHARD KEIDEL. *Farben-Ztg.* 34, 1242-3 (1929).—Paints were prepd. with TiO<sub>2</sub>, ZnO, lithopone and white lead tinted with Permanent Red R extra and other azo dyes which contained no sulfo groups and also with some basic dyestuffs, *e. g.*, Madder lake K, etc. The vehicles

were a 12% dextrin soln. with and without 5% glycerol, casein soln. and oil. Films of these paints were exposed to the sun and to ultra-violet light. The  $\text{TiO}_2$  paints faded more rapidly than the others. G. G. SWARD

**Titanium white catalysis.** HANS WAGNER. *Farben-Ztg.* 34, 1243-5(1929); cf. preceding abstr.—Expts. similar to those of Keidel were carried out using Milori blue and Helio fast red RL. The results were similar. W. ascribes the fading of dyes in the presence of  $\text{TiO}_2$  to the residual  $\text{H}_2\text{SO}_4$  in  $\text{TiO}_2$ . In some cases the bleaching may be due to the formation of Ti sulfate, in others to  $\text{TiO}_3$ . Addn. of ZnO in proper amts. produces a "neutral pigment," which does not bleach the dyes. G. G. SWARD

**Systematic (classification) of adhesives and paint vehicles.** ERNST STERN. *Farben-Ztg.* 34, 1312-3(1929).—S. considers that the classification proposed by Wagner and Kesseling (cf. C. A. 23, 2307) is too complex and submits the following: (1) aq. reversible, (2) aq. non-reversible, (3) non-aq. reversible, and (4) non-aq. non-reversible. Reply. HANS WAGNER. *Ibid.*—W. claims that the 4 simple classes of Stern do not cover technical conditions and offers a scheme for aq. systems. These may be divided into 2 classes, (1) mobile, and (2) immobile. (1) does not require an increase in pressure or temp. to effect a change of form. (2) may or may not undergo a change of form when the temp. or pressure is increased. After a change has taken place and the stress has been removed (2) may or may not recover. G. G. SWARD

**Systematic formulation of nitrocellulose lacquers.** S. DE LANGE. *Farben-Ztg.* 34, 1245-6(1929).—L. shows how the graphs of Hoffmann and Reid (cf. C. A. 22, 2849) may be extended to a third dimension, thus increasing their usefulness. G. G. S.

Application of nitrocellulose in the varnished leather industry (ALVAREZ) 29. The influence of light in fading tests (with pigments) (MERZ) 25. Additive and subtractive color mixing and decolorization (SCHONBORN) 2. Untreated fabrics for electrical purposes (DUNTON, MUIR) 13. Insulating materials (from synthetic resins) (Ger. pat. 473,111) 13.

CURTIS, C. A.: *Künstliche organische Pigmentfarben und ihre Anwendungsgebiete.* Berlin: J. Springer. 230 pp. Paper, M. 22.50; bound, M. 24. Reviewed in *Chimie & industrie* 21, 675; *Tiba* 7, 341(1929).

WOLFF, H.: *Monographien aus dem Gebiete der Fett-Chemie. Bd. X. Die natürlichen Harz.* STUTTGART. Wissenschaftliche Verlagsgesellschaft m. b. H. 379 pp.

**Paint.** ANDRÉ P. GESNEL. Fr. 648,615, Feb. 10, 1928. The solid constituent of paint consists of an Fe alloy, particularly Fe-Si, which is not attacked by air or chemicals.

**Paint.** ALBERT MORÉROD-TRIPION. Swiss 128,475, Oct. 5, 1927. A thick lead-less paint is composed of drying oil, resin and zinc white. It may also contain alc.

**Bituminous paint.** S. FOWLER and E. EDSER. Brit. 298,256, June 8, 1927. A bitumen and a neutral soap-free wool fat are dissolved in a volatile solvent such as "white spirit" with or without pigments such as red Fe oxide. Wool fat purified as described in Brit. 253,995 (C. A. 21, 2569) is especially suitable for this purpose and is preferably used in the proportion of about 10% the wt. of the bitumen.

**Heat-resisting paint.** J. C. CARROLL. Brit. 297,342, June 18, 1927. See Fr. 645,440 (C. A. 23, 2049).

**Lithopone.** WILLIAM J. O'BRIEN. U. S. 1,700,999, April 23. A soln. contg. Ti sulfate and free  $\text{H}_2\text{SO}_4$  is neutralized by ZnO in excess of the quantity required to neutralize the free  $\text{H}_2\text{SO}_4$ ; the resulting product is combined with Ba sulfide, heated and treated to obtain a lithopone contg. Ti oxide.

**Oxidizing drying oils.** I. G. FARBENIND. A.-G. Ger. 473,115, Oct. 26, 1926. Addn. to 472,111. The method of Ger. 472,111 (C. A. 23, 2584) is modified by atomizing or spraying the suspended or emulsified oil into air or O-contg. gases.

**Coating compositions.** D. CARNEGIE (to Atlas Powder Co.). Brit. 297,681, Sept. 23, 1927. Drying or semi-drying oils, such as linseed, soy-bean, china wood, perilla, or menhaden oils, are rendered miscible in all proportions with nitrocellulose solns., by a treatment which suitably modifies the oil, such as by treatment with air or other O-contg. gas at a temp. not above  $250^\circ$  so that the oil is oxidized but not polymerized. The viscosity of the modified oil should be between 20 and 80 secs. when a steel ball of 0.25-in. diam. is permitted to fall 12 in. through the oil.

**Varnish.** ELEKTRIZITÄTSWERK LONZA. Swiss 128,476, May 25, 1927. A varnish contg. nitrocellulose is rendered light-resisting by addn. of a substance such as diphenylamine, which is stable against the influence of light.

**Varnish.** ELEKTRIZITÄTWERK LONZA. Swiss 129,307, Feb. 12, 1927. A glossy-drying prepn. is obtained by mixing nitrocellulose varnish with the wood-oil varnish resulting from the melting of wood oil with resin.

**Production of colors and varnishes.** DE KEYN FRÈRES. Belg. 353,329, Sept. 30, 1928. The varnish consists of a mixt. of gums, resins and similar substances, palm oil and spirits of turpentine or similar products.

**Coloring lacs and varnishes.** SOC. ANON POUR L'IND. CHIM. A BALE. Fr. 648,087, Feb. 2, 1928. Lacs and varnishes are dyed with dyes having the formula  $R^1-N=R^2-R^3-R^4$ , in which  $R^1$  is an aromatic ring,  $R^2$  an aromatic ring capable of coupling in the position 4 to the  $R^1-N-R^4$  group, and  $R^3, R^4$  are H, alkyl, aralkyl, or aryl groups. Examples are given of dyeing cellulose acetate varnish red with *p*-nitraniline  $\rightarrow$  cresidine, and 4-nitro-4'-aminoazobenzene. Yellow colors are obtained with 2,5-dichloro-4'-aminoazobenzene or 2,5-dichloro-4'-amino-3-methylazobenzene, orange with 3-nitro-4'-aminoazobenzene, clear red with 4-nitro-4'-amino-2'-acetylaminazobenzene, and violet red with 4-nitro-2-alkyloxy-4'-dialkylaminazobenzenes.

**Lacquers.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 649,384, Dec. 28, 1927. Metal surfaces which are to be lacquered with cellulose lacquers are given a primary coating of a polyhydric alc.-polybasic acid resin such as a glycerol-phthalic acid resin. Suitable resins are described in Fr. 604,198 and its addn. 31,805 and they may be applied in soln., which should contain little or no pigment or filler. Plasticizers such as indene and its polymers, glycoldiacetate, diethyl phthalate, tricresylphosphate, triacetin, or anisol may be added to the resin during manuf.

**Lacquering.** ELEKTRIZITÄTWERK LONZA. Brit. 297,711, Sept. 25, 1927. A nitrocellulose lacquer or similar compn. is applied in the form of drops to form surfaces somewhat resembling leather, linoleum, or granite in appearance. It is stated that the lacquer is preferably applied under reduced pressure "so that the sprayers act as roses and not as atomizers."

**Drying lacquered articles.** HUNDT & WEBER GES. Brit. 297,411, Sept. 21, 1927. Air is circulated through a drying chamber and through a separator where solvent is sep'd. by centrifugal action. Various structural details are described.

**Synthetic resin lacquers for coating cans.** H. H. HOPKINS (to E. I. Du Pont de Nemours & Co.). Brit. 297,418, Sept. 21, 1927. Cans, such as those formed of sheet iron, or the sheets of metal from which the cans are made, are coated with lacquers of which various formulas are specified, e. g., a lacquer comprising the reaction products from heating together glycerol, phthalic anhydride and acids obtained by the hydrolysis of linseed oil in  $CO_2$  at  $220^\circ$ , or other similar reaction products.

**Coating composition comprising nitrocellulose.** MAURICE V. HITT (to E. I. Du Pont de Nemours & Co.) U. S. 1,710,453, April 23. A low-viscosity nitrocellulose (for which tests are given) is used with about 15-45% its quantity of a solvent softener such as di-Bu phthalate and with less than half its quantity of a resin or varnish gum.

**Refining rosin.** A. LANGMEIER (to Hercules Powder Co.) Brit. 298,214, Oct. 6, 1927. Refining is effected by melting the rosin at a temp. sufficient to vaporize components of low volatility and by causing the melted rosin to flow in contact with a heating surface so that the rosin is finally vaporized and condensed to obtain high-grade rosin and rosin oil. An app. and various details of procedure are described. Cf. C. A. 23, 970.

**Cellulose ester compositions.** E. C. DESTUBNER. Brit. 297,679, Sept. 24, 1927. Resins or gums such as Congo copal or other fossil or semi fossil resins are rendered compatible with cellulose esters, such as nitrocellulose or cellulose acetate, in compns. such as lacquers, by subjection to a treatment similar to that applied to other constituents of the compn., such as nitration, acetylation, or phosphatization.

**Condensation products of phenols and aldehydes.** LEONHARD DEUTSCH and ISAK THORN (to Selden Co.). U. S. 1,710,019, April 23.  $PhOH$  and  $CH_2O$  or other phenols and aldehydes capable of forming resins, which can be hardened by heat, are subjected to condensation in the presence of a non-volatile alkali such as  $Na_2CO_3$ , free water is volatilized and there is subsequently added to the product a compd. such as Na benzoate or salicylate or benzoic acid or other suitable compd. contg. the carboxylic radical; the product is hardened by heat. Cf. C. A. 22, 3498.

**Artificial resins.** I. G. FÄRRENIND. A-G. Brit. 298,085, Sept. 20, 1927. Phenol-formaldehyde condensation products contg. carboxylic groups are produced by the reaction of a phenol- $CH_2O$  resin with a halogen aliphatic acid or its salt such as chloroacetic acid or by the reaction of a phenoxyaliphatic acid such as cresoxyacetic acid with  $CH_2O$  or a substance yielding  $CH_2O$ . Hardened masses are produced by heating an  $HH_2$  or amine salt of the resin acid with or without a polyhydric alc. or by heating

the resin with a polyhydric acid to above 100°. The compns. may be used with various fillers, for forming laminated products of impregnated paper, for lacquers, etc. Various details and modifications are given.

**Synthetic resins.** MEILACH MELAMID (to Canadian Electro Products Co., Ltd.). U. S. 1,710,266, April 23. Reaction, in the presence of an acid such as  $H_2SO_4$  and of Hg and Fe salts or other suitable catalyst, is effected between  $C_2H_2$  and aromatic coal-tar components such as cresol, or sulfonated derivs. from naphthalene.

**Synthetic resin complex.** ISRAEL ROSENBLUM (to Varnol Chemical Corp.). U. S. 1,709,490, April 16. A phenol-aldehyde condensation product is reacted upon with a partially esterified polyhydric alc. such as mixed glyceridic abietates to produce a product which is suitable for making varnishes.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**The composition of spinach fat.** JOHN H. SPEER, EDWIN C. WISE AND MERRILL C. HART. The Upjohn Co., Kalamazoo. *J. Biol. Chem.* **82**, 105-10(1929).—Sixty-eight kg. of spinach yielded 550 g. of fatty acids, of which 47% were glycerides and 53% were free. Of these, 26.5 g. of solid acid was isolated, which consisted chiefly of palmitic and stearic acids, with 3% of cerotic acid. One hundred forty-five g. of liquid acids were recovered, which contained 12.7% linolenic acid, 34.7% linoleic acid and 26.3% oleic acid.

ARTHUR GROLLMAN

**The unsaponifiable fraction from spinach fat.** FREDERICK W. HEVL, EDWIN C. WISE AND JOHN H. SPEER. The Upjohn Co., Kalamazoo. *J. Biol. Chem.* **82**, 111-6(1929).—From the unsaponifiable fraction of spinach fat were isolated a hydrocarbon,  $C_{20}H_{42}$  (possibly *petroselinene* or *laurane*); a phytosterol,  $C_{27}H_{46}O$ , m. 165-167°; 2 alcs.,  $C_{22}H_{40}O$  and  $C_{24}H_{40}O_2$ ; and an unsatd., oily compd. whose formula was  $C_{27}H_{44}O$ .

ARTHUR GROLLMAN

**The hydrogenation of oils.** H. I. WATERMAN AND S. H. BERTRAM. *J. Soc. Chem. Ind.* **48**, 79-80T(1929). The detn. of the thiocyanogeniodine value combined with the I no. offers the possibility of obtaining an insight into the linoleic acid and linoleic glyceride content of fats which are free from linolenic acid. Soy-bean oil was hydrogenated by a method resembling that of Willbushewitsch. The lowering of the I no. is accompanied by a lowering of the thiocyanogen I value. The total decrease of the I no. is 71.8; that of the thiocyanogen I no. is 26.5 or 35%. The decrease of the diff. between the I no. and the thiocyanogen I no. is 45.3 or almost 80% calcd. on the initial diff. This diff. from Kaufmann's results may be due to the diff. method of hydrogenation or to the oil used. However, in accordance with Kaufmann, it is noted that the hydrogenation of those unsatd. compds. which are not satd. by thiocyanogen, but are satd. by ICl, dominates. The hydrogenated products contain much less linoleic acid than the original soy-bean oil.

E. SCHERUBEL

**Determination of organic sulfur in sulfonated oils.** K. H. BAUER. *Chem. Umschau Fette, Oele, Wachse Harze* **35**, 280 1(1928); cf. *C. A.* **22**, 2074; **23**, 2052.—B. shows that Herbig's proposal (*C. A.* **23**, 1519) to multiply by 2 the results in the org.  $SO_2$  detn. of sulfonated oils, since  $ISO_2 = 2KOH$ , is incorrect, because the detn. refers to the group  $HSO_4$  instead of  $SO_2$  and  $1HSO_4 = 1KOH$ . Expts. by boiling  $N H_2SO_4$  and  $N HCl$  for 1 hr. in various types of glass vessels and by adding broken glass to the acid solns. showed a varying loss in the strength of the acid, reaching up to 0.75 cc. per 50 cc.

P. ESCHER

**The determination of organic  $SO_2$  in sulfonated oils.** C. RIESS. *Colloquium* **1929**, 657-61.—The volumetric method (Herbig, *C. A.* **23**, 1519) with either  $H_2SO_4$  or  $HCl$  gives as good results with normal sulfonated oils as the gravimetric method. I. D. C.

**Fruits and seeds of *Aleurites fordii* from Kenya Colony.** ANON. *Bull. Imp. Inst.* **27**, 10-2(1929).—Seeds of *A. fordii* trees grown in Kenya Colony from seed from Hankow were composed of 37.9% shell and 62.1% kernel. The kernels contained 4.9%  $H_2O$  and on extn. with petr. ether gave 60.4% (63.5% on dry basis) of oil having the following const., as compared with those of the original Hankow seeds from which the Kenya Colony trees were grown, and with a sample of oil received from China: d<sub>4</sub><sup>20</sup> 0.9433, 0.9405, 0.9414; acid value 0.52, 0.63, 0.43; sapon value 192.7, 193.5, 195.3; I value (Hübl, 17 hrs.) 172.8, 174.8, 172.0%; unsapon. matter 0.4, 0.3, 0.4%;  $n_{20}^D$  1.512, 1.513, 1.513.

A. PAPINEAU-COUTURE

**Fruits and seeds of *Hydnocarpus woodii* from North Borneo.** ANON. *Bull.*

*Imp. Inst.* 27, 12-6(1929).—Kernels of two batches of seed of *H. woodii* from North Borneo contained 7.8 and 8.1% H<sub>2</sub>O after air-drying, and on extg. with petr. ether yielded 62.3 and 60.3% of a hard, cream-colored, solid oil. The constns. of the oil obtained from the first batch of seeds were  $d_{15}^{100}$  0.8989, acid value 32.8, sapon. value 202.4, I value (Hübl, 17 hrs.) 85.8, unsapon. matter 0.5%,  $n_D^{20}$  1.471, m. p. 28.5°,  $\alpha_D^{20}$  (in CHCl<sub>3</sub>) +53.1°, solidifying pt. of fatty acids 44.6°,  $\alpha_D^{20}$  of fatty acids +54.4°. Both hydro-carpic and chaulmoogric acids were identified.

A. PAPINEAU-COUTURE

The determination of the iodine value. R. DELABY AND R. CHARONNAT. *Bull. sci. pharmacol.* 35, 692-8(1928).—The results obtained by the method of Hanus with a soln. of BrI in AcOH are lower than the values obtained by the Hübl method. If the AcOH is not anhyd., the strength of the soln. decreases on standing, and the I is not in excess sufficient to sat. the second double linkages, within the conditions of the test. Therefore, the same soln. gives lower values with the same oil some weeks later. The method of Wijs with CHI is more reliable.

A. E. MEYER

The practical application of the salt-rubin method. A. BEYRODT. *Prague. Seifenforsch.* 1, 38-42(1928).—Results on protective colloids in soaps, obtained with Ostwald's salt rubin method (*C. A.* 13, 2625; 14, 1774), show that this method is well adapted for testing soaps.

P. ESCHER

Biochemical method for preparing fats (KULIKOV) 11C. The so-called arachic acid and other acids of high molecular weight from peanut oil (HOLDE, *et al.*) 10. The influence of temperature on the precipitation of NiCO<sub>3</sub> (SERGEYEV) 18. A specific color reaction for ergosterol and its transformation products (HÄUSSLER, BRAUCHLI) 11B. Emulsifying agents (Fr. pat. 648,138) 22. Motor fuel; emulsifying agents (Fr. pat. 618,142) 22. Apparatus for gravity separation of oil and water (Brit. pat. 297,936) 1. Apparatus for separating liquids such as oil and water by gravity (Brit. pat. 297,551) 1. Filter for oils (U. S. pat. 1,709,237) 1. Filter for oil (Brit. pat. 298,197) 1. Tank and baffle apparatus for separating oil and gas (U. S. pat. 1,710,178) 1. Apparatus for gravity separation of oil and water (U. S. pat. 1,709,971) 1. Oil cooler (Swiss pat. 129,687) 1.

MORPURGO, G. Corso di lezioni sui gliceridi; i grassi vegetali ed i grassi animali; loro origine ed impiego nell'economia. PADUA: Ed. Milani. 188 pp. L. 30. Reviewed in *Giorn. chim. ind. applicata* 10, 489(1928).

Apparatus for rendering fats by treatment with steam. M. GEARIN & SONS, LTD., and J. R. CULLEN. Brit. 297,728, Sept. 26, 1927. Various details of construction and use of a steam-jacketed and direct steam digestion app. are described.

Device for drawing off thick or thin oils and liquid fats in measured quantities from a reservoir. PETER HUBER. Swiss 129,779, Sept. 29, 1927. Addn. to Swiss 126,559. Details of arrangement

Mixtures of oils. MICHAEL MELAMID. Fr. 648,143, Feb. 3, 1928. Mixts. of mineral oils with fatty oils sol. in alc., such as castor oil, are obtained by heating them with catalysts such as Ni, Sn, Bi, or alloys of these metals. The fatty oil may be heated with the catalyst and then mixed with the oil.

Apparatus for extracting oil from seeds, etc., by use of solvents. F. KRUPP GRÜSONWERK A. G. Brit. 297,816, Sept. 30, 1927. Horizontal extractors are used in an app. generally similar to that described in Brit. 272,118 (*C. A.* 22, 1502).

Extracting oil from grain. SYNDICAT D'ÉTUDES DES MATIÈRES ORGANIQUES. Fr. 638,909, Dec. 29, 1926. The oil is extd. from grain by hydrogenated hydrocarbons, such as cyclohexane and its homologs, leaving a flour from which starch may be obtained.

Fish oil. MANUF. DE MACHINES AUXILIAIRES POUR L'ÉLECTRICITÉ ET L'IND. Fr. 648,961, Feb. 14, 1928. Oil is extd. from fish livers by grinding them in the presence of water and passing the semi-liquid mud to a centrifuge.

Soap. PAUL A. AKARDI. Fr. 648,936, Feb. 13, 1928. A soap, which may be used in salt or pure water, contains various oils 50, NaOH 25, Na<sub>2</sub>SO<sub>4</sub> 5, K 5, potash 15%.

Soap. OSCAR SCHÜPFER. Swiss 128,740, Mar. 6, 1928. A soap prepn. contains a mixt. of sawdust, sand, soda, soap, waterglass, vegetable fat, terpentine and citronella oil.

Soap paste. JOHN M. WEISS and CHARLES R. DOWNS (to Weiss & Downs, Inc.). U. S. 1,709,294, April 16. A soap paste suitable for removing grease from the hands

or other surfaces contains a neutral fatty acid soap, water, an ester of a dibasic org. acid such as dibutyl phthalate and a colloidal clay such as bentonite, which is capable of swelling by absorption of a large quantity of water.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

**Cold-water starch.** S. R. TROTMAN. *Ind. Chemist* 4, 399-400(1928).—Cold-water starches are prepd. in the form of powder that gives a paste when stirred into cold water. They are made in general by the action of acids, alkalies or other hydrolyzing agents on dried starch. Numerous ingenious methods and recipes are given, some in detail. E. G. R. ARDAGH

Self-emptying suction flask for sugar determination (PITMAN) 1. The  $H_2PO_4$  question in the cultivation of sugar cane in Java (ARRHENIUS) 15. Determination of N in molasses (FILOSOFOV) 16. Causes of shaft failures in cane mills (HELMER) 9. Treating gases with finely divided substances [conversion of starch into sugar by HCl gas] (Fr. pat. 648,525) 13. Extracting oil from grain [leaving a flour for starch manufacture] (Fr. pat. 638,909) 27. Heating system for apparatus for drying sugar (U. S. pat. 1,709,154) 1.

HOLLOWAY, T. E.: **Sugar Cane Insects Around the World.** Honolulu: Honolulu Iron Works. Reviewed in *J. Econ. Entomol.* 21, 793(1928).

**Sugar.** RAFFINERIE TIRLEMONTAISE SOC. ANON. Fr. 648,507, Feb. 7, 1928. Sugar is extd. from sirup or molasses by mixing the sirup, etc., with crystals of pure sugar and centrifuging. Cf. C. A. 23, 540.

**Sugar.** TROFILS GASPAR Y ARNAL. Swiss 128,983, June 23, 1927. Molasses and sugar juices contg. K are refined by treatment with ferrocyanide to eliminate the K. Preferably an alk. earth ferrocyanide is employed.

**Removing suspended organic matter from liquids such as sugar juices.** MORRILL B. SPAULDING. U. S. 1,709,286, April 16. The liquid is passed through a reciprocating screen which intercepts the suspended material. An app. is described.

**Apparatus for separating scum from sugar juices or solutions.** JAMES C. ETHEREDGE. U. S. 1,709,783, April 16. Scum is carried off from collecting floats provided with deflectors and placed in different compartments which communicate at their lower portions.

**Purifying solutions such as cane juice and molasses.** G. E. VAN NES. Brit. 297,430, Sept. 21, 1927. Colloids such as albumin, starch or water glass are added to the soln. and a coarsely dispersed ppt. is produced (at a suitable temp. and  $pH$ ) as by the addn. of lime and  $CO_2$  or of magnesia, baryta or Al oxide and  $SO_2$  or  $H_2PO_4$ . Cf. C. A. 23, 2319.

**Purifying molasses or other sugar solutions.** T. GASPAR Y ARNAL. Brit. 297,482, May 23, 1927. See Fr. 636,112 (C. A. 23, 223).

**Dextrin.** K. PERL & FR. STRINITZER CHEM. TECH. INSTITUT. Fr. 649,285, July 5, 1927. In the manuf. of dextrin by roasting starch, or substances contg. it, with the addn. of acids, a small amt. of a metallic salt such as a chloride or nitrate of Mn, Al, Fe or Pt is added to the acid.

**Crystallized dextrose.** RAYMOND E. DALY (to American Maize-Products Co.). U. S. 1,708,940, April 16. A sugar liquor derived from converted starch is brought to a d. of about 37-42° Bé. and the temp. is reduced to about 50°; dried seed crystals are added and the temp. is further reduced to about 38° and the liquor is introduced into a crystallizer contg. wet seed crystals in a quantity equal to substantially half that of the introduced liquor; the material is slowly agitated and the temp. further reduced to about 32-35° and the liquor is maintained at this temp. until it is permeated with crystals; the temp. is then raised to about 45-50° to cause the finer crystals to go into soln., the magma is slowly cooled to about 32-35° to cause the unmelted crystals to develop into crystals of relatively large size, and the magma is maintained at this temp. for about 12 hrs. while slowly agitating, and the crystals are then sep'd. from mother liquor by centrifuging.

## 29—LEATHER AND GLUE

ALLEN ROGERS

**Tanning barks of Madagascar.** F. HEIM DE BALSAC, *et al.* *Bull. agence gén. col.* 21, 935(1928); *Bull. Imp. Inst.* 27, 114-5(1929); cf. C. A. 22, 1055.—"Lalona" (*Weinmannia bojeriana*, Tul.) bark, which appeared to be derived from the trunk or the larger branches, furnished 13.7% tannin and 3.7% sol. non-tannins. A tanning ext. prep'd. from the bark quickly penetrated sheep skin and produced a fairly plump, pliable, soft leather, of a rather dark brown color. A. PAPINEAU-COUTURE

**Larch as a tanning material.** A. GOLOVIN AND N. IGNATOW. *Lederlech. Rundschau* 21, 25-6(1929).—Analyses of root and trunk barks of Siberian larch from Irkutsk showed only 4 to 6% tannin and 1 to 7% non-tannin. The tannin content is usually higher in larger trees; bark from a tree over 34 cm. in diam. is best for tanning. Although the tannin content is lower than reported by others the supply is abundant. I. D. C.

**The tanning value of "neb-neb" (*Acacia arabica*, var. *Adansonia*, Dubard) pods from Senegal.** F. HEIM DE BALSAC, A. DEFORGE AND H. HEIM DE BALSAC. *Bull. agence gén. col.* 21, 595(1928); *Bull. Imp. Inst.* 27, 115-6(1929).—All parts of "neb-neb" contain tannin except the wood. The roots, 3-10 mm. in diam., have a bark which furnishes 35% tannin; the old trunk bark, 5 mm. thick, furnishes 13% in the outer layer and 25% in the inner; the branch bark, 2 mm. thick, contains 29%. Pods weighing an av. of 0.2 g. and consisting of 72% pod case and 28% seed yielded 24.1% tannin and 18.0% sol. non-tannins, while the pods free from seeds furnished 36.8% tannins and 18% sol. non-tannins. Ext. prep'd. from the pods quickly penetrated sheep skin and produced a soft, pliable leather of very satisfactory appearance. "Neb-neb" pods are very similar to "Gonakié" (*Acacia arabica*, Willd.) from the tanning point of view, and the tannin content depends more on the degree of ripeness of the pods than on their botanical origin. A. PAPINEAU-COUTURE

**Adsorption and tanning power of synthetic tannins.** J. BERKMANN. *Collegium* 1929, 49-54.—Only syntans of sulfaromatic compds. are discussed. These contain sulfo acids, sulfo salts and mineral salts. Hide powder adsorbs most of the sulfo acid, very little of the mineral salt and variable quantities of the sulfo salt, depending on the nature of the org. part and the metal. Adsorption should be measured on the completely neutralized syntan. The order of increasing adsorption of syntan salts is: Na, K, NH<sub>4</sub>, (Ba, Ca, Mg) (Fe, Cr, Al, Cu). There is selective pos. adsorption of the org. portion and neg. of the metal by hide powder; neither hydrolysis nor adsorption of the larger mols. seems to be the explanation of this. The adsorption depends on the method of neutralization of the raw product. Analytical figures sometimes agree for different products when an adsorption curve, with different ratios of hide powder to tannin, shows that they have different adsorption capacities. I. D. C.

**Contribution to the study of the acidity determination in the tanning liquors.** G. H. BRAVO. *Ist. Nazion. ind. cuoio*, Torino. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 7, 45-52(1929). B. reviews the methods used for detg. the total acidity of tanning liquors and concludes that most of them are not fully satisfactory. He attempts to develop a method based on that of Seymour-Jones and Procter, in which fluorescent indicators are used. Although the new method was not, as yet, applicable for detg. the acidity of tanning liquids on account of the weak acids present, good results were obtained in the estn. of strong acids or alkalies in the presence of suspended or colored material. The detn. is carried out in the following way: A beaker contg. the soln. is placed under a Wood lamp at a distance not exceeding 30-40 cm. The ultra-violet rays should meet the surface of the soln. almost vertically. Two cc. of a 1% soln. of dichlorofluorescein is added per 100 cc. soln. On addn. of alkali a bright yellowish green fluorescence appears; the change, which is very distinct, occurs between  $p_H$  4.0 and 6.6. The titration has to be carried out in camera obscura. Eosin as a fluorescent indicator is of lesser value because of its color change between  $p_H$  0.0 and 3.0. G. SCHWOCH

**A simple and rapid method for determining the volatile acids in the tanning baths.** ANDREA PONTE. *Labor d. Soc. Nazion. Ind. Conciarie*, Corsico (Milano). *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 7, 57-63(1929).—Rota has found that on distg. 100 cc. of wine, until the distd. vol. was exactly 72 cc., the distillate contains 50% of the volatile acids present in the original sample. Based on this method a new procedure for detg. the volatile acids in tanning baths was elaborated. Solns. obtained in the detn. of the tannins according to Löwenthal-Hunt may be used for this purpose. Twenty cc. of 96% EtOH is added to a liquor sample and the soln. dild. to 200 cc. The d. of

the final soln. should be between 0.5 and 1.0° Bé. One hundred cc. of this soln. is distd. until the recipient contains exactly 72 cc.; then the vol. of the distillate is made up to 100 cc. with H<sub>2</sub>O of 15°. The total acidity (*A*) is detd. by titrating 50 cc. of the distillate with 0.1 *N* NaOH and phenolphthalein; it is expressed in g. of AcOH by multiplying the no. of cc. used by 0.006. Since SO<sub>2</sub> may be present in the distillate, dil. H<sub>2</sub>SO<sub>4</sub> and starch soln. are added to the same sample and the SO<sub>2</sub> is estd. by titration with 0.02 *N* I; its acidity (*B*) is expressed in g. of AcOH by multiplication with 0.0012. The amt. of volatile acids in 100 cc. of the dil. liquor is  $4 \times (A - B)$ . The values for volatile acids will be somewhat higher if H<sub>2</sub>O only, instead of EtOH + H<sub>2</sub>O, is used for dilg. the original sample. G. SCHWOCH

**Tannery waters.** E. MEZEY. *Collegium* 1929, 55 68. Buffer action, measured by  $dA/dpH$ , where *A* is the quantity of added acid or alkali, is briefly discussed. Titration and buffer curves of 4 waters (river, spring and tap) are given. The buffer curve is of value in detg. the suitability of a water for tannery use. I. D. C.

**Periodic and continuous tanning in factories.** B. SCHWARZBERG. *Collegium* 1928, 661-5.—By the ordinary method of periodic additions of tannin to tan liquors the speed of tanning is at first rapid, then drops practically to zero just before the next addn. This is caused by the decrease in tannin concn., purity and no. of large tannin particles. By the continuous method the hides remain in one of a series of connected vats, reels or drums, and the tan liquor circulates so that the concn. of tannin in each vat constantly increases. I. D. C.

**Influence of lactic acid and hydrochloric acid in deliming.** R. VON DER HEIDE. *Ledertech. Rundschau* 21, 49 53 (1929).—Two 4-kg. portions of hide were delimed with 2 l. of H<sub>2</sub>O and 5 kg. of lactic acid or 2.5 kg. of HCl. *pH* measurements were made every 5 mins. Lactic acid was much milder than HCl, the final *pH* with lactic acid was 6.6 and with HCl 4.3. I. D. C.

**Application of nitrocellulose in the varnished-leather industry.** JULIAN ALVAREZ. *Quim e ind* 6, 62-3 (1929).—The old varnish for the manuf. of varnished leather was usually made by prolonged boiling of linseed oil with about 10% of Prussian blue. The thick black varnish obtained was thinned with turpentine. The modern varnish is made by mixing a soln. of nitrocellulose and amyl acetate with the elements of the old varnish, and slowly incorporating colloids until a limpid and brilliant layer is produced upon the leather. The varnish thus obtained has the thickness, flexibility and brilliance of the old varnish. It is also indifferent to temp. changes and it neither breaks nor sticks. S. L. B. ETHERTON

**Tanning.** I. G. FARBENING, A. G. Brit. 297,830. Synthetic tanning materials in solid form and giving with water a tanning bath of requisite acidity are prepd. by the addn. of solid org. or inorg. acids or acidic substances to alkali salts of phenol condensation products contg. S which are not pptd. by dil. acids, such as are formed by the action of CH<sub>2</sub>O and a neutral sulfite or bisulfite on a phenol condensation product contg. S or by the action of a neutral sulfite and air on a phenol-S condensation product. Oxalic acid, KHSO<sub>4</sub> and 2-naphthalenesulfonic acid are among the substances which may be used. Cf. *C. A.* 23, 2319.

**Tanning with rare earth compounds.** F. W. WEBER. Brit. 297,754, March 21, 1927. Tanning may be effected by pptg. in the hide basic compds. such as those of Th, Ce, La, Er, didymium, Sc, Yt or Sa; the leather may be subjected to a double tanning by a further treatment with compds. of other metals such as Fe, Cr, Al or Mn. Various details and modifications are given.

**Artificial tannins.** MICHAEL MELAMID. Fr. 648,140, Feb. 23, 1928. Artificial

tannins are obtained by heating humic acid to about 180° with dil.  $\text{H}_2\text{SO}_4$  or dil.  $\text{HCl}$ , sepg. the liquid and heating to 110° with 20% oleum.

**Vegetable extracts.** ROBERTO LEPETIT. *Fr.* 648,546, Feb. 8, 1928. Tanning and coloring agents are obtained by treating vegetable exts., particularly from the chestnut tree, with solns. of sol. sulfides and sol. silicates with the subsequent addn. of acid salts or acids.

**Imitation leather.** J. S. MILLER. *Brit.* 297,916, Aug. 2, 1927. Stout muslin or other suitable fabric is impregnated and coated with bitumen, one of the faces is embossed with a grain, and a flexible pyroxylin varnish is applied. An app. is described.

### 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

**Isoprene and rubber. XIII. Constitution of rubber** H. STAUDINGER, M. ASANO, H. F. BONDY AND R. SIGNER. *Ber.* 61B, 2575-95(1928); cf. *C. A.* 21, 1371.—The evidence in favor of the Pummerer and the Staudinger views on the constitution of rubber is briefly reviewed. Against P.'s views the authors contend that: (1) Crystn. of a compd. is no proof that it is homogeneous and of low mol. wt.; the mixt. of polymeric-homologous polyhydroxymethylenes crystallizes just like homogeneous polyhydroxymethylene diacetates of low mol. wt. (2) A hydorrubber,  $(\text{C}_5\text{H}_{10})_n$ , distg. without decompn. does not exist; on distn. of the hydorrubber, which has a much higher av. mol. wt. (3000-5000), it undergoes cracking with the formation of a mixt. of unsatd. hydrocarbons. (3) Repetition of the mol.-wt. detns. in menthol shows that mol.-wt. detns. can be carried out only with great difficulty in this solvent with its extraordinary slowness in crystn.; crystn. after addn. of the substance under investigation must be approx. as rapid as that of the pure solvent and care must be taken that the outside temp. remains const., whereas addn. of rubber slows up the velocity of crystn. extraordinarily and considerable heat is lost to the surrounding bath, after the supercooling, so that very widely varying depressions of the m. p. are obtained. Similar observations were made on a cyclorubber having in  $\text{C}_6\text{H}_6$  an av. mol. wt. of 8500; in menthol it gave a value of 150. Expts. with paraffin hydrocarbons and paraffin hydrocarbon mixts. of high mol. wt. showed that the Rast method is well adapted to the detn. of the mol. wt. of such stable hydrocarbons and hydrocarbon mixts. The values obtained by Pummerer, Nielsen and Gündel with rubber were in the main confirmed, i. e., values between 1000 and 2000 were obtained, but that slight decomps. occur at these high temps. was shown by the fact that the camphor subliming over has a lower m. p. than pure camphor; moreover, cyclorubbers, whose mol. wts. in  $\text{C}_6\text{H}_6$  agree with their phys. properties (m. p., solv., viscosity of the soln.) show in camphor appreciably lower values. Association in  $\text{C}_6\text{H}_6$  seems excluded by the fact that the same values are obtained at different concns., and when these cyclorubbers are recovered from the camphor, they show in  $\text{C}_6\text{H}_6$  the same values as before, the viscosity of the  $\text{C}_6\text{H}_6$  solns. is likewise not altered by previously dissolving the cyclorubbers in camphor. The lowering in the m. p. of the sublimed camphor is ascribed to contamination by volatile products of low mol. wt. resulting from the breaking down of O contg. impurities in the camphor; when the rubber is recovered from the camphor, these volatile products remain dissolved in the alc. and therefore do not affect the mol. wt. in  $\text{C}_6\text{H}_6$  of the recovered rubber. (4) Isorubber-nitrone is not, as assumed by P., a homogeneous substance but a mixt. of polymeric-homologous products resulting from the breaking down of the rubber with  $\text{PhNO}$ . (5) Röntgenographic investigations cannot prove the existence of a small basic mol. The authors therefore held to their view that rubber consists of macromol. polymeric-homologous polyprenes. The results of mol. wt. detns. of cetel alc., cholesterol, cyclorubber and rubber in menthol, and of paraffins, paraffin mixts., rubber and gutta-percha in camphor are reported.

C. A. R.

**Natural and synthetic rubber. I. Products of the destructive distillation of natural rubber.** THOMAS MIDDLEY, JR. AND ALBERT L. HENNE. Cornell Univ. *J. Am. Chem. Soc.* 51, 1215-26(1929). Light pale crepe rubber was destructively distd. at atm. pressure, the temp. of the bath being raised as quickly as possible to 700° (to obtain a favorable yield of isoprene). Addn. of Mg to the rubber greatly increased the yield of substances other than isoprene and dipentene; Zn, Fe and Al have a similar effect but to a very much smaller extent; Cu is without effect; brass is the same as Fe. In the distns. the same components were found but in different proportions. A table gives the yields of the 2 distns. No fully satd. compd. was detected. The follow-

ing compds. were isolated by fractional distn. of the reaction product after the removal of the isoprene (the phys. const. and methods of identification are given): 3-methyl-1-butene, 2-methyl-1-butene, isoprene, 2-methyl-2-butene, a 2-methylpentene, b. 59–60°,  $d_{20}^{20}$  0.730,  $n_{20}$  1.4117; 3-methyl-2-pentene; a 3-methylpentadiene, b. 76–9°,  $d_{20}^{20}$  0.742,  $n_{20}$  1.4346;  $C_8H_8$ , a compd. b. 93–5°,  $d_{20}^{20}$  0.744,  $n_{20}$  1.422;  $\Delta^1$ -tetrahydrotoluene,  $\Delta^1$ -tetrahydrotoluene; a fraction b. 109–10°,  $d_{20}^{20}$  0.783,  $n_{20}$  1.4413;  $\Delta^1$ -tetrahydrotoluene, PhMe; a fraction b. 121–2°,  $d_{20}^{20}$  0.765,  $n_{20}$  1.4287, probably 2-methylheptene;  $\Delta^1$ ,  $\Delta^2$ -dihydro-*m*-xylene, b. 129–30°,  $d_{20}^{20}$  0.795,  $n_{20}$  1.4451; *m*- $C_6H_4Me_2$ , *p*-tetrahydroethyltoluene; a fraction b. 158–9°,  $d_{20}^{20}$  0.834,  $n_{20}$  1.4665; *p*-Et $C_6H_4Me$ ; a fraction b. 162–3°,  $d_{20}^{20}$  0.828,  $n_{20}$  1.46, analyzing for  $C_{10}H_{18}$ ; a dimethyloctadiene, b. 162–3°,  $d_{20}^{20}$  0.8105,  $n_{20}$  1.456; dipentene. Assuming that the Staudinger formula is correct, that the single bonds farthest from the double bonds are the weaker spots and that the formation of 6-C rings is favored, it has been shown that nearly all of the compds. actually isolated could be predicted. II. Reduction of isoprene by Na-NH<sub>3</sub>. *Ibid* 1293–4.—Reduction of isoprene with Na in liquid NH<sub>3</sub> gives 60% of 2-methyl-2-butene. High mol.-wt. hydrocarbons were formed but were not investigated. III. Dimethyloctadiene. *Ibid* 1294–6.—Well purified isoprene, active toward polymerization, was placed in contact with metallic K; EtOH was added slowly at a rate just sufficient to give a moderate evolution of H at the surface of the K; there resulted a mixt. of 2,6-, 2,7-, and 3,6-dimethyl-2,6-octadienes, b. 163–7°,  $d_{20}^{20}$  0.769,  $n_D^{20}$  1.4457. The constitution of the mixt. was detd. by oxidation with CrO<sub>3</sub> in AcOH. This reaction indicates that the mechanism of the polymerization of isoprene to synthetic rubber is the joining of many isoprene mols. by linkage of the 1,1-, the 1,4-, or the 4,4-C atoms to produce a long chain mol

C. J. West

The physical properties of rubber. MARTIN RUHEMANN AND FRANZ SIMON. Berlin. *Z. physik. Chem., Abt., 138A*, 1–20(1928).—The change of a supercooled liquid to an amorphous solid is not continuous, but occurs within a definite temp. interval. With glycerol, for example, this is shown by an anomaly in the sp.-heat curve, the value of the sp. heat falling off much more rapidly within this interval than in the neighboring temp. regions. This same anomaly in the sp.-heat curve, which R. and S. call the  $\alpha$  anomaly, was found in smoked sheet, where the change to a "glassy" solid with falling off of elasticity took place between  $-65^\circ$  and  $-80^\circ$ . With synthetic rubber the change was between  $+5^\circ$  and  $-12^\circ$  for methyl rubber II, and between  $-5^\circ$  and  $-22^\circ$  for methyl rubber W. A second anomaly, referred to as  $\beta$ , was found as a peak in the sp.-heat curve for natural rubber at about  $0^\circ$ , and was not easily reproducible. The behavior of the coeff. of expansion in this temp. range showed that this could not be due to the presence of H<sub>2</sub>O. "Patent rubber," pure, raw rubber, masticated, pressed several days at 150 atm. at  $-15^\circ$ , gave the same  $\alpha$  and  $\beta$  anomalies, though  $\beta$  was less pronounced. "Frozen" smoked sheet and "patent rubber" gave the  $\alpha$  and  $\beta$  effects, also peaks (called the  $\gamma$  anomaly) at  $+25^\circ$  and  $+17^\circ$ , corresponding to 4 cal. and 6 cal. per g. of rubber, resp. Since the opalescence vanished, and immediate cooling and re-warming showed no  $\gamma$  effect, this is taken as the heat of fusion of the crystallites shown by x-ray photographs to be present in frozen rubber. Smoked sheet, racked 500% at  $55^\circ$ , showed  $\alpha$  and  $\beta$  anomalies, but up to  $35^\circ$ , no  $\gamma$ , though the opalescence of the sample indicated that the "m. p." had not been reached. A sample racked 400% at  $35^\circ$  gave the  $\gamma$  effect, the max. of the peak being at  $34^\circ$ ; the rubber thus "melted" was clear and elastic. The total-, gel- and sol-rubbers of Pummerer (C. A. 22, 885) showed the  $\alpha$  and  $\beta$  anomalies. Rubber as a 2-phase system might be expected to show 2  $\alpha$  anomalies. The absence of a second anomaly is explained by the fact that the more viscous phase is in the "glass" state to above  $30^\circ$ , and hence the second  $\alpha$  effect was not detected in these expts. The (purely speculative) explanation advanced for the  $\beta$  anomaly is a further polymerization and attending solidification to the "glass" state.

G. R. Y.

The "degree of devulcanization" and the evaluation of reclaimed rubbers. HERNRICH LORWEN. *Kautschuk* 5, 61–2(1929).—Comments on an article by Lindmayer (cf. C. A. 23, 2069). So-called reclaiming does not represent true devulcanization, but plasticization, for devulcanization would involve the complete removal of combined S. The concept of devulcanization of L., whereby vulcanized rubber splits into a component rich in S and a component free of S, is contrary to all facts of org. chemistry and is not supported by exptl. data. All that can be said is that an increase in the CHCl<sub>3</sub>-sol. component is accompanied by an increase in plasticity. The "degree of devulcanization" on the basis proposed by L. is fallacious, for it signifies that only 0.5

of the rubber can become sol., an assumption without foundation. The suggestion of L. is of more practical than of theoretical significance. C. C. DAVIS

The use of "Catalpo" in the rubber industry. A. D. LUTTRINGER. *Caoutchouc & gutta-percha* 26, 14389-90(1929).—A description of the characteristics of "Catalpo" clay. C. C. DAVIS

The aging of rubber. Its preservation. F. JACOBS. *Caoutchouc & gutta-percha* 26, 14382-3(1929); cf. C. A. 22, 4876.—A review with special reference to work by Villey and Vernotte (cf. C. A. 19, 1208). No artificial aging method duplicates natural aging in darkness. Furthermore, it is considered that the deterioration of vulcanized rubber is an unnecessary change, in that mixts. of suitable compn. and vulcanized to the proper condition deteriorate little or not at all. C. C. DAVIS

Ornamented rubber. JOSEPH ROSSMAN. *India Rubber World* 80, 61-4(1929).—An illustrated review of U. S. patents relating to methods of designing and coloring. C. C. DAVIS

The cleavage of stretched rubber and the distortion of its cleavage planes by compounding. M. LE BLANC AND M. KRÖGER. Leipzig. *Z. Elektrochem.* 34, 725-34 (1928).—Whereas a cryst. substance undergoes a distortion of lattice on stretching, rubber must first gain a cryst. structure, which may then undergo distortion and breakage. The introduction of compounding ingredients causes a distortion of the lattice; at low temp. in rubber not contg. compounding ingredients, part of the rubber itself may act in this capacity. A microscopic examn. of the cleavage faces of various rubbers shows that: (1) the finer the compounding ingredient, the more the places of distortion of the planes, and (2) the greater the energy of adsorption of the compounding ingredient, the greater is this distortion. A scheme is given showing the interrelation of various forms of rubber (raw, compounded, vulcanized, etc.) Stress-strain data at various temps. are given for artificial isoprene rubber, and for 15 and 30% admixts. of KCl,  $\text{NH}_4\text{Cl}$ ,  $\text{B}_2\text{O}_3$ , KBr, KSCN, ZnO,  $\text{MgCO}_3$ ,  $\text{BaO}_2$ ,  $\text{BaSO}_4$  and for 15% admixts. of methylene blue, eosin, furrol B, furrol GB and rhodulin orange. The diam. of the testing ring has an influence on the stress-strain curves and breaking point, the breaking value being greater for a smaller ring than for the usual 44.6 mm. ring of the Schopper machine. Tables show results of these tests. G. R. Y.

A temperature-recording micropress for studying the course of vulcanization. JAMES C. WALTON. Boston Woven Hose & Rubber Co., Cambridge, Mass. *Ind. Eng. Chem., Anal. Ed.* 1, 106-8(1929).—A new temp.-recording electrically-heated micropress for use in studying vulcanization microscopically is described and illustrated (cf. Dannenberg, C. A. 21, 3764; Hauser and Hünemörder, C. A. 22, 4876; 23, 2070). This instrument permits the duplication of press cures on a very small scale and makes it possible to det. the temps. at which various changes take place during the progress of vulcanization. With the aid of this app., the vulcanization of several rubber mixts. with and without S was studied microscopically. It was found that after curing a rubber-S-PbO mixt. there is no crystn. of the free S, even when the cure is very brief. Both  $m\text{-C}_6\text{H}_4(\text{NO}_2)_2$  and benzyl peroxide vulcanize rubber in the absence of S. The former requires an activator like PbO (diphenylguanidine being ineffective), and does not crystallize from vulcanized mixt., where benzoyl peroxide does not require an activator, and it crystallizes from the vulcanized mixt. in a manner very similar to S. Photomicrographs of rubber before and after vulcanization by  $m\text{-C}_6\text{H}_4(\text{NO}_2)_2$  are included. C. C. DAVIS

The vulcanization of rubber by sulfur chloride. J. SOUDIER. *Caoutchouc & gutta-percha* 26, 14389(1929).—It is claimed that substances have been found which in very small proportions will accelerate the cold vulcanization of rubber by  $\text{S}_2\text{Cl}_2$  and give products of superior quality. They are not named. C. C. DAVIS

Plasticization and plasticizing agents. PAUL BARY. *Caoutchouc & gutta-percha* 26, 14464-8(1929).—A discussion of the phenomena and of the mechanism of plasticization in its relation to the chem. theory of colloids. Swelling of a colloid involves 2 distinct phases, (1) penetration of the liquid, accompanied by an increase of vol., and (2) solvation, which may proceed as far as complete colloidal soln. The mols. of the colloid are highly polymerized, and are previously solvated. Penetration, therefore, is aided by this initial solvation, though the liquid has insufficient affinity to rupture the mols. and to produce further solvation. For plasticization to accompany swelling it is necessary that: (1) the colloid be swollen enough to be elastic and deformable under pressure; (2) the liquid contain the elements of solvation to such a degree that the jelly fuses at a definite temp. and (3) this m. p. is close to the working temp. Plasticization requires the expenditure of energy corresponding to the depolymerization which takes place, and this expenditure is counterbalanced (in part or wholly) by the

heat evolved in the partial combination of the solvent at the points of mol. rupture. When the heat of solvation exceeds that of depolymerization, there is a reduction in the degree of polymerization, even to complete soln. However, liquids which swell colloids best are not always those with the greatest solvating power, but those which, without solvating the colloid appreciably at ordinary temp., begin their action at slightly elevated temps. On recooling, there should be repolymerization and desolvation. Assuming that rubber is solid  $\alpha$  form and a liquid  $\beta$  form dissolved in the  $\alpha$  form to produce a jelly, rubber may be considered to be an auto-plasticized substance. When polymerization of the isocolloid reduces the proportion of the  $\beta$  form, the plasticity diminishes. There is no essential difference in this rubber jelly and other jellies of 2 dissimilar components unless, as seems probable, there are solvating agents present in the rubber, viz., its resinous and protein impurities. If these impurities act as solvating agents, it is one of the reasons why synthetic rubbers have not so much elasticity as natural rubbers. In general, then, a substance is plastic only if it has 2 components: (1) a colloid capable of swelling and (2) a liquid sol. in this colloid and with the power of solvating the latter. This liquid can be a mixt. of 2 or more liquids, with differing powers of solvation, and therefore, lending different degrees of elasticity to the resulting plastic mixt. C. C. DAVIS

The dynamometer of Pierre Breuil (ANON) 1. The solubility of  $\text{CO}_2$  in vulcanized rubber (YAMAMOTO) 2. Abrasive wheel bonded to face plates with vulcanized rubber (U. S. pat. 1,709,820) 19.

**Rubber.** THE ANODE RUBBER CO. (ENGLAND), LTD. Fr. 648,631 Feb. 10, 1928. Aq. dispersion of org. substances, particularly vulcanized or unvulcanized or regenerated rubber or factis, is obtained by mixing the solid constituent after mastication successively with at least 2 auxiliary substances, at least one of which presents to the solid constituent and at least one to the liquid constituent a high physical affinity (solv., miscibility, swelling capacity and adsorption capacity) and at least one of the substances added first combining chemically with one of the substances added afterward under the conditions of working. Thus, regenerated rubber is treated in mixing cylinders, NaOH lye is added and afterward oil. Water contg.  $\text{NH}_3$  is added until reversion, and the dispersion of rubber obtained may be dild. as desired, preferably with feebly alk. water. Casein may be added with the NaOH.

**Rubber.** SOC. ANON DES CHAMIONS ACTIFS EDOUARD URBAIN. Fr. 648,194, June 14, 1927. A charge is used in the making of rubber consisting of an active or activated porous absorbent substance, which has absorbed vulcanizing substances. In examples, C, having served for the purification of coal gas and contg. 6-7% of S, thiols, thiophene, different amines and oxamides, is ground and dried and mixed with rubber and vulcanized. C used for coal gas purification is caused to absorb vapors of piperidine and  $\text{CS}_2$  and used as before. Cf. C. A. 23, 2963.

**Rubber.** SYNDICAT FRANCO NEUTRIANDAIS. Fr. 649,006, July 4, 1927. Waste vulcanized rubber, contg. no charge, after removal or destruction of any fabric, is regenerated by treating it with latex, giving a rubber equal to plantation rubber. Fr. 649,007 describes the coagulation of latex by means of waste vulcanized rubber, contg. no charge, and after removal or destruction of any fabric.

**Rubber composition.** HARRY H. KELLER. U. S. 1,710,181, April 23. A vulcanizable compn. which is suitable for tire treads, floor coverings, shoe soles, etc., is formed of rubber 100, S 3, ZnO 26.5 and Al oxide 26 parts and an accelerator.

**Liquefied rubber composition.** HAROLD P. BUTLER. U. S. 1,710,470, April 23. In prepg. a product which may be used with a brush or as a spray, rubber is placed in a still together with  $\text{C}_6\text{H}_6$ , toluene, or  $\text{CCl}_4$  and refluxed for several hrs. Cf. C. A. 22, 2291.

**Rubber deposition from latex.** P. KLEIN, A. SZEGVARI, R. P. MCKAY, C. HAYES and G. W. TROBRIDGE. Brit. 298,117, March 26, 1927. The properties of rubber produced by direct deposition from aq. dispersion are improved by submitting the surfaces not in contact with the deposition strata to the action of coagulating agents before drying. The treatment may take place alternately with the deposition of layers and coagulation may be effected by the application of a heated liquid such as hot water, hot moist air, steam, liquid coagulants such as  $\text{HOAc}$  or  $\text{CaCl}_2$  soln. or coagulating vapors.

**Electrophoretic deposition of rubber.** P. KLEIN, A. SZEGVARI, R. P. MCKAY, C. HAYES and G. W. TROBRIDGE. Brit. 297,780, March 26, 1927. In the deposition of

rubber from dispersions contg. insufficient OH ions to cause gas formation on the anode, as described in Brit. 257,885 (C. A. 21, 3141), the cond. of the dispersion is altered by the addn. of electrolytes free from OH ions or by removing electrolytes from the dispersion and replacing them by electrolytes free from OH ions. This treatment enables the OH concn. to be increased above the limit otherwise possible without gas formation. In using Zn anodes, alkali metal chlorides serve to prevent sticking of the rubber at the anodes and to produce softer deposits.  $\text{CaCl}_2$  increases coagulation and substances such as an alkali metal ferrocyanide or phosphates increase the toughness of the deposits.

**Coloring rubber.** I. G. FARBENIND. A.-G. Brit. 298,364, Oct. 6, 1927. Rubber is colored orange-red by mixing it, before vulcanization, with the Ca salt of benzeneazo-2-hydroxynaphthalene-6-sulfonic acid (Schultz No. 37).

**Forming rubber articles by dipping.** DUNLOP RUBBER CO., LTD., and D. F. TWISS. Brit. 297,911, July 25, 1927. A non-porous mold such as one of glazed porcelain, metal, or rubber is moistened with a coagulant liquid such as  $\text{CaCl}_2$ , K alum, or formic or acetic acid soln. and dipped in a coned dispersion, which may contain fillers and vulcanizing ingredients and which may include "mineral rubber" and reclaimed rubber and a salt such as  $\text{NaCl}$ ,  $\text{Na}_2\text{SO}_4$ , or  $\text{CaSO}_4$ .

**Rubber-filament formation by extrusion.** M. DRAEMANN. Brit. 297,912, July 25, 1927. Filaments are formed from a soln. of unmodified rubber, which is maintained at a temp. above the b. p. of the solvent used. The filaments after formation are carried by a belt conveyor through a chamber where they are vulcanized by molten S or hot air, and, before, during or after vulcanization, the filaments may be stuck together to form a band by use of liquid S, glue, casein or other suitable material. App. and various other details of procedure also are described.

**Molding rubber tires.** W. J. FILLMORE. Brit. 297,590, Nov. 9, 1927. The outer covering of a cushion tire is molded over the core portion by an extrusion process. An app. is described.

**Molding inner tire tubes or other hollow rubber articles.** T. L. FAWICK. Brit. 298,139, Oct. 3, 1927. Mech. features. Brit. 298,140 describes a special form of tire vulcanizing app.

**Forming endless circular rubber inner tire tubes for vulcanization.** OTTO J. KUHLE (to Kuhle Machine Co.). U. S. 1,709,795, April 16. Mech. features.

**Forming "punctureproof" tire tubes by conjoint use of slow curing and fast curing rubber compositions.** OTTO J. KUHLE. U. S. 1,709,797, April 16. Various mech. details are described.

**Progressive refrigeration of rubber straps to facilitate cutting.** JOHN R. GAMMETER (to A. G. Spalding and Bros.). U. S. 1,710,211, April 23. An app. is described.

**Reclaiming rubber.** JOHN J. MORIAKIS (CO. to James H. S. Kerr). U. S. 1,710,100, April 23. Effected and vulcanized material is ground, incorporated with a plasticizing material such as "mineral rubber," the material is milled with the further addn. of a reclaiming reagent such as a 20%  $\text{H}_2\text{SO}_4$  soln. and is then treated with steam under pressure.

**Forming and vulcanizing cored rubberized belting.** JOHN R. GAMMETER (to B. F. Goodrich Co.). U. S. 1,709,299, April 16. Mech. features.

**Vulcanizing rubber.** W. C. GRAY, B. DAVES and B. F. GOODRICH CO. (to Anode Rubber Co., Ltd.). Brit. 297,850, March 28, 1927. In the direct production of rubber goods on deposition strata or molds by dipping or electrophoresis, "ultra accelerators" are used, which effect complete vulcanization of the products during or before completion of drying, and at temps. below  $112^\circ$  or even below the b. p. of water. Suitable substances are diethylammonioethylthiocarbamate, dithiofuroic (dithiopropionic) acid and dithiofurates and mercaptobenothiazole. The vulcanization may be effected in heated air, heated moist air, or by dipping in hot water. Various natural or artificial rubber dispersions and compns. may be used.

**Vulcanizing rubber.** W. SWIFT (to Rubber Service Laboratories Co.). Brit. 297,726, Sept. 26, 1927. A vulcanizing accelerator is made by treating an aldehyde- $\text{NH}_2$  with a further quantity of the same or a different aldehyde, preferably by heating in a closed vessel to 90–95°. Examples are given of the use of the reaction products of various proportions of butylaldehyde and butylaldehyde ammonia, butylaldehyde and croton aldehyde ammonia and croton aldehyde and butylaldehyde ammonia.

**Vulcanization of rubber.** THE RUBBER SERVICE LABORATORIES CO. Fr. 648,239, Oct. 8, 1926. Accelerators for the vulcanization of rubber are obtained by reacting a mercaptan or compd. of mercaptan contg. a CSH group on a completely saturated org. base. The products obtained may be condensed with an aldehyde such as crotonic aldehyde. Suitable bases include hexamethylenetetramine, biguanide, triphenyl

biguanide, guanyl ureas, isoureas, thioureas, piperazine, trimethylsulfonium hydroxide and  $N(CH_3)_4OH$ . Mercaptan compds. include ethylmercaptan, thiophenol, thiocresol, mercaptobenzothiazoles, 2-mercaptothiazoline and its derivs., thioanilides, 2-mercaptobenzimidazole, mercaptoiminazole, thioamides and thioammeline. Cf. C. A. 23, 732.

Vulcanizing apparatus for pneumatic tubes. GILLETTE RUBBER CO. Fr. 648,504, Feb. 7, 1928.

Devulcanizing rubber. R. R. GROSS (to Firestone Tyre & Rubber Co. (1922), Ltd.). Brit. 297,817, Sept. 29, 1927. Rubber scrap such as that contg. textile reinforcements is treated with steam under a pressure of 400-1000 lbs. per sq. in. for 1-15 mins.; the pressure is then suddenly released; the scrap is thus disintegrated, the textile material is charred or hydrolyzed and free S is stated to be removed.

No. 12

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

**Works control and laboratory equipment.** ARTHUR SCHRODER. Fisher Scientific Co., Pittsburgh, Pa. *Ind. Eng. Chem.* 21, 481-5(1929).—Uniform quality of products, as demanded by the customer, can be insured only by const. testing of material during production. Plant control equipment is becoming more and more standardized and specialized. A brief description of some of the control instruments recently developed is given. The American scientific instrument industry is no longer a matter of mere merchandising but has become outstanding in design, manuf. and supply of instruments.

**Laboratory filtering device.** KARL-IVAR SKAERBLUM. *Tek. Tid., Uppl. C. Kemi* 58, 23-4(1928).—The described app. is particularly helpful in the slow vacuum-filtering of colloids through a Zsigmondy-Bachmann filter. The top opening of a bell jar is fitted with a stopper carrying the filter funnel. The filtrate is received in a flask placed under the jar. The flask contg. the liquid to be filtered is inverted with the top dipping into the liquid on the filter to maintain a const. level. The bell jar and the inverted flask are fixed to a ring stand in such a manner that they can be raised and lowered as a unit.

**A new self-adjusting pipet.** E. G. BILHAM. *J. Sci. Instruments* 6, 119-20(1929).—By means of an inner tube forming an extension of the ordinary discharge jet of a pipet, a fixed quantity of liquid is retained and can be recovered by pouring out from the top of the pipet. Pipets of this pattern have been found useful for purposes where definite fixed quantities of water or other liquid have to be measured rapidly and accurately.

**A new adiabatic calorimeter.** SEIJIRO UCHIDA. Imperial Fuel Research Inst. *J. Fuel Soc. (Japan)* 8, 306-16(1929).—U. designed a new adiabatic calorimeter the novel features of which are: The detn. is made independent of the room temp. The proper but delicate selection of the bucket, jacket and room temp. and rapid and accurate reading of a Beckmann thermometer in the bucket may be dispensed with. Delicate skill such as required in a bomb calorimeter is unnecessary. Correction for radiation is also unnecessary. It saves time; several detns. may be carried out side by side. An ordinary bomb calorimeter can easily be changed into an adiabatic calorimeter.

**A new ebullioscope for determining molecular weights using small quantities of substances.** EDWARD SUCHARDA AND BOGUSLAW BOBRANSKI. *I. w. ow Polytech. Przemysl Chem.* 11, 371-3(1927); cf. Swietoslowski, *Roczniki Chem.* 5, 96(1925).—Liquid (3-5 cc.) enough to fill the reservoir Z and the wavy tube F up to its outlet to the cup K is introduced through the condenser C. Enough Hg is introduced into the vessel N so that when a thermometer is introduced into it the level of Hg is the same as that of the cup K. At the beginning of the detn. the jacket D and the tubes P and F are carefully heated with a moving flame; then the solvent in the reservoir Z is heated to boiling, heat by a microburner provided with a chimney. It should be boiled fast enough to keep up a steady overflow over the cup K. Glass powder on the bottom of the reservoir steadies the boiling. After 5-7 mins. the b. temp. becomes steady to within 0.001°, and at that time the sample (10-50 mg.) may be added through the cooler C. The second reading is obtained in 2 or 3 mins. To avoid the complication of rapidly changing atm. pressure two simultaneous b.-p. detns. should be conducted, one with the solvent alone and the other with the solvent and the sample.

A. C. ZACHLIN

2853

**The efficiency of absorption apparatus.** E. ÖMAN. *Tek. Tid., Uppl. C, Kemi* 58, 89-94(1928).—A theoretical consideration of the different conditions governing the technical process of absorption of gases in liquids. A simple app. for detg. the absorption coeffs. is described.

A direct-reading thermocouple temperature indicator for electrical machinery. F. S. STICKNEY. *Instruments* 2, 135-40(1929). E. H.

**Manometer with mercury and oil.** R. DARBORD. *Compt. rend.* 188, 50-2(1929).—Hg and an oil with low vapor pressure are used. The Hg surfaces are large. The pressure is on a small surface of oil. The new manometer is more sensitive than the Hg manometer.

A super-micromanometer. JOHN L. HODGSON. *Instruments* 2, 125-8(1929). E. H.

**Device for the preparation of solutions of constant density.** J. HAMOUS. *Z. Zuckerind. Tschoslovak. Rep.* 52, 448(1928).—An app. for dilg. a liquid to const. d. consists of a cylindrical vessel contg. a float carrying a graduated spindle, which, according to its rise or fall, actuates a mechanism controlling the entrance of the dilg. liquid at the point where the denser liquid is admitted.

A new electrolytic gas apparatus. ROBERT MAND. *Z. physik. chem. Unterricht* 40, 305(1927)(Munich).—The new apparatus combines inexpensiveness, simplicity and safety. It requires either 110 or 220 v. d. c. The gas is let through soap soln. and the bubbles can be ignited within 1 or 2 mins. without interrupting the electrolysis. Into a cylinder is placed the gas cell into which 2 Ni electrodes are set. A glass tube leads from the cell into the soap soln.

A flow meter for gases. A. V. SIVOLOBOV. *J. Chem. Ind. (Moscow)* 5, 1429-31(1928).—To permit passing gases in definite quantities per unit of time, S. constructed a sort of a manometer, which represents an improvement over Riesenfeld's apparatus (*C. A.* 22, 187). The manometer, called *capillary tachimeter*, is described in detail and a drawing is appended.

Apparatus for thermomagnetic analysis. RAYMOND L. SANFORD. *Bur. Standards J. Research* 2, 659-70(1929). E. H.

**Electrically heated thermocirculator for hot leaching and digesting.** M. G. RAEDER. *Ind. Eng. Chem., Anal. Ed.* 1, 88(1929).—The reference in *C. A.* 23, 1532 should have been *Ind. Eng. Chem., Anal. Ed.* 1, 88.

**Mechanical dispersion by means of the colloid mill (TRAVIS) 2.** Some sources of error in determining the drop-point according to Ubbelohde, and their avoidance (NAUMANN) 2.

TRINKS, W.: *Industrie-Öfen*. Band I. Berlin: VDI-Verlag, G. m. b. H. 348 pp. M. 14.40; bound, M. 16.

**Mixing and agitating apparatus.** I. G. FARBENIND. A.-G. (Hermann Sturm and Karl Fierz, inventors). Ger. 473,404, May 24, 1925. Stationary guides having curved surfaces are arranged in advance of the stirrers, and the arrangement is such that vertical currents are produced in the mixt.

**Helical stirring apparatus.** MASCHINENFABRIK AUGSBURG-NÜRNBERG A.-G. Ger. 474,801, June 14, 1928.

**Apparatus for indicating pressures or temperatures.** L. DE FLOREZ. Brit. 299,008, Oct. 19, 1927. Structural.

**Penetrometer (with a blunt-nosed plunger) for testing the hardness of fruit and substances of similar consistency.** E. GRIFFITHS and E. A. GRIFFITHS. Brit. 298,662, July 12, 1927.

**Calorimeter for steam.** HERMANN SANDVOSS. Ger. 473,433, Dec. 4, 1926.

**Safety device for Bunsen burners.** NILS T. SELLMAN (to Spencer Thermostat Co.). U. S. 1,711,398, April 30. A thermostatic device closes the gas supply when the flame is extinguished.

**Ball mill construction, etc.** S. BRAMLEY-MOORE. Brit. 298,899, Oct. 15, 1927.

**Liquid-level indicator or regulator** (utilizing electrical conductivity of liquid in a gage glass). NAAMLooZE VENNOOTSCHAP MACHINEFABRIEK G. DIKKERS & Co. and W. LULOFS. Brit. 299,012, Oct. 19, 1927.

**Filters.** ALFRED SCHOLZ. Ger. 472,901, Nov. 25, 1926. Compressed filter cakes for acids are completely leached out by treating with substances which cause  $\text{CO}_2$  to be developed within their mass, so neutralizing the acid and producing a network of capillary pores, which facilitates the leaching. The process is continued until the washings from the mass give a neutral reaction. Thus, filter cake contg.  $\text{HCl}$  is leached with  $\text{Na}_2\text{CO}_3$  until the washings are only slightly acid. The leaching is then continued with water until the washings are neutral.

**Filter drum.** EUGEN GEIGER. Ger. 474,358, Aug. 19, 1926. Addn. to 472,181 (C. A. 23, 2328).

**Filter for milk or other liquids.** KIRK K. WRIGHT. U. S. 1,710,758, April 30. Structural features.

**Apparatus for separating benzine, etc., from water.** JOSEF MUCHKA. Austrian 112,646, Nov. 15, 1928. Sieves, fillers, or the like are arranged above the inlet for the mixt. so as to break up eddies in the incoming stream.

**Apparatus for the gravity separation of gasoline and water or other mixed liquids of different specific gravities.** JEAN SCHÄFER. U. S. 1,711,428, April 30.

**Apparatus for gravity separation of oil and water or other liquids of different densities.** F. PINK. Brit. 298,683, June 29, 1927.

**Apparatus for removing dust and other suspended particles from air or other gases by centrifugal action.** HUNDT & WEBER GES. Brit. 298,855, Nov. 10, 1927.

**Centrifugal apparatus for removing dust from gases.** ARTHUR STIEVENART. Fr. 649,470, Feb. 3, 1928.

**Gas-purification apparatus.** PAUL SCHMIDT. Ger. 473,878, Feb. 13, 1927. App. for sepp. vaporized liquids, such as oils, from gas currents, such as flue gases, is described.

**Dry-gas purifying apparatus.** RUDOLF GRIPERT. Ger. 473,987, Nov. 15, 1927. The purifying material is spread along the gas passage in thick layers in chambers bounded by cross walls.

**Spray apparatus for washing gas, moistening air, evaporating, drying, etc.** FERDINAND WREESMANN. Ger. 473,455, Nov. 14, 1924. App. is described in which liquid is fed centrally to a rapidly rotating vessel together with air or gas under pressure, the liquid escaping through peripheral openings.

**Gas washer with a spiral surface within a tower.** I. G. FARBENIND. A.-G. Brit. 299,075, June 20, 1927. Structural features.

**Apparatus for the recovery of gases or vapors from adsorbent substances.** NORIT-VEREENIGING VERKOOP CENTRALE. Fr. 648,775, Jan. 9, 1928.

**Safety valve for gas conduits.** GOTTFRIED BORNEFELD. U. S. 1,711,133, April 30. A valve is described, which closes if the conduit behind the valve leaks or is not fully open.

**Gas holder of the "waterless" type.** PAUL M. KUEHN (to Bartlett-Hayward Co.). U. S. 1,711,392, April 30. Structural features.

**Column of perforated plates for impregnating liquids with gases.** L'AIR LIQUIDE SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE. Ger. 472,749, Jan. 28, 1926. Details of arrangement.

**Acetylene generator.** KARL KAHN. Ger. 474,145, Apr. 8, 1928. Water supplied to the generator under pressure actuates the carbide feed and also a stirrer serving to maintain the sludge in a thin liquid state.

**X-ray apparatus.** NAAMLooZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Fr. 649,940, Feb. 25, 1928.

**Röntgen-ray apparatus.** PHÖNIX RÖNTGENROHRENFABRIKEN A.-G. Ger. 473,929, Aug. 6, 1925. A screen surrounding the cathode is made with a layer of material opaque to the rays and a layer of gas-absorbing material to preserve the vacuum.

**Röntgen-ray apparatus.** SIEMENS-REINIGER-VEIFA GES. FÜR MEDIZINISCHE TECHNIK M. B. H. Ger. 473,930, Oct. 27, 1925. The tube has a screen arranged near the focus.

**Röntgen-ray tube.** W. D. COOLIDGE (to British Thomson-Houston Co., Ltd.). Brit. 298,987, Oct. 18, 1927. In making tubes with a metal window close to the target, the window is electrostatically protected from electrons passing from the target. A tube is described having a window about a half mil in thickness and formed of ferrochrome contg. about 25% Cr, secured to the metal portion of the tube, with a metal grid interposed between the anode target and the window. Various structural details are described.

**Thermionic rectifier for Röntgen-ray apparatus, etc.** NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 299,098, July 22, 1927. Structural features.

**Thermionic valves.** FRANÇOIS PERI. Fr. 648,357, June 18, 1927.

**Thermionic valves.** MARCONI'S WIRELESS TELEGRAPH CO., LTD. Fr. 650,079, Feb. 23, 1928.

**Electron discharge tubes.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 648,859, Oct. 14, 1927.

**Electric discharge device (gaseous glow lamp).** A. W. HULL (to British Thomson-Houston Co., Ltd.). Brit. 298,906, Oct. 15, 1927. An indirectly heated cathode is used, which may comprise a Ni cylinder contg. heating coils and coated with BaCO<sub>3</sub> is heat-treated at temps. up to 1300° to render it active. Ba-coated Ni may be heated to near the m. p. of Ni. Various structural and elec. features are described.

**Incandescent cathode discharge tubes.** C. H. F. MÜLLER A.-G. Fr. 649,358, Feb. 21, 1928.

**Anti-cathodes.** WESTINGHOUSE LAMP CO. Ger. 472,661, Dec. 18, 1921. Anti-cathodes for Röntgen-ray tubes are made from U or Th or their alloys, with or without other heavy metals, by heating the metals or their salts for a long period in powd. form in a high vacuum in a high-frequency induction furnace.

**Automatic tilt-start device for mercury-vapor rectifiers.** "ELIN" A.-G. FÜR ELEKTRISCHE IND. (Wilhelm Ganster, inventor). Austrian 112,317, Oct. 15, 1928.

**Multistage mercury-vapor pump for high vacuums.** AKTIEN-GESELLSCHAFT BROWN, BOVERI & CIE. Swiss 130,468, Feb. 1, 1928.

**Burner for mercury-vapor lamps.** QUARZLAMPEN-GESELLSCHAFT. Fr. 649,672, Feb. 24, 1928.

**Furnace.** WM. BROWN. Ger. 473,932, May 2, 1926. A smoke-consuming furnace has a gas flame inserted in the conduit leading off the smoke and flue gas.

**Furnace.** WALTHER & CIE. A.-G. Ger. 472,856, July 18, 1924. A furnace for damp fuel has a mechanically operated fire chamber, a drying shaft and air conduits.

**Furnace.** SOCIÉTÉ "SIDÉROFOURS." Ger. 472,920, July 19, 1925. A regenerative gas furnace with a reversible flame direction and an artificially increased air velocity is described.

**Furnace.** ERNST VÖLCKER. Ger. 474,302, Jan. 1, 1926. A furnace having a stepped or inclined grate is provided with means for feeding a supplementary supply of powd. fuel along the length of the grate and means for supplying air under pressure below the lowest part of the grate.

**Furnace.** CATO VAN VOLLENHOVEN GEB. JONKERS. Ger. 472,926, Feb. 10, 1926. Gas, coal dust and like fuels are burned in a cylindrical chamber into which they are led by tubes tangential to the chamber.

**Furnaces.** EUGEN ROOSCHÜZ. Ger. 474,684, May 18, 1927. Addn. to Ger. 473,747. A series of disks in the central canal arrest the smoke and enable it to be removed.

**Furnaces.** WILHELM SCHUSTER. Ger. 472,917, June 13, 1928. A shaft or roasting furnace has a pyrometer built into a recess in the walls.

**Furnaces.** ALLGEMEINE ELEKTRICITÄTS-GES. (Friedrich Reinhardt, inventor). Ger. 474,596, May 7, 1926. The fire chamber walls of a coal-dust furnace are water cooled.

**Furnaces.** LOUIS E. PINOCHE. Fr. 649,915, Aug. 1, 1927. A description is given of a continuous rotating furnace in which the material is passed through by means of a screw; it is indirectly heated.

**Furnaces.** HEINRICH KOPPERS A.-G. Fr. 649,471, Feb. 3, 1928. Construction of hearth for gas and coke furnaces.

**Furnaces.** M. H. DETRICK CO. Fr. 649,418, Jan. 18, 1928. Construction of suspended roof in independent sections.

**Furnace with observing window.** VASTINE ENGINEERING PRODUCTS CORP. Ger. 474,617, Aug. 8, 1926.

**Furnace with a series of fixed and a series of movable rods.** MANUEL E. IRIZAR. Ger. 472,773, Nov. 4, 1926.

**Furnace with cooling chambers in the walls.** STETTINER CHAMOTTE-FABRIK A.-G. VORM. DIDIER. Ger. 474,616, June 30, 1926.

**Annealing furnace.** OTTO BASSON. Ger. 474,940, Aug. 25, 1927. The doors are coupled so that on opening one, the other is automatically closed.

**Annealing furnace.** HIRSCH, KÖPFER-UND MASSENGWERKE A.-G. and MANUEL TAMA. Fr. 649,816, Feb. 25, 1928. Charging frame on wheels.

Annealing and hardening furnace. AKTIEN-GESELLSCHAFT BROWN, BOVERI & CIE. Swiss 130,010, Nov. 4, 1927.

Automatically acting annealing furnace. AKTIEN GESELLSCHAFT BROWN, BOVERI & CIE. Fr. 650,005, Nov. 7, 1927.

Revolving tube furnace. JOHN KEITH. Ger. 473,506, July 14, 1925. Details of construction.

Shaft furnace with a flat fire chamber. JOSEF KNOTHE. Ger. 472,695, Sept. 9, 1925. Details of arrangement.

Shaft furnace for powdered fuel. ERNST C. LOESCHE. Ger. 474,727, Oct. 20, 1926. Details of construction.

Refuse-destructer furnace. C. H. WECK COMM.-GES., MASCHINENBAU-ANSTALT HUMBOLDT and MUSAG GES. FÜR DEN BAU VON MÜLL- UND SCHLACKENVERWERTUNGS-ANLAGEN A.-G. Ger. 473,482, Sept. 23, 1925. A horizontal grate is arranged in advance of a mechanically moved inclined grate. The horizontal grate comprises longitudinal stepped parts moved independently of the inclined grate.

Radiation furnace. ELEKTRISCHE KOCH- UND HEIZAPPARATE H. & S. STEINBERGER. Ger. 474,092, Dec. 9, 1927.

"Soaking-pit" furnaces. FORREST W. MANKER (to Surface Combustion Co.). U. S. 1,711,273-4, April 30. Structural features.

Furnace for generator gas. GIULIO ALLIATA. Swiss 130,112, Dec. 1, 1927.

Furnace for burning, roasting and sintering operations. E. C. LOESCHE. Brit. 298,651, Oct. 14, 1927. The flame from a burner is directed onto a heap of material which is continuously maintained and renewed by an underfeed device.

Furnace burning finely powdered fuel. PEABODY ENGINEERING CORP. Fr. 649,809, Feb. 25, 1928. The fuel is caused to traverse a spiral path in the tube leading to the combustion chamber and enters the chamber in a relatively thin layer round the periphery of the end of the tube.

Burner for powdered coal. JAY G. COUTANT. Fr. 649,680, June 16, 1927.

Burner for powdered fuel. CARL HOLD. Ger. 473,340, May 22, 1924; 473,341, Oct. 11, 1924; 473,342, Oct. 14, 1924; 473,343, Nov. 23, 1924 and 473,344, Nov. 23, 1924. Addns. to 472,412. The burner described in Ger. 472,412 (C. A. 23, 2329) is modified in that (1) a no. of supplementary, individually regulable, air-addn. nozzles is provided in the upper part (473,340); (2) the bottom of the combustion chamber is closed by a rotating perforated hollow drum (473,341); (3) an internally cooled breast piece extends into the combustion chamber (473,342); (4) plates corresponding in shape to the combustion chamber are arranged between the chamber and the surrounding masonry (473,343); (5) the lower part of the combustion chamber wall is made hollow and cooled with air or water (473,344).

Burner for oil and powdered fuel. SOC. FRANÇAISE DES CONSTRUCTIONS BABCOCK ET WILCOX. Fr. 649,509, Feb. 14, 1928.

Burners for liquid or gaseous fuel. PAUL LINKE. Fr. 648,839, June 29, 1927.

Oil furnace with an electrically operated burner. WILLIAMS OIL-O-MATIC HEATING CORP. Ger. 473,748, Dec. 8, 1926.

Oil burner. AKTIEN GESELLSCHAFT PRIOR PATENTVERWERTUNGS-GES. Ger. 473,481, July 5, 1927. Air is admitted to a cup-shaped oil burner through 2 superposed series of holes in the side wall, each hole in the upper series being horizontal and each in the lower series inclined so that its axis meets the bottom of the burner.

Oil burner. WILLIAMS OIL-O-MATIC HEATING CORP. Ger. 473,233, Aug. 21, 1926. See Brit. 268,209.

Gas-supply control for oil burners. WALTER W. WILLIAMS (to Williams Oil-O-Matic Heating Corp.). U. S. 1,711,436, April 30. An app. is described suitable for controlling gas supply for ignition of the oil.

Gas furnaces. STEIN- UND THON-IND.-GES. "BROHLTHAL" A.-G. Ger. 474,816, June 6, 1926. Burners for industrial gas furnaces are formed with gas nozzles at an angle to the axis of the burner, and surrounding the air nozzle.

Gas burner. WM. A. BECKETT. U. S. 1,710,964, April 30.

Gas burner. THEODORE A. SALA. U. S. 1,710,841, April 30.

Gas burner. REONIER EICKWORTH. U. S. 1,710,726, April 30.

Gas burner. FREDERICK H. WILCOX (to Fryn Engineering Co.). U. S. 1,711,256, April 30. A burner is described suitable for blast-furnace stoves or gas-fired boilers.

Compressed gas burner. SELAS A.-G. Ger. 474,788, Dec. 16, 1925. Addn. to Ger. 419,471.

Spray burner. ERIC S. DREW and ALEXANDER B. S. LAIDLAW. Ger. 473,232, Aug. 14, 1926. See Brit. 260,668.

**Spray burner for liquid hydrocarbons.** FIRMA J. AICHELIN and CARL HUMMEL. Ger. 474,685, May 24, 1927.

**Furnace-efficiency indicator.** CARL M. GRISAR. Ger. 473,241, July 21, 1926. A scale is described on which the CO and CO<sub>2</sub> contents of the waste gases and the excess of O or air are mech. indicated in accordance with analyses of the gases.

**Furnace-efficiency indicator.** GUSTAV ROTH. Ger. 474,348, Nov. 1, 1925. An indicator moves over a table in accordance with impulses received from 2 independent measuring instruments, *e. g.*, from meters for the fuel supply and the CO<sub>2</sub> content of the flue gases, or, more simply, from meters for the draft and the resulting temp. The app. described includes elec. recording means.

**Method of regulating furnaces by means of pressure.** SMOOT ENGINEERING CORP. Fr. 649,304, Dec. 16, 1927.

**Device for regulating the cooling of furnace parts.** ERICH ROUCKA. Ger. 473,531, Apr. 29, 1926.

**Apparatus for controlling combustion in furnaces.** WM. M. HEPBURN (to Surface Combustion Co.). U. S. 1,710,772, April 30. The presence of unconsumed air in the furnace flue gas serves to actuate a control device restricting the air supply to the furnace, and the presence of unconsumed fuel in the flue gas serves to increase the air supply. Various details of the app. are described.

**Apparatus for damping the fuel in a charging funnel of a furnace.** ERICH ROUCKA. Ger. 473,529, Sept. 4, 1926 and Ger. 473,530, Sept. 3, 1926.

**Mechanical stoker.** C. H. WECK COMM.-GES. Ger. 473,484, Dec. 16, 1926.

**Loading device for furnaces.** EDGAR E. BROSIUS. Ger. 472,921, Feb. 12, 1926.

**Loading device for annular kilns.** THOMAS STÖLZLE. Ger. 473,507, Mar. 18, 1927. Details of construction.

**Discharging means for tubular driers for brown coal, etc.** JOSEF KÜPPER. Ger. 474,070, Mar. 17, 1928.

**Stirrer for step grates.** THEODOR LANG. Ger. 474,446, Feb. 9, 1928.

**Construction of furnace walls.** ERNST JÜRGES. Ger. 474,420, Sept. 27, 1925.

**Water-tube boiler.** CHRISTOPH HERMANN & SOHN and JOSEPH JÜNGER. Ger. 472,745, Mar. 16, 1927. The lower series of tubes are coated with fireproof material.

**Heat-exchange apparatus.** T. R. CAVE-BROWNE-CAVE. Brit. 299,085, July 21, 1927. A construction is described suitable for heating of a boiler or the like by waste gases from an internal-combustion engine.

**Heat regenerators.** HEINRICH SCHMIDT. Ger. 474,142, Apr. 24, 1927. Regenerators are packed with fillers sufficiently light to be fed in by compressed air and removed, when required, by suction.

**Regenerative chamber kiln.** C. OTTO & CO., G. M. B. H. Ger. 472,678, Mar. 15, 1927. Addn. to 466,752 (C. A. 23, 1535).

**Reaction chambers.** SOC. GÉNÉRALE METALLURGIQUE DE HOBOKEN. Fr. 649,664, Feb. 24, 1927. Filling material for reaction towers, etc., consists of bricks or the like having a cross section between the top and bottom surfaces less than these surfaces, the sides being provided with grooves.

**Apparatus for effecting catalytic reactions.** ASSOC. PARISIENNE POUR L'IND. CHIM. (Edouard Desparmet, inventor). Fr. 650,099, Aug. 8, 1927. An app. is described for constantly renewing the surface of contact of the catalyst; it consists of paddles rotating on a central axis in a cylinder.

**Hydraulic closing device for a vertical distilling retort.** JULIEN PIETERS. Ger. 474,877, Mar. 23, 1928. Details of arrangement.

**Apparatus for reflux distillation, evaporation, or rectification.** I. G. FARBERIND. A.-G. Brit. 299,084, July 20, 1927. Structural features.

**Apparatus for spray-dsecication of liquids.** D. M. A. G. HAWES. Brit. 298,524, July 8, 1927. Structural features.

**Apparatus for making solid carbon dioxide.** DRYICE CORP. OF AMERICA. Fr. 649,483, Feb. 7, 1928.

**Apparatus for producing solid carbon dioxide.** JEAN H. J. VIEILLARD. Fr. 649,395, Oct. 27, 1927 and Fr. 649,396, Oct. 28, 1927.

**Valve for regulating the removal of oxygen from liquid-air apparatus.** FRANKFÜRTER MASCHINENBAU A.-G. VORM POKORNY & WHITTEKIND and VIKTOR FISCHER. Ger. 473,864, Sept. 12, 1925.

**App. for the rectification of liquid air and other liquefied gases.** E. BARDET & FILS & CIE. Ger. 472,950, Feb. 11, 1921.

**Cooling apparatus.** SIEMENS-SCHUCKERTWERKE A.-G. (Edmund Altenkirch,

inventor). Ger. 473,729, April 21, 1923. A natural cooling app. is described having a number of small interconnected evap. chambers.

Cooling flask for the preparation of lampblack. HERM. F. WELLHAUSER. Ger. 474,568, Oct. 23, 1927. The flask has thick conical interfitting plates mounted on parallel axes, for splitting up the flame.

Pressure regulator in a closed circuit crystallization plant. METALLBANK UND METALLURGISCHE GESELLSCHAFT A.-G. Fr. 650,067, Feb. 16, 1928.

Air and furnace gas circulating system for drying chambers. N. G. MOREIRA (to B. Penteado & Co.). Brit. 298,916, Oct. 14, 1927.

Apparatus for drying macaroni or other materials. JOSEPH TRIULZI (to Braly Mfg. Co.). U. S. 1,711,188, April 30. Structural features of a rotatable drum app.

Kiln for drying lumber or other materials. HENRY H. PAYZANT. U. S. 1,711,100, April 30. Structural features.

Device with a manometer and electrical connections for controlling vacua. GENERAL ELECTRIC CO., LTD., and E. WEINTRAUB. Brit. 298,875, Jan. 5, 1928.

Automatic neutralizing machine for fuller's earth. OSKAR BURGHARDT. Ger. 472,958, March 3, 1928. The fuller's earth and lime are ground up and mixed in a milling machine.

Apparatus for mixing foundry sand, clay, or other materials. A. B. SMITH and C. R. SMITH. Brit. 298,929, July 16, 1927.

Centrifugal apparatus for treating metal articles coated by immersion. HANS HOFER (to Verzinkerei Zug A.-G.). U. S. 1,711,389, April 30. An app. is described suitable for removing surplus coating metal.

Thermostatic signal device. CARL F. WENTZEL. U. S. 1,711,335, April 30. Structural features of an elec. signal system.

Thermostatic electric switch. ALLGEMEINE ELEKTRICITÄTS-GES. (to International General Electric Co.). Brit. 298,897, Oct. 15, 1927. Structural features.

Thermostatic plug for electric appliances. GEORGE W. UFFORD and HARALD E. ALLEN (to Safegard Electric Appliance Co.). U. S. 1,710,955, April 30. Structural features.

Thermostatic valve suitable for use with heating radiators. FRANK L. HUTCHINSON. U. S. 1,710,875, April 30.

Thermostatic device for control of gas supply to gas jets. JOHN A. SPENCER (to Spencer Thermostat Co.). U. S. 1,711,400, April 30.

Thermostatic pilot cut-off for gas burners. ROBERT F. BOGER (to Spencer Thermostat Co.). U. S. 1,711,443, April 30. Structural features.

Thermostatic pilot cut-off for gas burners. JOHN A. SPENCER (to Spencer Thermostat Co.). U. S. 1,711,430, April 30. Structural features.

Thermostatic control and pilot cut-off for gas burners such as those of water heaters. RUFUS H. MAURER (to Spencer Thermostat Co.). U. S. 1,711,420-1, April 30. Structural features.

Thermostatic control for fuel such as gas supplied to the burner of refrigerating or other apparatus. ROBERT F. BOGER (to Spencer Thermostat Co.). U. S. 1,711,403, April 30. Structural features.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

William Higgins, a pioneer of the atomic theory. J. REILLY AND D. T. MAC-SWENEY. *Sci. Proc. Roy. Dublin Soc.* 19, 139-57(1929).—Historical. E. H.

Nomography. Nomogram for English and metric measures. OTTO LIESCHKE. *Chem. Fabrik* 1929, 124-5; cf. *C. A.* 23, 1536.—Parallel scales are shown with a guide line between them upon which are indicated points through which lines may be drawn to find such eqivs. as sq. ft.—sq. cm., barrels—cu. m., miles—km., etc.

W. C. EBAUGH

New regularities among the ionic radii of the elements. A. M. BERKENHEIM. *Z. physik. Chem., Abt. A*, 141, 35-40(1929); cf. *C. A.* 22, 4338.—By comparing the ionic dimensions (detd. by Goldschmidt) of those elements occurring in the same series of the periodic table, B. ascertained certain regularities which are virtually a quant. extension of Mendelyev's periodic law. The ionic radii of elements (pos. as well as neg. ions) occurring in the same horizontal period appear as an arithmetical series with a const. difference between the values for the different elements. This const. difference has a different value for each series. E. g.: to the ions  $C^{4+}$ ,  $B^{3+}$ ,  $Be^{2+}$ ,  $Li^{+}$  corresponds the series 1, 2, 3, 4; to Ne and the ions  $F^{-}$ ,  $O^{2-}$ , the series 10,  $9\frac{1}{2}$ ,  $8\frac{1}{2}$ , etc.; also to the ions  $C^{4+}$ ,  $Si^{4+}$ ,  $Ti^{4+}$ ,  $Zr^{4+}$ ,  $Ce^{4+}$ , the series 1,  $2\frac{1}{2}$ , 4,  $5\frac{1}{2}$ ,  $6\frac{1}{2}$ . B. plans to use these relationships to calc. undetd. ionic radii and from these values, the energy of electrostatic attraction in binary compds.

W. C. FERNELIUS

Researches on the melting curves of helium. I. FRANZ SIMON, MARTIN RUHEMANN AND W. A. M. EDWARDS. *Z. physik. Chem., Abt. B*, 2, 340-4(1929).—The  $p$ - $t$  diagram for solid He-liquid He was detd. from  $T = 12.15$  to  $20.20^{\circ}$  K., for which  $p$  varies from 827 to 1826 kg./sq. cm. The m. p. was very definite. The equation  $\log_{10} p$  (in kg./sq. cm.) =  $1.5537 \log_{10} T + 1.233$  satisfies the exptl. values to within 0.3%. Extrapolation to lower temps. gives values differing from those of Keesom by 10% (*C. A.* 21, 1386). (This may be due to the 2 phases of liquid He observed by Keesom.) The equation  $\log_{10} (p + 17) = 1.5544 \log_{10} T + 1.236$  agrees within 1% with both the present work and Keesom's data. Heats of fusion/cc. are 3.7 at  $16^{\circ}$  K.; 4.2 at  $17^{\circ}$  K.; 4.2 at  $18.6^{\circ}$  K. Further work is now in progress. W. E. V.

The specific heat of molybdenum from  $250^{\circ}$  to  $-40^{\circ}$ . D. COOPER AND G. O. LANGSTROTH. Dalhousie Univ., Halifax. *Phys. Rev.* 33, 243-8(1929).—By the use of a long covered tube in the calorimeter proper of an ordinary Richards adiabatic calorimeter, values for the heat capacities of metals from high temps. may be obtained, even when the falling body is not protected from radiation losses by a metal jacket. The exptl. procedure for such a detn. is given. A calorimeter arrangement in which the metal was first partially cooled in the calorimeter and then allowed to come into contact with the water of the calorimeter proved unsuitable as is shown. The sp. ht. of Mo between the temps. of  $-30^{\circ}$  and  $300^{\circ}$  are given by the following equation with an accuracy of about 1%:  $C_p = 0.0593 + 0.000013 (T + 40) - 0.0265/(T + 40)^{1.66}$ . Stern's (*C. A.* 23, 326) equation, which is linear, agrees with the values given between  $50^{\circ}$  and  $300^{\circ}$ . Below  $50^{\circ}$  the curve shows a decided bend. BERNARD LEWIS

Thermal conductivity of lead and of single- and poly-crystal zinc. C. C. BIDWELL AND E. J. LEWIS. Lehigh Univ. and Cornell Univ. *Phys. Rev.* 33, 249-51(1929).—The thermal conductivities of Pb and of single- and poly-crystal Zn over the temp. range  $-250^{\circ}$  to  $100^{\circ}$  detd. by a method previously described by Bidwell (*C. A.* 21, 355) are reported upon. The thermal cond. increases for these metals as the temp. is lowered but shows no extraordinary increase at extremely low temps. as was found for Li. The single-crystal Zn shows about 18% better thermal cond. than the poly-crystal sample. A Zn sample cast in open air showed about 7% poorer cond. than a sample prepd. *in vacuo*. The data are in agreement with the law  $k/aC = K/T + K'$ . B. L.

Electrode potential of nickel. III. Mechanism of the re-activation of the passive state of nickel. KWANJI MURATA. *Tech. Repts. Tohoku Imp. Univ.* 8, 209-20(1929).—See *C. A.* 23, 1558. E. C. M.

The change of electrical conductivity in strong magnetic fields. I. Experimental results. P. KAPITZA. *Proc. Roy. Soc. (London)* A123, 292-341(1929).—The change of resistance in a transverse magnetic field up to 300,000 gaussas at room temp., at the temp. of solid  $CO_2$  and ether and at the temp. of liquid N was measured in metals of each of the groups of the periodic table which include: Li, Na, Cu, Ag, Au, Be, Mg, Zn, Cd, Hg, Al, Ga, In, Tl, C, Ti, Ge, Zr, Sn, Pb, Th, V, As, Sb, Bi, Ta, Cr, Mo, Te, W, Mn, Fe, Ni, Pd and Pt, in a Au-Ag alloy and in CuAs. The app. was similar to that used in earlier expts. (cf. *C. A.* 22, 3342), with a specially wound transformer added to the

circuit when the resistance of the conductor was too small to obtain larger deflections in the oscillograph with the same current. The change of resistance in a parallel field was measured for Cu, Cd, Al, Ga and Mo. The increase of resistance,  $\Delta R/R$ , in all the metals is proportional to the square of the magnetic field in fields up to 60,000 to 100,000 gauss, and in stronger fields follows a linear law,  $\Delta R/R$  being proportional to  $H$ . The sources, analyses, and details of prepn. of the sep. metals for measurement are given. Phys. change produced in a conductor by hardening and annealing and by transformation to polymorphic modifications influences the change of resistance as well as other properties. Impurities tend to reduce the change of resistance. II. The analysis and the interpretation of the experimental results. *Ibid* 342-72.—The change of resistance follows the linear law with increasing magnetic field and is masked in weaker fields by initial disturbances in the metal distributed at random throughout the conductor. When the disturbance produced by the outside field grows larger than that of the inside field, there is a gradual approach to a linear law. Corresponding to the external and internal disturbances are the ideal and addnl. resistances, resp. Formulas are deduced, agreeing with the exptl. facts, which permit an evaluation of these sep. resistances and it is shown that while the addnl. resistance is independent of temp. the ideal resistance has a const. value for a given temp. for each metal. The addnl. resistance is equal to the residual resistance which is observed close to abs. zero. A periodicity appears in the variation of the coeff. of the linear law with the position of the metal in the periodic system. The observed phenomena are not adequately explained by the existing theories for change of resistance such as deflection of the paths of free electrons, alteration of the no. of free electrons, irregularity in the crystal lattice, and disturbance of crystal lattice due to foreign atoms. K. favors the hypothesis that the magnetic field increases the scattering power of each atom by disturbing the symmetry of its structure which decreases the free path of an electron and thus increases the resistance.

H. W. WALKER

**Magnetic susceptibility of certain praseodymium sulfate solutions.** ORAZIO SPECCHIA. *Nuovo cimento* [N. S.] 5, 432-40(1928); cf. C. A. 22, 3823.—S. describes an interference method for the measurement of magnetic susceptibility. Two vessels connected by a tube contain the soln. under examn. which rises to a common height in each. One vessel is placed between the poles of an electromagnet. When a magnetic field is induced there is a movement of the liquid from one vessel to the other. The resulting change in the liquid level is measured by interference methods. In this the magnetic susceptibility of various solns. of  $\text{Pr}_2(\text{SO}_4)_3$  was measured and the no. of Bohr magnetons of  $\text{Pr}^{+++}$  found by calcn. from the results to be 3.56.

L. T. FAIRHALL

**Rotatory magnetic power in an anisotropic medium.** R. DE MALLEMANN. *Compt. rend.* 188, 863-5(1929); cf. C. A. 20, 1556; 21, 2419, 3014.—A theoretical discussion. The anisotropic rotatory magnetic power results from the anisotropy of refraction of the electrons, atoms, or mols. The relations of the 3 principal rotations are functions of the intermol. birefringence.

H. W. WALKER

**The electric dipole moment of pentaerythritol by means of the molecular ray method.** J. ESTERMANN. *Univ. Hamburg. Z. physik. Chem., Abt. B*, 2, 287-8 (1929); cf. C. A. 23, 2081.—Because of the insufficient soly. of pentaerythritol in dipole-free solvents, it could not be investigated by the usual method. However, by comparison of the deflections in a non-homogeneous elec. field of mol. beams of both the pentaerythritol and benzophenone, the dipole moment of the former has been found to be in the neighborhood of  $2 \times 10^{-18}$  c. g. s. units.

**The electromotive force of the reversible cell in a non-aqueous solution.** TAKEKO YOSHIDA. *Science Repts. Tôhoku Imp. Univ.*, 1st. ser. 17, No. 7, 1279, 87(1928).—See C. A. 22, 1893.

E. C. M.

**The structure of crystals.** J. M. BIRVOGT. *Chem. Weekblad* 26, 158-63(1929).—A lecture.

B. J. C. VAN DER HOEVEN

**Crystallization at the surface of fused masses.** A. SHUBNIKOV AND G. LÄMMLIN. *Z. Krist.* 67, 329-38(1928).—When seed crystals are introduced at a point on the surface of supercooled fused phenyl salicylate they spread rapidly with increasing velocity and at the same time develop into spherulites. An explanation is given.

L. S. RAMSELL

**Recrystallization of single crystals of aluminum.** W. G. BURGERS AND J. C. M. BASART. *Z. Physik* 54, 74-91(1929); cf. C. A. 23, 806.—Small Al single crystals are deformed by rolling. The crystal structure so produced is studied by Debye-Scherrer pictures. The relative position of the single crystal and the application of the deforming force det. the resulting structure after rolling. Heating for a few seconds (600°) produced a definite crystal system with a preferred orientation.

G. G.

**An experimental study of the growth of zinc crystals by the Czochralski-Gomperz method.** A. G. HOYEM AND E. P. T. TYNDALL. Univ. of Iowa. *Phys. Rev.* **33**, 81-9(1929).—The conditions necessary to grow Zn single crystals of 2.7 mm. diam. and of any desired orientation are detd. experimentally. When a const. rate of growth is used and the crystal is initially given the desired orientation by starting it on a suitable nucleus the detg. factor for the successful growth of a single-crystal rod 10 cm. or more in length is found to be the temp. gradient existing in the column of liquid Zn just below the growing crystal. The appropriate temp. gradient is a function of the orientation of the crystal. It is depicted graphically in a figure which shows the upper and lower limiting curves for the region of successful growth when the rate of growth is 1.2 cm./min. Attempts to grow crystals outside of the appropriate region result in sudden or gradual changes to new orientation. In the latter the orientation shifts gradually through a considerable range. Illustrations are given of such changes.

BERNARD LEWIS

**The crystal form of magnesium tungstate.** F. MACHATSCHKI. *Z. Krist.* **67**, 163-5(1928).— $\text{MgWO}_4$  is isomorphous with Mn and Fe tungstates. Crystals with a prismatic development several mm. long and 0.5 mm. wide were measured with the following results: monoclinic prismatic,  $a:b:c = 0.8263:1:0.8703$ ,  $\beta = 89^\circ 40'$ . The most common forms were 100, 010, 110, 011, 121 and  $\bar{1}21$ . L. S. RAMSDELL

**Crystalline structure of some phosphides of bivalent and of tervalent metals.** L. PASSERINI. Reale Politecnico, Milano. *Gazz. chim. ital.* **58**, 655-64(1928).—The present work is part of a systematic series of expts. dealing with (1) the variations in the cryst. structure of compds. of the  $A_2B_3$  type when A or B is replaced by another element with a different atomic diam., and (2) the relations between the structure of  $A_2B_3$  compds. and the diams. of the substituent atoms. The present paper is also of importance because of the data obtained on the diameter of the neutral P atom. The phosphides examd. by x-rays included  $\text{Zn}_3\text{P}_2$ ,  $\text{Cd}_3\text{P}_2$ ,  $\text{Mg}_3\text{P}_2$  and  $\text{AlP}$ .  $\text{Zn}_3\text{As}_2$ ,  $\text{Cd}_3\text{P}_2$  and  $\text{Mg}_3\text{P}_2$  crystallize in the cubic system, with a non-ionic structure of the  $\text{Zn}_3\text{As}_2$  type, the coordinates being: metal:  $(\frac{1}{2}, \frac{1}{2}, 0)$ ;  $(\frac{1}{2}, 0, \frac{1}{2})$ ;  $(0, \frac{1}{2}, \frac{1}{2})$ ;  $(\frac{1}{2}, 0, 0)$ ;  $(0, \frac{1}{2}, 0)$ ;  $(0, 0, \frac{1}{2})$ . P:  $(\frac{1}{4}, \frac{1}{4}, \frac{1}{4})$ ;  $(\frac{3}{4}, \frac{1}{4}, \frac{3}{4})$ ;  $(\frac{1}{4}, \frac{3}{4}, \frac{3}{4})$ ;  $(\frac{3}{4}, \frac{3}{4}, \frac{1}{4})$ . The elementary cells contain 2 mols. For  $\text{Zn}_3\text{P}_2$ ,  $a = 5.68$  A. U., the calcd. d. is 4.678, the distance between the Zn and P atoms is 2.46 A. U., and on the assumption that the radius of a Zn atom is 1.33 A. U., the radius of the neutral P atom is 1.13 A. U. For  $\text{Cd}_3\text{P}_2$ ,  $a = 6.06$  A. U., the calcd. d. is 5.956, the distance between the Cd and P atoms is 2.46 A. U., and on the assumption that the radius of a Cd atom is 1.49 A. U., the radius of the neutral P atom is again 1.13 A. U. For  $\text{Mg}_3\text{P}_2$ ,  $a = 5.92$  A. U., the calcd. d. is 2.162, the distance between the Mg and P atoms is 2.56 A. U., and if the radius of a Mg atom is 1.62 A. U., the radius of a neutral P atom is 0.94 A. U.  $\text{AlP}$  belongs to the cubic system, with a structure of the blende type. Its  $a$  value is 5.42 A. U.; the calcd. d. is 2.424; the distance between an Al and a P atom is 2.34 A. U., and if the radius of an Al atom is 1.43 A. U., the radius of a neutral P atom is 0.91 A. U. C. C. DAVIS

**X-ray analyses of cadmium arsenide and of arsenious anhydride.** L. PASSERINI. Reale Politecnico, Milano. *Gazz. chim. ital.* **58**, 775-81(1928); cf. preceding abstr.—The expts. are a continuation of a study to det. the structural changes in  $A_2B_3$  compds. brought about by substitution of A or B by elements of different at. diams. and the relations between the dimensions of the substituent atoms and the cryst. structure. X-ray examn. of  $\text{As}_2\text{O}_3$ , already studied by Bozorth (C. A. **17**, 3434) in a different way, gave the opportunity to det. the sensitivity of the powder method for a structure with elementary cells of very large dimensions, to confirm the size of the cells of the metallic arsenides, and to det. precisely the lattice dimensions of  $\text{As}_2\text{O}_3$ .  $\text{Cd}_3\text{As}_2$  crystallizes in the cubic system, with a non-ionic structure of the  $\text{Zn}_3\text{As}_2$  type, defined by the coordinates: Cd:  $(\frac{1}{2}, \frac{1}{2}, 0)$ ;  $(\frac{1}{2}, 0, \frac{1}{2})$ ;  $(0, \frac{1}{2}, \frac{1}{2})$ ;  $(\frac{1}{2}, 0, 0)$ ;  $(0, \frac{1}{2}, 0)$ ;  $(0, 0, \frac{1}{2})$ . As:  $(\frac{1}{4}, \frac{1}{4}, \frac{1}{4})$ ;  $(\frac{3}{4}, \frac{1}{4}, \frac{3}{4})$ ;  $(\frac{1}{4}, \frac{3}{4}, \frac{3}{4})$ ;  $(\frac{3}{4}, \frac{3}{4}, \frac{1}{4})$ . The dimension of the elementary cell  $a$  is 6.29 A. U. The cell contains 2 mols. and the calcd. d. is 6.495. The distance As-Cd is 2.723 A. U. With the powder method, the structure of the cubic modification of  $\text{As}_2\text{O}_3$  was found to be the same as that found by the Laue method and by the rotating-crystal method of Bozorth. The dimension of the elementary cell is 11.08 A. U. The cell contains 16 mols. of  $\text{As}_2\text{O}_3$ , and the calcd. d. is 3.851. The distance As-O is 2.016 A. U. Based on these data and a radius of 1.32 A. U. for the O ion, calcns. show that the radius of the  $\text{As}^{+++}$  ion is 0.666 A. U.

C. C. DAVIS

**Importance of crystal-structure imperfections in understanding the technical properties of industrial materials that are alterable.** ADOLF SWEHAL. *Metallwirtschaft* **7**, 776-82(1928).—The elastic and thermal properties and a series of optical

regularities of materials are the result of the lattice arrangement of the atoms in crystals. The modulus of elasticity, sp. heat and energy of chem. cohesion can be detd. simply from the properties of the lattice. In no case as yet is it possible to interpret those technical properties that can be altered by the use of the lattice theory. The ideal crystal possesses technical properties that cannot be influenced in any way. Deviations from the ideal lattice structure can be concerned with only a proportionally small fraction of the crystal atoms. Such deviations are detected by optical and elec. cond. methods. There are 2 kinds of crystal structure formations for every crystal: first, the lattice atom formation, and second, a far less frequent kind which is identical with the first only from a chem. viewpoint. The latter atoms show a much greater energy content than the lattice atoms because of the looseness with which they are bound to the lattice structure. These atoms are called loose atoms and their orbits "loose positions" or voids of the crystal. In such an orbit the ideal regularity of the space lattice structure is distorted. Every real crystal must be built of lattice and loose atoms. The rupture strength of an imperfect real crystal is 100 to 1000 times smaller than for an ideal crystal, since it lacks homogeneity due to voids. The strain distribution in the immediate region of the voids is not uniform; the notch effect of the voids results in high local strains. Premature rupture of the real crystal is conditioned by the voids. When a real crystal is plastically deformed the no. of loose atoms in the deformed portion of the crystal is increased about tenfold. Loose atoms which are most weakly bound wander into regions of greater bonding strength, where they become part of the lattice structure when the temp. is raised during the recryst. process. Minute addns. of foreign matter favor crystal imperfections by increasing the no. of voids. 0.001 to 0.01 atom % of the foreign atoms is distinctly effective in the wedging action to prevent slip within the crystal. C. H. LORIG

The change in lattice spacing at a crystal boundary. J. E. LENNARD-JONES and BERYL M. DENT. Univ. Bristol. *Proc. Roy. Soc. (London)* A121, 247-59(1928); cf. C. A. 22, 1258.—Davisson and Germer (cf. C. A. 22, 350) have found it necessary to postulate a contraction of as much as 30% at the surface of a crystal in order to interpret the results of their expts. on the reflection of electrons from crystals. In view of this the authors have calcd. by an independent method the contraction at the boundary of several crystals of the NaCl type. The upper limit of contraction was found to be of the order of 5%. The results of D. and G. are more satisfactorily explained by supposing that the electrons are refracted in the crystal in an optical sense with an index of refraction greater than unity. A. J. KING

Test of crystals for piezoelectricity. S. B. ELINGS AND P. TERPSTRA. *Z. Krist.* 67, 279-84(1928).—The piezoelec. effect should be observed only in those symmetry classes lacking a center of symmetry. Crystals from 16 different classes were tested. Neg. results were obtained with diamond, zincite, benitoite, wulfenite, carborundum, S and  $K_2Cr_2O_7$ . Pos. results were obtained from sphalerite, boracite, K and Na bromate,  $KLiSO_4$ , nephelite, cinnabar,  $Hg(CN)_2$ ,  $KH_2PO_4$ ,  $KH_2AsO_4$ ,  $NH_4H_2AsO_4$ , strychnine and strychnine sulfate, willemite, melinophane, hexamethylenetetramine, Na santonate, benzophenone, cinchonidine, glutamic acid, hippuric acid,  $NaSO_4 \cdot 7H_2O$ , Sr, Ba and Pb formates, iodic acid, tartar and tartar emetic, lactose,  $\alpha$ -rhamnose, glucosamine-HCl, scolecite, hematoxylin trihydrate,  $SrH_2(C_4H_4O_6)_3 \cdot 4H_2O$ . L. S. RAMSDELL

The behavior of insulating ionic crystals in electric fields. ADOLF SNEKAL. *Ans. Akad. Wiss. Wien* 64, 115-7(1927).—When an elec. field is applied to insulating ionic crystals (alkali halides, etc.), electrostatic expansion of the crystal lattice takes place, also electrolytic or electronic conduction. This latter is connected with the loosening of the space lattices. Both phenomena increase with increasing fields. S. contends that the elec. field causes a plastic deformation of the space lattice, producing more "loosening" of the ions in the space lattice (analogous to mechanical plastic deformation), which would lead to the known fact that the cond. of ionic crystals increases exponentially with the elec. field applied. I. J. PATTON

A method of increasing the accuracy of Debye-Scherrer photographs. A. E. VAN ARKEL. *Z. Krist.* 67, 235-8(1928).—The film is so placed that the higher-order lines are recorded near the middle of the film, and all measurements are made from these lines. By this method the following values were obtained: the side of the unit cube for C = 3.606, Ag = 4.077, Au = 4.070, Pt = 3.914, Rh = 3.794 and Si = 5.418. In a series of W-Mo alloys the values were W-100%, 3.1583; W-82.4%, 3.1551; W-73.2%, 3.1540; W-33.5%, 3.1460; W-0%, 3.1401. L. S. RAMSDELL

The determination of the thermal coefficient of expansion of crystallized salts. WILHELM KLEMM. *Z. Elektrochem.* 34, 523-8(1928); cf. C. A. 23, 746.—Preliminary

values for the expansion coeff. of 32 salts are given. These values are compared with those calcd. from the lattice theory. The deviation from expt. depends on coordination no. The product of the expansion coeff. and melting temp. is const. for salts of the same valence type. The ratio of the coeffs. of the crystal and its melt is const., for salts 0.39 and for metals 0.7.

F. R. BICHOWSKY

Physical purity and x-ray spectrograms. N. H. KOLKMEIJER. *Proc. Acad. Sci. Amsterdam* 31, 1028-9; *Verslag Akad. Wetenschappen Amsterdam* 37, 745-6; *Z. physik. Chem.*, Abt. A, 138, 311-12(1928); cf. *C. A.* 22, 1066.—Polemical in reply to Levi (*C. A.* 23, 745).

A. J. KING

Alums of organic bases. I. Alums of methylamine. A. QUILICO. Reale Politecnico, Milano. *Gazz. chim. ital.* 58, 682-90(1928).—The alums are peculiar in their isomorphic properties in that the isomorphism is retained even with the introduction of very heavy groups, e. g.,  $\text{NH}_4$  alum and tribenzylammonium alum are isomorphous. It was therefore thought that x-ray examn. of alums of org. bases would be especially fruitful in studying the effects of substitution. In the present work, the structures of  $\text{NH}_4$  alum and of  $\text{MeNH}_2$  alum were compared by the x-ray powder method and by the method of Laue. These alums have similar cryst. structures, with dimensions of the elementary cells of  $a = 12.16 \pm 0.02$  A. U. and  $12.44 \pm 0.02$  A. U., resp. The increase in the dimension of the cell on introducing the Me group makes doubtful the existence of some of the alums of org. bases described in the older literature.  $\text{MeNH}_2$  alum has accordingly a larger cell than that of any alum so far examd. by x-rays. The elementary cells of  $\text{NH}_4$  alum and of  $\text{MeNH}_2$  alum contain 4 mols. of  $\text{M}^+\text{M}^{++}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$ , from which the calcd. densities are 1.674 and 1.614, resp. Based on the increase of 0.28 A. U. in the dimension of the elementary cell by the substitution of Me for H, calcns. show a mol.-vol. of 18.67 cc. for the Me group, a value which agrees well with the data of Klemm and Klemm (cf. *C. A.* 21, 2824) on the mol. vols. of methyluric acids.

C. C. DAVIS

A quantitative study of the reflection of x-rays by sylvine. R. W. JAMES AND G. W. BRINDLEY. Manchester Univ. *Proc. Roy. Soc. (London)* A121, 155-71(1928); cf. *C. A.* 22, 2692.—The variation of the intensity of reflection of x-rays from KCl has been shown to be in quant. agreement with the Debye-Waller law from the temp. of liquid air to about  $400^\circ$  abs. At higher temp., the decrease of intensity with increasing temp. is much more rapid than the law indicates. The value of the temp. factor based on observations at room temp. and at liquid-air temp. agrees very well with that calcd. by Waller from the elastic consts. of the crystal, and also with the value calcd. from the Debye-Waller law using the characteristic temp. The abs. values of the intensity of reflection are in good agreement with those calcd. from the Schrödinger density distribution for  $\text{K}^+$  and  $\text{Cl}^-$  obtained by Hartree's method, if each element of the distribution is assumed to scatter classically, and if, in correcting for temp., the existence of zero-point energy is assumed.

A. J. KING

How does carbon dioxide behave under pressure? NORMAN W. KRASE AND J. B. GOODMAN. Univ. of Ill. *Chem. Met. Eng.* 36, 162-3(1929); cf. *C. A.* 22, 4284.—The use of compressed  $\text{CO}_2$  as an acid offers interesting possibilities. At moderate pressures and temps. it is possible to produce approx. 10%  $\text{AcOH}$  by displacement from a salt. There are possibilities for the use of carbonic acid in the prepn. of pure glucose, as well as other reactions involving H ions.

J. H. PERRY

The specific heat of gases and vapors. A critical review of methods and results. A. LEDUC. Univ. of Paris. *Chem. Reviews* 6, 1-16(1929).

ARTHUR FLEISCHER

Certain immediate thermodynamic consequences of quantitation of the ideal monatomic gas. G. POLVANI. *Nuovo cimento* [N. S.] 5, 256-64(1928).—P. explains the results obtained by the application of general equations of thermodynamics to Fermi's new equation of state for the ideal monatomic gas. In an adiabatic reversible transformation the internal energy of the gas is proportional to the abs. temp. In general the internal pressure to which the gas is subjected is always neg. The Joule-Thomson effect is independent of the sp. vol. and inversely proportional to the  $3/2$  power of the abs. temp. The difference between the sp. heat at const. pressure and that at const. vol. approaches zero proportionately to the cube of the abs. temp.

L. T. FAIRALL

The new quantistic theory of the ideal monatomic gas and Avogadro's law. G. POLVANI. *Nuovo cimento* [N. S.] 5, 307-9(1928).—Deviations from Avogadro's law in gas degeneration have been calcd. If 2 ideal monatomic gases occupy equal vols. under equal pressures at an infinitely low temp. the numbers of their mols. are related to the  $3/5$  power of their mol. (at.) wts., thus:  $N_1/N_2 = (m_1/m_2)^{5/4}$ .

L. T. F.

General form of the characteristic equation for the ideal monatomic gas. G.

POLVANI. *Nuovo cimento* [N. S.] 5, 331-40(1928).—P. derives the equation  $pV = NkT\theta$  as the characteristic equation for the ideal monatomic gas. In this  $p$ ,  $V$ ,  $N$ , and  $T$  have their usual significance,  $k$  is a const. and  $\theta$  is the total action possessed by the gas (that is, the product of the sum of the quantity of motion possessed by the mols. by the radius cubed of vol.  $V$ ) and  $\varphi$  is a function depending upon the statistical laws for the gas considered. Calc. shows that with different gases constituted of the same no. of mols. acquired by infinitely great degeneration ( $T, V \rightarrow 0$ ), the total action becomes equiv.

The thermodynamics of gases which show degeneracy (Entartung). GILBERT N. LEWIS AND JOSEPH E. MAYER. *Univ. Cal. Proc. Natl. Acad. Sci.* 15, 208-18 (1929).—Math. demonstration of the invalidity of Boltzmann's equation for distribution with respect to energy.

J. H. PERRY

The calculation of van der Waals' constant  $a$  from Dühring's specific factor  $q$  according to van Laar's vapor pressure relation. RICHARD LORENZ. *Z. anorg. allgem. Chem.* 179, 293-6(1929).—Van Laar has shown that the const. of van der Waals' equation can be derived from the expression for the vapor pressure of pure substances  $\ln p = -(A/T) - B \ln T + C - DT$ . This equation simplifies in a great many cases to:  $\ln p = -(A/T) + C$ . The abs. b. p. at pressure  $p_1$  is then  $T_1 = A/(C - \ln p_1)$  and for a pressure  $p_2$ ,  $T_2 = A/(C - \ln p_2)$ . For a second substance the resp. b. ps.  $\theta_1$  and  $\theta_2$  at the same pressures are  $\theta_1 = A'/(C' - \ln p_1)$  and  $\theta_2 = A'/(C' - \ln p_2)$ . Hence  $(T_2 - T_1)/(\theta_2 - \theta_1) = A(C' - \ln p_2) \times (C' - \ln p_1)/A'(C - \ln p_2) \times (C - \ln p_1)$ . For substances with approx. the same values of the  $C$  const. this last equation reduces to  $(T_2 - T_1)/(\theta_2 - \theta_1) = A/A' = q$ , which is Dühring's law of corresponding b. ps. For the alkali metals the  $C$ -values fluctuate between 12 and 11.55 and for the alkali halides between 7.74 and 8.95. Knowing  $A'$  for one substance one can find  $A$  by means of the equation  $A/A' = q$  and hence  $a$ .

H. S. v. K.

The viscosity of gases. S. S. KISTLER. *College of Pacific. J. Franklin Inst.* 207, 389-96(1929).—An error in the customary derivations of the equation for the viscosity of gases is pointed out in which the counting of momentum is at fault.

J. H. PERRY

The rare gases. RICHARD B. MOORE. *Purdue Univ. Chem. Bull.* (Chicago) 16, 151-2, 157-8, 178-80(1929).—A review.

The nature of Kucera anomalies in electrocapillary curves. KAREL TEIGR. *Charles IV Univ., Prague. Chem. Listy* 23, 54-8(1929).—An electrocapillary curve obtained by weighing the drops exhibits a discontinuity at a definite electromotive potential which was observed by Kucera. T. shows that all of the present theories accounting for this anomaly are inadequate and proposes a concept which considers a replacement of nonelectrolytes by electrolytes from the surface of the cathode within certain ranges of the electromotive polarizing potential. This explains the max. in the polarographic curve. Three other stages of the curve are considered; an extended paper is promised.

FRANK MARSH

Crystal climbing. II. HANS ERLENMEYER. *Inorgan. Chem. Inst., Basel. Helv.*

*Chim. Acta* 12, 264-9(1929); cf. *C. A.* 22, 1071.—Capillary-active substances like glycerol, sugar, and thymol prevent the climbing of KCl on glass rods. Urea delays the climbing. The thicker the glass rod the higher the soln. will climb on the rod.

ARTHUR FLEISCHER

**Adsorption of gases by glass walls. V. Carbon dioxide.** M. CRESPI. *Anales soc. españ. fis. quim.* 27, 108-19(1929).—The system of tubes used heretofore has been replaced by a system of small ampoules having a total vol. equal to the vol. of the largest ampoule used for comparison. Detns. were made with very pure CO<sub>2</sub>, giving for adsorption per cc.  $A_s = 0.93 \times 10^{-3} \times p^{0.444}$  g. between 1 and 0.25 atm. at 13° and  $A_s + 0.025 \times 10^{-3} = 1.77 \times 10^{-3} \times p^{0.877}$  between 1 and 0.062 atm. At low pressures there is deviation from the exponential law. With a 1 l. bulb under ordinary conditions the CO<sub>2</sub> adsorbed is 0.000086 g. Expressed in mols, this is of the same order as was found for CHCl<sub>3</sub>. It was again verified that the error in d. detns. increases the less the vol. of the container and the less the pressure.

E. M. SYMMES

**Adsorption of gases by metals.** LUDWIG KAUL. *Metallborse* 18, 1883-4(1928).—Controversial with Sieverts (*Metallborse* 18, 1717; cf. *C. A.* 23, 2401). Sprouting of molten Ag is connected with the existence of an equil. of at. O with at. Ag, which is disturbed by change of temp. To bring about combination of active O and Ag a pressure must be exerted which causes "agglomeration" of the O atoms in the space, thereby rendering combination possible. Freezing Pt and Pd show similar sprouting tendencies. The action of N on heated Fe is peculiar. At the  $\gamma$ -point a state is reached at which N is fixed by the release of at. energy. Further heating alters conditions so that the then highly active N is no longer fixed. On cooling below the  $\gamma$ -point the freed energy is again required for cohesion and the N given up.

E. M. SYMMES

**An optical study of absorbed films.** J. H. FRAZER. Johns Hopkins Univ. *Phys. Rev.* 33, 97-104(1929).—The optical method of Rayleigh (*Phil. Mag.* 23, 431(1903)) and Drude (*Lehrb. d. Optik*) for the study of surface "transition layers" was experimentally modified so as to give greater accuracy, and was applied to the study of adsorption on glass. Various substances were investigated, and of these only 2, water and MeOH, showed definite absorption. Curves for these, plotting thickness of absorbed layer against partial pressure, are given. Up to 5 or 6 mm. pressure, there is no detectable adsorption of H<sub>2</sub>O (apart from the probable presence of the first monomol. layer). From then on there is a cluster formation which results in a gradual covering of the surface until at 12.5 mm. pressure there is another monomol. layer present. Above 13 mm. there is strong condensation. The results for MeOH were similar. Adsorption began at 30% satn. and continued linearly up to 90% satn. pressure when strong condensation set in. It is pointed out that the method is applicable to the study of surface conditions at the interface between any 2 phases.

B. L.

**The adsorption of phenols at the interface of water-air, water-carbon and water-mercury.** A. FRUMKIN. *Rec. trav. chim.* 48, 288-90(1929).

A. WHITE

**Adsorption of acetic and propionic acids in the presence of salts with common anion.** E. ANGELESCU AND V. N. COMANESCU. *Bul. soc. chim. România* 10, 170-82(1928).—The adsorption on charcoal of acetic and propionic acids from aq. solns. and from solns. contg. the Na and K salts was studied. The adsorption of the acids was slightly decreased in the presence of the salts. Detns. of the partition of AcOH between benzene and water and between benzene and 1 N AcOK indicate a tendency for greater soly. of the AcOH in the salt solns., a result parallel to that of the adsorption detns. Similarly a decrease in the soly. of AcOH in 1 N NaCl, as detd. by the same method, is parallel to the increased adsorption of AcOH on charcoal in the presence of NaCl, as previously reported by Wiegner. Therefore, a decrease in adsorption is accompanied by a tendency toward greater soly. in the solvent, and *vice versa*.

J. FLEISCHER

**The adsorption of hydroxybenzenes and other aromatic compounds and their displacement of each other at the interface water-charcoal.** I. M. KOLTHOFF AND ELS VAN DER GOOT. *Rec. trav. chim.* 48, 265-87(1929).—A study was made of the adsorption of hydroxybenzenes and other benzene derivs. with polar groups from aq. soln. by "Carbo medicinalis neu Merck." Purification of the charcoal by the HF method of Miller does not influence the shape of the adsorption isotherm. It is doubtful whether the adsorption of strong electrolytes depends upon the properties of the charcoal in the same way as that of nonelectrolytes. With respect to the adsorption of hydroxybenzenes and other derivs. of benzene with polar groups, the water-charcoal interface and the water-air interface behave just oppositely. At the water-air interface, the capillary activity decreases rapidly with the no. of polar groups, whereas at the water-charcoal interface the adsorbability increases with the no. of polar groups (this rule, of course, holds only for the benzene derivs. studied). Di- and trihydroxybenzenes

have practically no influence upon the surface tension of a phenol soln. On the other hand, at a charcoal-water interface the phenol is replaced by bi- and tervalent phenols. The polar groups of the benzene derivs. are directed to the charcoal side and not to the bulk of the soln. It is suggested, that the adsorbed water layer on the charcoal is responsible for this phenomenon. The change of the adsorption with the concn. can be expressed satisfactorily by the equation of Freundlich.  $x/m = x C^{1/n}$  although the shape of the adsorption isotherm is somewhat dependent upon the amt. of charcoal taken and the diln. of the soln. There is a regular decrease in the value of  $1/n$  with increasing no. of polar groups. The ratio is approx. 3:2:1 for univalent: bivalent: tervalent phenols. Expression of the amt. adsorbed in terms of the no. of millimoles per g. charcoal does not give a real measure of the adsorbability. The no. of milliequivalents adsorbed should be used instead. For the benzene derivs. with nonelectrolyte (or very weak electrolyte) character the equiv. no. is equal to the no. of polar groups in the mol. The influence of NaCl upon the adsorption of different aromatic compds. was investigated. The salt has a tendency to increase the adsorption. This rule does not hold generally. Moreover the effect seems to depend upon the properties of the charcoal used.

A. WHITE

The decomposition of aqueous bromine and of bromic acid solution by charcoal. I. M. KOLTHOFF. Univ. of Minn. *Rec. trav. chim.* **48**, 291-7(1929); cf. preceding abstr.—Br in aq. soln. is rapidly decompd. in contact with charcoal, introducing errors into the detn. of the adsorption isotherm when the usual procedure is followed. An analytical procedure has been developed for studying this decompn. An I soln. under similar conditions is not decompd. A soln. of Br in  $CCl_4$  is not decompd. Hypoiodite and hypobromite are very rapidly decompd. in the presence of charcoal. Bromic acid in the adsorbed state on charcoal is decompd. with the formation of HBr.

LOUIS WALDBAUER

The adsorption of phosphoric acid by iron hydroxide in the presence of changing amounts of ammonia. F. ANGELESCU AND GR. BĂLĂNESCU. *Kolloid-Z.* **47**, 207-21 (1929).—Complete simultaneous pptn. of Fe and P is possible at a ratio of Fe/P greater than 2 and at a  $p_H$  less than 7. The temp. and the anion of the ferric salt are without effect on the pptn. In alk. soln. the P is no longer completely adsorbed. The amt. of sol. P depends upon the Fe/P ratio and the concn. at the start. The coagulation of the ppt. changes with the ammonia concn. and with the ratio Fe/P at the start. Two regions of peptization were observed: in acid solns. with large Fe/P ratios and in alk. solns. with small Fe/P ratios. The different behavior in acid and alk. solns. is explained by a surface dissocn. of the  $Fe(OH)_3$  which is influenced by the  $p_H$  of the soln. As an application of the results the methods for the detn. of P, Fe and Al in soil analysis are discussed and corrected.

L. F. MAREK

The binding of alkali metals by carbon. II. KARL FREDENHAGEN AND HERMANN SUCK. *Z. anorg. allgem. Chem.* **178**, 353-65(1929); cf. *C. A.* **21**, 1582.—The method used previously was improved by the use of a temp. regulator, by sealing off part of the reaction vessel, contg. the K-C compd. after the reaction has been completed, and by detg. the amt. of K by a gravimetric method instead of the volumetric method used previously. Expts. were carried out with graphite and K at 400° and 450°, and with soot and K at 400°. Graphite and soot, though different in their adsorption characteristics, show the same behavior toward K. Heated at the same temp. and pressure they take up the same amt. of K. Na combines with soot, but not with graphite. Diamond does not react with K, or with Na. The taking up of K by graphite occurs in 2 steps. The expts. with the graphite side of the reaction vessel at 400° are evaluated in the form of a curve, plotting the vapor tension of K, calcd. according to Fiock and Rodebusch (cf. *C. A.* **20**, 3600), against the mol. K per mol. C. Increasing the temp. of the K from 200° to 256°, corresponding to an increase of the K vapor pressure from 0.006 to 0.06 mm., the amt. of combined K increases from 0.032 mol K pro mol C to 0.049. Increase of the temp. to 284° (0.17 mm.) does not materially increase the amt. of K combined. A further increase of the temp. with 17°, corresponding to an increase of the K vapor pressure from 0.17 to 0.29 mm., doubles the amt. of combined K. Similar curves were obtained with graphite at 450° and with soot at 400°. With graphite equil. is attained after 22 hrs., with soot only after 60 hrs. The previous treatment of the soot influences its taking up of K. The color of the graphite-K is at first dark blue-black, after the great increase in K content the color changes to copper-red (Siemens graphite being used). If a coarsely cryst. graphite, such as Ceylon graphite, is used, the color is at first steel-blue with a distinct metallic gloss, followed by a bronze coloration after the amt. of K increases. This change in color seems to occur suddenly after the great increase in K content.  $K_4C_4$  could not be detected by passing over

graphite-K, H<sub>2</sub>O vapors contg. H, then collecting the gas in a soln. of 1 g. Cu(NO<sub>3</sub>)<sub>2</sub>, 4 cc. of concd. HCl and 3 g. hydroxylamine salt in 50 cc. H<sub>2</sub>O. J. A. SEILARD

**Contradictions in the physico-chemistry of colloids.** AUGUSTE LUMIERE. *Chimie et industrie* 21, 223-6(1929); cf. C. A. 21, 3375.—The definitions of Francesco Selmi (1846), Graham (1864), Loeb, and Kruyt (C. A. 23, 4305) are discussed, showing that none of them embraces all of the substances which are generally recognized as colloids. The structure and function of mol. colloids and of micellar colloids are discussed and contrasted. Conclusion: Monomol. protein colloids behave like crystalloids of very high mol. wt., and there is no valid reason for classifying them apart from the crystalloids, while substances exhibiting micellar arrangement have entirely different characteristics and behavior, and it is not rational to designate such dissimilar substances by the same name. It is suggested that the term colloid be discarded altogether.

A. PAPINEAU-COUTURE

**Differential equation of physical chemistry.** H. FAXEN. *Arkiv Mat. Astron. Fysik.* 21B, No. 3, 6 pp.(1929).—The general equation for the rate of sedimentation in an ultracentrifuge is integrated. The equation includes terms for diffusion and specific sedimentation.

F. R. BICHOWSKY

**Mechanical dispersion by means of the colloid mill.** PIERCE M. TRAVIS. *Ind. Eng. Chem.* 21, 421-5(1929); cf. C. A. 22, 897.—Colloid mills are classified as (1) beater type, (2) smooth surface type, (3) rough surface type, (4) turbine type. Uses of the mill are described and emphasis is placed upon control of H-ion concn., temp. and use of a protective material.

L. B. MILLER

**The stability of colloidal solutions.** A. BOUTARIC. *Rerue gén. colloides* 7, 49-52 (1929); cf. C. A. 22, 3080.—Electrification of the micelle is only one factor in stability of the colloid. During slow coagulation of a dispersion by a low concn. of electrolyte, the charge on the micelle is neutralized so slowly that a reorganization takes place within the micelle, forming a new product having different properties from the original dispersion. During rapid coagulation by a high concn. of electrolyte there is not time enough for reorganization within the micelle and the character of the product remains unchanged.

L. B. MILLER

**Taktosols.** H. ZOCHER AND K. JACOBSON. Kaiser-Wilhelm-Inst. *Kolloid-chem. Beihefte* 28, 167-206(1929); cf. C. A. 19, 3401.—A no. of colloidal solns. have been found which contain non-spherical particles. In these *taktosols*, as distinguished from ordinary sols, or *ataktosols*, the individual microscopic particles are called *taktoids*. Rod-shaped taktoids arrange themselves spontaneously with their long axes parallel. Taktoids are optically anisotropic. On aging, certain sols split into taktosol and ataktosol in a manner analogous to the pptn. of a 2nd phase from a mol. soln. The taktosol settles to the bottom. In cataphoresis, the taktoids of a V<sub>2</sub>O<sub>5</sub> sol prepd. by the method of Biltz have their long axes parallel to the lines of force in a d. c., perpendicular to them in an a. c., and parallel to them in a magnetic field. In a sol of benzopurpurin the rod-shaped taktoids arrange themselves in a magnetic field, with their long axes perpendicular to the lines of force. A sol of WO<sub>3</sub> contains disk-shaped particles which are colloidal in one direction only. The taktoids from chrysophenin solns. consist of anisotropic crystals having their long axes parallel. They are colloidal in one direction and are destroyed by shaking. The pptd. mass of taktoids has the character of a gel.

CORNELIA T. SNELL

**New studies on the preparation and properties of colloidal metals and their compounds.** J. REITSTÖTTER. *Oesterr. Chem.-Zig.* 30, 217-20(1927). E. C. M.

**Studies on the dispersoidal synthesis of gold by means of alkaline formaldehyde.** P. P. VON VEHMARN. *Bull. Chem. Soc. Japan* 4, 35-47(1929).—New expts. are described to show that the size of the particles of Au suspension prepd. by the action of alk. HCHO on AuCl<sub>3</sub> may be predicted by the well-known rule of V. J. G. M.

**The manganese equilibrium in glasses.** WILDER D. BANCROFT AND R. I. NUGENT. *J. Phys. Chem.* 33, 481-97(1929).—Information on the coloring effect of Mn was obtained from quant. expts. on the chem. behavior of Mn in the borax bead. The pink-violet color of Mn is due to tervalent Mn; Mn in the colorless bead is bivalent. The equil. of bivalent and trivalent forms is affected by temp., O<sub>2</sub> pressure and acid or alk. quality of the melt. Litharge-boric acid-Mn system examd. quant. also showed definite shift of color like that with the borax bead. The Na<sub>2</sub>O-P<sub>2</sub>O<sub>5</sub> system gave a qual. indication of color shift. The study was extended to reactions in glass; prolonged exposure to light produces violet color in glass which may be due to the shift of Mn<sup>++</sup> to Mn<sup>+++</sup> under the influence of light. The coloration of rose quartz is also considered.

M. McMAH

**Colloidal potassium ferrocyanide solutions.** ARTHUR KUTZLEW.

47, 221-2(1929).—Colloidal systems of  $K_4Fe(CN)_6$  are obtained by treating the solid salt with mixts. of water and EtOH, MeOH, PrOH, acetone, etc., *e. g.*, by shaking 0.1 g. of salt with 100 ml. of EtOH and 50 ml. of water. L. F. MAREK

Some sources of error in determining the drop-point according to Ubbelohde, and their avoidance. E. NAUMANN. *Chem. Fabrik* 1929, 136-8.—The errors are due to the glass tips, 80-90% of those on the market being of faulty construction. N. proposes making the tips of brass. J. H. MOORE

The number of nuclei in the crystallization from gels. P. A. THIESSEN and E. TRIEBEL. Göttingen Univ. *Z. anorg. allgem. Chem.* 179, 267-76(1929).—Count was made of the no. of nuclei which appear under definite conditions in the crystn. of Na oleate. The no. increases with the time of supercooling, the degree of supercooling, increase of concn. of the gel from 0.43 to 0.6 N, and the extent to which the soap is in the form of colloidal micelles. CORNELIA T. SNELL

Some caseinates and the theory of the lyophilic colloids. MARTIN H. FISCHER and MARIAN O. HOOKER. *Kolloid Z.* 47, 193-206(1929).—The formation of gels from "neutral" casein by the action of acids and bases in different concns. does not depend solely upon  $p_H$  but varies specifically. The acids and bases combine with casein to form salts, such as casein acids or metal caseinates, resp. The colloidal properties of these compds. in water depend upon their soly. and hydration. The general theory for solvated colloids (*C. A.* 12, 2327) describes the behavior of the casein compds. Salts may affect casein acids or metal caseinates in aq. soln. in two ways: (1) the salt may react with the casein compd. to form a new compd. having different soly. and degree of hydration, or (2) the salt may combine with the solvent, thereby changing such colloidal properties as viscosity, gelatinization, syneresis and final sepn. into solid and liquid phases. L. F. MAREK

Solubilities of alkali nitrates. FRIEDRICH. *Metallbörse* 18, 1966-7(1928); cf. *Caliche* 10, 5(1928).—The soly. relations of salts resulting from combinations of the ions K, Na, Cl,  $NO_3$  and  $SO_4$ , which apply also to other salts of interest in the manuf. of Chile salt-peter, are shown. E. M. SYMMES

The solubility of iodine in solutions of halides. JOHN S. CARTER and CHARLES R. HOSKINS. Govt. Lab., London. *J. Chem. Soc.* 1929, 580-5.—The soly. of  $I_2$  was measured at 25° in aq. HCl, KCl,  $MgCl_2$ ,  $BaCl_2$  and HI, and was recalcd. in NaBr and KBr (cf. *C. A.* 6, 567). The influence of 2 inert salts,  $NaNO_3$  and  $Na_2SO_4$ , was detd. Soly. of  $I_2$  in halides is the resultant of the tendency to form polyhalides and of simple salting out. Polyhalide formation increases, and salting out decreases, with increasing at. wt.  $I_2$  in aq. fluorides gave iodides and acid. GERALD M. PETTY

Structure of plant compounds and solubility. R. H. CARR. *Science* 69, 407(1929).—The relationship between structure and soly. of carbohydrates and related compds. is discussed. Formic acid dissolves sugars, dextrans, starch, inulin, glycogen, agar, chlorophyll, glucosides, pigments, but not much mucilage, lignin, gum, cellulose or proteins. The carbohydrates that are sol. are the ones easily hydrolyzed, yielding aldehyde or ketone groups. From the known structure of the mols., this soly. seems to decrease as the active hydroxyl groups in the mol. decrease and as C atoms increase. A further correlation between structure and soly. lies in the fact that sugars and org. acids are mentioned as polar compds. and these are the ones which dissolve in formic acid, a polar compd. Non-polar compds. like fats and cellulose are insol. N. M. NAYLOR

Osmotic and activity coefficients. R. C. CANTELO. *J. Phys. Chem.* 33, 627-32(1929).—The mathematical theory of elec. cond. of electrolytes developed by Debye and Hückel (*C. A.* 18, 190) may be tested by deriving expressions for activation and osmotic coeff. of an electrolyte. A method for deriving these mathematical equations is described. M. MCMAHON

The boiling points of aqueous solutions. WILDER D. BANCROFT and HERBERT L. DAVIS. *J. Phys. Chem.* 33, 591-604(1929).—Data on abnormalities of f. ps. of concd. and dil. solns. with their bearing on the disscn. theory are reviewed. Similar abnormalities were found in the b. ps. of solns. of KCl, KBr, KI and  $KNO_3$ . A specially devised app., a modification of the Cottrell app., designed to prevent superheating of pure  $H_2O$  is described and illustrated. The investigation of the effect of higher pressures and temps. on b. ps. was begun; the pressure app. used is described in detail. B. ps. were observed under 10 to 20 atm. pressure. M. MCMAHON

Heitler's theory of concentrated solutions. LEO VIETH. *Physik. Z.* 30, 126-39(1929).—A thorough discussion of Heitler's theory (*C. A.* 20, 3371) is presented. The results of the theory are compared with exptl. values for heats of mixing and vaporization for a no. of mixts. E. R. SMITH

**Oxygen-compound formation with acetaldehyde at low temperature.** D. L&B. COOPER. *Chem. News* 138, 264(1929).—See *C. A.* 23, 2093. E. C. M.

**Reactions carried out under high pressure.** ERNEST BERL. *Chimie et industrie* 21, 452-65(1929).—The work of B. and co-workers on the limits of combustibility of mixts. of air with inflammable gases and vapors at higher pressures (B. and Werner, *C. A.* 21, 1884) and on corrosion phenomena at high pressures (B. and von Taack, *C. A.* 22, 4445) is outlined. A. PAPINEAU-COUTURE

**The theory of chemical reaction velocity.** N. SEMENOV. *Z. physik. Chem., Abt. B*, 2, 161(1929).—A chain-mechanism theory is developed to account for both slow reactions and explosions. The probability  $\delta$  of a collision between an activated reaction product and one of the reactants with sufficient energy to start branching of the stoichiometric chain increases with the temp. If  $\nu$  is the number of single reactions in the simple chain and  $n_0$  is the sp. rate of the endothermic reaction, the velocity =  $n_0\nu$ . When secondary activation is considered, the velocity =  $w = n_0\nu/(1 - \nu\delta)$ . When  $\nu\delta = 1$ ,  $w = \infty$ , and the reaction is an explosion. The alterations in  $\nu$  resulting from admixture of an inert gas and from collisions with the vessel walls are discussed. A relation is derived between the min. explosion pressure and temp. which is identical with that derived from the author's heat theory of explosion (cf. *C. A.* 22, 2842). A correction is made to the earlier paper extending the validity of the relation to chain reactions. In agreement with Franck, S. finds the probability of a transfer of excitation energy into kinetic energy is  $10^{-4}$ . These considerations are most important for fast reactions in which  $w$  is commensurable with the rates of activation and deactivation. L. W. ELDER, JR.

**The kinetics of the combination of hydrogen and oxygen.** N. SEMENOV. *Z. physik. Chem., Abt. B*, 2, 169(1929).—The investigations of Hinshelwood (*C. A.* 22, 4324) on the homogeneous reaction  $2H_2 + O_2 = 2H_2O$  are discussed on the assumption that it is a chain reaction of such a nature that the chains formed by the energy-rich intermediate products undergo branching, in consequence of secondary activation (cf. preceding abstract). Hinshelwood's observations agree satisfactorily with this view, but expts. in progress in the author's laboratory are contradictory.

L. W. ELDER, JR.

**Nature of unstable intermediates in chemical kinetics.** ANTON SKRABAL. Univ. Graz. *Monatsh.* 51, 93-156(1929); cf. *C. A.* 23, 1338.—The supposition that the concn. of the intermediates of a chem. reaction become const. is not correct. In a math. discussion a theory is developed for monomol. reactions. The concn. of the intermediates changes with time; only the concn. relations become stationary. The "Arrhenius" type of intermediate is in equil. with the initial product and the intermediate of the "van't Hoff" type is in equil. with the end product. A reversible reaction goes in one direction over the "A." type and in the other over the "H." type. Catalytic acceleration of a reaction may change the nature of the type of intermediate. The acceleration of a reaction with an intermediate of the "H." type may lead to a less stable end product. The velocity regulates the order of the stages of a reaction ("regulation law"). E. SCHOTTE

**Kinetic salt effect. II. Velocity of ionic reactions at great dilutions.** A. N. KAPPANNA. Univ. of Dacca, India. *J. Indian Chem. Soc.* 6, 45-52(1929); cf. *C. A.* 23, 21.—The kinetics of the reaction between  $BrCH_2CO_2Na$  and  $Na_2S_2O_8$  were investigated over a range of total ionic concn. from 0.0025 to 0.10. The reaction is bimol.  $K$  (30°) varies from 0.196 to 0.494;  $K$  (40°), 0.440 to 0.989; and  $K$  (50°), 0.986 to 2.250. Part of the exptl. data are given in detail; the remainder are summarized. The data serve to test the validity of the Debye-Hückel limitation law for strong electrolytes on the basis of both Brønsted's and Soper's theories and are found to satisfy the course of the reaction as predicted by Debye's equation up to an ionic strength of 0.015. The temp. coeff. of the reaction rate is about 2.2 to 2.3 and is the same for all ionic concns. at the temps. investigated. WILLIAM E. VAUGHAN

**The oxidation of iodide ion by persulfate ion. I. Effect of tri-iodide ion formation on the reaction velocity.** ERIC JETTE AND CECIL V. KING. *J. Am. Chem. Soc.* 51, 1034-47(1929).—The velocity of the reaction between iodide and persulfate ions was reinvestigated from the standpoint of tri-iodide ion formation. Expts. were made in solns. contg. no iodine in the initial mixt. and in solns. satd. with iodine. The observed reaction velocity is attributed to two influences, (1) the iodide ion and (2) the tri-iodide ion. The rate of reaction of the persulfate ion with the tri-iodide ion is half as fast as that with the iodide ion. The results contradict those of Kiss and his co-workers concerning the influence of the tri-iodide ion (cf. *C. A.* 21, 2593, 3523; 22, 2700). II. The effect of removing the products of the reaction on the reaction velocity.

CECIL V. KING AND ERIC JETTE. *Ibid* 1048-57.—The preceding conclusions as to the reaction of tri-iodide ions as well as of iodide ions with persulfate ions were confirmed at higher concns. than those previously used. Removal of iodine by org. solvents as soon as formed generally produced uniform reaction velocity constns. differing but little from previously obtained values for the reaction in the absence of the org. solvent. Removal of the sulfate ion by Ba and Ca salts did not materially affect the reaction rate.

PAUL H. EMMETT

The reaction between nitrogen pentoxide and ozone. II. H. J. SCHUMACHER AND G. SPRENGER. Univ. Berlin. *Z. phys. Chem.*, Abt. B, 2, 267-81(1929); cf. *C. A.* 23, 2636.—S. and S. have further investigated this reaction over a range of pressures of  $N_2O_5$  ranging from about 0.2 to 67 mm. and pressures of  $O_3$  ranging from about 100 to 300 mm. at 20° and 30°. The empirical reaction rate equation is  $dp/dt = k[N_2O_5]^{1/2}[O_3]^{1/2}$ . The temp. coeff. of the rate is 2.07 for 10°. The disappearance of the ozone is marked by the formation of  $NO_2$ . A series of four reactions is postulated and from them, with several assumptions, may be derived the exptl. result; these equations are: (1)  $N_2O_5 \longrightarrow 2 NO_2 + \frac{1}{2}O_2$  ( $k_1$ ); (2)  $NO_2 + O_3 \longrightarrow NO_3 + O_2$  ( $k_2$ ); (3)  $NO_3 + NO_2 \longrightarrow 2 NO_2 + O_2$  ( $k_3$ ); (4)  $NO_3 + NO_2 \longrightarrow N_2O_5$  ( $k_4$ ). The results are said to be in accord with previous expts. and tend to clarify former work. The postulated  $NO_3$  is a point for consideration. Exptl. data and derivations of equations are given.

WILLIAM E. VAUGHAN

A study of nitric acid. IV. The special behavior of the system nitric acid-nitrous acid in oxidation reactions. The activation of nitric acid. ALFONS KLEMENC AND LUDWIG KLIMA. Univ. Wien. *Z. anorg. allgem. Chem.* 179, 379-412(1929).—In a freshly prepd. soln. of the system  $HNO_3$ - $HNO_2$ , an oxidizing action is obtained upon  $Sn^{++}$  ions, which however gradually decreases to zero. Numerical data show that (a) with equal  $HNO_3$  concn. the oxidation value at a given time is increased by increasing the concn. of  $HNO_2$ , (b) with equal  $HNO_2$  concn. the oxidation value at a given time is increased by increasing the concn. of  $HNO_3$ , (c) the addition of  $NO$  causes the oxidation value to decline much more rapidly as time passes, (d) a slight increase in  $HNO_3$  concn. causes the oxidation value to decline less rapidly. When the oxidation value against  $Sn^{++}$  has fallen to zero, diln. with  $H_2O$  again produces activation and oxidizing action. The oxidizing value of  $HNO_3$  in this system is ascribed to an activation by the reaction  $3HNO_2 \rightleftharpoons HNO_3 + 2NO + H_2O$ . This reaction produces activation in either direction, and it is concluded that the formation or decompn. of  $NO$  in this manner converts a definite portion of the  $HNO_3$  present into an active form.

The extent of this activation appears to be conditioned by a reaction which takes place through  $NO_2$  or  $N_2O_4$ . The activated  $HNO_3$  decomposes according to the equation  $HNO_3 \longrightarrow NO_2 + \frac{1}{2}O_2$ . In this system it can be assumed that a direct relation exists between reaction and activation, according to which one reaction can be regarded as the catalyst for the other. In the reaction between the activated  $HNO_3$  and  $Sn^{++}$ , amt. of  $Sn^{++}$  not oxidized is detd. by titration with a nitrite soln. using KI and  $FeCl_3$  as indicator.  $HNO_3$  oxidizes  $Sn^{++}$  salts instantly.

H. STOERTZ

Activity of certain acid-base indicators. JULIUS SENDROY, JR. AND A. BAIRD WIGGS. Rockefeller Inst., N. Y. *J. Biol. Chem.* 82, 197-244(1929).—The effect of  $NaCl$ ,  $KCl$ ,  $Na_2SO_4$ ,  $K_2SO_4$ ,  $MgCl_2$ ,  $CaCl_2$ ,  $MgSO_4$ , acetate and phosphate buffers on glucose on the activity coeffs. of bromocresol green, bromocresol purple and phenol red was studied by means of electrometric  $p_{aH^+}$  detns., and color readings against bicolor standards. The value of  $pK'$  for these dyes is shown to be dependent on the total electrolyte concn., the relation of ionic strength to  $pK'$  being expressed by the Debye and Hückel's equation. Other factors than ionic strength have a relatively small influence on the relation between  $p_{aH^+}$  and indicator color. Tables and equations are given for detg.  $p_{aH^+}$  colorimetrically. The various phases of recent work in the field of  $p_{aH^+}$  detns., are discussed.

ARTHUR GROLLMAN

Lithium compounds of hydrogen chloride with ether and acetone. D. MCINTOSH. *News* 138, 214-5(1929); cf. *C. A.* 22, 2308.—A check of previous work indicates that  $Et_3O \cdot HCl$ ,  $Et_3O \cdot 2HCl$ ,  $Et_3O \cdot 5HCl$ ,  $Me_3CO \cdot HCl$  and  $Me_3CO \cdot 5HCl$  are formed as described. Hirai's failure to obtain the compds. contg.  $5HCl$  is probably due to a high degree of supercooling.

A. S. CARTER

Autooxidation of hydroquinone catalyzed by manganous salts in acid solutions. In whose velocity is proportional to the driving force. VICTOR K. LAMER AND J. TEMPLE. Columbia Univ. *Proc. Natl. Acad. Sci.* 15, 191-4(1929).—With

$H_2O_2$

$Hg$ ,  $HgCl$  | satd.  $KCl$  | Buffer Soln. |  $Au$ , in which the hydroquinone ( $H_2Q$ ),  $O_2$  (1 atm.)

and quinone (Q) are satd. with mol.  $O_3$ , the kinetics of the oxidation of  $H_2Q$  were studied. Denoting by  $x$ , the %  $H_2Q$  oxidized,  $E = K - 0.0296 \log (100 - x)/(x)$ , where  $K$  is a const. evaluable for any given buffer by detg. the e. m. f. with quinhydrone ( $x = 50\%$ ).  $dx/dt = A + B \log (100 - x)/x$ , where  $A$  and  $B$  are consts. In order to avoid side reactions, it is necessary to work in a  $pH$  range of 5.3 to 6.3 and to use small amts. of  $MnCl_2$  as a catalyst to obtain a suitable velocity. The rate of reaction in this  $pH$  range is directly proportional to the  $[Mn^{++}]$ , and inversely proportional to  $[H^+]$ . This is the first case in which the rate of a homogeneous chem. reaction is proportional to the logs of the initial and final concns., or what is the same thing, the energy levels of the system. It is suggested that the reaction proceeds by the following steps: (1)  $H_2Q \longrightarrow Q + 2H^+ + 2E$ ; (2)  $2E + O_3 \longrightarrow O_3^{--}$ ; and (3)  $2H^+ + O_3^{--} \longrightarrow H_2O_3$ .

J. H. PERRY

The theory of heterogeneous catalytic reactions. The multiplet hypothesis. Model for dehydrogenation catalysis. A. A. BALANDIN. *Z. physik. Chem.*, Abt. B, 2, 289-316 (1929).—A theory of dehydrogenation catalysis is developed and application made to numerous reactions and catalysts. The basic idea is that underlying the "spacing theory" of catalysis advanced by Langmuir, Adkins and Burk. Catalytic dehydrogenation occurs when a group of surface atoms appropriately spaced and of the necessary activity adsorb the reactant in a definitely oriented position. Because simultaneous action on the part of several surface atoms is postulated the theory is called the "multiplet hypothesis." The multiplet for the dehydrogenation of a mol. may consist of two, three, four or more surface atoms. For example, the hexagonal cyclohexane mol. is pictured as being adsorbed upon the network of atoms of a 111 face of a face-centered metal catalyst in such a way that each pair of C atoms in the ring straddles and is held to one of the three metal atoms located at the corners of a unit triangle in the crystal face. Dehydrogenation occurs as a result of half of the H atoms from two such adjacent pairs of C atoms being drawn together and caused to unite by the nearest surface metal atoms unoccupied by the C atoms. From geometrical considerations of an adsorbed mol. oriented in such a fashion the distance  $\Delta$  between the H atoms of cyclohexane and the metal atoms to which they are drawn can be calcd. in terms of the diam.  $R$  of the C atom, and the diam.  $K$  of the metal atom. A plot of the value of  $\Delta$  vs.  $K$  for all face-centered and hexagonal metals gives a straight line. All of the metals upon that portion of the line extending from  $\Delta = 1.00$  A. U. to  $\Delta = 0.79$  A. U. and from  $K$  values of 1.397 A. U. to 1.236 A. U. are catalytically active in the dehydrogenation of cyclohexane. The metals having face-centered or hexagonal structures lying within this "square of activity" are Pd, Pt, Ir, Rh, Cu, Co, Ni, Fe, Zn, Os and Ru, while Ca, Ce, Th, Pb, Ag, Au, Al, Sn, Ce, Cd, Zr, Mg, Ti and Be of these systems lie without. This is in agreement with the fact that all of the metals in the first, but none of the latter group is active in the dehydrogenation. All the metals having a body-centered structure when plotted in the same manner as above outlined fall upon a line not touching the "square of activity" and as would be predicted are not good dehydrogenation catalysts for cyclohexane. This group includes K, Na, Li, Ta, W, Mo, V, Cr, Ge and Si. The remaining metals, As, Sb, Bi, Hg, In and gray Sn belong to rhombohedral or to tetragonal lattice, neither of which possesses trigonal symmetry on any face; accordingly none of these can be active catalysts for the dehydrogenation reaction. The following further predictions that would be made from the theory are in accord with exptl. facts: (1) cyclopentane and cycloheptane, being 5- and 7-membered rings, should not be dehydrogenated by metal catalysts. (2) Cyclohexene and cyclohexadiene should not be obtainable as products of partial catalytic dehydrogenation of cyclohexane. (3) Disubstituted cyclohexanes should not be dehydrogenated when the substituted groups are on the same C atom. Miscellaneous applications are also made to hydrogenation and decompn. reactions other than dehydrogenations. The viewpoint of the present theory is somewhat different from that of Taylor, inasmuch as it centers most of the catalytic activity in groups of normal surface atoms of certain crystal faces rather than in edges and corners of crystals. The multiplet theory as a whole, however, is compatible with Taylor's theory of active centers.

P. H. ENNERT

The influence of charcoal upon the velocity of the reaction between iodide-iodate and hydrogen ions, the decomposition of thiosulfuric acid and the reaction between phenol and bromine. I. M. KOLTHOFF. *Rec. trav. chim.* 48, 298-309 (1929).—HI in the adsorbed state on the surface of charcoal does not react with iodate and hydrogen ions in aq. medium. From a mixt. of an aq. soln. of alkali iodide and iodate only HI is adsorbed by ash-free charcoal. Charcoal apparently inhibits the reaction between iodate-iodide and hydrogen ions in aq. soln. If, however, the part of the hydrogen

and iodide ions removed by adsorption is accounted for, the charcoal accelerates the reaction, as it is a powerful adsorbent for the reaction product, iodine. The decompn. of a weakly acid soln. of thiosulfate is very much accelerated in the presence of charcoal. From a neutral buffer soln.  $\text{Na}_2\text{S}_2\text{O}_3$  decomposes rapidly in the presence of charcoal. The decompn. of thiosulfate with acid is due to the formation of the undissocd.  $\text{H}_2\text{S}_2\text{O}_3$ , which is unstable. Bromine and phenol adsorbed from aq. soln. on the surface of charcoal do not react with each other or react very slowly in the adsorbed state. Iodine and hydroquinone adsorbed from aq. soln. react very rapidly on the surface of the charcoal.

A. WHITE

The surface chemistry of catalytic hydrogen peroxide decomposition by mercury and the  $p_{\text{H}}$  value necessary for pulsation. G. BRÉDIG AND AD. STARR. *Z. physik. Chem.*, Abt. B, 2, 282-86(1929).—The observations of v. Antropoff (cf. *C. A.* 2, 2186) show that the pulsating decompn. of  $\text{H}_2\text{O}_2$  by a Hg surface is a typical case of catalysis in an interface region. Prolonged pulsation of the Hg surface during the decompn. can be obtained only if the  $p_{\text{H}}$  value is  $7.00 \pm 0.02$ . Gradual addition of a 10:1 mixt. of  $N$  NaOAc and 0.01  $N$  HOAc to commercial preps. is recommended as a means of obtaining a  $p_{\text{H}}$  value appropriate for the pulsating decompn. P. H. EMMETT

The heterogeneous catalysis of hydrogen peroxide by copper compounds. E. I. SHPITALSKIĬ, N. N. PETIN AND B. A. KONOVALOVA. Moscow State Univ. *J. Russ. Phys.-Chem. Soc.* 60, 1237-70(1928).—The reaction velocity was detd. gasometrically (cf. *C. A.* 19, 1924). The mixt. was kept at  $25^\circ$  and stirred continuously. The ppt. was analyzed according to Moser (cf. *C. A.* 1, 2782). The velocity const.  $K$  (calcd. from the equation of 1st order) was negligibly small in the presence of even  $2N$   $\text{CuSO}_4$ . On adding NaOH,  $K$  increased slowly at first and then, in the neighborhood of  $p_{\text{H}}$  12, rapidly and with simultaneous pptn. of  $\text{Cu}(\text{OH})_2$ . When this ppt. was filtered off,  $K$  again decreased to about 0.01 of its highest value. The residue, when washed free of Cu and transferred to a neutral soln. of  $\text{H}_2\text{O}_2$ , exerted a similar catalytic effect. The variation in  $K$  with  $p_{\text{H}}$  is, therefore, due to heterogeneous catalysis by the ppt. During the reaction  $K$  changed with time; in neutral soln. it passed through a min., in faintly acid soln. it passed through a max. With small concns. of  $\text{H}_2\text{O}_2$  the reaction velocity declined approx. linearly with time; in the case of higher concns. of  $\text{H}_2\text{O}_2$  the initial velocity was smaller, and there was a rapid decrease followed by a slow rise. The velocity of decompn. in alk. media also decreased with time, at first rapidly and then more slowly. It is concluded that a change took place in the catalyst during the decompn. of  $\text{H}_2\text{O}_2$ , namely the transformation of hydrated  $\text{CuO}$  into  $\text{CuO}_2$ . Analysis of the ppt. formed in the presence of large concns. of  $\text{H}_2\text{O}_2$  showed that it contains as much as 85%  $\text{CuO}_2$ . When  $\text{CuSO}_4$  was pptd. with NaOH from soln. weaker than 0.1  $N$   $\text{H}_2\text{O}_2$ , the ppt. contained 6-25%  $\text{CuO}_2$ . The peroxide content of the solid phase increased gradually while in contact with even dil.  $\text{H}_2\text{O}_2$  solns.; in concd. solns. the equil. was reached more rapidly (before the  $\text{H}_2\text{O}_2$  is used up). The disappearance of free  $\text{H}_2\text{O}_2$  was followed by the decompn. of  $\text{CuO}_2$  which proceeded very slowly (0.4 cc.  $\text{O}_2$  in 25 hrs.) in neutral media, while in alk. soln. it was complete in 1.5 hrs. The velocity of catalytic decompn. of  $\text{H}_2\text{O}_2$  in neutral media was 5 times that of the catalyst. The catalytic properties of the residue were influenced also by its state of dispersion, i. e., there was an aging process accompanied by a decrease in reaction velocity which could be largely prevented by continuous stirring. The authors conclude that the solid phase contains passive  $\text{CuO}$ , and another highly active intermediary product. The latter is formed instantly and  $\text{CuO}_2$  gradually, depending on the concn. of  $\text{H}_2\text{O}_2$ . The decompn. of each of the intermediary products is a time reaction;  $\text{CuO}_2$  decomposes much more slowly than the catalyst. In either case the concn. of  $\text{H}_2\text{O}_2$  has no influence. The velocity of the catalyzed decompn. of  $\text{H}_2\text{O}_2$  is directly proportional to the concn. of the catalyst which, again, depends on formation and decompn. velocity of  $\text{CuO}_2$ .

B. SOYENKOFF

The promoter action of copper and copper oxide on the reaction  $2\text{H}_2 + \text{O}_2 = 2\text{H}_2\text{O}$ .

I. Oxidation velocity of copper. YOSHIO OKAYAMA. *J. Soc. Chem. Ind. (Japan)* 31, 300-6(1928); Suppl. binding 31, 74.—The velocity of oxidation of Cu in an atm. of  $\text{O}_2$  at a pressure of 0.12 mm. Hg was investigated. The surface of the bulb of a Hg thermometer was covered with a thin layer of Cu. Through the bulb a thin capillary tube of glass was passed in a spiral form, and sealed at its ends to the wall of the bulb. A capillary tube carried in it a spiral of platinum wire 0.1 mm. in diam. and 10 cm. g. which served as a heating element. Thus the Hg in the bulb, together with the layer of copper on it, could be heated to any desired temp. The reaction velocity was detd. by the change of pressure, which was measured by means of a McLeod manometer. It was found that the velocity of oxidation increases with time, following

the equation  $-dp/dt = kp/t$ , where  $p$  and  $t$  are the pressure and time, resp. This increase is thought to be caused by the catalytic action of CuO formed by the reaction, the action taking place at the Cu-CuO interface. After some time, the velocity of oxidation decreases, as a result of the decrease in the surface of Cu and in the pressure of  $O_2$ . The relation between the velocity of oxidation and temp. is given by the equation  $\log k = -3823/T + 5.5$ , where  $k$  and  $T$  are the velocity const. and the abs. temp. resp. II. The reduction of CuO. *Ibid* 399-406; Suppl. binding 31, 93-4(1928).—The reduction of CuO by H is autocatalytic even at temps. above  $200^\circ$ . The reaction is retarded by the presence of water vapor. When H was passed over CuO the weight of the latter increased at first and then decreased. This initial increase in weight was found to be due to adsorption on the surface of CuO of water vapor, formed by the reaction. This adsorption made it impossible to study the velocity of reduction by measuring the rate of decrease in weight of CuO or by measuring the amt. of water formed and liberated. Therefore the decrease in pressure was measured by means of the app. described in the first report of this series, and condensing the water vapor formed by liquid air. The velocity of reduction is given by the equation  $-dp/dt = kpt/(p_0 - p)$ , where  $p_0$  and  $p$  are the initial pressure of H and the pressure at the time  $t$ , resp. The velocity const.  $k$  at the abs. temp.  $T$  is given by the equation:  $\log k = -5257/T + 7.38$ . III. The autocatalytic action in heterogeneous system. *Ibid* 407-10; Suppl. binding 31, 95 (1928).—Autocatalysis in the heterogeneous reaction can be easily explained by Volmer's nucleus theory. But it still remains in question, whether all autocatalytic actions in heterogeneous system are due to the removal of the difficulty of the formation of nuclei. There are two possibilities for the autocatalysis: (1) facilitating the rate of the mol. change in question, and (2) the removal of the difficulty of nucleus formation.

Y. NAGAI

Physicochemical investigation on the casein-splitting action of papain with special reference to the fundamental properties of its action as well as to the mechanism of the acceleration of hydrocyanic acid solution upon its action. MASAKASU SATO. *Separate* (1928).—Papain was prepd. from the milky latex of the green fruits of papaya tree produced at Heito, Formosa, and purified. The chief results of the investigation are as follow: (1) The quantity of casein digested by papain during unit time is directly proportional to the concn. of papain, in the range of the reaction which does not approach its equil. Schütz's law cannot be applied. (2) The law of mass action is not applicable and the value  $K$  corresponding to the const. in the monomol. reaction increases gradually as the reaction proceeds. (3) The temp. coeff. in this case becomes smaller as the range of temp. becomes higher. This fact agrees with that shown by the equations proposed by van't Hoff, Arrhenius, and Kooy. (4) The optimum temp. was found to be about  $80^\circ$  with some variation. (5) The optimum H-ion concn. was found to be at  $p_H = 6.5$ . (6) The action is retarded by various concns. of NaOH soln. and its action is entirely stopped at the concn.  $N/125$  to  $N/75$ . (7) Papain forms mainly polypeptides in its casein-splitting action and it has little or no ability to form amino acids. (8) The marked acceleration of HCN soln. upon the casein-splitting action of papain is due mainly to the undissocd. HCN, and not to  $H^+$  or  $CN^-$  ions.

F. I. NAKAMURA

Theory of passivity. IV. The relation between the specific passivity time and the concentration and nature of the electrolyte with iron. W. J. MÜLLER and O. LÖWY. *Techn. Hochschule, Wien. Monatsch.* 51, 73-85(1929); cf. *C. A.* 23, 2635.—In the formula  $t_p = B(i_0/F_0)^n$  (cf. *C. A.* 22, 4246),  $B$  is the sp. passivity time for c. d. = 1 amp. per sq. cm. For a small  $H_2SO_4$  concn.,  $B$  is small. With 2-3  $N$   $H_2SO_4$  the value is about 15 times that with  $1/18$   $N$  and then decreases with increasing concn. at 13  $N$  being about  $1/3$  of the value at 2-3  $N$ . The change in  $B$  at high  $H_2SO_4$  concn. is due to the decrease in soly. of  $FeSO_4$ . The sp. passivity time of  $N$   $H_2SO_4$  is 2.19 at  $20^\circ$  and 6.9 at  $40^\circ$ . For  $N$   $H_2SO_4$  half and fully satd. with  $FeSO_4$ ,  $B$  is resp. 1.04 and 1.7 at  $20^\circ$  and 1.04 and 2.3 at  $40^\circ$ . The first phase of the passivification of iron is followed by a coating with a layer of salt.

E. SCHOTTE

Circuit transmission and interference of activation waves in living tissues and in passive iron. RALPH S. LILLIE. *Science* 69, 305-8(1299).—When irritable tissue is stimulated the reaction never remains localized but tends automatically to spread in the form of a wave, often rapidly and to an indefinite distance, as in a nerve; and the tissue is always inert and unresponsive for a brief period after excitation. If the anatomical relations are such that the excitation wave can return to its starting point, as by passing around a continuous circular path, it may continue its motion indefinitely, provided the tissue has recovered sufficiently between successive circuits. Such circuit transmission is not normally found in the intact animal, but can be obtained

exptly., several instances of which are described. Trapped excitation waves of this kind may become a source of deranged coördination in organs whose normal activity depends on regular transmission in one direction. Cardiac fibrillation is probably an example of this. Two chief conditions for circuit transmission are: (1) The excitation wave must be of limited length, so that at any instant it occupies only a restricted portion of the circuit; and (2) its rate of movement must be relatively slow so that the time required for the wave front to travel the distance of the circuit (less the wave length itself) is greater than that occupied by the recovery process of the tissue. Circuit transmission of a similar kind has been obtained in passive iron wires in  $\text{HNO}_3$  as follows: A ring, 22 cm. in diam., of electrolytic or Armco Fe wire, 2 mm. in diam., is suspended by thin glass hooks in a circular trough 2 cm. in diam. in 76-80 vol.-%  $\text{HNO}_3$  (sp. gr. 1.42). The ends of the wire may be welded or hooked together. In the latter case a piece of Pt wire inserted at the junction prevents rythmical waves of activity from spreading along the wire in both directions. When the passive wire is held at one region with Pt-tipped forceps and is touched at a neighboring point with Zn, the activation wave thus started is blocked at the Pt while its progress in the other direction is unhindered. If the Pt is withdrawn before the circuit is completed an isolated activation wave is left in the wire; this continues in movement in a manner analogous to the trapped excitation waves in living tissues. Progress of the wave can be stopped by contact with Pt; the whole wire then becomes passive. The activation wave under these conditions is 12-15 cm. in length and its speed about 15 cm./sec. Any single region of the metallic surface passes through a cycle of chem. change lasting about 1 sec. consisting in a reduction and soln. of the passivating surface film, followed by its re-formation under the oxidizing influence of the acid and local elec. circuit. If the passive wire is touched with Zn at any point, 2 activation waves are started which travel in both directions; they meet on the opposite side of the ring and there extinguish one another, the whole wire becoming again passive. A similar interference of excitation waves in living tissue has long been known. Electrochem. interference of this type is a possibility in any reaction occurring at an interface under the influence of a local circuit. The fact that it is equally characteristic of activation waves in living tissues constitutes further evidence that the primary chem. reactions of excitation and transmission in protoplasm are surface reactions controlled by local biolec. circuits. From a consideration of the chem. aspects of the phenomenon it would appear that in both the living and the non-living systems the removal of the chemically reactive surface layer in which the essential process of activation occurs, depends on the formation of some oxidation product or products. The sp. nature of the chem. processes assocd. with excitation and transmission in living tissues, such as nerve, can be detd. only by special investigations on the metabolism of these tissues during rest and activity.

R. H. LOMBARD

**The reduction of tungsten by hydrogen.** G. A. MEERSON, Moscow Techn. School. *J. Russ. Phys.-Chem. Soc.* 60, 1217-28(1928).—Reduction of  $\text{WO}_3$  with moist  $\text{H}_2$  yields large crystals of W (cf. *C. A.* 16, 1530). The effect of  $\text{H}_2\text{O}$  on the size of crystals was studied. W from recrystd.  $\text{Na}_2\text{WO}_4$  was heated in a stream of moist  $\text{H}_2$  for several hrs. The crystals of the metal were then moistened with turpentine, spread on a slide to dry, and their size detd. under a microscope. Below  $1050^\circ$  there was no loss in wt. nor change in cryst. size. Above this temp. sublimation took place; some of the crystals increased from 2-4 to 6-8  $\mu$  in diam. The partial pressure of  $\text{H}_2$  corresponded to the formation of  $\text{WO}_2$ . Moist  $\text{H}_2$  and  $\text{WO}_3$  below  $800^\circ$  gave small crystals (1-4  $\mu$ ) of W or  $\text{WO}_2$ . Above  $850^\circ$   $\text{WO}_3$  volatilized and the crystals grew.  $\text{W}_2\text{O}_6$  apparently sublimates with  $\text{H}_2$  above  $900^\circ$ . The cryst. size of  $\text{WO}_3$  does not influence that of the resulting W.

**Equilibrium between two liquid phases. V. Aniline-propionic acid-water.** E. ANGELESCU. *Bul. soc. chim. România* 10, 160-9(1928); cf. *C. A.* 22, 192.—The isotherms at  $0^\circ$  and  $20^\circ$  were detd. by the same technic as previously, and also the partition coeff. of propionic acid between the two liquid layers at  $30^\circ$ . The variation of equil. with temp. was studied by detg. the soly. curves at definite propionic acid concns. (24.56, 26.48, 28.55 and 30.16%). The curves show only upper crit. soln. temps.; therefore the existence of a lower crit. soln. temp. cannot be due to the hydrolysis of

in water is lactic, acetic and propionic acid. VI. *o*-Toluidine-propionic acid. *Ibid* 183-91.—The isotherms at 0° and 20° were detd. as previously, and also partition coeff. at 20° of the acid between the two liquid layers. Soly. curves w detd. at definite propionic acid concns. (30.61, 32.07 and 34.10%), the curves show upper crit. soln. temps. Solns. contg. about 20% acid also showed indications of lower crit. soln. temp., which could not be detd., as the mixt. crystd. at the low ten Propionic acid increases the soly. of *o*-toluidine more than AcOH. J. FLEISCHER

The ternary system: mercuric chloride-mercuric iodide-water. RUTH SUGG Univ. of Melbourne. *J. Chem. Soc.* 1929, 488-91. —The system was examd. at 25° and 70°. Suitable mixts. were heated to 100°, filtered, sealed and brought to eq Solid and soln. were weighed and analyzed. The two salts are mutually sol., there is no evidence of compd. formation. GERALD M. PERRY

The system aluminum nitrate-potassium nitrate-water between 0° and 60°. G. MALQUORI. Reale Univ., Roma. *Gazz. chim. ital.* 58, 781-91(1928). —In continuation of earlier expts. (cf. *C. A.* 23, 1561), data were obtained with which the peritectic thermic diagram of the system  $\text{Al}(\text{NO}_3)_3$ - $\text{KNO}_3$ - $\text{HNO}_3$ - $\text{H}_2\text{O}$  could be constructed, and from this the conditions of fractional crystn. of the reaction liquor from the attack of leucite by  $\text{HNO}_3$  by the Blanc process could be defined. To construct this diagram, data on the ternary systems  $\text{Al}(\text{NO}_3)_3$ - $\text{KNO}_3$ - $\text{H}_2\text{O}$ ,  $\text{KNO}_3$ - $\text{HNO}_3$ - $\text{H}_2\text{O}$  and  $\text{Al}(\text{NO}_3)_3$ - $\text{HNO}_3$ - $\text{H}_2\text{O}$  must be known. The isotherms of the 1st at 0°, 25°, 40° and 60° and of the 2nd at 25°, 40° and 60° have already been obtained (cf. *C. A.* 21, 2108; 23, 757), besides a few other scattered data. The data which were lacking were, therefore, obtained by the same method used in the previous work. To fix the points of the quaternary isotherms, the solns. corresponding to the triple points of each ternary system were employed, adding the 4th components to obtain the satd. acid soln. of the 3 salts. The results are given in complete form in tables and 3-dimensional diagrams. In the Blanc process, the whole process of fractional crystn. is effected in the space situated to the right of the surfaces of coexistence of  $\text{KNO}_3$  and  $\text{Al}(\text{NO}_3)_3$ ,  $6\text{H}_2\text{O}$ ,  $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$  and  $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ , and with the low soly. of  $\text{Al}(\text{NO}_3)_3$  and the great soly. of  $\text{KNO}_3$  in concd.  $\text{HNO}_3$ , the closer to the  $\text{KNO}_3$ - $\text{HNO}_3$  face and particularly to the curve representing the soly. of  $\text{KNO}_3$  in pure  $\text{HNO}_3$ , the more complete is the sepn. of  $\text{KNO}_3$  and  $\text{Al}(\text{NO}_3)_3$ . Because of the high acidity of the solns. in this zone,  $\text{Al}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$  seps.; this is of great importance, for this salt decomp. at 140° to a basic salt which decomp. in turn at 200° to  $\text{Al}_2\text{O}_3$ . ### 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

An atomic model for the chemist. X. FLORENCE LANGWORTHY. *Chem. News* **138**, 225-7(1929); cf. *C. A.* **22**, 3826. E. H.

The distribution of electrons in atoms. I. M. ALEXANDER. Univ. of Cincinnati. *Phil. Mag.* [7], **7**, 517-22(1929).—A. proposes a distribution of electrons in the sub-levels of the atoms on the basis of the idea that there is an increase in the potential necessary to remove successive electrons in a given sub-level. Whenever a decrease in the potential is found a new sub-level has started. A table is presented showing the distribution of electrons for the various electron levels in the atoms of a no. of the elements, based on Bohr's general scheme and A.'s proposal. L. H. REYERSON

Paramagnetism and structure of combined atoms. B. CABRERA. *Anales soc. españ. fis. quim.* **27**, 73-107(1929).—When passing from simple systems constituted of free atoms to more complex systems represented by mols. it does not suffice to renounce the idea of rigidity of atoms. Experience so far shows that paramagnetism owes its existence, in the interior of the atom, to imperfectly satd. electronic configurations. According to quantum mechanics these configurations have a definite magnetic moment, whose natural unit is the Bohr magneton. By the Langevin formula, whose theoretical validity has been recognized, exptl. values are obtained which contradict theory, but which on the contrary confirm the existence of the Weiss magneton, which up to the present time has not had a satisfactory theoretical interpretation. The problem suggests that the Weiss magneton denotes the existence of a new principle which regulates the at. configurations when they combine to form mols. It is almost certain that on this same principle depends the problem of chem. valence, the actual interpretation of which is simple. The at. linkage is by a kind of assemblage of their superficial layers. It is incorrect to speak of valence of a single atom. The general nature of certain facts is explained by the analogies in the structure of atoms, which has been translated into the periodic system, and by the existence of the above principle. Study of paramagnetism is assuming a greater importance. In comparing the exptl. and theoretical magnetic moments it can be appreciated to what point the organization of atoms is modified by chem. bonds. The very close value of the 2 moments in the rare earths proves that the deformation produced is not profound, in spite of the fact that it is very intense on the surface of Fe, Pd and Pt. The inorg. complexes are of special

interest. The theory established by Sidgwick, which assumes the creation of new layers or electronic stages in the at. nucleus of the complex, offers many difficulties, particularly from the magnetic point of view. The influence of the surroundings of an atom upon it is represented by the const.  $\Delta$  of the Curie-Weiss law. In this const. there are no changes of value of magnetic moment, but only the probability which corresponds to each possible position on the axis of said moment. When the variation is considered as a function of the 2 factors it can be seen clearly that the changes are due to the paramagnetic atom and of the mol. in which it lies. A true interpretation of the phenomenon lies in the future.

E. M. SYMMES

**Electronic symmetry and polyatomic moles.** P. VINASSA. *Atti accad. Lincei* [6], 7, 975-9(1928).—In representing the electronic structure of atoms,

Muller gives  $F_2$  and  $Cl_2$  structures  $\cdot\ddot{F}:\ddot{F}\cdot$  (Cl the same), with 2 electrons in common and giving a perfect equil. of the type with 8 electrons, like the noble gases. If this were the case, then  $N_2$  should have the structure  $\cdot\ddot{N}:\ddot{N}\cdot$  which is not the 8 towards which mols. are supposed to tend. Con-

clusion: A mol. such as  $F_2$  does not have 2 electrons in common, but rather there is an internal couple of electrons common to the 2 nuclei as shown.

A. W. CONTIERI

**Ionic arrangement.** H. J. KIST. *Rec. trav. chim.* 48, 310-1(1929).—K. discusses, on the basis of Kossel's theory, the space distribution of 2, 3, 4, 6, 8 equal neg. ions surrounding a pos. nucleus. He calculates the potential for alternative arrangements of 8 ions, and finds the more probable arrangement to be, not a cube, but a tetragonal trapezohedron.

LOUIS WALDBAUER

**Magneto-optical determination of the intensities of the first two lines of the main potassium series, and of the vapor pressure of potassium.** J. WEINER. Univ. Tubingen. *Ann. Physik* [5], 1, 361-99(1929), cf. C. A. 23, 36. The abs. no. of dispersing electrons in non-luminescent K vapor was detd. This no. is characteristic for the intensity of the absorption lines. The intensity ratio for the first and second doublets is 2:1 ( $\pm 4\%$ ). Between 150° and 375°, it is independent of the temp. The ratio of the red and violet lines is 98.5:1 ( $\pm 5\%$ ) between 250° and 295°. The vapor pressure may be represented by the equation  $\log p/T = - (20590/455.1 T) - 10.133$ , on the assumption that the no. of dispersing electrons involved is equal to the total no. of atoms in the vapor state.

FRANK URBAN

**Compressibility of crystals and exponent of repulsive force between atoms.** N. v. RASHEVSKY. *Nature* 123, 448-9(1929).—It is well known that a real crystal has many submicroscopic cracks between the large no. of perfect crystals of which it is made up. The presence of the cracks is made responsible for the tremendous difference between the exptl. and calcd. values of the tensile strength. As is well known the calcd. value is several hundred times larger. R. now claims that the compressibility of real crystals may be due only to the closer packing of the small perfect crystals, and that a perfect crystal may have no compressibility at all. The exponent in the force equation of repulsion as calcd. by Born (*Atom Theorie des festen Zustands*, pp. 734-5) may really be much higher than 9, which is calcd. from ordinary compressibility. GEORGE GLOCKLER

**The coloration of deformed rock salt crystals by radium rays.** ADOLF SMEKAL. *Anz. Akad. Wiss. Wien* 64, 22-4(1927).—The coloration of rock salt crystals (bent under water) by means of radiations from Ra was more intense for the plasticized parts of the crystals, and persisted longer in these parts. This was due to the appreciable increase in the no. of places where the space lattice had been "loosened." I. J. PATTON

**Further investigations on deformed rock salt crystals.** ADOLF SMEKAL. *Anz. Akad. Wiss. Wien* 64, 46-8(1927); cf. preceding abstract. When irradiated crystals were bent, and subsequently exposed to light, the plasticized parts of the crystals decolorized more rapidly than the elastically strained parts. This proves S.'s hypothesis (C. A. 20, 1385) that the "slipping" of deformable crystals takes place at the "loosening" points, and that new centers of coloration are formed by the slipping process.

I. J. PATTON

**The one-dimensional relativistic Kepler problem in wave mechanics.** V. S. VRKIJAN. *Z. Physik* 54, 133-6(1929).—It is shown that the one-dimensional relativistic Kepler problem when treated by the methods of wave mechanics give energy term values as calcd. by Bohr and Sommerfeld in 1915.

GEORGE GLOCKLER

**Wave mechanics of an alkali metal atom in an electric field.** F. RABETTI. *Atti accad. Lincei* [6], 7, 1010-6(1928).—A mathematical paper in which it is shown that the dielectric const. of vapor of alkali metal can be calcd. by means of the expression  $E$

$= 1 + 4\pi NP = 1 + 3.5 \cdot 10^{-23} N$ , where  $P$  is the polarizability and  $N$  represents the density of the atom. Precise values for dielectric const. of these vapors have not been detd., but the above expression is at least of the correct order of magnitude.

A. W. CONTIERI

**Breadth of some lines of the mercury spectrum.** A. CARRELLI. *Atti accad. Lincei* [6], 7, 1013-8(1928).—The width of some lines in the Hg spectrum has been measured by the interferometer method of Buisson and Fabry. They vary from a min. of 0.013 Å. U. to the max. of 0.05 Å. U.

A. W. CONTIERI

**Synthesis of the elements.** G. I. POKROVSKII. *Z. Physik* 54, 123-32(1929).—The question of the synthesis of a few elements from protons is discussed. The energies and frequencies of radiation emitted during such synthesis are considered. It is thought that the frequencies emitted are whole no. multiples of a fundamental frequency ( $\lambda_0 = 1.33 \times 10^{-13}$  cm.) which depends upon the structure of time. The frequencies of the cosmic rays recently studied by Millikan and Cameron (*C. A.* 22, 3093) are compared with the theoretical frequencies and fair agreement is claimed. P.'s speculation lead to the notion that the abs. value of the gravitational potential cannot be greater than  $c^2$  anywhere ( $c$  = velocity of light). The energy of a proton cannot then be greater than  $c^2 H$  ( $H$  = mass of proton). On the other hand the max. energy residing in a proton must be  $(hc)/\lambda_0$  ( $\lambda_0$  = fundamental wave length); from which  $H = 1.667 \times 10^{-24}$  g. as compared with  $1.662 \times 10^{-24}$  g.

GEORGE GLOCKLER

**Atomic disintegration. Ionization method for the detection of corpuscular rays.** A. WEGERICH. *Z. Physik* 53, 729-46(1929).—The construction and behavior of an ionization cell filled with a rare gas are described. It was used in expts. on at. disintegration with Ru as a source of  $\alpha$  particles. H atoms were shown to be products of disintegration in C, Al, Fe, Cu and Zn. The results are in substantial agreement with the Vienna expts. Cf. *C. A.* 21, 2219.

GEORGE GLOCKLER

**H-particles made visible.** HANS PETTERS-ON. *J. Sci. Instruments* 6, 130-2(1929). E. H.

**Range fluctuations of  $\alpha$ -rays.** P. PREISLER. *Z. Physik* 53, 857-86(1929).—The fluctuations in range of the  $\alpha$ -particles from Th C in air, mica and Bi are studied by the aid of a Geiger counter. The dispersion in range is considerably larger than can be calculated with the present theories. However, it is shown that the present measurements and other known irregularities of the at. stopping powers can be explained in a satisfactory manner if it is assumed that not only no. and position of the electrons of a scattering substance have a bearing upon its stopping power, but that the speed of electrons within the atoms has also an influence upon its behavior as a scatterer for  $\alpha$ -rays.

GEORGE GLOCKLER

**$\alpha$ -Ray disintegration.** D. ENSKOG. *Z. Physik* 53, 639-45(1929); *C. A.* 23, 764.-It is assumed that the constituents of the nucleus have magnetic moments and that an  $\alpha$ -particle changes from 2 magnetons to one during the process of at. disintegration. This quantum change needs additional energy for the emission of the fastest  $\alpha$ -particles known, but can proceed with energy liberation in the slower  $\alpha$ -particles.

GEORGE GLOCKLER

**Permeability test with radioactive indicators.** K. LARK-HOROVITZ. *Purdue Univ. Nature* 123, 277(1929).—By using radioactive indicators for testing the permeability of single cells of *Valonia macrophysa* it was found that  $Pb^{++}$  ions do not enter the sap of living cells even if the cells are kept for several months in  $Pb(NO_3)_2$  soln.  $Pb^{++}$  ions enter readily the sap of dead cells. Ru, being a rare gas, is after 1 hr. evenly distributed between the cell sap of living cells and the surrounding sea water. G. G.

**Physical methods in chemical laboratories. IX. The use of radioelements as indicators.** FRITZ PANETH. *Univ. Berlin. Z. angew. Chem.* 42, 189-92(1929).

MARIE FARNSWORTH

**Researches on the radioactivity of wines.** A. NODON AND G. CUVIER. *Compt. rend.* 187, 725-7(1928).—Measurements were made with a Nodon electrometer. The radioactivity varies from year to year, and also depends on the manner of prepn. The white wines differ more from year to year than do the red wines. The radioactivity varies from 0.006 to 0.030 microcuries per l.

L. D. ROBERTS

**The gamma rays of potassium.** A. KARSTEN-SALMONY. *Chem.-Ztg.* 53, 137(1929).—Hypothetical.

MARIE FARNSWORTH

**Mass spectrum of uranium lead and the atomic weight of protactinium.** F. W. ASTON. *Nature* 123, 313(1929).— $Pb(CH_3)_4$  prepd. by Piggot (*C. A.* 22, 2511) was ed. The Pb was U Pb from Norwegian broeggerite. The mass spectrum consists of a strong line at 206, a faint one at 207 and a still fainter one at 208. The impossibility of eliminating Hg limits the search for lighter isotopes but there is not the least

indication of 203 or 205. The mean at. wt. deduced is 206.19, rather higher than that detd. for other samples of U Pb by chem. methods. The line 207 is of peculiar significance. It cannot be due to the presence of Pb as an impurity for in ordinary Pb 208 is about twice as strong as 207; neither can it be the product of Ra or Th. It is difficult to resist the conclusion that it is the end-product of the only other known disintegration family, that of Ac. If this is so it settles the mass numbers of all the members of this series, that of Pa being 231. Extrapolation of the packing fraction curve suggests an at. wt. of 231.08 for O = 16.

GEORGE GLOCKLER

**Origin of actinium and age of the earth.** E. RUTHERFORD. *Nature* **123**, 313-4 (1929).—Speculation regarding the isotope 207 of Pb due to actinium Pb (see preceding abstr.). The probable mass of the new isotope, which R. calls for convenience *actino-uranium*, is discussed. It seems simplest to suppose that its mass is 235 and that it undergoes first an  $\alpha$  and then a  $\beta$  transformation into protactinium. Other possibilities are mentioned. An est. of the period of transformation of the new isotope of U can be deduced on certain probable assumptions. If the half value period of transformation of U is  $4.5 \times 10^9$  years, then the period for Ac U is  $4.2 \times 10^8$  years. If the U in the earth had its origin in the sun and if it is supposed that the production of U ceased as soon as the earth sepd. from the sun it follows that the earth cannot be older than  $3.4 \times 10^9$  years.

GEORGE GLOCKLER

**The problem of the interaction of radiation and the electron.** R. D. KLEEMAN. *Science* **69**, 380-1 (1929). The electron possesses the following properties: (a) It may possess internal energy apart from kinetic energy, and (b) it can radiate in 2 entirely different ways: (1) while undergoing accelerations, and (2), on emitting a part of its internal energy as radiation. (c) The surrounding radiation gradually slows down its motion, which is attended by an increase in internal energy. (d) The force acting upon it in an elec. field depends on its internal energy. These deductions have been proved thermodynamically. The inherent difficulties of the Bohr atom and its antagonism to the Lewis-Langmuir atom completely disappear.

J. H. PERRY

**Thermodynamical properties of the electron, and atomic theory.** R. D. KLEEMAN. *Phil. Mag.* [7], **7**, 493-504 (1929). K. applies the ideas previously given (cf. preceding abstr.) to the deduction of the equation of state of an electron gas. He claims that the velocity of an electron in an electronic gas decreases gradually between 2 consecutive collisions and increases during a collision. K. further considers the effect of radiation surrounding an electron on its kinetic energy and its internal energy and as a result finds that the internal energy of an electron in an electron gas increases between 2 consecutive collisions and decreases during a collision. The elec. field surrounding an electron may undergo an increase, during which it radiates some of its internal energy into space. The equil. between the emission and absorption by electrons in electron gas is considered. From this deduction K. considers the formation of atoms and applies the ideas to the Bohr-Lewis-Langmuir atom.

L. H. REYERSON

**Atmospheric electricity. LXX. A study of the fluctuation of the cosmic ultra-gamma rays on Sonnblick (3100 m.) and in the Tyrol.** VICTOR F. HESS AND OSKAR MATHIAS. *Sitzb. Akad. Wiss. Wien, Abt. IIa*, **137**, 327-40 (1928). In the summer and autumn of 1927, measurements of cosmic rays were made at 4 different sea levels: Graz (380 m.), Lans in Tyrol (890 m.), Patscherkofel (1910 m.) and the Sonnblick (3106 m.), a Kolhorster app. (C. A. **21**, 1054) protected by 5 cm. of Fe being used. In all 4 places there was an irregular small fluctuation of the ionization; an increase in the amplitude of the fluctuation with the height was not observed. There was no definite evidence of a daily fluctuation as found by Kolhorster and Buttner. Expts. on a glacier on Sonnblick gave  $2.07 \times 10^{-3}$  sq. cm. g. as the mean mass absorption coeff. of the cosmic rays between 0 and 10 m. of ice and a definite hardening of the rays with increasing thickness in agreement with others. Expts. with and without the covering plate of Fe in Graz and Sonnblick gave mass absorption coeffs. in Fe  $\mu/\rho = 4.5 \times 10^{-3}$  and  $8 \times 10^{-3}$  sq. cm./g., resp.; in air the value was  $3.9 \times 10^{-3}$  sq. cm./g. The differences can be explained by scattering and the relative preponderance of the weaker ray component in the higher place.

MARIE FARNSWORTH

**Electron and ion currents in gases at low pressure.** G. SPIVAK. *Z. Physik* **53**, 805-39 (1929).—Starting with the fundamental equations of electrostatics and the condition of stability G. considers the reactions that take place between 2 plane parallel electrodes when an ionized gas is present at low pressure (0.001 mm. Hg). The ionization is brought about by electron impact. The electrons come from a hot cathode. The influence of the initial velocity distribution (Maxwellian due to hot filament) of the electrons is studied in its effect upon the ionization produced in the gas. Expressions are obtained which are the analogs for the case at hand to the Child-Langmuir

law. While the latter applies to the case of an electron stream in vacuum, the present equations apply where there are charges of 2 kinds carrying current between the electrodes. The potential distribution in the region between the 2 electrodes is detd. Cf. *C. A.* 22, 2319.

GEORGE GLOCKLER

**A criticism of the electron theory of metals.** H. MONTEAGLE BARLOW. *Phil. Mag.* [7], 7, 459-70(1929).—B. criticizes Sommerfeld's attempt to reinstate the electron theory of metallic conduction on the basis of a degenerate electron gas. B. cites various examples where the electron gas hypothesis is unsatisfactory and then carries out a series of expts. using 3 different methods. The 3 methods of investigation are (1) expts. on the elec. effect of accelerating a conductor, (2) expts. on the total displacement of electricity in an insulated conductor subjected to an induced e. m. f. and 131 expts. on the resistance of a charged conductor. B. claims that the results of these expts. prove that the assembly of electrons in the interior of a conductor behaves like a perfectly incompressible fluid and in no way resembles a gas. The fundamental hypothesis of the Sommerfeld theory of conduction cannot, therefore, be maintained.

L. H. REYERSON

**Electrons that are "pulled out" from metals.** EDWIN H. HALL. Harvard Univ. *Proc. Nat. Acad. Sci.* 15, 241-51(1929); cf. *C. A.* 17, 22-19, 1371; 21, 2416. H. upholds his former ideas, that there are 2 kinds of electrons in metals, differing in the mean kinetic and the mean potential energy. On the basis of data provided by Colpitts (*C. A.* 23, 333) he calculates that there is one thermion (those electrons that share in the energy of thermal agitation) for every  $10^6$  atoms. From data by Eyring and Millikan (*C. A.* 22, 2318) he concludes that valence (or "free") electron conduction is effected by the intermittent movements of trains of electrons, each train extending, perhaps, over many atoms. The essential requirements for the movement of a train are a potential gradient and a vacant space, i. e., an ion at the forward end of the train.

LOUIS WALDBAUER

**Production of the normal cathode drop.** MAX STEENBECK. Berlin-Siemensstadt. *Z. Physik* 53, 192-7(1929).—The postulate of Compton and Morse (*C. A.* 22, 3350) that in a normal stationary luminous discharge there exists such a potential distribution that an electron leaving the cathode will make a max. no. of collisions in the gas is discussed. The change of the Townsend discharge to the normal luminous discharge is caused by the concn. of the discharge in a region of high space charge. The c. d. increases until the most favorable potential distribution for ionization has been reached. The change from Townsend to luminous discharge shows many analogous features to the change from luminous to arc discharge.

GEORGE GLOCKLER

**Exponential yield of positive ions in argon.** KATHARINE B. BLODGETT. *Proc. Nat. Acad. Sci.* 15, 237-4(1929).—B. studied A under various pressures, using a W hot cathode and a Mo anode, the app. being so arranged that the temp. of the cathode could be measured with a pyrometer. At high pressures, the current rises so rapidly that at 5-cm. pressure and 90 v., the total arc current is 13 times the satn. electron emission from the filament. This can be explained on the basis of the pos. ion sheath surrounding the cathode (*C. A.* 19, 1531 *et seq.*). In the A tube the sheath was known to be of the order of 0.5 mm. When the mean free path of the electron is sufficiently short compared to the sheath thickness, the electron can make several ionizing collisions before reaching the boundary of the sheath, and Townsend ionization by collision occurs. If the field is sufficient for this process to be repeated  $n$  times,  $(2^n - 1)$  pos. ions will be formed. If the sheath is thin, the electron merely passes through. Thus the magnitude of the pos. ion current is, to a considerable extent, detd. by the relation of the sheath thickness to the distance which an electron must travel from the cathode before it ionizes.

LOUIS WALDBAUER

**Possible role of diffusion by electrons in the propagation of short waves.** PONTE AND Y. ROCARD. *Compt. rend.* 187, 942-3(1928).—The diffusion of short waves in the H layer should be analogous to that of light in a perfect gas. Calcn. shows the diffusion too weak to be observed. For reception the calcd. result must be multiplied by  $10^4$ . The H layer should not be like a gas of electrons. It is constituted of small relatively dense clouds, with diams. a little below  $\lambda$ . The problem is considered analogous to x-rays with  $h = 360$  km.,  $\lambda = 14$  m., conforming to expt. Diffusion seems to account for the facts.

L. D. ROBERTS

**Laws of photoelectric emission.** R. SUHRMANN. *Z. Physik* 54, 99-107(1929).—There are 2 ways to det. the photoelec. emission of a metal surface: First, measure the current  $i$  due to photoelectrons produced by black body radiation of temp.  $T$  falling upon the surface. Second, measure the photoelec. sensitivity curve  $f(\nu)$  as a function of the frequency  $\nu$ . The ordinates are multiplied by  $E(\nu, T)$  from Planck's radiation

formula and the total emission curve is thereby obtained, from which the total photoelec. current  $i$  may be deduced. The second method is the more accurate. The const.  $r$  in Richardson's equation for photoelec. total emission  $i = M.T.e^{-r/T}$  can be calcd.  $M$  and  $n$  are const. From a knowledge of  $r$ ,  $n$  can be detd. and then the long wave length limit can be found. This limit is found to be displaced toward the violet when compared with the exptl. limits.

GEORGE GLOCKLER

**The magnetic moment of the lithium atom.** O. STERN. *Z. Physik* **54**, 158 (1929).—Stern replies to D. A. Jackson (*C. A.* **23**, 2359) regarding the work of J. B. Taylor (*C. A.* **23**, 1568). J. assumes that the magnetic moment of the Li kernel must be  $1/2000$  of the value of a Bohr magneton. However, if one wishes to explain the fine structure of Li by assuring an appropriate value for the magnetic moment of the kernel then it is seen that nearly a whole magneton is necessary to explain the situation. Taylor's work has therefore definite basis and justification and Jackson's remark is beside the point.

GEORGE GLOCKLER

**Anomalous magnetic rotation of excited neon.** R. N. JONES. Drexel Inst., Phila. *Nature* **123**, 278(1929).—Values of the dispersion const. detd. from the anomalous dispersion of excited Ne given formerly (*C. A.* **23**, 764) are in error. The factor  $\pi/180$  was omitted from equation  $\alpha$ . This error is now corrected and a table of new values given.

GEORGE GLOCKLER

**Crystallographic optics of x-rays.** W. EHRENBERG, P. P. EWALD AND H. MARK. *Z. Krist.* **66**, 547-84(1928).

E. C. M.

**Soft x-rays of the lighter elements.** B. B. RAY AND R. C. MAJUMDAR. *Z. Physik* **53**, 646-57(1929).—Two electron jumps are assumed to be responsible for some critical potentials in the soft x-ray region (40-200  $\mu$ ). The monochromatic radiation sent out by the atom would have a frequency equal to the sum of the frequencies of the electron jumps when occurring singly. The elements Fe, Co, Ni and Cu are studied. Some of the crit. potentials of Mn and Cr can also be treated in the manner outlined.

GEORGE GLOCKLER

**Measurement of the size of crystal particles by x-rays.** A. L. PATTERSON. *Z. Krist.* **66**, 637-50(1928).

E. C. M.

**Precision measurements of x-ray reflection from crystal powders. The lattice constants of zinc carbonate, manganese carbonate and cadmium oxide.** J. BRENTANO AND J. ADAMSON. Manchester Univ. *Phil. Mag.* **17**, 7, 507-17(1929).—Exact detus of the spacing and of the rhombohedral angle of  $ZnCO_3$  and  $MnCO_3$  were made from x-ray measurements on cryst. powders. The results were used to verify the calcd. lattice const. of the carbonate series. With the values of the authors it was found that calcns. in which a fixed parameter for the  $CO_3$  group was assumed gave good approxn. but do not quite agree with the observed data. This indicates that terms characteristic of the various elements must be considered. The method as previously described (cf. *C. A.* **21**, 1384) gives uniformly spaced lines of const. width. A standardizing substance of great vol. absorption was introduced and the lattice const. of  $CdO$  was detd. so that it could be used as a standard.

L. H. REYERSON

**Newer measurements in the L-series of x-ray spectra.** H. BRAUNS. *Z. wiss. Phot.* **25**, 325-44(1928).—The various methods of measuring the L series in x-ray spectra (those of Bragg, Siegbahn and Seeman) are critically discussed. The differences between abs. and relative methods of measurement are pointed out and the errors involved in each method are reviewed. Several examples are included to illustrate how wave lengths are measured.

M. E. RUSSELL

**Polarization and Compton effect.** P. LUKIPSEK. *Z. Physik* **53**, 792-804(1929); cf. *C. A.* **22**, 4060.—The known properties of the Compton effect lead to the notion that the relative probability of the Compton scattering as compared with classical scattering increases with decreasing wave length. Hard x rays scattered on light elements should show mostly Compton's scattering. Expts. on paraffin show that the wave length of x-rays ( $\lambda = 0.1$  A. U.) scattered at right angles increases by 0.022 A. U. A purely Compton scattering should produce a wave length change of 0.0243 A. U. This agreement shows that the scattering is actually mostly of the Compton type. Study of the scattered (tertiary) radiation showed the same to be polarized as demanded by classical theory. It follows that the intensity of the Compton radiation in a given direction depends upon the projection of the elec. vector in that direction. The Compton electrons must have a favored direction if produced by linearly polarized rays which lies in the plane which contains the magnetic vector of the incident rays. This phenomenon is known in a qual. way. Quantitatively the problem could be solved by studying the Compton effect with hard, linearly polarized  $\gamma$ -rays in a Wilson cloud chamber.

GEORGE GLOCKLER

**Series in the arc spectrum of bromine.** T. L. DE BRUIN AND C. C. KIESS. Bur. of Standards. *Science* 69, 360-1(1929).—The arc spectrum of Br has been photographed out to 9300 Å. U. in the infra-red. These new lines together with those observed in the Schumann region by Turner have permitted the detection of terms in the doublet and quartet systems which characterize the spectrum emitted by a neutral halogen atom. Certain of these terms form Rydberg series and are used to calc. an ionization potential of 12.2 v. for the neutral Br atom. C. C. KIESS

**The spectrum of hydrogen. The bands analogous to the parhelium line spectrum.** I. O. W. RICHARDSON AND P. M. DAVIDSON. *Proc. Roy. Soc. (London)* A123, 54-80 (1929).—A detailed analysis is given of 2 band systems in the  $H_2$  spectrum which are analogous to the singlet system of He. Most of the strong lines of the secondary H spectrum from 8902 Å. U. in the infra-red to 3394 Å. U. in the violet are included in these bands. The final states of all these bands belong to the electronic state  $2^1S$ . The first system of 4 bands is designated as  $3^1B - 2^1S$ , each band consisting of only one single Q branch, and the lines of each band alternating in intensity and exhibiting no Zeeman effect. The second system of bands is designated as  $3^1C - 2^1S$ . Each band of this system consists of a strong R branch and a weak P branch, the individual lines showing Zeeman effect. From the analysis of the bands it is shown that the lower states are single, with the rotational terms given by  $Bm^2 - Cm^4$  where  $m = 1/2, 3/2, 5/2, \dots$ . The initial states designated as  $1^1B$  and  $1^1C$  have the electronic quantum no. 3. They are neither typical  $3^1S$  nor  $3^1P$  levels but have properties which suggest both types of levels. C. C. KIESS

**Patterns and Paschen-Back analog in the Stark effect for neon.** J. S. FOSTER AND W. ROWLES. McGill Univ. *Proc. Roy. Soc. (London)* A123, 80-103(1929).—Measurements of the Stark effect are presented for about 150 Ne lines. The source was a modified Lo Surdo discharge tube operated by d. c. at high potential. Observations were made at field strengths of 70,600 and 100,000 v/cm. The patterns observed for the sharp, diffuse and combination lines are never more complex, and in most cases are identical with those observed for singlet system lines of He. Many of the diffuse and combination lines present a simple pattern consisting of but 1 parallel and 1 normal component. These observations show that in high fields what may be termed the Paschen-Back analog in the Stark effect appears and is characterized by 2 main features: (1) the normal fine structure of a complex term fuses to form a characteristic Stark pattern which lacks symmetry; (2) the group pattern presented by the groups of combination lines brought out by the field are symmetrical. C. C. KIESS

**Stark effect in a violet region of the secondary spectrum of hydrogen.** J. K. L. MACDONALD. McGill Univ. *Proc. Roy. Soc. (London)* A123, 103-7(1929).—Twenty lines of  $H_2$  between 3980 and 4080 Å. U. have been examd. for Stark effect. A table presents the measured displacements of the normal and parallel components for a field of 95 kv/cm. Lines in the violet half of this region are displaced toward the violet while those in the long wave half are displaced redward. Five of the lines exhibit a very close structure not previously reported. C. C. KIESS

**Relative intensities of Stark components in hydrogen.** J. STUART FOSTER AND LAURA CHALK. McGill Univ. *Proc. Roy. Soc. (London)* A123, 108-18(1929).—A method of photographic photometry was used to det. the relative intensities of the Stark effect components of  $H_\alpha$ ,  $H_\beta$ ,  $H_\gamma$  and  $H_\delta$ . The sources were modified forms of Lo Surdo tubes, the advantages and disadvantages of which are described. The observed results are found to be in excellent agreement with those calcd. by Schrödinger on the basis of the wave-mech. theory. C. C. KIESS

**Polarization of scattered light quanta.** C. V. RAMAN AND K. S. KRISHNAN. *Nature* 122, 169(1928).—The recent discovery of a new type of light scattering with altered frequency makes it of importance to ascertain whether a light quantum which is scattered with diminished energy is less perfectly polarized than in the ordinary case. A brief report is made of an investigation of the question. FRANK V. JOHNSON, JR.

**Light scattered by a potassium carbonate solution.** M. LEONTOVICH. *Z. Physik* 54, 155-7(1929).—A modified scattered line is found in the scattered light of the soln. of  $K_2CO_3$  which corresponds to the infra-red frequency of 9.26  $\mu$ . GEORGE GLOCKLER

**Intensity measurements in the helium spectrum.** M. G. PETERI AND W. ELENBAAS. *Z. Physik* 54, 92-8(1929).—The intensity of He lines is measured as a function of pressure and electron velocity and it is found that the selection rules that hold for radiation also hold for electron excitation although not as rigidly. G. G.

**Interference fringes in light rays passing over a liquid surface.** Z. VALKOVA. *Z. Physik* 53, 708-18(1929).—When a parallel ray passes over a liquid surface there is produced a double system of interference fringes upon stirring the liquid. Both these

systems of fringes disappear in a period of from 1 to 3 mins. after the disturbance but they can be reproduced upon further agitation of the surface. The situation can be understood if it is assumed that there exists at a certain distance from the surface a layer or region of condensed droplets or particles which is being destroyed above and below by diffusion.

GEORGE GLOCKLER

**Simple relations between more intense and higher radiations of chemical elements in the bright atmosphere of the sun.** H. DESLANDRES. *Compt. rend.* **188**, 20-4(1929); cf. *C. A.* **18**, 2840; **19**, 606. The simple relation (ultimate radiations of atoms, last to disappear in mixts., are in general multiples of a same elementary frequency = 1062.5) announced in 1924 by D. for 20 simple substances has been verified. It is especially true with He and of simple substances of which the at. wt. is a multiple of 4. Study has been made of spectra of substances illuminated in the lab. and of large masses, of gas observed in celestial space, especially the chromosphere. The results are given in a table.

L. D. ROBERTS

**Molecular constants of hydrogen.** H. H. HYMAN AND R. T. BIRGE. *Nature* **123**, 277-8(1929). The B-A system of  $H_2$  mol. spectrum has been photographed with a ten-foot vacuum spectrograph and the photograph shows clearly that the bands of this system consist of P and R branches only. The lines show clearly the alternating intensity expected from a symmetrical mol. on the basis of the old quantum mechanics. The zero vibrational level of the B state is  $B_0 = 19.46 \pm 0.04$  giving  $b_0 = 1.423 \pm 0.003 \times 10^{-49}$  g. sq. cm.

GEORGE GLOCKLER

**Sulfur in gaseous nebulae.** I. S. BOWEN. *Nature* **123**, 150(1929). The analysis of the S II spectrum by Ingram (*C. A.* **23**, 36) makes it possible to identify certain S lines with lines in gaseous nebulae. It may be noted that all the elements thus far found in the nebulae—namely, H, O, He, C, N, S—are gases or have stable compds. that are gases at low temps.

GEORGE GLOCKLER

**Helium lines in stellar spectra.** OTTO STRUVE. *Nature* **122**, 994-5(1928). The intensity of He lines from various stars is estd. and compared with results from lab. expts. (cf. Ornstein, Burger and Kapuscinsky, *C. A.* **23**, 40). While the relative abundance of atoms in the m p and m P levels is subject to considerable variations in different stars, the av. ratio triplet: singlet in stellar spectra is not very different from that observed in the lab. under normal pressure.

GEORGE GLOCKLER

**Anomalous dispersion of lithium and mercury.** F. SEGRE AND E. AMALDI. *Atti accad. Lincei* [6], **7**, 919-21(1928). The intensity of the absorption bands of Li at 2S - 2P (6708 Å. U.) and 2S - 3P (3232 Å. U.) as well as for Hg 6S<sub>1/2</sub> - 6P<sub>1</sub> (2537 Å. U.) and 6S<sub>1/2</sub> - 6P<sub>3/2</sub> (1849 Å. U.) has been detd. With Li a thin Fe tube was placed inside the quartz oven since Li attacks quartz at high temps.; thus photographs of the spectrum at 1200°C. could be taken, a C arc being used. Thus it was detd. that the relation between the electrons at the above wave lengths for Li was 135, with a possible error of 20%. With Hg, Fe electrodes were used, and the absorption between the lines 2537 Å. U. and 1849 Å. U. was photographed. The results indicate that at 2537 Å. U. the no. of electrons dispersed is about  $\frac{1}{100}$  of the no. of atoms. From the mech. wave-motion theory Rasetti had calcd. the ratio for Li was about 2, which is very far from the exptl. value obtained above.

A. W. CONTIERT

**Sebor's method of quantitative spectral analysis.** J. KNOP. *Chem. Abstr.* **1**, 253-6(1926). The method whereby it is sought to det. the concn. of dyes by measurement of the width of the absorption bands is inexact.

B. C. A.

**Second spark spectrum of potassium (K III).** T. L. DE BRUIJN. *Z. Physik* **53**, 678-64(1929); cf. *C. A.* **23**, 2361.

GEORGE GLOCKLER

**Mechanism of spark discharge.** LEONARD J. NEUMAN. *Univ. of Calif. Proc. Nat. Acad. Sci.* **15**, 259-65(1929). Using a Ni anode and a Na cathode, N. was able to confirm previous work showing that in A at low pressure, the cathode material plays an important part in the spark discharge. Under these conditions, the principal mechanism by which pos. ions liberate electrons from the cathode depends on the velocity or energy of impact of the pos. ions with the cathode. The liberation of electrons from the cathode by photoelec. action of the radiation produced by the neutralization of slowly moving pos. ions near, at or on the cathode is not the primary mechanism. As the pressure increases, the predominating mechanism of electron production changes from that in which the electrons are liberated from the cathode by the bombardment of swiftly moving pos. ions, to that in which the electrons are generated in the gas by collision between swiftly moving ions and neutral mols. At pressures above 20 mm., the spark potential becomes independent of the cathode material.

L. W.

**Intercombinations in the arc spectrum of carbon.** D. S. JON. *Nature* **123**,

318(1929).—Certain intercombination lines in the arc spectrum of C have been observed for the first time.

GEORGE GLOCKLER

**Arc spectrum of germanium.** C. RICHTER. *Z. wiss. Phot.* 25, 380-93(1928).—The previous methods of measuring Ge arc spectrum are reviewed. In spite of all the previous measurements almost none of them has yet been incorporated in the international tables. Consequently R. has carefully measured the spectrum down to about 200  $\mu$ . The dispersion was about 1.97 A. U./mm. The spark spectrum will be measured later.

M. E. RUSSELL

**Perturbation in helium band spectrum.** G. H. DIEKE. *Nature* 123, 446-7 (1929).—Kronig's theory (C. A. 23, 32) of perturbation in band spectra predicts that if 2 mol. terms with the same  $j$ , which besides have to fulfil certain other conditions, come close together, their mutual influence has the effect that they seem to repel each other. ( $j$  = magnetic quant. no.) D. tests this theory on certain He bands and finds it works satisfactorily.

GEORGE GLOCKLER

**Band systems of the hydrogen molecule.** R. MECKE AND W. FINKELNBURG. Physik. Inst., Bonn. *Naturwissenschaften* 17, 255-6(1929).—The dominating systems of the  $H_2$  band spectrum were found to be a singlet and a triplet system; the Balmer band spectrum ( $\alpha, \beta, \gamma$  and  $\delta$  bands) is taken to be the singlet system contrary to Richardson and Birge. In this system 550 lines have been classified; a further 725 lines have been classified in 60 bands and 179 branches of a new triplet system. These bands have 3 intensive branches of  $\Delta m = 0$ , 2 weaker ones of  $\Delta m = \pm 2$ . Term, nucleus vibration no. and moment of inertia were found for  $2^3S, 3^3P, 4^3P$  and  $3^3D$ ; the  $2^3S$  term is the common end term for all new bands; it is the initial term of the ultra-violet Lyman bands ( $1^1S$  to  $2^3S$ ). A table is given, surveying the terms found. It is taken to be proved that  $H_2^+$  and  $H_3$  play an insignificant role if any at all in the emission of the line spectra of  $H_2$ .

B. J. C. VAN DER HOEVEN

**Band spectrum of chlorine or hydrogen chloride.** E. B. LUDLAM. Univ. of Edinburgh. *Nature* 123, 414(1929).—The bands described (C. A. 23, 1816) were caused by traces of S introduced into the  $H_2$  stream by the  $H_2SO_4$  wash bottles.

G. C.

**Ferrous nitroso compounds.** H. I. SCHLESINGER AND H. B. VAN VALKENBURGH. *J. Am. Chem. Soc.* 51, 1323-31(1929). The compd.,  $FeSO_4 \cdot NO$ , is formed when NO is passed into solns. of  $FeSO_4$ . It has been shown that  $FeCl_2$  in alc. soln. reacts with NO. Curves are used by S. and V. to show the absorption spectra of  $FeCl_2 \cdot NO$ . An absorption band extending approx. from oscillation frequencies 1920 to 2330 is shown in 30, 70 and 90% alc. mixts. with  $H_2O$ . In aq. soln. the band is somewhat narrower but its right-hand margin and the region of max. transmission are the same as those for the alc.- $H_2O$  mixts. When abs. alc. is used the band is definitely different, showing with respect to the others a displacement toward the red of both margins and of the region of max. transmission. The spectra of the dil. alc. solns. of the complex  $FeCl_2 \cdot NO$  are practically identical, so far as location of the band is concerned, with those of the less strongly acid solns. of  $FeSO_4 \cdot NO$ . The compd.  $FeHPO_4 \cdot NO$  was studied and a table shows the soly. of NO in concd. phosphoric acid solns. of  $FeHPO_4$ . The absorption spectra of  $FeHPO_4$  satd. with NO in solns. contg. various amts. of  $H_2PO_4$  are shown graphically. The shift of the absorption band towards the violet end of the spectrum, which occurs with increasing diln. of  $H_2SO_4$  solns. of  $FeSO_4$  satd. with NO, also occurs on dilg.  $H_3PO_4$  solns. of  $FeHPO_4$  and alc. solns. of  $FeCl_2$  satd. with NO. S. and V. conclude that the transition in the 3 pairs of compds. having, resp., the empirical formulas  $FeSO_4 \cdot NO$ ,  $FeHPO_4 \cdot NO$  and  $FeCl_2 \cdot NO$  is not related to the nature of the neg. ion but is detd. by the activity of the  $H_2O$  in the soln. The methods and app. described by Schlesinger and Salathe (C. A. 17, 3835) were employed. A. J. M.

**The Raman effect in diatomic gases.** F. RASETTI. Calif. Inst. Tech. *Proc. Nat. Acad. Sci.* 15, 234-7(1929).—The Raman effects for  $O_2$ ,  $N_2$  and CO have been detd. at atm. pressure in a glass tube of 4-cm. diam., a quartz Hg arc 12 cm. long and a cylindrical Al reflector. The light scattered by the gas was collected by a lens and projected on the slit of a spectrograph. All of the gases gave Raman lines, excited by  $\lambda$  4047 and 4358 of Hg. The results obtained are:

	$\nu$	$\lambda Hg$	$\Delta$	$\nu_{osc.}$
$O_2$	21384	4358	1553	1552
$N_2$	22374	4047	2330	2332
	20598	4358	2330	
CO	20781	4358	2156	2133
	22550	4047	2154	

J. H. PERRY

**Resonance impacts in fluorescence and chemi-luminescence.** H. BEUTLER AND B. JOSEPHY. *Z. Physik* 53, 747-65(1929).—The energy of an excited atom is transferred during impact of the second kind to another normal atom with great selectivity. This means that those impacts are most likely wherein the energy level of the atom to be activated is nearest to the energy level of the exciting atom. The tendency is to transfer as little as possible of the energy of activation into kinetic energy. Radiation of a Na-Hg vapor mixt. with the resonance line 2537 Å. U. of Hg brings out the Na transition  $1^2S - 7^2S$  which is nearest to the Hg transition  $2^3P_1 - 1^1S_0$ . This resonance phenomenon is measured experimentally by detg. the intensity of the lines by photographic photometry. If the exciting Hg atoms are brought down from the  $2^3P_1$  state (by means of added  $N_2$  causing more impacts) to the  $2^3P_0$  then the resonance takes place in such a way as to produce the Na transition  $1^2S - 5^2S$  which is nearest to the Hg transition  $2^3P_0 - 1^1S_0$ . The D-lines of Na appear only as a secondary phenomenon. In chemi-luminescence similar resonance phenomena are found. Transition probabilities due to this resonance phenomenon are quite different from the probabilities as calcd. from thermal statistical considerations. GEORGE GLOCKLER

**Average life of excited molecules in fluorescing water solutions.** S. I. VAVILOV. *Z. Physik* 53, 665-74(1929).—The idea that extinction of fluorescence in liquid media is due to impacts of the second kind is tested on the expts. of Jette and West (*C. A.* 23, 1352). New expts. concerning the influence of temp. upon the extinction process are described and they confirm the theory. The av. life ( $\tau$ ) calcd. is found to agree (with uranin, etc.) with the direct detns. made by Gaviola (*C. A.* 21, 3022).  $\tau$  is independent of the exciting wave length  $\lambda$ . This fact is discussed in relation to the depolarization of fluorescence shown by Lewschin and Froehlich (*C. A.* 19, 3222; 20, 1952) as a function of wave length. GEORGE GLOCKLER

**Monatomic hydrogen, oxygen and nitrogen.** E. WREDE. *Z. Physik* 54, 53-73 (1929).—Two glass spheres are connected by a very small hole. In one of the spheres at  $H_2$ ,  $N_2$  or  $O_2$  is produced by a discharge. In the second recombination only happens. A difference in pressure will be developed which can be used as a measure of at. concn. With  $H_2$  the conditions were found to be very reproducible so that the concn. of atoms in the discharge as a function of the current could be deduced. In  $N_2$  activated in the usual manner it was found possible to prove the existence of a few percent of N atoms. Spark discharges lead to increased at. concns. up to 30 to 40%. However, a recombination effect in the discharge is a hindering effect for the attainment of high atomic concns. Small glowing particles of dust could be used to indicate the life of the at. state.  $O_2$  dissociates in the discharge easier than does  $H_2$ ; however, increasing c. d. leads to greater recombination. GEORGE GLOCKLER

**Intensity measurements of molecular rays of gases.** F. KNAUER AND O. STERN. *Z. Physik* 53, 766-78(1929).—A method to measure the intensity of mol. rays is developed. The ray of mol. passes through a slit into an otherwise closed vessel and causes therein an increase in pressure until as many mols. leave as enter through the slit. The pressure is measured by a hot wire manometer. The accuracy reached is about one per mille. The mean free path of  $H_2$  mols. is detd. GEORGE GLOCKLER

**Reflection of molecular beams.** F. KNAUER AND O. STERN. *Z. Physik* 53, 779-91(1929).— $H_2$  and He beams are reflected from highly polished surfaces at nearly glancing angle. The behavior of these rays upon reflection is in accordance with ideas obtained for such phenomena from the de Broglie wave theory. Expts. to show diffraction on ruled gratings gave no results. Also in rock salt surfaces there is found specular reflection. The observations made on crystal cleavage planes are probably due to diffraction phenomena although their complete interpretation has as yet not been given. GEORGE GLOCKLER

**Photochemical preparation of optically active substances.** WERNER KUHN AND E. BRAUN. Univ. Heidelberg. *Naturwissenschaften* 17, 227-8(1929).—K. and B. succeeded in sepg. optically active isomers from their racemic mixt. by irradiation with circularly polarized light (Cotton effect). For the purpose  $MeHCBBrCO_2Et$  was used; expts. had shown that its bands in the ultra-violet range (2450 Å. U.) are closely related to its optical activity (ultra-violet irradiation causes first a rise in rotation to  $4000^\circ$ , then a reversal). From 4 to 8% solns. of the racemic ester in abs. EtOH were sealed in quartz flasks and exposed to left or right circular monochromatic Mg light (2800 Å. U.). From a simultaneous expt. with a soln. of active ester in the same but nonpolarized light the amt. of ester could be detd. which had reacted (by decrease in rotation); the irradiation of the solns. was stopped at 50% reaction. After removal of the solvent, the rotation of both ester samples corresponded to the direction of rota-

tion of the light employed in the irradiation. The best result obtained was  $0.05^\circ$  rotation to either side.

B. J. C. VAN DER HOEVEN

**Kinetics, quantum efficiency and temperature coefficients of the decomposition of ferric thiocyanate and the bleaching of neocyanin and some other photochemical reactions in radiations of different frequencies.** A. K. BHATTACHARYA AND N. R. DHAR. Allahabad Univ., India. *J. Indian Chem. Soc.* 6, 143-54(1929); cf. *C. A.* 23, 772.—The unimol. decompn. of ferric thiocyanate has temp. coeffs. of 2.12 at 4725 A. U., 2.3 at 5650 A. U., and 2.5 at 7304 A. U. and quantum efficiencies varying from 4 to 12. For the bleaching of neocyanin, which is monomol., the temp. coeffs. are 1.29 (4725 A. U.), 1.2 (5650 A. U.), and 1.12 (7304 A. U.) and the yield varies from 1 to 5. Reaction between Na lactate and I is bimol.; temp. coeffs. are 2.49 (dark); 2.02 (4725 A. U.); 2.11 (5650 A. U.); 2.21 (7304 A. U.); the yield varies from 4 to 16. Na tartrate and I reaction is bimol.; temp. coeffs. are 2.51 (dark); 2.11 (4725 A. U.); 2.2 (5650 A. U.); 2.26 (7304 A. U.); yield changes from 4 to 18. The reaction of chromic and citric acids has temp. coeffs. of 3.73 (dark); 2.59 (4725 A. U.); 2.66 (5650 A. U.); 2.89 (7304 A. U.) and quantum efficiencies of from 2 to 8. Chromic and tartaric acids react with a high quantum yield and temp. coeffs. of 2.13 (dark); 1.9 (4725 A. U.); 1.95 (5650 A. U.); 2.0 (7304 A. U.). Reaction of chromic and lactic acids has quantum yields of from 2 to 8 and temp. coeffs. of 1.8 (dark); 1.62 (4725 A. U.); 1.7 (5650 A. U.); 1.75 (7304 A. U.). Exptl. details and many tables are given. W. E. V.

**Inhibition of certain photochemical reactions by oxygen.** H. B. DUNNICLIFF AND JANKI NATH JOSHI. Gov. Coll., Punjab Univ., Lahore. *J. Indian Chem. Soc.* 6, 121-7(1929).—Air, O, H<sub>2</sub>O<sub>2</sub>, and O<sub>2</sub> inhibit the reaction  $2\text{HgCl}_2 + (\text{NH}_4)_2\text{C}_2\text{O}_4 \longrightarrow 2\text{HgCl} + 2\text{NH}_4\text{Cl} + 2\text{CO}_2$ , under the radiation of a C arc. O<sub>2</sub> was found to be a neg. catalyst in the oxidation of lactic acid by Br water. The photochem. reduction of ferric oxalate to ferrous oxalate under the influence of visible light is retarded by O<sub>2</sub> as is the decompn. of Ag halides.

WILLIAM E. VAUGHAN

**Temperature coefficients of some photochemical reactions.** GEO. B. KISTIAKOWSKY. Princeton Univ. *Proc. Natl. Acad. Sci.* 15, 194-7(1929).—Reaction velocities were detd. by heating stoichiometrical mixts. of (1) H<sub>2</sub> and O<sub>2</sub> and (2) CO and O<sub>2</sub> in a quartz vessel, and illuminating the gases by means of the radiation obtained by passing a high-power condensed spark between Al electrodes. The temp. coeffs. were at great variance with Arrhenius' equation, increasing with temp., and at a rate the greater the higher the temp. Two mols. of H<sub>2</sub>O or CO<sub>2</sub> are formed per absorbed quantum, and the conclusion is that at 500°, long chains of activated mols. are formed in both gaseous mixts. (cf. *C. A.* 22, 2842). The total rate of a photochem. reaction consists of 2 parts, (a) the immediate processes following light absorption and requiring for their completion either none or a very small addnl. thermal activation energy, and (b) the secondary chain mechanism, which may be started by some of the primary processes if a sufficient thermal agitation energy is supplied. The second reaction may be identical in mechanism with the normal thermal reaction. LOUIS WALDBAUER

**The decomposition of nitrous oxide in the silent electric discharge.** II. SHRIDHAR SARVOTTAM JOSHI. *Trans. Faraday Soc.* 25, 108-17(1929).—Expts. on the decompn. of N<sub>2</sub>O (*C. A.* 21, 2613) are continued. An equation derived for velocity of chem. reaction in the silent elec. discharge is examd. for applicability to the initial stages of decompn. of N<sub>2</sub>O in the discharge. Tables are given showing values of O, percentage decompn. of N<sub>2</sub>O, in a specially designed ozonizer for different conditions of gas pressure, applied potential and duration of exposure. It is assumed that effects of wall catalysis and ultra-violet light, produced during discharge, on rate of decompn. are negligible. III. **The variation of the current and of the power during the reaction.** *Ibid* 118-28.—During the decompn. of N<sub>2</sub>O in silent discharge in an ozonizer, current flowing through the ozonizer is characterized by remarkable variations seemingly closely related to corresponding stages of the reaction. This phenomenon was investigated in detail: measurements of energy consumed in an ozonizer show that current and power consumed diminished during the first part of the reaction and finally increased with completion of change. Data on the reactions are tabulated. The decompn. of N<sub>2</sub>O started at given pressure and definite alternating potential takes place in 3 stages; N<sub>2</sub>O<sub>4</sub> is an intermediate product of the decompn.

STARK, JOHANNES: **Die Axialität der Lichtemission und Atomstruktur.** Berlin: Polytechnische Buchhandlung. A. Seydel. 124 pp.

WORSNOP, B. L.: **x-Rays.** London: Methuen & Co., Ltd. 2s. 6d. net.

**Radium.** OTTO HAHN. Ger. 472,857, Aug. 16, 1924. Stable Ra preps. with high emanating properties are prepd. by treating Ra salt solns. with soln. of substances which, with a common pptg. agent, give a ppt. with a greater surface. Thus,  $\text{RaBr}_2$  is mixed with  $\text{La}(\text{NO}_3)_3$  and HF added. The  $\text{RaF}_2$  produced is stable and of good emanating quality.  $\text{FeCl}_2$  and  $\text{RaBr}_2$  may be pptd. with  $\text{NH}_4\text{OH}$ . Other examples are given.

**Treating water or other liquids with radium emanation.** SPA MONOPOLAR COMPANY, PAGNIE FERMIERE DES EAUX ET DES BAINS DE SPA. Brit. 298,915, Oct. 15, 1927. The emanation is conveyed by a current of gas (such as purified air) circulating in a closed system in an app. which is described. A potash bulb removes  $\text{CO}_2$  and any explosive gas which may be formed is destroyed by Cu oxide or platinized asbestos in a heated tube.

**Röntgen-ray screen.** RUDOLF MANNL. Swiss 130,019, April 25, 1927. The screen is provided with concentric series of radial projections for trapping the secondary rays.

#### 4—ELECTROCHEMISTRY

COLIN G. FINK

**Electric furnace increases production.** W. J. WYLIE. *Elec. News* **37**, No. 21, 49-50(1928).—A 35-kw. 220-v. "Homo" elec. drawing furnace with elements connected for 3-phase operation is described. It is used for heat treating of gears, jack shafts, studs and other parts of transmissions. The charge can be brought to the desired temp. more rapidly than by any method in which heating by radiation is used. Other advantages include uniformity of temp., reduction in time for the drawing cycle, elimination of salt replacement and greater flexibility of furnace operation. The unit cost should be materially reduced, though definite figures are not available. W. H. B.

**Recent developments in electric furnaces.** D. F. CAMPBELL. *World Power* **11**, 363-5(1929). See C. A. **23**, 2369.

**Some advantages of the electric furnace for heat treatment.** P. C. KELLY. *Elec. West* **62**, 204-5(1929).—Economics effected by elec. heat treatment of hand tools are

indicated by comparative costs. Similar economies were effected in treating ball bearings.

W. H. BOYNTON

**Electrolytic oxidation and reduction in the presence of some gases.** V. SIHVONEN. *Ann. acad. sci. Fennicae* 29A, 19 pp.(1927).—A study was made of electrolysis with a. c. of dil. solns. of  $\text{H}_2\text{SO}_4$  and of  $\text{NaOH}$  with Pt-gauze electrodes in the presence of gases. The results are explained in accord with theories previously suggested (SiHVonen, *Ann. acad. sci. Fennicae* 28A, 1) in which the existence of bivalent ionic forms of O and  $\text{O}_2$  adsorbed on the cathode were postulated, which are in equil. on the one hand with gaseous  $\text{O}_2$  and on the other with an electrolyte. The gases studied were air,  $\text{N}_2$ ,  $\text{CO}_2$ , CO and  $\text{SO}_2$ . For air,  $\text{N}_2$  and  $\text{CO}_2$  the influence on the current potential was analogous to the thermal dissocn. of the gases and the recombination of the atoms to form new mols. CO and  $\text{SO}_2$  because of their action as reducing agents depolarized the originally  $\text{O}_2$  laden electrodes.

F. L. BROWNE

**The electric cleaning of blast-furnace gas.** ANON. *Feuerungstech.* 16, 260-1 (1928).—A new plant of the Cottrell type is briefly described and illustrated. The tubes are cleaned by reversing the gas flow and by mech. knocking. ERNEST W. THIELE

**Investigation on the theory of chromium deposition.** E. A. OLLARD. *Electroplat. Deposit. Techn.* 5-24(Nov. 9, 1927); *Chimie et industrie* 21, 321; cf. C. A. 22, 4068.—A study of the chem. properties of chromic acid shows that the electrolyte used in electroplating should contain  $\text{H}_2\text{Cr}_2\text{O}_7$ ,  $\text{Cr}_2(\text{Cr}_2\text{O}_7)_3$  and a chromic salt such as  $\text{Cr}_2(\text{SO}_4)_3$ . A small proportion of colloids may also be present. Under the action of the elec. current the Cr ions go to the cathode and pass to the metallic state. The most important factors are the  $\text{Cr}^{+++}$  and  $\text{H}^+$  concns. and the current d. The compn. of the electrolyte may be selected to work at either high or low current d., as desired. The  $\text{Cr}^{+++}$  concn. can vary according to the nature and amt. of the other acid added, while the  $\text{H}^+$  concn. depends on the degree of reduction of the soln.

A. P.-C.

**Automatic plating machinery.** EDWIN M. BAKER. Univ. of Mich. *Ind. Eng. Chem.* 21, 400-4(1929).—B. discusses the different types of plating equipment and the various handling methods in use. Where automatic electroplating methods can be adopted the following advantages may be gained: (1) saving of labor, eliminating up to 90% of that required for hand methods; (2) insuring more nearly uniform quality than can be had by other methods; (3) reducing required size of generating equipment, since this can be continuously under full load, with the resultant elimination of peak or overload capacity; (4) reduction of percentage of work rejected; and (5) predetd. productive capacity for a fixed working period. On the other hand automatic methods are advantageous only where production is reasonably uniform and the vol. of work large enough to warrant the expense.

M. C. ROGERS

**A table of electrochemical equivalents. Based on 1929 atomic weights.** G. A. ROUSH. *Trans. Am. Electrochem. Soc.* 55 (preprint) 11 pp.(1929)(also in pamphlet form).—The last complete table of electrochemical equivalents is that calcd. by Hering based on 1917 atomic weights. Since that time there has been a large number of revisions in atomic weights, some of them of considerable magnitude. The entire list was therefore recalculated to 5 decimal places on the basis of the 1929 atomic weights.

C. G. F.

**Formation of ozone by an electric discharge of high frequency.** WLÓDZIMIERZ DANIŁEWSKI. *Roczniki Chem.* 9, 83-96(1929).—Using an "MTI" Marconi tube as generator of a. c. of high frequency the efficiency of an ozonator was studied and found to be independent of the frequency between 290,000 and 1,250,000 cycles. The efficiency of an ozonator without the dielectric and high frequencies was found to be equal to that with the dielectric at low frequencies.

JAROSLAV KUČERA

**The electrical equipment of scientific laboratories.** LEOPOLD FINK. *Elektrochem. Maschinenbau* 47, 258-60(1929).

C. G. F.

**Modern methods of teaching electrochemistry.** ROY L. DORRANCE. *Am. Electrochem. Soc. Pamphlet*, May, 1929, 3 pp.—There is considerable diversity, both in methods of teaching and in subject matter included, in the courses in electrochemistry given at the various colleges. The importance of a thorough grounding in physical chemistry and mathematics is emphasized. The history of electrochemistry should be included in any well-rounded course.

C. G. F.

**The importance of electrochemistry in the teaching of analytical chemistry.** N. HOWELL FURMAN. *Am. Electrochem. Soc. Pamphlet*, May, 1929, 6 pp.—In analytical chemistry it is essential and important to have the students fully conversant with the laws of electrolysis. Electroanalysis should include a study of the changes occurring at the anode and cathode during electrolysis. The theory of volumetric analysis rests on an adequate foundation only when it is discussed throughout from an electrochemical

viewpoint. The electronic viewpoint of oxidation-reduction reactions appears to be useful to students in mastering the more difficult processes. Much of the recent development in analytical methods is directly traceable to advances in understanding of electrochemical principles. C. G. F.

**Electrical measuring instruments for use in teaching electrochemistry.** HENRY C. PARKER. *Am. Electrochem. Soc. Pamphlet*, May, 1929, 12 pp.—Various electrical measuring instruments are described that can be used in the electrochem. lab. Especial emphasis is laid upon the instruments which are also suitable for industrial measurements. Most of these instruments are simple to manipulate, and several are direct reading. C. G. F.

**The teaching of electro-organic chemistry.** C. J. BROCKMAN. *Am. Electrochem. Soc. Pamphlet*, May, 1929, 4 pp.—In most of the North American universities the teaching of org. electrochemistry forms but a small part (at most 10%) of the lectures and lab. expts. in electrochemistry. This is ascribed partly to the complexity of the subject, and partly to the fact that there are in America today very few industrial applications. A survey of the courses in electrochemistry given in South America and in Europe indicates conditions similar to those in the United States and Canada with the two exceptions, Germany and Switzerland. These two countries have contributed more to the advancement of organic electrochemistry than all other countries combined. The value and importance of organic electrochemistry is emphasized, and a closer and wider study of this branch of electrochemistry is strongly recommended. C. G. F.

**Electrochemical engineering at the Massachusetts Institute of Technology.** M. DEKAY THOMPSON. *Am. Electrochem. Soc. Pamphlet*, May, 1929, 4 pp.—Massachusetts Institute of Technology has offered a regular four-year course in electrochem. engineering ever since 1900. Instruction in electrochemistry begins in the first term of the third year and continues for two years. Besides the lecture courses, there are laboratory periods, which include expts. with elec. furnaces, storage batteries and electrolytic alkali cells. C. G. F.

**The teaching of electrochemistry.** LOUIS KAHLENBERG. *Am. Electrochem. Soc. Pamphlet*, May, 1929, 6 pp.—General training in chemistry and physics should precede a course in electrochemistry. It is a mistake to present to the student at the outset current electrochemical theories and then proceed from these in a deductive manner. The student should learn all of the current conceptions. He should know these thoroughly. The great importance of thorough lab. instruction is emphasized. Lab. exercises are far more essential than lectures. Based on first hand lab. experience, theoretical conceptions should be developed, and their value and also their shortcomings should receive consideration. C. G. F.

Use of simple metallic electrodes in the potentiometric titrations of acids and bases (CLOSS, KAHLENBERG) 7. New rustproofing materials (MARTELL) 9. **Dry cell (with disruptable electrolyte container).** MANNESMANN LICHT A.-G. Ger. 473,474, April 13, 1924.

**Storage batteries.** JOSEPH BOUTEILLE. Fr. 648,382, June 21, 1927. Improved insulation.

**Storage batteries.** SOC. DES ACCUMULATEURS ÉLECTRIQUES (Anciens Établissements Alfred Dinin). Fr. 649,841, July 21, 1927. Activated charcoal is used in place of the usual powd. C.

**Galvanic cells.** SOC. ANON. LE CARBONE. Ger. 472,966, Jan. 9, 1924. Porous bodies for use as depolarizing elements in galvanic batteries are prep'd. from wood charcoal impregnated with a colloid such as starch or fish glue, with or without addn. of glycerol.

**Apparatus for concentrating dry galvanic battery constituents.** WILHELM HASSE. Ger. 472,616, Mar. 3, 1928. Details of arrangement.

**Thermoelectric battery.** CARL E. STEPHAN. Ger. 473,475, Oct. 21, 1926. Each element is shaped like a hair-pin and comprises 2 wires of suitable metals soldered together at the apex of the pin. A no. of such elements is affixed to an insulating plate in such a way that all the apices lie on 1 side while the adjacent ends of different elements are joined by metal sheets bent so as to provide radiating surfaces. The battery comprises several such plates of elements, suitably connected, and includes an elec. heater in proximity to which the apices of the elements are disposed.

**Electrometallurgy.** OTTO NIELSEN. Ger. 474,790, Nov. 30, 1926. The lower part of a large cathode for the electrodeposition of metals is composed of a channeled plate.

**Electrodeposition of cadmium.** THE GRASSELLI CHEM. CO. Ger. 474,211, Nov. 5, 1925. See Brit. 265,292 (*C. A.* 22, 196).

**Electroplating.** SIEMENS & HALSKE A.-G. (Georg Erlwein and Martin Hosenfeld, inventors). Ger. 474,311, Jan. 15, 1927. Coatings of Cr, Ni, W, or Nb are produced by electrolysis of a fused bath contg. a comp'd. of the metal and a sulfate or bisulfate of an alkali or alk. earth metal or Mg. In the example, a mixt. of NaHSO<sub>4</sub>, 1000 and Cr<sub>2</sub>O<sub>3</sub>, 90 parts is electrolyzed at 730° with a cathode c. d. of 2500 amp./sq. m.

**Electroplating metal tubes internally.** F. G. MARTIN and W. RAMSEY. Brit. 299,071, April 22, 1927. Flexible anodes are used in processes such as internal coating of long and narrow condenser tubes or the like with Cr. An app. and various mech. details are described.

**Chromium plating of non-ferrous tubes of heat exchange apparatus.** F. G. MARTIN and W. RAMSEY. Brit. 299,100, April 22, 1927. An electrolytic deposit of Cr is applied to the interior or to both the interior and exterior of metal tubes.

**Chromium.** HARRY SCHMIDT. Ger. 472,663, Nov. 10, 1926. Cr is deposited by electrolyzing a fused mass of chromite.

**Electrolytically coating metals.** J. STONE & Co., LTD. Ger. 472,937, Sept. 13, 1927. App. for electrolytically coating the inner surfaces of metal tubes, such as condenser or superheated tubes, with a layer of such metal as Cr is described.

**Metal coatings.** SIEMENS & HALSKE A.-G. (Georg Erlwein and Martin Hosenfeld, inventors). Ger. 474,902, Mar. 9, 1927. A coating of metal is obtained by the electrolysis of a molten mass contg. more than twice as much silicate as comp'd. of the desired metal. Thus, for a coating of Cr, a molten mass contg. 1000 g. Na<sub>2</sub>SiO<sub>3</sub>, 100 g. NaCl and 350 g. CrF<sub>3</sub> is electrolyzed.

**Metal coatings deposited from ionized metal vapors.** FRANKLIN SMITH (to American Machine & Foundry Co.). U. S. 1,710,747, April 30. A metal such as Pb is vaporized by heating and the vapor is ionized (suitably by glow discharge); the ionized vapor is then electrically deposited and condensed on a metal to be coated, e. g., on a ferric wire. An app. is described.

**Treating aluminum surfaces.** CHARLES H. R. GOWER and STAFFORD O'BRIEN & PARTNERS, LTD. Fr. 650,059, Feb. 10, 1928. A resistant coating is obtained on surfaces of Al or Al alloys by anodic treatment of the surfaces in an electrolytic bath contg. H<sub>2</sub>SO<sub>4</sub>, e. g., 150–200 g. of H<sub>2</sub>SO<sub>4</sub> to 1 l. of water. Coloring agents such as K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, (AcO)<sub>2</sub>Pb, or KCNS may be added to the bath and NH<sub>3</sub> or NH<sub>4</sub> salts to deepen the colors.

**Electrolytic extraction of metals.** JOHANN C. F. A. SCHÜTTE. Swiss 130,480, Dec. 5, 1927. The metal-contg. raw material is placed in a rotary anode cage through which the electrolyte can pass.

**Metallurgy.** TURE, R. HAGLUND. Ger. 474,518, Aug. 13, 1925. Metal is extd. from sulfide ores by smelting in an elec. furnace with briquettes contg. C and oxides difficult to reduce, such as  $\text{CaO}$ ,  $\text{MgO}$ ,  $\text{BaO}$  and  $\text{Al}_2\text{O}_3$ . Siliceous oxides, such as kaolin, clay, or bauxite, may be used, in which case the reduced Si forms an alloy with the metal from the ore.

**Metals.** HAMPUS G. CORNELIUS. Ger. 472,918, Nov. 13, 1925. Fe and other metals and their alloys, contg. a predetd. quantity of C, are produced directly from oxidized ores in an elec. furnace by the aid of reducing material such as C briquettes.

**Aluminum.** SOCIETÀ ITALIANA DI ELETTROCHIMICA. Ger. 472,006, May 21, 1927. Agglomerated  $\text{Al}(\text{OH})_3$  is dissolved in a bath of fused fluorides, e. g., cryolite, with or without chlorides, and the melt is electrolyzed. The  $\text{Al}(\text{OH})_3$  may be agglomerated by compression and (or) by addn of binders, and may be dried after agglomeration.

**Bismuth hydroxide and carbonate.** R. S. CARRERAS. Brit. 208,587, July 7, 1927. Bi hydroxide is produced by electrolysis of a dil. soln. (suitably a 3% soln.) of  $\text{NaClO}_4$  charged with  $\text{CO}_2$ , anodes of Bi and cathodes of C, Zn, Fe, Al, or other suitable metal being used. Mention is also made of the production of Bi carbonate when a high proportion of  $\text{CO}_2$  is employed. Various details are given. Cf. C. A. 23, 779.

**Electrolytic production of white lead.** R. S. CARRERAS. Brit. 208,520, July 7, 1927. The process described in Brit. 277,723 (C. A. 22, 2517) is modified by using a very dil. soln. of the electrolyte, such as  $\text{NaClO}_4$ , which serves as a catalytic agent, with  $\text{CO}_2$ , which is the sole reactive substance. The electrodes are spaced widely apart to permit pptn. of the basic Pb carbonate as a cloudy slime away from the surface of the electrodes.

**Alloys.** CARL SCHANTZ. Ger. 472,850, Feb. 7, 1926. Alloys and the like are refined electrolytically in a cell wherein the anode is a base metal receiving current from an outer cell. The pole anode contains a considerable amt. of base metal and is sepd. from the pole cathode by a diaphragm.

**Aluminum-silicon alloys.** METALLURGES A. G. Ger. 474,186, June 11, 1921. Al-Si alloys contg. more than 5% Si and suitable for use without further treatment are prep'd by electrolysis of a fluoride melt such as is normally used in the manuf. of Al and to which sufficient  $\text{SiO}_2$  has been added. The  $\text{SiO}_2$  may be added as Fe-free sand or silicious bauxite.

**Electrolytic condensers.** L. SZILARD. Brit. 208,950, Oct. 17, 1927. Blocking condensers are made with electrolytically conducting dielectrics to lower the a. c. resistance, the polarizing voltage being utilized to prevent the passage of d. c. Paper dielectrics may be impregnated with electrolyte or the condenser plates are given oxide or sulfide coatings. Water, ales. and  $\text{PhNO}_2$  may be used for impregnating liquids; the condenser plates are preferably Al or Sn.

**Electrolytic rectifier.** CLARENCE W. BALKE (to Fansteel Products Co.). U. S. 1,710,806, April 30. The output of a Ta-Pb  $\text{H}_2\text{SO}_4$  electrolytic rectifier unit is stabilized by controlling the c. d. at about 1 amp. for every 0.5 to 1.5 sq. in. of active Ta surface exposed.

**Electric furnace.** HAMPUS G. E. CORNELIUS. Ger. 473,784, May 12, 1926. An elec. furnace for the refining of iron has electrodes, which can be raised or lowered.

**Electric furnaces for high temperatures.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fl. 648,871, Nov. 10, 1927.

**Electric furnace for metallurgy.** EMILIEŃ BORNAND and HANS A. SCHLAEFFER. Swiss 130,562, Dec. 8, 1927.

**Electric furnace for hardening metals.** ALLGEMEINE ELEKTRIZITÄTS GES. Ger. 474,606, Feb. 16, 1927.

**Electric furnaces for tempering metals, etc.** MAURICE RIPOCHE. Fr. 648,330 and 648,331, June 15, 1927.

**Electrical heating of drums for roasting, etc.** SIEMENS ELEKTROWARME G. M. B. H. (Stephan Schneider, inventor). Ger. 474,140, Dec. 25, 1924. Elec. features.

**Electric arc furnace suitable for calcium carbide production.** HILLIARY ELDRIDGE (to Martha K. Eldridge). U. S. 1,711,088, April 30. Structural features.

**Electric resistance furnace of the bath type suitable for hardening steel articles.** CHARLES A. CADWELL (to Electric Railway Improvement Co.). U. S. 1,710,763, April 30. Structural features.

**Electric resistance heater.** O. L. PEARD and A. F. HARRISON. Brit. 208,695, July 18, 1927. In making elec. heaters to be operated at a temp. not over about 95°, wire of low resistance, such as Al or Cu, insulated by cotton or enamel, is wound on hollow cylinders such as Zn covered with asbestos paper or other non-magnetic material having a coeff. of expansion greater than that of the wire, so that by its expansions lackness produced in the wire by heating is taken up.

**Device for adjusting the electrodes of an electric arc furnace.** ALLGEMEINE ELEKTRICITÄTS-GES. (Ernst Riecke and Max Herklotz, inventors). Ger. 474,814, Jan. 21, 1926.

**Furnace electrodes.** SIEMENS-PLANTAWERKE A.-G. FÜR KOHLEFABRIKATE. Ger. 474,441, Mar. 21, 1925. Electrodes cased in metal are prep'd. by inserting the burnt or semi-burnt electrode into a metal casing fitting as closely as possible, and filling any space between the electrode and the casing with crude electrode material. This may be done by using a perforated casing contg. an excess of the crude material, the excess being extruded through the perforations when the electrode is pressed into place.

**Arc-lamp electrodes.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 649,401, Jan. 7, 1928. The life and luminous intensity of arc electrodes are increased by the addn. of ilmenite 67.5-76.5, magnetite 20.65-17.22, chromite 3-5.5, NaF 0.15-0.28, with or without Ti carbide 8.2 or Fe-Ti 12.8, and with or without LiF 0.5%.

**Arc generator electrode cooled by circulating liquid.** HANS O. STORM (to Federal Telegraph Co.). U. S. 1,711,185, April 30. Structural features of an electrode which may be rapidly rotated.

**Copper oxide electrode.** ERNEST W. WESCOTT (to Comstock & Wescott, Inc.). U. S. 1,711,462, April 30. An electrode for batteries comprises granular Cu oxide and fine soft Cu, which serves as a bonding agent and which is flowed into coherent form under heavy pressure.

**Anodes of electric discharge devices.** L. SMEDÉ (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 298,572, Oct. 11, 1927. Anodes of discharge devices such as Hg-vapor rectifiers are formed of a metal of the Fe group such as iron itself, which has been case-hardened with powd. C or, preferably, by a suitable C-contg. gas.

**Electrical purification of gases.** "ELGA" ELEKTRISCHE GASREINIGUNGS-GES. M. B. H. Ger. 474,483, July 12, 1924. The gases traverse a channel the walls of which constitute the pptg. electrodes; discharge electrodes are suspended at intervals along the middle of the channel. The improvement consists in arranging the discharge electrodes at decreasing intervals in the direction of flow of the gases.

**Electrical purification of gases.** OSKI A.-G. (Erich Oppen, inventor). Ger. 474,177, Jan. 22, 1924. The high-tension coil of a single transformer is tapped to give the voltage required to operate simultaneously a no. of elec. gas-purification plants operating at different voltages, a sep. rectifier being provided for each plant.

**Purification of gases.** SIEMENS-SCHUCKERTWERKE A.-G. (Moritz Schenkel, inventor). Ger. 472,902, Sept. 6, 1922. Addn. to Ger. 354,783. An insulating arrangement for a plant for the elec. pptn. of solid particles from gases is described.

**Device for the separation of gases produced in a bipolar electric gas generator.** MASCHINENFABRIC OERLIKON. SWISS 130,144, Dec. 15, 1927.

**Electric gas-purifying apparatus.** METALLGESELLSCHAFT A.-G. Ger. 474,857, July 14, 1920. The electrodes are endless bands passing over rollers.

**Means for cleaning electrical gas-purifier electrodes.** MASCHINENFABRIK BETH A.-G. Ger. 474,265, Dec. 19, 1926.

**Apparatus for electrically forging iron and steel bars.** EZIO GIACCHINO. SWISS 129,940, Oct. 24, 1927. Details of arrangement.

**Electric apparatus for the air-tight fusing of metal caps on glass tubes.** SIEMENS-SCHUCKERTWERKE A.-G. (Werner Espe, inventor). Ger. 474,947, Oct. 21, 1925. Details of arrangement.

**Electro-endosmosis.** VINCENT A. LAPENTA. U. S. 1,711,416, April 30. An app. suitable for treating serums or other liquids comprises a membranous bag for holding the substance to be treated, a pair of porous cells one of which contains a pos. and the other a neg. electrode, an outer vessel in which the bag and cells are positioned and which may hold an electrolyte serving to collect material passing from the bag by the action of an elec. current. Various details of the app. are described.

**Mercury-vapor lamp suitable for therapeutic uses, etc.** G. PHILIP. Brit. 298,903, Oct. 15, 1927.

**Vacuum lamps, etc.** SIGMUND LOEWE. Fr. 648,731, Oct. 24, 1927. For the production of a high vacuum in lamps, etc., by the vaporization of Mg, the Mg is movably mounted on a support fixed to the anode support.

# **PHOTOGRAPHY**

C. E. K. MEES

**The silver iodide problem.** A. STEIGMANN. *Phot. Ind.* **27**, 375(1929).—Supplementing his previous expt., S. has added colloidal AgI to emulsions in place of KI. AgI exerts a restraining action on the ripening of the emulsion both in regard to the size of grain and to the sensitizing proclivity of the gelatin. C. E. MEULENDYCKE

**Photolysis of medium-free silver bromide—determination of silver.** H. KIESER. *Z. wiss. Phot.* **26**, 1-45(1928).—A method of analysis for the detn. of the photolytically formed Ag in the Ag halide has been worked out, a soln. of 5%  $\text{Na}_2\text{S}_2\text{O}_3$  with 0.07%  $\text{Na}_2\text{CO}_3$  being used. AgBr was pptd. and exposed as: (1) a Br compd. (pptd. in excess of Br ions) and placed in a  $\text{NaNO}_2$  soln.; (2) a Br compd. in  $\text{H}_2\text{O}$ ; and (3) a Ag compd. (pptd. in excess of Ag ions) in a  $\text{AgNO}_3$  soln. The Ag formation in nitrite is independent of the washing of the ppt. and of the concn. of the Br absorbed. For  $\lambda = 436 \text{ m}\mu$ , AgBr gives in  $\text{NaNO}_2$  a quantum effect; in  $\text{H}_2\text{O}$ , only 1 atom of Ag per 15-20 quanta. The energy of blue radiation absorbed by the Ag atoms is transferred to the Br ions of the AgBr lattice. With longer exposures the quantum effect in  $\text{NaNO}_2$  diminishes irregularly in accordance with the sensitizing and screening action of the sepd. Ag. The absorption of blue, green, and red by AgBr and its increase with increasing exposure were detd. by measurements of reflected light. A. P. H. TRIVELLI

**Negative developers for contrast.** J. SOUTHWORTH. *Brit. J. Phot.* **75**, 689-91, 706-8(1928).—The merits of several contrast developers for process and line work are discussed. A new metol-hydroquinone-soda formula is given which is claimed to give high contrast, and good shadow detail in high speed plates under conditions of min. exposure. Development fog is classified as follows: (1) intrinsic fog formed latently during manuf. or on subsequent aging of the emulsion, and (2) extrinsic fog, which is not latent before development but is produced by the action of the developer upon the emulsion. In the absence of bromide, extrinsic fog increases in proportion to the development time. With a metol-hydroquinone developer, and at high gammas, KBr depresses such fog more than intrinsic fog or the light-image. Sol. KI in minute concn. (0.02 g. per l.) assists the action of KBr. Yellow stain produced by contrast developers is usually dichroic fog and is composed of deposited colloidal Ag. The importance of rinsing in a stop bath between development and fixation is stressed as a preventive of stain in the fixing bath. G. E. M.

**Evolution of the latent image.** G. JAUSSEAN. *Compt. rend.* **188**, 783-4(1929).—By making successive exposures over a period of 7 hrs. on different parts of the same plate, which he developed immediately after the last exposure, J. has obtained new evidence of an alteration in the latent image with time. Apparently the latent image of the lower light-exposures diminishes and that of higher exposures increases, and const. values are not reached for several hrs. Each of 4 kinds of plates studied showed the effect, though in varying degree. E. R. BULLOCK

**Is the silver germ theory of the latent image still tenable?** F. WEIGERT. *Phot. Korr.* **65**, 65-70(1929).—From evidence arrived at in his discovery and investigations of the Weigert effect, especially the absence of any recognizable increase in the free Ag content of an emulsion during exposure for this effect, W. concludes that the Ag germ theory of the latent image is no longer tenable. The evidence of post fixation physical development is easily explicable on the assumption that the latent image contains metallic Ag; and chem. development shows that it must also contain Ag halide. W. considers that a system of Ag and Ag halide is present in the unexposed sensitive material, and that the action of light on this system, to form the latent image, is of an intimately mech., rather than of a chem., nature. E. R. BULLOCK

**New investigations of bleach-out reactions.** LUTPO CRAMER. *Phot. Ind.* **27**, 129-31(1929); cf. *C. A.* **22**, 3102.—Work with metallic salts and desensitizing dyes is continued. The latent image is more readily destroyed when treatment with Cu and Fe salts or desensitizing dyes has been made before exposure. This has been especially shown in an expt. with phenosafranine. With latent image formed in presence of dyes, the Ag nuclei formed are more readily attacked because of the higher dispersity and greater tendency to form at surface of grains. Salts of heavy metals other than Cu and Fe do not appear to have desensitizing properties. Salts of Cu and Fe appear to be able to destroy latent image without light-action; desensitizing dyes have little or none of this property. C. E. MEULENDYCKE

**Transferring bromoil prints on to lithographic stone or zinc.** C. DE SANTUL. *Phot. Korr.* **65**, 78-80(1929).—After pointing out the need for a process by which a

number of identical copies of a bromoil print may be obtained, de S. gives a summary of the chemistry of lithography and then describes the dyeing of a bromoil print, its transfer-printing on to stone, and the intensification, etching and retouching.

E. R. BULLOCK

**The value of sulfur toning as a method of intensification.** O. CROY. *Das Atelier* 35, 128-9 (1928).—S. toning, by the method of bleaching in  $K_3Fe(CN)_6$ -KBr and then darkening in  $Na_2S$  soln., affords a useful degree of intensification of a well-developed negative. The contrast to be obtained may be accentuated or subdued by a blue or yellow filter, resp., a color-sensitive make of paper being used in the latter case.

E. R. BULLOCK

**Jahrbuch für Photographie, Kinematographie und Reproduktionsverfahren für die Jahre 1921-1927.** Bd. XXX. Edited by J. M. EDER and F. KUCHINKA. Halle (Saale): Verlag von Wilhelm Knapp. In 3 parts, part 3 containing whole index. Each part, M. 19; bound, M. 21.

**Photography.** AKTIEN-GESELLSCHAFT FÜR ANILIN FABRIKATION. Fr. 649,758, Nov. 12, 1925. In the "reflection" process the treatment of the sensitive material which follows the exposure is confined to the surface of the sensitive layer, which may be from 0.001 to 0.1 mm. thick. Sensitized films may have an anti-curling layer on the back and this layer is used for retouching the negative obtained. As colloids, gelatin, gum arabic, sugar, etc., may be used and as sensitizing agents chromates, Fe salts, U salts, etc. If Ag halide emulsions are used they are developed by physical means such as selective deposition from supersatd. solns.

**Color photography.** KALLE & Co. A.-G. Brit. 299,010, Oct. 19, 1927. Superposed color record positive images are printed on layers contg. stable diazo compds. which lose their color under the action of light. For a 3-color record, the sensitizing baths may comprise aq. solns. of (1) borofluoride of 1-diazo-4-ethylamino-3-methylbenzene, tartaric acid and PhOH, for yellow, (2) the same diazo compd. with tartaric acid and Na 1-amino-8 naphthol-3,6-disulfonate, for blue, and (3) 1-diazo-2-naphthol-4-sulfonic acid, Al sulfate and resorcinol, for red. Baths for a 2-color record, and various other modifications are also described.

**Color photography.** SOC. CIVILE POUR L'ÉTUDE DE LA PHOTOGRAPHIE ET CINÉMATOGRAPHIE. Fr. 649,817, July 22, 1927. The selector filter used with films having microscopic refracting elements has, in addn. to the red, green, and violet areas, 2 compensating zones on the outsides which are, respectively, green-yellow and orange-yellow. This prevents color overlap of red on blue-violet between 2 refractive elements and produces neutral gray edges.

**Lenticular films for color photography and cinematography.** SOC. FRANÇAISE DE CINÉMATOGRAPHIE ET DE PHOTOGRAPHIE FILMS EN COULEURS KELLER-DORIAN. Brit. 298,951, Oct. 17, 1927. Optical features.

**Photographic materials.** ERNST WALTMANN. Ger. 473,285, Jan. 26, 1928. Salts of  $\alpha$ -hydroxyglutacondialdehyde dianil or of like compds. prepd. from substitution products of the dialdehyde or from other amines are used in the prepn. of layers for color photography. The layers are capable of being bleached out.

**Photographic materials.** I. G. FARBENIND. A.-G. (Otto Matthies and Bruno Wendt, inventors). Ger. 473,000, Feb. 1, 1928. Addn. to Ger. 445,753. To a light-sensitive emulsion of a Ag salt are added org. compds. whose Ag salts are not more sol. than  $AgCl$ . Thioglycolic acid, thiolactic acid, tetrazole, allylaminothiodiazole sulphydrate and 2,6-dimercapto-4-keto-3,5-diphenylpenthiophene, are given as examples of the added org. compds.

**Photographic films.** JULES ROUSSET. Fr. 649,694, July 12, 1927. The usually mat surface of photographic films is made smooth and polished by passing the film into a soln. of alc. contg. 5% formol, and passing the film after drying to polishing wheels, the peripheries of which are impregnated with a colloidal powder mixed with a lubricant.

**Photographic plates.** I. G. FARBENIND. A.-G. (Ernst Leupold, inventor). Ger. 472,890, June 30, 1927. Addn. to 472,115. The method of prepg. anti-halation plates described in Ger. 472,115 (C. A. 23, 2381) is modified by using a coating prepd. by treating an alk. soln. of casein with  $CH_3O$  and a dye. An example is given.

**Photographic developers containing a selenium salt and sodium thiosulfate.** GEVAERT PHOTO-PRODUCTEN NAAMLOOZE VENNOOTSCHAP. Brit. 298,953, Oct. 17, 1927. Blue to violet images are obtained if KBr also is used, and if  $Na_2CO_3$  is added instead (or a sufficient quantity of Na thiosulfate used) brown to red images are obtained.

**Light-sensitive papers.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 649,490, Feb. 8, 1928. Light-sensitive papers such as "blue prints" have a sensitive layer on both sides and are made sufficiently thick to prevent light on one side affecting the other.

**Photographic dye images.** F. LIEKG. Brit. 298,979, Oct. 18, 1927. Dye components necessary for forming the image are embodied in a silver emulsion in a water insol. condition (such as in the form of urates, sebatos or rosins acid or similar insol. salts of the dye components) and, after the silver image is produced, the dye image is developed from its components as by oxidation or diazotization. In addn. to the dye components there may also be introduced in the emulsion layer a water-insol. substance which yields  $\text{HNO}_2$  on treatment with acids or acid vapors such as the double salts of luteo Co chloride with diammino Co nitrite or with Co nitrite; by treatment with a neutral salt this substance is destroyed by oxidation at the parts occupied by the Ag image when the latter has been developed and fixed, leaving the nitrite compd. unchanged at the parts free from Ag so that afterward at these parts a positive azo dye image may be developed. Various details and other modifications are described.

**Photo-copying.** I. G. FARBERMAN, A. G. OTTO Siebert and Gustav Reddehen, inventors). Ger. 473,445, Mar. 11, 1928. Photographic copies and prints are prepd. with the use of the chromate of unilaterally diazotized *p*-phenylenediamine as light-sensitive material. Fixing is effected by washing with ordinary water.

## 6-- INORGANIC CHEMISTRY

A. K. MIDDLETON

**Basic lead acetate.** E. SOMMER. *Z. Zuckerind. u. choslovak Rep.* 52, 644-51 (1928).

—A series of solns. of basic Pb acetate was prepd., all in the usual manner, but from different grades of com. litharge. The most striking result was obtained with a grade of flake litharge, a soln. contg. 34.2% PbO (basic), with only 7.2% of residue resulting. In the other solns. the content in basic PbO varied from 15.0 to 34.2%. By using 1 pt. of the normal acetate and 2 pts. of litharge, a soln. contg. as much as 66.66% PbO (basic) was prepd., but it was not possible further to increase the basicity by using more litharge. From "superbasic" solns. thus made it was possible to ppt. the dibasic Pb compd. quantitatively by the addn. of alc. (9.1), ordinary basic Pb acetate remaining in soln.

B. C. A.

**Basic chlorides and addition compounds from metallic chlorides and hexamethylenetetramine.** Exceptional behavior of nickel chloride. JAMES C. DUFF AND EDWIN J. BILLS. Central Tech. College, Birmingham. *J. Chem. Soc.* 1929, 411-9.  $\text{CaH}_2$ ,  $\text{Ni}_2\text{I}$  in  $\text{H}_2\text{O}$  does not react with the chlorides of Mg, Ca, Sr and Ba when the solns. are boiled; Zn,  $\text{Fe}^{++}$ , Cr, Al, Sb and Sn all yield the corresponding hydroxides; Cd, Pb and Bi give the resp. basic chlorides.  $\text{MgCl}_2$  gives the compd.  $\text{MgCl}_2 \cdot 2\text{L} \cdot 10\text{H}_2\text{O}$ ,  $\text{MnCl}_2$  gives the basic chloride and from the hot filtrate, the addn. compd.  $\text{MnCl}_2 \cdot 2\text{L} \cdot 10\text{H}_2\text{O}$ ,  $\text{FeCl}_2$  gives  $3\text{Fe}(\text{OH})_2 \cdot \text{FeCl}_2$ ,  $\text{NiCl}_2$  gives a pale green powder,  $\text{N}(\text{CH}_2\text{OH})_4 \cdot 3\text{Ni}(\text{OH})_2$ ; when dried at  $100^\circ$  it loses 3 mols.  $\text{H}_2\text{O}$ . Cold solns. of chlorides in abs. EtOH added to I in abs. EtOH give the following addn. compds.:  $\text{SnCl}_4 \cdot 2\text{L}$ ,  $\text{SnCl}_4 \cdot 4\text{L}$ ,  $\text{SbCl}_3 \cdot 3\text{L}$ ,  $\text{SbCl}_3 \cdot 6\text{L}$ ,  $\text{BiCl}_3 \cdot \text{L}$ ,  $\text{ZnCl}_2 \cdot 2\text{L}$ . In  $\text{H}_2\text{O}$  the following addn. compds. were prepd.:  $3\text{ZnCl}_2 \cdot 2\text{L} \cdot 6\text{H}_2\text{O}$ ,  $\text{CaCl}_2 \cdot 2\text{L} \cdot 10\text{H}_2\text{O}$ ,  $\text{SrCl}_2 \cdot 2\text{L} \cdot 9\text{H}_2\text{O}$ ,  $\text{FeCl}_2 \cdot 2\text{L} \cdot 9\text{H}_2\text{O}$ ,  $\text{Cu}(\text{OH})\text{Cl} \cdot \text{CuCl}_2 \cdot \text{L} \cdot 2\text{H}_2\text{O}$ ,  $2\text{CuSO}_4 \cdot \text{L} \cdot 2\text{H}_2\text{O}$ .

C. J. WEST

**The preparation of phosphenyl chloride.** J. A. C. BOWLES AND C. JAMES. Univ. New Hampshire. *J. Am. Chem. Soc.* 51, 1406-8 (1929). An app. is described in which good yields were obtained of phosphenyl chloride from  $\text{PCl}_3$  and benzene, and of acetamide from  $\text{NH}_4$  acetate. It consists of a boiling flask and reflux condenser connected to a reaction vessel heated by a nichrome winding inside a quartz tube. T. H. C.

**The rapid concentration of germanium and gallium contained in the zinc oxide carrying them.** C. JAMES AND H. C. FOGG. Univ. of N. H. *J. Am. Chem. Soc.* 51, 1459-60 (1929).—Dissolve the sample in excess concd.  $\text{HCl}$ . Filter off  $\text{PbCl}_2$ . Add some of the original sample to the hot soln., while stirring, until it is basic. Continue the stirring some time. Filter off Ge and Ga, and sep. in the usual way. G. M. P.

**Oxides of the noble metals.** GULBRAND LUNDE. *Metallwirtschaft* 7, 417-8 (1929).—Although the Pt metals, Ag and Au are considered "noble" metals, they form many compds. with O, either directly or indirectly. The following compds. are known,  $\text{Pt}_2\text{O}$ ,  $\text{Ag}_2\text{O}$ ;  $\text{Au}_2\text{O}$  and  $\text{AuO}$  ( $\text{Au}_2\text{O}_3$  could not be confirmed);  $\text{PdO}$ ; ( $\text{PtO}$ )  $\text{PtO}_2$ ;  $\text{Rh}_2\text{O}_3$ ,  $\text{IrO}_2$ ;  $\text{RuO}_2$ ,  $\text{RuO}_3$ ;  $\text{OsO}_2$ ,  $\text{OsO}_4$ . The crystal structures of  $\text{PdO}$ ,  $\text{Rh}_2\text{O}_3$ ,  $\text{IrO}_2$ ,  $\text{RuO}_2$  and  $\text{OsO}_2$  are known, the last 3 being isomorphous.

W. C. BRAUGH

**The constitution of boron hydrides.** EGON WIBERG. Chem. Inst. Tech. Hochschule, Karlsruhe. *Helv. Chim. Acta* 12, 225-7(1929).—Ephraim's (*C. A.* 23, 785) structural formula for diborane differs from W.'s only by the symmetry of the H atom distribution. W. has 2 H atoms sharing an electron pair with B. The proof of W.'s unsymmetrical formula is that pentaborane,  $B_5H_9$ , adds 4 mols. of  $NH_3$  as predicted by W.'s formula, whereas E.'s formula predicts the addn. of 5 mols. of  $NH_3$ . A. F.

**The constitution of boron hydrides.** EGON WIBERG. Chem. Inst. Techn. Hochschule, Karlsruhe. *Z. anorg. allgem. Chem.* 179, 309 20(1929); cf. following abstr.—Polemical with Müller (*C. A.* 20, 2625). W.'s hypothesis that electron pairs can hold more than one atom is found to be true not only for B compds. but also in compds. like  $PCl_5$ , acetone-HCl and  $CH_3I.Cl_2$ . His formulas for B compds. are in accordance with Grimm's displacement rule. His formulas also predict the chem. behavior and stability, e. g., the reaction with  $NH_3$  or  $Cl_2$ . W.'s formula gives the correct coordination no. for B, while M.'s formula for pentaborane shows 2 B atoms with coordination nos. of 5, which is impossible. M.'s comparison of B and Fe is unfair since in the hydrides B retains its valence and coordination no. and is not reduced as Fe changing from  $Fe^3$  to  $Fe^{2+}$ . ARTHUR FLEISCHER

**Valency chemistry of boron and the constitution of the simplest boron hydride.** E. WIBERG. *Z. anorg. allgem. Chem.* 173, 199-221(1928).—An electronic formulation of boron hydride,  $B_2H_6$ , is derived by postulating that (1) the octet rule is valid for B compds., (2) the B atom cannot combine by covalencies with more than 4 atoms, (3) H is combined by electrovalencies only in the metallic hydrides, and in all other cases by covalencies. Conclusion: In all electrovalency compds. B is trivalent and in all covalency compounds, quinquivalent. Quadivalent boron, in the sense of quadri-valent C, does not exist. The formula derived is consistent with the addn. of Na and  $NH_3$  to the hydride, its reactions with water and the H halides, and the formation of hypoborates. B. C. A.

**Heterotri salts. V. The existence of heterotriborates and their isomorphism with the other heterotri series.** G. CANNERI. Reale Univ. Firenze. *Gazz. chim. ital.* 58, 840-4(1928); cf. *C. A.* 21, 1233. — Because of the isomorphism and the close similarity of constitution and cryst. form of certain borotungstates, silicotungstates and phosphotungstates, expts. were carried out to det. whether borotungstovanadates could be found, which are similar to silico- and phosphotri salts, and if so, what rela-

tions exist among them. Assuming the general structures:  $R_4 \left[ Si \begin{smallmatrix} (W_2O_7)_x \\ (V_2O_6)_y \end{smallmatrix} \right] nH_2O$  and  $R_7 \left[ P \begin{smallmatrix} (W_2O_7)_x \\ (V_2O_6)_y \end{smallmatrix} \right] nH_2O$ , where  $x + y = 6$ , the substitution of a Si or P atom by a B atom should not modify essentially the structure, for several reasons, which are discussed. These reasons apply in turn to the replacement of Si or P by B, and so attempts were made to prep. borotungstovanadates similar to silicotungstovanadates and phosphotungstovanadates. The method of prepn. was that used for previous heterotri salts, attempts being made to condense the  $W_2O_7$  and  $V_2O_6$  by using a large excess of  $H_3BO_3$  with the hot mixt. of alk. tungstate and vanadate and by removing by filtration the products which sep. by cooling and which comprise alk. polyborates and excess  $H_3BO_3$ . The condensation of the tungstate by  $H_3BO_3$  was shown by the formation of borotungstates. The variation in the color of the mixed tungstate and vanadate solns. supersatd. with  $H_3BO_3$  indicated a similar polymerizing action of  $H_3BO_3$  on vanadates, such solns. having a ruby-red color characteristic of the ions of hexavanadic acid. In the initial expts., the solns. were allowed to evap. with  $H_3BO_3$ , small quantities of alk. polyborates first sepg. followed by orange-red crystals of tungstovanadates, which are much less sol. than the heterotri salts, and finally large brown cubic or octahedric crystals with the same crystallographic characteristics as phospho-, arseno- and silicotri salts. The quantity of these crystals in the different preps. was in all cases so disproportionately small that it appeared as if their formation might arise from impurities rather than from a main coordinating reaction. Repeating the expts. with highly purified  $H_3BO_3$ , no brown cryst. products with the chem. or cryst. properties of heterotri salts were obtained. An investigation proved that phosphates and silica were the impurities which promoted the coordination, and P and Si were found in the heterotri salts. Such a power of Si to induce coordination has already been described by Péchard (cf. *Compt. rend.* 117, 788(1893)). The expts. in general indicate that B does not coordinate  $W_2O_7$  or  $V_2O_6$  groups with the formation of heterotri salts, and that there are boroheterotri salts corresponding to phospho- and silicotri salts. In the presence of similar groups where the coordinating function is exercised by elements with similar ionic diams.,

such heteropoly compds. of B are stabilized in the form of mixed crystals. The following data give the color and the % of  $\text{WO}_3$ ,  $\text{V}_2\text{O}_5$ ,  $\text{SiO}_2$ ,  $\text{P}_2\text{O}_5$ ,  $\text{H}_3\text{BO}_3$ ,  $\text{NH}_3$  and  $\text{H}_2\text{O}$ , resp., in mixed crystals, the 1st 5 being *mixed crystals of heterotrisilicates and heterotriborates*, and the last 5 *mixed crystals of heterotriphosphates and heterotriborates*: orange-red, 65.9, 14.34, 1.42, —, 0.65, 5.38, 13.2; brick-red, 56.7, 19.6, 1.36, —, 0.82, 5.61, 14.1; ruby red, 53.3, 22.3, 1.55, —, 0.75, 6.1, 14.31; brown-red, 47.1, 26.8, 1.81, —, 0.66, 7.12, 15.4; pitchy brown, 42.06, 31.4, 1.42, —, 0.88, 7.4, 16.1; orange-red, 63.4, 15.82, —, 1.62, 0.41, 5.5, 1.9; brick-red, 57.8, 19.1, —, 1.88, 0.55, 6.42, 1.8; ruby-red, 52.9, 22.8, —, 1.91, 0.64, 6.63, 1.2; brown-red, 48.3, 25.9, —, 1.82, 0.75, 7.51, 1.8; pitchy brown, 40.2, 32.02, —, 1.08, 0.61, 8.81, 1.9. The detn. of B in these salts was very difficult until it was found that the method of Copaux (*C. A.* 3, 2098) was very effective.

C. C. DAVIS

**Sulfito salts.** G. JANTSCH AND K. ABRESCH. Univ. of Bonn. *Z. anorg. allgem. Chem.* 179, 345-56 (1929).—A study of the sulfito salts of tervalent metals was made to det. the stability of the complex  $[\text{M}(\text{SO}_3)_3]^{3-}$ . Na and Li trisulfitocobaltates were pptd. by pouring a soln. of the hexanitritocobaltate into a boiling soln. of the alkali sulfite. The Na salt is stable in air. The Li salt appeared to be moderately sol. but the elec. cond. of the soln. indicated that most of the salt was in colloidal suspension. This was confirmed by the use of the ultramicroscope. After subjecting the soln. to ultrafiltration the Tyndall cone disappeared and the soly. was very slight. The cond. measurements and migration of Co to the anode during electrolysis indicate that the  $[\text{Co}(\text{SO}_3)_3]^{3-}$  is stable. The insol.  $\text{K}_3[\text{Co}(\text{SO}_3)_3] \cdot 6\text{H}_2\text{O}$  was prepd. by metathesis with the Li complex. Attempts to prep. the salts from the oxalato and cyano complexes were unsuccessful. This was true also of the attempted prepn. of the  $\text{Me}_3\text{N}$ ,  $\text{PhMe}_3\text{N}$  and guanidine sulfitocobaltates from the nitrito complexes. The far-reaching analogy between the nitrito and the sulfito complexes points to the non-existence of salts of this type of Fe, Al, Cr and Bi. Those of Rh and Ir, however, should be stable. H. F. J.

**Complex oxalates of quinequevalent molybdenum.** HENRY M. SPITTLE AND WM. WARDLAW. Univ. of Birmingham, Edgbaston. *J. Chem. Soc.* 1928, 2742-56.—According to Werner's theory, Bailhache's compds (*Bull. soc. chim.* 29, 161 (1903); 33, 439 (1905))  $\text{Mo}_2\text{O}_7(\text{OH})_6(\text{C}_2\text{O}_4)_2 \cdot \text{H}_2\text{Ba} \cdot \text{H}_2\text{O}$  and  $\text{Mo}_2\text{O}_7(\text{OH})_4(\text{C}_2\text{O}_4)_2(\text{OH})_2\text{R}_2 \cdot 2\text{H}_2\text{O}$  (R = K or  $\text{NH}_4$ ) may be considered as members of a series  $\text{R}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot x\text{H}_2\text{O}]$  (R = K,  $\text{NH}_4$ ,  $\frac{1}{2}\text{Ba}$ , etc.). The authors have justified this hypothesis by prepg. new members of the series and by detg. the mol. wts. and conductivities. The following compds. were prepd. and studied: *quinolinium molybdenum dioxoxalate*,  $(\text{C}_9\text{H}_7\text{N})[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot \text{H}_2\text{O}]$ , yellowish brown, from  $(\text{C}_9\text{H}_7\text{N})_2[\text{MoOCl}_5] \cdot \text{H}_2\text{O}$  and  $\text{H}_2\text{C}_2\text{O}_4$ , or from  $\text{Ba}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 5\text{H}_2\text{O}]$  and  $(\text{C}_9\text{H}_7\text{N})_2\text{SO}_4$ ; *complex acid pyridinium molybdenum oxoxalates*,  $(\text{C}_5\text{H}_5\text{N})_3\text{H}[\text{Mo}_2\text{O}_7(\text{C}_2\text{O}_4)_2 \cdot 6\text{H}_2\text{O}]$  or  $(\text{C}_5\text{H}_5\text{N})_3[\text{Mo}_2\text{O}_7(\text{OH})(\text{C}_2\text{O}_4)_2 \cdot 6\text{H}_2\text{O}]$ , orange-yellow, from  $(\text{C}_5\text{H}_5\text{N})_2[\text{MoOCl}_5]$  and  $\text{H}_2\text{C}_2\text{O}_4$ , on further treatment with pyridine it gives a pale yellow compd.  $(\text{C}_5\text{H}_5\text{N})[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot \text{C}_5\text{H}_5\text{N}]$ , sol. in  $\text{H}_2\text{O}$ ; normal *pyridinium molybdenum oxoxalate*,  $(\text{C}_5\text{H}_5\text{N})[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot \text{H}_2\text{O}]$ , chrome-yellow, from  $\text{Ba}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 5\text{H}_2\text{O}]$  and  $(\text{C}_5\text{H}_5\text{N})_2\text{SO}_4$ , decompd. by boiling  $\text{H}_2\text{O}$ , gives the acid salt on steam distn. in an atm. of N; *barium molybdenum dioxoxalate*,  $\text{Ba}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 5\text{H}_2\text{O}]$ , red, from  $\text{BaCl}_2$  and a mixt. of  $\text{H}_2\text{C}_2\text{O}_4$  and  $(\text{NH}_4)_2[\text{MoOCl}_5]$ ; *potassium molybdenum dioxoxalate*,  $\text{K}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 3.5\text{H}_2\text{O}]$ , yellow, and  $\text{K}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 2.5\text{H}_2\text{O}]$ , red (cf. Bailhache) from  $\text{Ba}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 5\text{H}_2\text{O}]$  and  $\text{K}_2\text{SO}_4$ , gives, in *vacuo* over  $\text{H}_2\text{SO}_4$ ,  $\text{K}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 1.5\text{H}_2\text{O}]$ , yellow; concn. of soln. of any of these hydrated salts at  $100^\circ$  in *vacuo* gives  $\text{K}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot \text{H}_2\text{O}]$ , red; *ammonium molybdenum dioxoxalate*, small quantity of golden yellow needles, insufficient for analysis, and  $(\text{NH}_4)[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 2.5\text{H}_2\text{O}]$ , red, from  $\text{Ba}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 5\text{H}_2\text{O}]$  and  $(\text{NH}_4)_2\text{SO}_4$ , in an atm. of N, gives a yellow powder,  $(\text{NH}_4)[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 1.5\text{H}_2\text{O}]$ , when dried in *vacuo* over  $\text{H}_2\text{SO}_4$ , and a brittle red crust when its soln. is evapd. to dryness in *vacuo* at  $100^\circ$ ; and an *oxoxalate of quinequevalent molybdenum*,  $\text{Mo}_2\text{O}_7(\text{C}_2\text{O}_4)_2 \cdot 4\text{H}_2\text{O}$ , pale yellow, from  $\text{Ba}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot 5\text{H}_2\text{O}]$  and  $\text{H}_2\text{SO}_4$  in an atm. of N. The last compd. corresponds to the hypothetical parent acid,  $\text{H}[\text{MoO}_2(\text{C}_2\text{O}_4)_2 \cdot x\text{H}_2\text{O}]$ ; it is insol. in cold  $\text{H}_2\text{O}$  or in cold concd.  $\text{HCl}$  or in  $\text{HNO}_3$ , stable in air, sol. in hot  $\text{H}_2\text{O}$ , it gives green solns. with warm  $\text{HCl}$ , and red solns. with dil.  $\text{NH}_4\text{OH}$  or alkalis. Valency detns. were carried out by dissolving a weighed amt. of the substance in air-free 2 N  $\text{H}_2\text{SO}_4$ , titrating cold with standard  $\text{KMnO}_4$  in a N atm. until colorless, heating the soln. to  $70^\circ$  and continuing the titration until a permanent pink color was obtained. The amt. of permanganate necessary to oxidize the Mo to the sexavalent state was obtained by subtracting from this reading the amt. necessary to decomp. the oxalate radical. General properties of the complex oxalates are: in air, they are stable in the dry condition, but slowly oxidize in aq. soln.; concd. aq. solns. are blood-red, becoming brownish yellow to yellow on diln.; they are insol. in such org. sol-

vents as alc., ether and benzene; they give with HCl, green solns. of the complex chlorides  $R_2[MoOCl_3]$ , with  $H_2SO_4$ , a green soln., and with HCNS, a red soln.

RUBY K. WORNER

**Coördination compounds of quinquevalent molybdenum: complex thiocyanates.** ROBERT G. JAMES and WM. WARDLAW. Univ. of Birmingham, Edgbaston. *J. Chem. Soc.* 1928, 2726-39; cf. *C. A.* 22, 201.—The reaction between salts of the type  $R_2[MoOCl_3]$  and  $NH_4CNS$  gives rise in aq. soln. to salts of the type  $R_2[MoO_2(CNS)_3]$ , and in the presence of excess HCNS to salts of the type  $R_2[MoO(CNS)_4]$ . The formation of the compds.  $R_2[MoO_2(CNS)_3]$  is addnl. evidence for the previously proposed scheme of ionization and hydrolysis. When  $[(CH_3)_3NH]_2MoOCl_6$  or  $[(CH_3)_4N]_2MoOCl_6$  reacts with  $NH_4CNS$ , salts of the type  $R_4Mo_2O_7(CNS)_8$  are produced. The following compds. were prepared and studied: *dipyridinium molybdenum dioxytrithiocyanate*,  $(C_5H_5N)_2[MoO_2(CNS)_3]$ , bright reddish brown crystals, from  $(C_5H_5N)_2[MoOCl_3]$  and  $NH_4CNS$ , m.  $181^\circ$ , sol. in acetone, and sol. in boiling alc., giving a red soln.; *diquinolinium molybdenum dioxytrithiocyanate*,  $(C_8H_8N)_2[MoO_2(CNS)_3]$ , brownish red crystals, sol. in boiling alc., but almost insol. in  $H_2O$ ; *dihydrogen molybdenum dioxytrithiocyanate*,  $H_2[MoO_2(CNS)_3]$ , anhyd. and with  $2H_2O$ , black, from  $(NH_4)_2[MoOCl_3]$  and  $NH_4CNS$  in an atm. of N, purple-red in concd. aq. soln.; *dihallous molybdenum dioxytrithiocyanate*,  $Tl_2[MoO_2(CNS)_3 \cdot H_2O]$ , bluish purple, made by pouring a warmed purple-red soln. of  $H_2[MoO_2(CNS)_3]$  into a satd.  $TlNO_3$  soln.; *tetra-trimethylammonium dimolybdenum trioxoacthithiocyanate*,  $[(CH_3)_3NH]_4[Mo_2O_7(CNS)_8]$ , purple with greenish luster, from  $[(CH_3)_3NH]_2[MoOCl_3] \cdot H_2O$  and  $NH_4CNS$ , sparingly sol. in cold  $H_2O$ , but more so in hot, due to hydrolysis, leaving a bluish purple streak on unglazed porcelain, purple in concd. soln., turning blood-red, then orange and finally bright yellow on diln., with  $TlNO_3$  pptg. impure  $Tl_2[MoO_2(CNS)_3 \cdot H_2O]$ ; *tetra-tetramethylammonium dimolybdenum trioxoacthithiocyanate*,  $[(CH_3)_4N]_4[Mo_2O_7(CNS)_8]$ , bluish purple, from  $[(CH_3)_4N]_2MoOCl_6$  and  $NH_4CNS$ , with properties similar to the trimethylammonium analog (an attempt to prep. the diethylammonium analog was unsuccessful); *tetrapyridinium dimolybdenum trioxosulfatohexathiocyanate*,  $(C_5H_5N)_4[Mo_2O_7(SO_3)(CNS)_6]$ , purple, from  $(C_5H_5N)_2[MoO_2(CNS)_3]$  and  $H_2SO_4$  by slightly modifying the method of Sand and Burger (*Ber.* 39, 1761 (1903)), almost insol. in alc., sparingly sol. in cold water, but dissolving on continued contact and forming a brown soln., which changes to yellow on diln., producing on prolonged action of  $H_2SO_4$  dark-brown cryst. substances in which probably some of the thiocyanate groups have been replaced by sulfate; *dipyridinium molybdenyl pentathiocyanate*,  $(C_5H_5N)_2[MoO(CNS)_4]$ , greenish black, from  $(C_5H_5N)_2[MoO_2(CNS)_3]$  and HCNS, making a red mark on unglazed porcelain; *diquinolinium molybdenyl pentathiocyanate*,  $(C_8H_8N)_2[MoO(CNS)_4]$ , greenish black crystals, from HCNS and  $(C_8H_8N)_2[MoO_2(CNS)_3]$ ; *ditrimethylammonium molybdenyl pentathiocyanate*,  $[(CH_3)_3NH]_2[MoO(CNS)_4]$ , greenish black crystals, from HCNS and  $[(CH_3)_3NH]_2[Mo_2O_7(CNS)_8]$ ; and *ditetramethylammonium molybdenyl pentathiocyanate*,  $[(CH_3)_4N]_2[MoO(CNS)_4] \cdot H_2O$ , reddish brown crystals, from  $[(CH_3)_4N]_2[Mo_2O_7(CNS)_8]$  and HCNS, sparingly sol. in  $H_2O$  more so in alc. and chloroform, giving with aq. alc. a magenta-colored ppt., probably the octathiocyanate. The prepn., by a method involving electrolytic reduction and the use of alc. HCl, of the following compds. used in this investigation is described: ditrimethylammonium molybdenyl pentachloride,  $[(CH_3)_3NH]_2[MoOCl_5] \cdot H_2O$ , bisdiethylammonium molybdenyl pentachloride,  $[(C_2H_5)_2NH]_2[MoOCl_5]$ ; and ditetramethylammonium molybdenyl pentachloride,  $[(CH_3)_4N]_2[MoOCl_5]$ , together with pure *monotetramethylammonium molybdenyl tetrachloride*,  $(CH_3)_4N[MoOCl_4 \cdot H_2O]$ . The above formulations according to Werner's theory were confirmed directly by detns. of the mol. wts. and conductivities of all the compds. and indirectly by the methods of prepn. and by the reactions. In some of the formulations, O has been assigned one position in the coördination sphere, in others 2 positions.

RUBY K. WORNER

**The stability of complex cobalt and chromium salts as solid phases. I.** ALFRED BENRATH. Aachen Tech. Hochschule. *Z. anorg. allgem. Chem.* 177, 286-302 (1928).—**Cobalt pentammines.**—The pure salts were shaken with various solns. and transformations of the solid phase investigated.  $[Co(NH_3)_5H_2O]Cl_2$  is stable in contact with neither  $H_2O$  nor dil. HCl. The rate of conversion to  $[Co(NH_3)_4Cl]Cl_2$  is inversely proportional to HCl concn. because of the decreased soly. of the aquochloride (cf. *C. A.* 20, 2128). The soly. curves of  $[Co(NH_3)_5H_2O](NO_3)_2$  and  $[Co(NH_3)_4NO_2](NO_3)_2$  must intersect since the first goes to the second with hot dil. or concd.  $HNO_3$ , but in cold dil.  $HNO_3$  the reaction is reversed (cf. *C. A.* 18, 3152). At  $25^\circ$   $[Co(NH_3)_5H_2O](C_2O_4)_2$  and  $[Co(NH_3)_4(C_2O_4)](C_2O_4)_2$  are stable in  $H_2O$  for 8 days. At  $50^\circ$  and  $75^\circ$  in satd.  $(CO_2H)_2$  the aquooxalate slowly forms the acid oxalooxalate.  $[Co(NH_3)_4NO_2](NO_3)_2$  is converted to  $[Co(NH_3)_4](NO_3)_3$  at a rate proportional to the concn. of

$\text{NH}_3$ .  $[\text{Co}(\text{NH}_3)_6\text{Cl}]\text{Cl}_2$  gives the same reaction more slowly at  $25^\circ$  but readily at  $50^\circ$ .  $[\text{Co}(\text{NH}_3)_5\text{H}_2\text{O}](\text{NO}_3)_3$  reacts more slowly than the nitratonitrate. At  $50^\circ$  and  $75^\circ$   $[[\text{Co}(\text{NH}_3)_5]_2\text{SO}_4](\text{SO}_4)_2$  reacts more readily than the nitrate. *Chromium pentammines*.— $[\text{Cr}(\text{NH}_3)_6\text{Cl}]\text{Cl}_2$  shaken 5 days with  $\text{HCl}$  or water remains unchanged but the  $\text{Cr}$  dissolved decreases from 0.1499% in water to 0.0162% in 16.15%  $\text{HCl}$  at  $25^\circ$ . Similar treatment of  $[\text{Cr}(\text{NH}_3)_5\text{H}_2\text{O}]\text{Cl}_3$  gives the chloro deriv.  $[\text{Cr}(\text{NH}_3)_5\text{NO}_3](\text{NO}_3)_2$  at various concns of  $\text{HNO}_3$  is converted to  $[\text{Cr}(\text{NH}_3)_5\text{H}_2\text{O}](\text{NO}_3)_3$ . Treatment of  $[\text{Cr}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$  with  $\text{H}_2\text{SO}_4$  gives at 15–70%  $\text{H}_2\text{SO}_4$   $[\text{Cr}(\text{NH}_3)_5\text{Cl}]\text{SO}_4$  and at 70–80%  $[[\text{Cr}(\text{NH}_3)_5\text{Cl}]\text{SO}_4]_2 \cdot 3\text{H}_2\text{SO}_4$ .  $[\text{Cr}(\text{NH}_3)_6\text{Cl}]\text{Cl}_2$  is slightly hydrolyzed by  $\text{NH}_3$  to give  $\text{Cr}(\text{OH})_3$ , but even with 30%  $\text{NH}_3$  and at  $75^\circ$  no hexammine is formed. Concd.  $\text{KCl}$  soln gives  $[\text{Cr}(\text{NH}_3)_6]\text{Cl}$  very slowly at  $25^\circ$  but within 8 days at  $50^\circ$ . The  $\text{Br}$  and  $\text{I}$  derivs. behave similarly but then change slowly to the aquo salt.  $[\text{Cr}(\text{NH}_3)_6](\text{NO}_3)_3$  in concd.  $\text{HNO}_3$  gives  $[\text{Cr}(\text{NH}_3)_6](\text{NO}_3)_3 \cdot \text{HNO}_3$ . From  $\text{NH}_3$  soln. of  $[\text{Cr}(\text{NH}_3)_5\text{H}_2\text{O}](\text{NO}_3)_3$ ,  $\text{HNO}_3$  ppts.  $[\text{Cr}(\text{NH}_3)_6](\text{NO}_3)_3$ . In concd.  $(\text{CO}_2\text{H})_2$  soln.,  $[\text{Cr}(\text{NH}_3)_5\text{H}_2\text{O}](\text{NO}_3)_3$  gives  $[\text{Cr}(\text{NH}_3)_5(\text{C}_2\text{O}_4)](\text{NO}_3)_2 \cdot \text{H}_2\text{O}$ . *Cobalt tetrammines*.—At 0–35%  $\text{H}_2\text{SO}_4$ ,  $[\text{Co}(\text{NH}_3)_4(\text{H}_2\text{O})_2](\text{SO}_4)_3 \cdot 3\text{H}_2\text{O}$  is stable but at 35–80%  $\text{H}_2\text{SO}_4$ ,  $[\text{Co}(\text{NH}_3)_4(\text{H}_2\text{O})_2]_2(\text{SO}_4)_3 \cdot 2\text{H}_2\text{SO}_4 \cdot 4\text{H}_2\text{O}$  is formed. Above 80%  $\text{H}_2\text{SO}_4$ , on cooling,  $[\text{Co}(\text{NH}_3)_4(\text{H}_2\text{O})\text{SO}_4]_2\text{SO}_4 \cdot \text{H}_2\text{SO}_4$  is formed.  $[\text{Co}(\text{NH}_3)_4(\text{H}_2\text{O})_2]_2(\text{SO}_4)_3$  in 30 days at  $25^\circ$  in 25%  $\text{NH}_3$  gives  $[\text{Co}(\text{NH}_3)_5\text{OH}]\text{SO}_4 \cdot 2\text{H}_2\text{O}$ .  $[\text{Co}(\text{NH}_3)_4(\text{H}_2\text{O})_2](\text{NO}_3)_3$  at  $25^\circ$  in  $\text{HNO}_3$  reacts more rapidly with increasing concn. of acid to give  $[\text{Co}(\text{NH}_3)_4\text{NO}_3(\text{H}_2\text{O})](\text{NO}_3)_2$ .  $[\text{Co}(\text{NH}_3)_4(\text{H}_2\text{O})_2]\text{Cl}_3$  in  $\text{HCl}$  changes slowly, more rapidly with high concn. of acid, to  $[\text{Co}(\text{NH}_3)_4(\text{H}_2\text{O})]\text{Cl}_2$ . The same product results from  $[\text{Co}(\text{NH}_3)_4\text{Cl}_2]\text{Cl} \cdot \text{H}_2\text{O}$  in  $\text{HCl}$ . Probably a similar reaction occurs with  $[\text{Co}(\text{NH}_3)_4\text{Cl}](\text{H}_2\text{O})\text{Cl}_2$ .  $[\text{Co}(\text{NH}_3)_4\text{Cl}_2]\text{Cl} \cdot \text{H}_2\text{O}$  or  $[\text{Co}(\text{NH}_3)_4(\text{H}_2\text{O})]\text{Cl}_3$  with  $\text{NH}_3$  gives a mixt. of  $[\text{Co}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$  and  $[\text{Co}(\text{NH}_3)_5\text{OH}]\text{Cl}_2 \cdot \text{H}_2\text{O}$ . At 25% from less than 12.5%  $\text{HCl}$  the neutral 1,2-dichlorochloride and above 12.5% the acid 1,6-dichlorochloride are formed. An equil. must be present, the soly. being affected by acid. In every case of transformation above, the metal content of the soln. is decreased, indicating that the changes are due to soly. and not to formation of a slightly ionized complex. FOSTER DEE SNELL.

**Cobaltic derivatives of  $\beta, \beta', \beta''$ -triaminotriethylamine.** FREDERICK GEORGE MANN, Univ. of Cambridge. *J. Chem. Soc.* 1929, 409–11. A mixt. of roseo-cobaltic chloride and  $(\text{H}_2\text{NCH}_2\text{CH}_2)_3\text{N} \cdot 3\text{HCl}$  added to  $\text{H}_2\text{O}$ , boiled, cooled and dil. with concd.  $\text{KCN}$  soln., gives *dithiocyanatotriaminotriethylaminocobaltic monothiocyanate monohydrate*,  $[(\text{SCN})_2\text{Co}(\text{tren})\text{SCN} \cdot \text{H}_2\text{O}]$ , deep red,  $m. 208–10^\circ$  (decompn.); a cold supersatd. soln. and very dil.  $\text{HNO}_3$  give the *mononitrate monohydrate*, deep red,  $m. 226^\circ$  (decompn.); dil.  $\text{HCl}$  gives the *monochloride*, deep red,  $m. 225^\circ$  (decompn.), the *chloroplatinate* is deep brick-red,  $m. 203–4^\circ$  (decompn.). The base is coordinated by all 4  $\text{NH}_2$  groups and the complex ion, having a plane of symmetry, cannot be resolved into optically active forms. C. J. WEST.

**Complex metallic cyanides. II.** HANS REIHLEN AND U. V. KUMMER, Univ. Tübingen. *Ann.* 469, 30–44 (1929); cf. *C. A.* 21, 3324. Further support is deduced in favor of the polynuclear structure of complex metallic cyanides. The compd.  $\text{FePb}_2(\text{CN})_6 \cdot 5.5\text{H}_2\text{O}$  (I), black to deep brown red, results from  $\text{K}_2\text{Fe}(\text{CN})_6$  and  $\text{Pb}(\text{NO}_3)_2$ ; 100 g.  $\text{H}_2\text{O}$  at  $0^\circ$  dissolves 5.23 g., with  $d = 1.037$ ; the compd.  $\text{CoPb}_2(\text{CN})_6 \cdot \text{NO}$   $\cdot 5\text{H}_2\text{O}$  (II) is colorless. From these were prepd. the complex salts  $[\text{Fe}(\text{CN})_6\text{Pb}(\text{H}_2\text{O})_2]\text{Cl}$  (Cs) and  $[\text{Co}(\text{CN})_6\text{Pb}(\text{H}_2\text{O})_2]\text{Cl}$  (Cs) by the action of  $\text{TiNO}_3$  or  $\text{CsNO}_3$ . These salts have relatively high solubilities and at  $v = 100$  l. per mol. the mol. cond. is only about 60% that of  $\text{K}_3\text{Fe}(\text{CN})_6$ . Further diln. causes an anomalous increase in the cond., presumably because of further dissocn. of the complex ion into  $\text{Fe}(\text{CN})_6^{4-}$  and  $\text{Pb}^{2+}$ . The compds. I and II are formulated with homopolar linkings in the complex. The salt  $\text{K}[(\text{NO}_3)_2\text{Pb}_2\text{Fe}(\text{CN})_6]$  could not be obtained in the solid form but the soly. of  $\text{KNO}_3$  and I in the presence of one another are much greater than for each salt alone. The salts  $\text{FePbK}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$  and  $\text{Fe}_2(\text{CN})_6 \cdot 2\text{H}_2\text{O}$  are also described. C. J. WEST.

Purity of  $\text{S}_2\text{Cl}_2$  (KRETOV) 7.

## 7—ANALYTICAL CHEMISTRY

W. T. HALL.

**Experimental notes on quantitative emission spectral analysis. II. Determination of zinc in solutions and of molybdenum in steel by the test method of quantitative spectral analysis.** HILDE THURNWALD, Tech. Hochschule, Prague. *Z. anal. Chem.* 76, 335–47 (1929); cf. *C. A.* 23, 2387. The method described permits the detn. of an element with considerable accuracy without it being necessary to pay undue attention

to strict reproducibility of the spark or other exptl. conditions. As *test soln.* is understood a soln. of some metal salt which possesses at least 1 ultimate line which can be used for comparison with the element that is to be detd. The so-called "test method" depends upon a comparison of the intensities of such lines produced by the element to be detd. and by the test soln. suitably diluted. Thus Zn shows a characteristic line at 3345 which is suitable for comparison with a line at 3383 which is characteristic of Ag. A table is given showing the wt. of Ag per 100 cc. which is necessary to give the same intensity line as that produced by a given wt. of Zn and the table shows that the wt. of Ag is  $0.05 \times$  the wt. of Zn. This ratio permits the detn. of quantities of Zn ranging from 5 to 500 mg. with an accuracy of 20–25% of the actual Zn content. To carry out an analysis it is only necessary to mix 2-cc. portions of a suitable series of Ag solns. with 2-cc. portions of the Zn soln. and det. the spectra. The detn. of 0.1–1% of Mo in steel can be detd. similarly by comparison with Pb lines. By dissolving the steel in acid and pouring the acid soln. into NaOH soln. a suitable  $\text{Na}_2\text{MoO}_4$  soln. is obtained which can be mixed with  $\text{Pb}(\text{NO}_3)_2$  solns. and the Mo line at 2816 compared with the Pb line at 2832. The results can be obtained quite rapidly. W. T. H.

**Thermometric titration methods.** C. MAYR AND J. FISCH. Univ. Wien. *Z. anal. Chem.* 76, 418–38(1929).—Dutoit and Grobet have found that certain titrations can be made by adding small, equal portions of reagent and measuring the temp. change by means of a very sensitive thermometer. Curves are drawn with the temps. as ordinates and the vols. of reagent as abscissas. Dean and Watts later applied this method to the titration of  $\text{SO}_4^{--}$  with 0.5 *N*  $\text{BaCl}_2$  and of halides with  $\text{AgNO}_3$ . These expts. being repeated it is now claimed that these methods for detg.  $\text{SO}_4^{--}$  and halogen are not always applicable because of interference of other cations which are likely to be present. Good results were, however, obtained with the following thermometric titrations: (1) detn. of Ca and Sr by titration with  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ ; (2) titration of Hg with  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ , an empirical factor being used for computing the results; (3) titration of Pb with oxalic acid; (4) titration of arsenite with  $\text{KBrO}_3$ , provided care is taken to adjust the acidity and an empirical factor is used for the calcn; (5) titration of available Cl in bleaching powder with arsenite; (6) titration of oxalic acid,  $\text{H}_2\text{O}_2$ ,  $\text{FeSO}_4$  and  $\text{Fe}(\text{CN})_6^{--}$  with  $\text{KMnO}_4$ . W. T. H.

**Notes on the detection of aluminum by dyestuff reagents.** EDWIN ECGRIWE. Univ. Riga. *Z. anal. Chem.* 76, 438–43(1929).—Expts. are described which indicate that of the 4 dyestuffs tested, morin is the most characteristic reagent for Al but is easily influenced by the presence of Fe. Alizarin S is the most sensitive to Al but also the most sensitive to the injurious effect of Fe. Alizarin red P S is sensitive and shows a fluorescent as well as color effect. Eriochromocyanin R is sensitive and the best reagent of the 4 to use in the presence of Fe. W. T. H.

**Use of simple metallic electrodes in the potentiometric titrations of acids and bases.** J. O. CLOSS AND L. KAHLENBERG. *Trans. Am. Electrochem. Soc.* 54, 369–92(1928).—The single potentials of the metals W, Mo, As, Sb, Bi, Al and Sn in 0.1 *N* acids differ greatly from their potentials in 0.1 *N* alkalis. All these metals yield sharp end points in titrations with *N* NaOH. The change at the end point in some cases is much greater than with a H electrode. Except with Sn in oxalic acid solns. and with Cd electrodes, the potential always changed towards baser values at the end point. With Sn electrodes a second discontinuity was generally observed in the alk. region of the curve, but its position depends on the acid being titrated and is influenced by shaking the electrode. The potentials of the metals in general become const. within 1 min. after each addn. of alkali. Satisfactory results were similarly obtained with platinized Pt electrodes, but Th, Pb and Zn electrodes gave anomalous results. The theory of the method is discussed and the conclusion drawn that the observed potentials arise from the adsorption of O or H by the metal surface. W. H. BOYNTON

**Use of cresol red in acid solutions.** F. R. McCrUMB AND W. R. KENNY. La-Motte Chem. Products Co. *J. Am. Chem. Soc.* 51, 1458–9(1929).—The color change is from red at  $p_H$  0.2 to yellow at  $p_H$  1.8, with half-point at  $p_H$  1.0. It is more stable in soln. than methyl violet. GERALD M. PETTY

**The use of yatren, a single-color, amphoteric indicator.** H. W. VAN URK. Marine hospital at Helder, Holland. *Z. anal. Chem.* 77, 12–4(1929).—Yatren, 7-iodo-8-hydroxy-5-quinoline-sulfonic acid, a yellow powder, is an amphoteric electrolyte. The ions of the salts in both forms are colorless; the color is due to the undissociated substance. In alk. solns. the color is very faint even when near the neutral point at  $p_H = 8$ . Then, as acid is added, the color increases and reaches a max. at  $p_H' = 4$  but fades when more acid is added. It may serve, therefore, to mark end points at about  $p_H = 8$ . W. T. H.

**A berry-juice indicator.** L. MOSENDZ. Ukrainian Agr. Acad. *Z. anal. Chem.* 77, 37-8(1929).—Directions are given by which an indicator can be prepd. from the juice of the chokeberry, *Morus nigra* L. The color is green with bases and light red with acids. With  $H_2SO_4$  and NaOH the end points checked those obtained with phenolphthalein in titrations. W. T. H.

**The Prussian blue and Turnbull's blue tests.** H. W. VAN URK. Marine hospital at Helder, Holland. *Z. anal. Chem.* 77, 39-41(1929).—Szebellédy has recently shown that the blue tests for Fe are influenced by the presence of  $NH_4F$ ; the explanation is vouchsafed that this is due to the diminution of the acidity of the soln. In fact, by adding  $NH_4F$  to a soln. of  $FeCl_3$  or  $FeSO_4$ , expts. show that the  $pH$  values are increased. W. T. H.

**Determination of halogen by the method of O. Gasparini.** KURT HELLER. Univ. Prague. *Z. anal. Chem.* 76, 408-18(1929).—In 1905 and 1907, Gasparini (*C. A.* 2, 238) proposed a method for the destruction of org. substances by electrolysis of  $HNO_3$  solns. and in some of his expts he reduced chlorates to chloride by passing the gases evolved during electrolysis into the aq. soln. If an inorg. chlorate is subjected to electrolysis in  $HNO_3$  soln. and the evolved gases are passed through  $AgNO_3$  soln. the Ag halide subsequently obtained gives results 6-10% too low but with  $KBrO_3$ ,  $KBr$ ,  $KI$ ,  $KIO_3$  and  $KIO_4$  it is possible to get correct results. The app. recommended consists of 2 electrolyzing tubes with a dropping tube connected to the first one and a Pélégot tube to the second, all connections being of ground glass. The lower electrodes serve as anodes. The method is useful for the detn. of I and Br in org. substances except when the substance sublimes too readily. From 0.15 to 30 g. of the substance is introduced into the first electrolyzing tube and 15-20 cc. of 0.1 N  $AgNO_3$  soln. into the Pélégot tube. Conc'd.  $HNO_3$  is added from the dropping funnel and the soln. is electrolyzed with gradually increased current so that not more than 1 bubble per sec. of gas is evolved. The electrolysis is continued for 4-5 hrs. and the current is raised to 4 amp. during the last 15 mins. The contents of the entire app. are then collected and 1.2 g. of Na sulfite crystals is added to make sure that all iodate and periodate are reduced. After 15 mins. add perhydrol until no more sulfite is present, or boil off the  $SO_2$  in the case of Br compds. Finally weigh the Ag halide or det. the excess Ag by the Volhard method. The results obtained in the analysis of more than 25 substances are given. W. T. H.

**Determination of small quantities of nitrate nitrogen.** B. G. ŠIMEK. *Chem. Listy*, 22, 353-7, 473-6(1928).—The reduction methods of Devarda and of Ulsch are unsuitable for the detn. of small quantities of nitrate N (less than 2 mg.), while that of Arnd gives an av. error of only about 1% when duraluminum is used for reduction. The Gladstone-Tribe colorimetric method gives results on the av. 10% below the actual values. The Marx-Trommsdorff titration method gives good agreement for quantities of N within the limits 0.1-0.5 mg.; this method cannot, however, be applied in the presence of NaCl. B. C. A.

**Determination of nitrogen in nitro compounds by reduction with stannous chloride and subsequent titration with iodine.** COSTA WALLERUS. *Tek Tid, Uppl. C (Kem)* 58, 33-5(1928).—The method described is a modification of that developed by E. De W. S. Colver and E. B. R. Prideaux (*C. A.* 11, 2277). The nitro compds., particularly explosives and related substances, are reduced to primary amines by boiling with  $SnCl_2$  in conc'd. HCl and titrating the excess  $SnCl_2$  with  $I_2$ . The N detns. are carried out as follows: Weigh out 0.020 g. equivs. of the compd. in question, in a 100-cc. Kjeldahl flask and pour in 20 cc. of approx. N  $SnCl_2$  soln. Connect to a reflux cooler and boil gently. Place an asbestos sheet between flame and flask with a 2.5-cm. hole in the center which is filled out by the bottom of the flask, in order to avoid any destruction of nitro compds. sticking to the flask walls above the surface of the liquid. Continue the boiling for about 20 mins. The nitro compds. are dissolved in the form of amine hydrochlorides and the soln. is taking a light yellow to dark brown color. Cool rapidly in water, add starch soln. and titrate the excess  $Sn^{++}$  with standard  $I_2$  soln. The more volatile nitrohydrocarbons such as nitro-benzene, -toluene and -xylene should preferably be subjected to a sulfonation before the N detn. since the unsulfonated compds. are likely to be retained to a certain degree in the reflux cooler. The sulfonated compds. are very stable at the temp. in question and good results are obtained in this way. The sulfonation is carried out in the reduction flask by adding 3-4 g. of oleum and heating for about 30 mins. on a boiling water bath. Cool and add a few drops of  $H_2O$  under shaking and continued cooling to convert  $SO_3$  into  $H_2SO_4$ . The N detns. can be carried out in 30 mins. and the results are accurate. C. A. ROBAK

**Determination of traces of phosphorus in ammonia and other combustible gases.** WITOLD HENNEL. *Przemysl Chem.* 11, 634-7(1927).— $NH_3$  is burned in O by an elec.

discharge passing from one gas to the other. Water produced in the reaction is collected and then analyzed for P by the colorimetric vanado-molybdate method. Cf. Schröder, C. A. 14, 1795. A. C. ZACHLIN

**Determination of sulfur (prismatic, cubic) in pebble powder.** VALTER ÖHMAN. *Tek. Tid., Uppl. C (Kemi)* 58, 49–50 (1928).—The extn. of S by  $\text{CS}_2$  in a Soxhlet app., after dissolving out the saltpeter and drying, gives too low results even after extg. for 7 hrs. The following oxidation method which is essentially the same as that used for many years in coal analysis gives good results. Boil 0.5 g. of powder with 50-cc.  $\text{H}_2\text{O}$  to dissolve the saltpeter, wash with boiling  $\text{H}_2\text{O}$ , transfer the residue to a 7-cm. filter and dry carefully on a watch glass on a boiling water bath. Bind up the filter with a cotton thread and place it in a quartz crucible in a Berthelot-Maler calorimeter bomb of non-corroding steel. Place 10 cc. of  $\text{H}_2\text{O}$  in the bomb and introduce 30 atm. of  $\text{O}_2$ , taking care that the filter is not wet. After the combustion, cool for 5–10 mins. Pass the bomb gases through a soln. 10 cc. of 3%  $\text{H}_2\text{O}_2$  in 50 cc. of  $\text{H}_2\text{O}$ . Wash out the bomb and the valves carefully with hot water, and titrate the  $\text{H}_2\text{SO}_4$  with  $\text{NaOH}$ . C. A. ROBAK

**New blowpipe tests for metals.** OTTO PRÖSCHOLD. *Z. physik. chem. Unterr.* 41, 40–4 (1928).—By heating metals to a glowing molten mass and letting them fall on a piece of paper, characteristic designs are obtained as the mass jumps about. Those for Sb, Bi, Woods metal, Cd, Pb, Sn, Zn and Ag are described. M. BEBER

**Standard methods of analysis of aluminum alloys.** A. E. LEIGHTON. *Dept. of Defence Munitions Supply Board*, May, 1926, 7 pp. Correction to C. A. 23, 58–9.—*Detn. of Si.*—Use 1.2 l. of 10 N  $\text{H}_2\text{SO}_4$  (not 2.5 N). *Detn. of Cu, Pb, Fe, Mg and Ni.*—Treat the  $\text{NaOH}$  soln. with  $\text{H}_2\text{S}$  (not  $\text{NaOH}$ ) to see if Zn is present. *Detn. of Pb* "lead acid" should read "lead acid." *Detn. of Ni.*—Citric acid is added to prevent the pptn. of Fe, etc. W. T. H.

**Estimation of carbon in steel wire.** H. N. MARR. *Iron & Steel Ind.* 2, 184–5 (1929).—It is desirable to use millings of mild steel as a flux and a Morganite combustion tube rather than one of fused  $\text{SiO}_2$ . The furnace must be maintained at a higher temp. than that ordinarily used. Thoroughly mix the drillings of mild steel and det. C by combustion. Weigh out a factor wt. (2.727 g.) into a Morganite combustion boat and place a weighed piece of the wire on top of this. See that the wire is resting on, and is surrounded by, the flux at all points. Introduce the boat into the hottest part of the furnace, close the tube and allow the contents of the boat to get hot for 2–3 mins. before turning on the  $\text{O}_2$ . Then turn on a liberal supply of  $\text{O}_2$  for 7 mins. and sweep out the train by passing  $\text{O}_2$  for another 5 mins. Absorb the  $\text{CO}_2$  in ascarite contained in a Midvale tube. W. T. H.

**A sensitive test for magnesium.** WM. L. RUGH. Princeton Univ. *J. Am. Chem. Soc.* 51, 1456–7 (1929); cf. C. A. 20, 3000.—*o,p*-Dihydroxyazo-*p*-nitrobenzene will give a blue color with 0.002 mg. Mg. GERALD M. PETTY

**Notes on the detection of magnesium by dyestuff reagents.** EDWIN EGRIWE. Univ. Riga. *Z. anal. Chem.* 76, 354–9 (1929).—Recently several tests for Mg have been recommended which depend upon the adsorption of a dyestuff by  $\text{Mg}(\text{OH})_2$  and a change in color. Thus quinalizarin and titanium yellow A have been recommended in particular. For such a test it is necessary not only that the dyestuff should be adsorbed but that a change of color should make the fact at once evident to the eye. In the latter respect most dyestuffs adsorbed by magnesia fail but the disazo dyes are likely to prove successful. Moreover, a sym. constitution seems favorable. In this paper the following dyestuffs are shown to be sensitive toward traces of Mg in alk. soln.: (1) Toluylene-orange R(S) and Direct Orange R(J); (2) Benzopurpurin 4 B (Gr-E); (3) Titanium yellow A and thiazole yellow (A); (4) Azo-Blue (By); (5) Diamine pure blue and Chicago blue 6 B (A); (6) 1,2,5,8-tetrahydroxyanthraquinone and alizarincyanin 3 R (By). To carry out a test for Mg, add 1–2 drops of 0.01% aq. dye soln. and follow with an excess of 2 N  $\text{NaOH}$ . All of these dyestuffs are sensitive to Mg in the absence of Ni, Co or Cr. The presence of colored ions like those of Cr interferes with the test. Nos. 2 and 5 of the above dyes are effected least by colorless ions other than Mg. W. T. H.

**Volumetric determination of magnesium.** J. VONDRÁK. *Z. Zuckerind. Czecho-slov.* 52, 113–9 (1927).—The method depends on the conversion of the Mg salt into  $\text{NH}_4\text{AsO}_4$  reduction of this with sulfite, and titration with 0.1 N I at 37–50°; re- 99–99.5% of the theoretical value were obtained. B. C. A.

**An ultramicrochemical method for the determination of mercury.** J. BODNÁR, EDMUND SZÉP. Univ. Debrecen. *Biochem. Z.* 205, 219–29 (1929).—The Hg is d. from its soln. in 10% KCl very easily and quantitatively by means of "nascent

**Cu.** This is accomplished by placing a piece of pure iron wire in the Hg soln. to which a small amt. of  $\text{CuSO}_4$  has been added. The Cu is deposited on the Fe wire, carrying the Hg with it. The Hg is then distd. off from the iron wire; the Hg droplets are formed into a single mass by centrifuging with alc. The diam. of the Hg drop is measured under the microscope and its wt. is calcd. from this. By this procedure Hg can be accurately detd. in amts. of 0.04 to 10  $\gamma$ . S. MORGULIS

**The titration of tin with chloramine-T.** E. RUPP AND F. LEWY. Pharm. Universitätsinstitut Breslau. *Z. anal. Chem.* 77, 1-3 (1929). -For the reduction of  $\text{Sn}^{++++}$  to  $\text{Sn}^{++}$  it is convenient to use shavings of commercial, electrolytic Fe. To prevent oxidation, it is necessary to maintain an atm. free from  $\text{O}_2$ . This can be accomplished with the aid of a Göckel valve contg.  $\text{NaHCO}_3$  soln. or by using a 100 cc. dropping funnel pushed down as far as it will go into the one-hole rubber stopper that closes the reaction flask and with the stem of the funnel cut off flush with the bottom of the stopper. To the slightly acid soln. contg. 0.05-0.15 g. of Sn in a 300 cc. Erlenmeyer flask, add 30 cc. of 6 N HCl and about 3 g. of finely cut Fe. Close the flask with the stopper carrying the cut-off dropping funnel which has been filled with 70 cc. of water contg. 3 g. of  $\text{NaHCO}_3$ . Open the stopcock slightly, so that when there is no pressure from below there will flow out about 1 drop in 2-3 secs. Heat carefully. As the Fe dissolves, the escaping  $\text{H}_2$  will force its way through the opening and prevent the  $\text{NaHCO}_3$  soln. from dropping into the flask. When all of the Fe has dissolved, remove the flame, open the stopcock and cool to room temp. Then add some starch soln. and a little KI to the  $\text{NaHCO}_3$  soln. By opening and closing the stopcock from time to time and applying gentle suction, cause  $\text{NaHCO}_3$  to flow into the flask which is inclined so that the walls are thereby washed down. Finally remove the stopper and titrate with 0.1 N chloramine or with 0.1 N  $\text{I}_2$  soln. W. T. H.

**The determination of vanadium in special steels.** CARLOS GALLEGO. *Quim. ind.* 6, No. 62, 53-4 (1929). -The chief difficulty is to sep. Cr from V. The following method gives excellent results: Treat 2 g. of the metal with hot  $\text{H}_2\text{SO}_4$  (d. 1.60) to form  $\text{V}_2\text{O}_5(\text{SO}_4)_2$ . If W is present, it will be pptd. as hydrated  $\text{WO}_3$  in the concd.  $\text{H}_2\text{SO}_4$ , and it is better to filter it off, or it will be converted into tungstate by the  $\text{NaHCO}_3$  to be added and interfere with the gravimetric detn. of the V. Dil. the soln. to 200 cc., heat to boiling and add  $\text{NaHCO}_3$  until a permanent ppt. is obtained. Filter and wash the ppt. with hot water. Calculation then gives an impure mixt. of Cr and V oxides. Fuse with 4 parts of  $\text{Na}_2\text{CO}_3$  and 1 part by wt. of  $\text{KHC}_4\text{H}_4\text{O}_6$  to convert the V to  $\text{Na}_2\text{VO}_4$  sol. in hot water, leaving insol.  $\text{Cr}_2\text{O}_3$  behind. Take of the aq. ext. of the melt as much as represents 1 g. of the sample and add an excess of solid  $\text{NH}_4\text{Cl}$  to ppt.  $\text{NH}_4\text{VO}_3$ . Filter, wash with 5%  $\text{NH}_4\text{Cl}$  soln. and calcine to  $\text{V}_2\text{O}_5$ . Another method is to take an aliquot part of the aq. soln., add 25 cc. of sirupy  $\text{H}_3\text{PO}_4$  and 0.5 g. of  $(\text{NH}_4)_2\text{SO}_4$ . Add 2 g. of KI and titrate with 1 N  $\text{Na}_2\text{S}_2\text{O}_3$ . S. L. B. ETHERTON

**Detection of vanadium and cerium by hydrogen peroxide.** JOHANN LUKAS AND ANTON JILEK. Tech. Hochschule, Prague. *Z. anal. Chem.* 76, 348-51 (1929). The  $\text{H}_2\text{O}_2$  test for V is extremely sensitive but sometimes fails when V is known to be present. To detect V in the presence of tungstates and molybdates in not too great concn., add solid  $\text{H}_3\text{BO}_3$  and  $\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$  in excess to the alk. soln. and then some 30%  $\text{H}_2\text{O}_2$ . When the alk. soln. is made acid in this way, the brown color characteristic of V is obtained without much interference of W and Mo. The yellow color characteristic of the reaction between  $\text{Ce}^{+++}$  and  $\text{H}_2\text{O}_2$  can be obtained both in faintly alk. and in weakly acid soln. or even in neutral soln. if quinine HCl is added and the  $\text{Ce}^{+++}$  salt is the nitrate, but the test is often faulty in the presence of salts which hydrolyze strongly like Th and Zr. To test for Ce with  $\text{H}_2\text{O}_2$  it is recommended to proceed as follows: To the neutral  $\text{Ce}(\text{NO}_3)_3$  soln. add some 30%  $\text{H}_2\text{O}_2$  and then an excess of solid quinine HCl, or drop 30% peroxide soln. on solid  $\text{Ce}(\text{NO}_3)_3$  and add some solid quinine-HCl; in either case the characteristic yellow or reddish yellow color will be obtained. W. T. H.

**The uses of mixed bromides in place of chlorides in the determination of alkalis.** E. SPENCER AND K. B. SEN. *Analyst* 54, 224-6 (1929). The J. L. Smith and the Berzelius methods for detg.  $\text{Na}_2\text{O}$  and  $\text{K}_2\text{O}$  in minerals call for the weighing of NaCl and KCl, the detn. of the  $\text{K}_2\text{O}$  by weighing as  $\text{KClO}_4$  or as  $\text{K}_2\text{PtCl}_6$ , and the detn. of  $\text{Na}_2\text{O}$  by difference. Data are given here showing that good results can be obtained by substituting HBr for HCl in the analysis and weighing a mixt. of NaBr and KBr instead of chlorides. It is also shown that  $\text{K}_2\text{PtBr}_6$  can be pptd. advantageously with  $\text{H}_2\text{PtBr}_6$  and the relative solubilities of the Na and K salts are favorable. W. T. H.

**Carbon dioxide determination in air by titration.** A. KROGH AND P. BRANDT REHBERG. Univ. Copenhagen. *Biochem. Z.*, 205, 265-72 (1929). -The app. consists

of 3 parts: (1) An absorption tube made of Pyrex glass with a diam. of 5 mm. is drawn out at one end and bent upwards, and at 1.5 cm. from the other end it has a bulb 1.5 cm. in diam. The total length of the tube is 15 cm. This tube is filled with 0.4–0.5 cc.  $\text{Ba}(\text{OH})_2$  soln. Air is drawn through the tube at such a rate that it takes an air bubble 15 secs. before it reaches the bulb and bursts. (2) A suction pipet with a capacity of 120 or 60 cc., the upper narrow portion of which is calibrated in cc. (25 and 15 cc., resp.), is provided with a 30-cm. tube of 2-mm. internal diam. attached to a 2-way stopcock. The latter ends in 2 tubes, of which one is a short capillary while the other is long and of ordinary size. (3) A bottle of about 150 cc. capacity is provided with a rubber stopper. The long tube reaches through the stopper to the bottom of the bottle. The capillary branch is of such internal diam. that 110 cc. will flow through it in 15–20 mins. The suction produced by the outflow of water from the pipet into the bottle draws air through the absorption tube contg. a known amt. of  $\text{Ba}(\text{OH})_2$ , colored red with an alc. soln. of cresolphthalein. The unused  $\text{Ba}(\text{OH})_2$  is titrated with standard HCl. With practice an accuracy of 1 part in 100,000 is possible.

**Improved rapid method for the determination of gases in metals, particularly oxygen in steel.** W. HESSENBRUCH. *Rev. métal.* **26**, 93–114 (1929).—See II. and Oberhoffer (*C. A.* **22**, 2525). A bibliography of 147 references is given.

A. P.-C.

**Metallic cyanates. VI. (1) New reactions of cyanic acid. (2) Qualitative test for cobalt. (3) New test for cobalt in the presence of iron.** R. RIPAN. *Univ. Cluj. Bul. soc. stiinta Cluj* **4**, 144–53 (1928).—Eleven new tests are proposed for the detection of the  $\text{OCN}$  ion. They are: (1) Add  $\text{AlCl}_3$  soln. to a hot soln. of  $\text{KNCO}$ ;  $\text{Al}(\text{OH})_3$  is pptd. (2) Add  $\text{FeCl}_3$ ; a reddish color is obtained, or  $\text{Fe}(\text{OH})_3$  is pptd. when hot, accompanied by evolutions of gas. (3)  $\text{CrCl}_3$  gives a  $\text{Cr}(\text{OH})_3$  ppt. These 3 reactions require a 2% soln. of cyanate, while the reagents should contain 0.5% metal. (4) Add a few cc. of  $\text{Ni}(\text{NO}_3)_2$  or  $\text{NiSO}_4$ , then a few drops of pyridine to the  $\text{KNCO}$  soln.; avoid an excess of reagent; blue  $[\text{NiPy}](\text{NCO})_2$  ppts. immediately, or after a few hrs. when the soln. is very dil.; 0.01 g.  $\text{KNCO}$  can be detected. (5)  $\text{Co}^{++}$  salts give blue  $[\text{Co}(\text{NCO})_4]\text{K}_2$  with as little as 0.02 g. cyanate. For smaller concns. add one drop of  $\text{Co}(\text{NO}_3)_2$  in  $\text{Me}_2\text{CO}$  to one drop of tested soln. on a watch glass; a blue coloration is observed at the time the two drops meet, providing 0.0004 g. cyanate is present. (6) To the soln., add  $\text{Co}(\text{NO}_3)_2$ , then pyridine; pink crystals of  $[\text{CoPy}_4](\text{NCO})_2$  ppt. with as little as 0.001 g. of cyanate. (7) To a 2% cyanate soln., add a few cc.  $\text{Zn}(\text{NO}_3)_2$  soln., then pyridine until the ppt. no longer redissolves. Avoid an excess of cyanate, which redissolves  $[\text{ZnPy}_2](\text{NCO})_2$ . (8) Add 1 cc.  $\text{CuSO}_4$  and 1–3 drops picoline; if a large quantity of cyanate is present, blue  $[\text{Cu}(\text{C}_6\text{H}_7\text{N})_2](\text{NCO})_2$  ppts.; otherwise add 2–3 cc.  $\text{CHCl}_3$  and shake, obtaining a blue coloration in  $\text{CHCl}_3$ . (9) Add 2–3 cc. dibenzylamine in  $\text{AmOH}$  (3 cc. amine per 10 cc.  $\text{AmOH}$ ), then 2–3 cc. of 1%  $\text{CuSO}_4$ , and rotate the test tube slowly; the alc. layer is colored violet by cyanate; 0.0001 g. can be detected. (10) Add the cyanate soln. to  $\text{Cd}(\text{NO}_3)_2$  soln., pptg. colorless  $[\text{Cd}(\text{NCO})_2]\text{K}$ ; this reaction detects 0.01 g. cyanate. (11) Add 2–3 cc. of 1%  $\text{Cd}(\text{NO}_3)_2$  soln., then a few drops of pyridine, pptg. cryst.  $[\text{CdPy}_2](\text{NCO})_2$ ; 0.01 g. cyanate is detectable. The following reaction is proposed to detect Co: add 1–2 cc. of 4%  $\text{KNCO}$  soln. freshly prepd., then one drop of concd.  $\text{AcOH}$ . A blue color is obtained with as little as 0.00004 g. Co. If  $\text{Me}_2\text{CO}$  is added (2–4 cc.) without stirring, the supernatant soln. will color it blue with as little as 0.00002 g. Co. The following reaction is proposed to detect  $\text{Co}^{++}$  in the presence of  $\text{Fe}^{++}$ : add 2–4 cc.  $\text{NH}_4\text{Cl}$  or  $\text{NH}_4\text{NO}_3$  soln.; boil; add 2–4 cc. of 4%  $\text{KNCO}$  soln.; a gaseous evolution occurs and  $\text{Fe}(\text{OH})_3$  ppts.; filter while hot; the filtrate is blue if Co is present; if colorless, add a little  $\text{KNCO}$  soln. to compensate decompn. of the cyanate by boiling. As little as 0.0005 g. of Co will give a blue color. If  $\text{Fe}^{++}$  is present, it should be oxidized with  $\text{HNO}_3$ , then neutralized with  $\text{CaCO}_3$  before testing with cyanate. Two new amines have been prepared:  $[\text{Cu}(\text{C}_6\text{H}_7\text{N})_2](\text{NCO})_2$ , blue crystals from 2 g.  $\text{CuSO}_4$  in 100 cc.  $\text{H}_2\text{O}$  and 2-cc. picoline in 50 cc.  $\text{H}_2\text{O}$ ; purified from alc. or  $\text{CHCl}_3$ .  $[\text{Cu}(\text{C}_6\text{H}_7\text{N})_2](\text{NCO})_2$ , violet crystals from 4 g.  $\text{CuSO}_4$  in 100 cc.  $\text{H}_2\text{O}$  + concd.  $\text{KNCO}$  (enough for complete soln.) and an emulsion of 3 cc. dibenzylamine in 100 cc.  $\text{H}_2\text{O}$ , with efficient shaking; purification by recrystn. from  $\text{Et}_2\text{O}$  and washing with  $\text{Et}_2\text{O}$  on the filter.

**Use of liquid amalgams in volumetric analysis. XI. Determination of phosphoric acid by using zinc or cadmium amalgam.** KIN'ICHI SOMEYA. *Sci. Repts. Tôhoku Imp. Univ.*, 1st ser., **17**, No. 7, 1289–98 (1928).—See *C. A.* **23**, 60.

E. C. M.

**Analytical studies on pyrophosphoric acid.** RUDOLF DWORZAK and WILHELM REICH-ROHRWIG. *Univ. Vienna. Z. anal. Chem.* **77**, 14–37 (1929).—The transformation of  $\text{Na}_2\text{HPO}_4$  into  $\text{Na}_4\text{P}_2\text{O}_7$  begins to take place at about  $220^\circ$ , a lower temp. than

has been given hitherto. To det.  $H_3PO_4$  in the presence of  $H_4P_2O_7$ , the method of Berthelot and André gives good results when approx. equal quantities of each acid are present but when  $H_3PO_4$  predominates the following modified procedure is recommended: Add the soln. of phosphate to a mixt. of 100 cc. of acid magnesia mixt. (55 g.  $MgCl_2 \cdot 6H_2O$ , 105 g.  $NH_4Cl$  per l. and enough  $HCl$  to make the soln. acid to methyl red) 20 cc. of cold, satd.  $NH_4Cl$  soln. and 20 cc. of cold, satd.  $NH_4OAc$  soln. Dissolve the resulting ppt. in 40 cc. of 2 N  $AcOH$ . Heat the soln. (200-400 cc.) on the water bath in a covered beaker for 4-5 hrs., filter off the ppt. of  $Mg_3P_2O_7$  and wash with hot water contg.  $NH_4Cl$  and  $NH_4OAc$ . Evap. the filtrate somewhat to secure a second crop of these crystals. Filter again through a small filter. Then, if no further pyrophosphate ppt. appears, ppt. the  $H_3PO_4$  by the method of Schmitz. Dissolve the pyrophosphate ppt. in hot, dil.  $HNO_3$ , digest on the water bath to convert all  $P_2O_7^{4-}$  to  $PO_4^{3-}$  and ppt. by the method of Schmitz. Further expts. were carried out in the search for a new titration method for detg.  $P_2O_7^{4-}$  in the presence of  $PO_4^{3-}$  based on the soly. of heavy metal pyrophosphates in an excess  $Na_2P_2O_7$  soln. Expts. with  $SnCl_4$  proved futile but with the aid of  $UO_2(OAc)_2$  a titration method was developed which permits the ready detn. of  $P_2O_7^{4-}$  in the presence of  $PO_4^{3-}$  with sufficient accuracy except when the preponderance of pyrophosphate is very great. If a soln. of  $Na_2P_2O_7$  is treated dropwise with a soln. of  $UO_2(OAc)_2$  a ppt. is produced which redissolves instantly at first and more slowly as the end point is approached when the ratio  $UO_2 : 2P_2O_7$  is reached. With  $Na_2HPO_4$ , on the other hand, the first drop of  $UO_2^{++}$  soln. produces a permanent ppt. The best way to carry out the titration is as follows: As titrating soln. use 2%  $UO_2(OAc)_2$  soln. Fifty cc. of such a soln. reacts with 1.25 g. of  $Na_2P_2O_7$ . To 25 cc. of phosphate soln. contg. about this quantity of pyrophosphate, add 1.5 cc. of concd.  $NH_4OH$  and water to make 150 cc. Titrate, dropwise, while stirring constantly, until a permanent turbidity is obtained. Carry out about 10 similar expts., each time adding a little more or less of the reagent. Allow all of the tests to stand 6 hrs. and then det. in which cases the ppt. was permanent. The method of Aoyama was tested. It depends upon the treatment of a soln. contg.  $PO_4^{3-}$  and  $P_2O_7^{4-}$  with a measured excess of 0.1 N  $AgNO_3$ , titration of the excess with  $KCN$  by the method of Volhard, suspending the original ppt. in water, saturate with  $H_2S$ , ppt. all of the  $Ag$  as  $Ag_2S$  and finally titrating with 0.1 N  $KOH$  using methyl orange first and the phenolphthalein as indicators. The original directions proved faulty but the following method gave good results. To the phosphate soln. which is faintly alk. to phenolphthalein, add a measured excess of  $AgNO_3$  and enough alc. to make the soln. contain 50% of this reagent. Filter, and treat the filtrate, which now shows an acid reaction, with 0.1 N  $NaOH$  until the newly formed  $Ag$  ppt. shows a distinct gray tint, due to the pptn. of  $Ag_2O$  which is formed when all phosphate is pptd. Filter through the same filter as that used before and titrate the excess  $Ag$  in the filtrate. Rinse the  $Ag$  ppt. into a stoppered bottle, add a measured vol. of 0.1 N  $HCl$  and shake about 30 mins. in the dark. Filter off the  $AgCl$  and titrate with 0.1 N  $NaOH$  to a methyl orange end point and then, after adding salt and cooling to 0°, to an end point with phenolphthalein. From these data the content of  $H_3PO_4$ ,  $H_4P_2O_7$  and  $HPO_3$  salts can be computed by the 3 equations given by Aoyama.

W. T. H.

**A new sensitive reaction for the detection of silicic acid.** F. OBERHAUSER AND J. SCHÖRMULLER. *Techn. Hochschule München, Z. anorg. allgem. Chem.* 178, 381-8 (1929).—The new method is based on the formation of a stable hetero poly acid of the compn.  $SiO_2 \cdot 12MoO_3 \cdot xH_2O$  of yellow color and corresponding to the well-known As and P acids, first isolated by Parmentier (cf. *Compt. rend.* 94, 213 (1882)). This yellow acid is reduced in alk. or acid soln. by  $SnCl_2$  to an acid of a lower grade of oxidation of an intensive blue color, of unknown compn. In a strongly alk., above 7.7 N  $NaOH$ , or strongly acid soln., above 5.21 N  $HCl$ , a dirty brown and yellowish brown color, resp., are obtained, instead of the pure blue. Best results are obtained with the following method: To the soln. contg.  $Si$  in sol. form, possibly obtained through fusion with  $Na_2CO_3$  in a Ni crucible or with  $NaOH$  in a Ag crucible, are added 10 cc. of a 10% neutral soln. of  $(NH_4)_2 \cdot 7MoO_3 \cdot 4H_2O$ , then the soln. is slightly acidified by slowly adding  $AcOH$ ,  $HCl$  or  $H_2SO_4$ . To this a freshly prepd. cold soln. of  $SnCl_2$  contg.  $NaOH$  in excess is added quickly until a clear soln. is obtained. A few drops of a 5%  $SnCl_2$  soln. are sufficient; on the other hand as much as 20-30 cc. is not harmful. The intensive blue color obtained may change into a dirty blue after some time. The sensitiveness of the reaction is 1:1,000,000.

J. A. SZILARD

**Detection of sulfides and thiosulfates by the iodine-azide reaction.** L. METZ. *Chem.-Tech. Reichsanstalt, Berlin. Z. anal. Chem.* 76, 347-51 (1929).—Comments on the paper by Feigl, *C. A.* 22, 4083, showing that the test is a reversal of the well-known

azide test of Raschig and that it is not characteristic of thiosulfate because quite a no. of other substances such as sulfides and polythionates show a similar catalytic effect.

W. T. H.

**The detection, determination and oxidation of sulfur dioxide.** DOUGLAS HENVILLE. *Analyst* 54, 228-31(1929).—A two-bulb tube is shown which is to be fastened to the top of a reflux condenser when  $\text{SO}_2$  is evolved by boiling a sample with dil.  $\text{HCl}$ . The lower bulb serves to prevent any liquid being drawn back into the flask and the upper one to absorb the bulk of the  $\text{SO}_2$ . Ten ml. of  $\text{H}_2\text{O}_2$  is placed in the lower bulb; 2 drops of bromophenol blue and enough  $\text{NaOH}$  to make the color blue are added; the vent in the tube is then closed with a stopper. When the app. is set up and  $\text{CO}_2$  introduced to remove air, the gas flowing from the top of the condenser enters the lower bulb through tubing that extends nearly to the top of the bulb. The gas then pushes the  $\text{NaOH-H}_2\text{O}_2$  soln. up into the upper bulb through a curved piece of tubing that reaches nearly to the bottom of the lower bulb and rises to the middle of the upper bulb with the exit near the bottom of this bulb. The  $\text{SO}_2$  is oxidized to  $\text{H}_2\text{SO}_4$  by the  $\text{H}_2\text{O}_2$  and the acid formed is indicated by a color change. Moreover, the absorption of small quantities of  $\text{SO}_2$  is complete and the soln. in the bulbs can be titrated with  $\text{NaOH}$  as the test proceeds so that a quant. measurement can be obtained. In making such an analysis the chief danger to guard against is loss of  $\text{SO}_2$  by volatilization. The expts. here described show that the expulsion of air to prevent atmospheric oxidation is probably unnecessary.

W. T. H.

**Determination of sulfuric acid in a mixture of sulfuric acid, acetic and acetic anhydride.** TAKAYUKI SOMIYA. *J. Soc. Chem. Ind. (Japan)* 31, 306-10(1928); suppl. binding, 31, 74-5; cf. *C. A.* 23, 1840.—When  $\text{Ba}(\text{OAc})_2$  was dissolved in  $\text{AcOH}$  contg. a little  $\text{Ac}_2\text{O}$ , and the resulting soln. was used as a standard, sulfacetic acid could be easily titrated thermometrically in the presence of  $\text{Ac}_2\text{O}$  according to the following equation:  $\text{Ba}(\text{CH}_3\text{CO}_2)_2 + 2\text{HSO}_3\text{CH}_2\text{CO}_2\text{H} = \text{Ba}(\text{SO}_3\text{CH}_2\text{CO}_2\text{H})_2 + 2\text{HCH}_3\text{CO}_2$ .  $\text{Ba}(\text{CH}_3\text{CO}_2)_2 + 2\text{CH}_3\text{CO}\cdot\text{O}\cdot\text{SO}_3\text{H} = \text{Ba}(\text{CH}_3\text{CO}\cdot\text{O}\cdot\text{SO}_3\text{H})_2 + 2\text{HCH}_3\text{CO}_2$ . The amt. of heat developed by these reactions was far greater than that developed by the reaction:  $\text{Ba}(\text{CH}_3\text{CO}_2)_2 + \text{Ba}(\text{SO}_3\text{CH}_2\text{CO}_2\text{H})_2 = 2\text{BaSO}_3\text{CH}_2\text{CO}_2 + \text{HCH}_3\text{CO}_2$ . The standardization of the  $\text{Ba}(\text{OAc})_2$  soln. could be carried out thermometrically by titrating against  $\text{H}_2\text{SO}_4$  dissolved in  $\text{AcOH}$  soln., which was equally good whether or not it contained a little  $\text{Ac}_2\text{O}$ .

Y. NAGAI

**Purity of sulfur monochloride.** A. E. KRETOV. *J. Chem. Ind. (Moscow)* 5, 1268-73(1928).—On the basis of K.'s detns. made on 10 different recently purified samples, the sp. gr. of  $\text{S}_2\text{Cl}_2$  is 1.6824 at  $\frac{20^\circ}{20^\circ}$ ; the sp. gr. of  $\text{SCl}_2$  is 1.6222 at  $\frac{20^\circ}{20^\circ}$ . For

purposes of factory control it is sufficient to det. the sp. gr. in order to form an idea of the degree of purity of  $\text{S}_2\text{Cl}_2$ . The analytical methods based on distg. and fractionating com.  $\text{S}_2\text{Cl}_2$  cannot be employed for the detn. of its purity, particularly with older samples. As  $\text{S}_2\text{Cl}_2$  used for vulcanization must be very pure, it is necessary to det. either its Cl or both Cl and S. Of the numerous methods which have been proposed, the best are those based on hydrolysis of  $\text{S}_2\text{Cl}_2$  by alkalis;  $\text{NH}_4\text{OH}$  can be used for the detn. of Cl, whereas 2 N  $\text{NaOH}$  can be used for the detn. of both Cl and S. The latter method is very exact when operating as follows: Place 50 cc. of 2 N  $\text{NaOH}$  (free from halogens) in a round-bottom flask with a long narrow neck, and add about 0.2 g. of the sample contained in a small, thin-walled sealed tube. Stopper the flask with a rubber stopper and break the tube by gently striking the flask. After 30 mins. action in the cold, heat 4-4½ hrs. on a water bath if both Cl and S are to be detd. or 1.5 hr. if Cl alone is required. Cool, at with 3-4 cc. of perhydrol added in small portions, which does not affect Cl but quantitatively oxidizes S to  $\text{H}_2\text{SO}_4$ . Then heat on a water bath not longer than 0.5 hr., eat first with concd., and then with dil.,  $\text{HNO}_3$  till weakly acid, pour into a 250-cc. measuring flask and fill with  $\text{H}_2\text{O}$  to the mark. Take 50-100 cc. of this liquid for Cl by the Volhard method, and use 50-100 cc. for the detn. of S and  $\text{BaSO}_4$ .

BERNARD NELSON

**Sanio's potassium dichromate test for tannins.** CHRISTINA M. FEAR. *Bristol rev. Analyst* 54, 227(1929).—One cc. of satd.  $\text{K}_2\text{Cr}_2\text{O}_7$  prepd. according to Sanio's ctions was added to 1% aq. solns. of 23 substances. Gallic acid gallotannin, pyrool, phloroglucinol, maclurin, cinchonine sulfate, and the hydrochlorides of berberine, nine, strychnine, papaverine, narcotine and narceine all gave ppts. The remaining substances, namely  $\beta$ -resorcylic acid, veratric acid, salicylic acid, vanillic acid, oxalic acid, phenol, quercitrin, rhamnetin and the hydrochlorides of betaine, caffeine and pilopine, gave no pptn. It is obvious that no reliance can be made upon the Sanio test for tannins.

**The contribution of organic chemistry to mineral analysis.** LOUIS GUGLIAMELLI. *Rev. centro estud. farm. y bioquím.* 16, 360-6(1927).—A list of org. reagents used in analytical chemistry and a brief discussion of their applications. J. L. POWERS

**A simple method for the determination of acetaldehyde.** YOSHINORI TOMODA. Tokyo Imperial Univ. *J. Soc. Chem. Ind.* 48, 76-7T(1929).—Ripper's bisulfite method (*Monatsh* 21, 1079) for the detn. of AcH is frequently in error because of loss of  $\text{SO}_2$ . A direct method has been developed for the I titration of combined  $\text{SO}_3$  ion upon dissocn. in a  $\text{NaHCO}_3$ -buffered soln. A slight excess of  $\text{NaHSO}_3$  or  $\text{KHSO}_3$  is added to an aq. soln. of AcH and after 15 min. standing the mixt. is titrated with 0.1 N  $\text{I}_2$  to a blue color with starch;  $\text{NaHCO}_3$  is then added until there is an excess of the solid and after the blue color reappears, it is again titrated with  $\text{I}_2$  until the blue persists for a few sec. The last addn. of  $\text{I}_2$  is equiv. to the combined  $\text{SO}_3$  ion (equiv. to the AcH present); 1 cc. 0.1 N  $\text{I}_2$  = 0.0022 of AcH. The relation between  $p_{\text{H}}$  and the dissocn. of AcH-bisulfite in aq. soln. is discussed, showing that at  $p_{\text{H}}=8$  ( $\text{NaHCO}_3$  buffer) the compd. is slightly dissocd. and combined  $\text{SO}_3$  ion is completely oxidized by  $\text{I}_2$ . A. S. CARTER

**Estimation of alcohol.** WILLIAM L. O. WHALEY. *Planter Sugar Mfr.* 82, 61-5(84-100)(1929); cf. *C. A.* 23, 2675.—A continuation of the study of alc. detn. in complex com. mixt. such as beverages, lotions, flavoring exts., photographic developers, antifreeze preps., etc., by densimetric, refractometric and ebulliometric methods, comparative results of which are given. Oils are removed by diln. or salting out followed by shaking with kerosene or other petroleum oil and centrifuging, the supernatant oily layer being removed by absorption in filter paper. The aq. soln. may then be clarified by shaking with  $\text{MgCO}_3$ , "Kieselguhr," active carbon or other inert substance. Satisfactory results are obtained where only water and alc. are present in the soln. examd. with an instrument. The presence of methanol and other substances influencing sp. gr.,  $n$  or b. p. lead to erroneous results. J. F. BREWSTER

**Determination of ethylene by absorption in a solution of silver nitrate.** V. N. MORRIS. *J. Am. Chem. Soc.* 51, 1460-2(1929).—A 20 to 40% soln. of  $\text{AgNO}_3$  is recommended. The  $\text{C}_2\text{H}_4$  may be recovered by evacuation.  $\text{C}_2\text{H}_2$  and  $\text{C}_2\text{H}_6$  may be detd. in a gas mixt. GERALD M. PETTY

**Colorimetric microchemical determination of furfuraldehyde.** K. SUMINOKURA AND Z. NAKAHARA. *Trans. Tottori Soc. Agri. Sci.* 1, 158-9(1928). Xylidine in presence of AcOH gives with furfuraldehyde a red color stronger and more stable than the corresponding color with aniline. The color with xylidine has the added advantage of being sp. for furfuraldehyde, and enables accurate detns. of the latter to be made in aq. or ethereal soln. B. C. A.

**Detection of gallic acid and tannin.** S. A. CELSI. *Rev. centro estud. farm. y bioquím.* 16, 642-50(1928). Gallic acid, tannin, etc., which yield pyrogallol when heated, are detected by the production of a cherry red color when a trace of the latter in concd. AcOH is heated with a few drops of  $\text{CH}_3\text{O}$  soln. and concd. HCl. B. C. A.

**New reactions of leucine or aminoisocaproic acid.** JUAN SANCHEZ. *Rev. centro estud. farm. y bioquím.* 16, 244-5(1927). Leucine was heated in a test tube until it decompd. into isoamylamine. Upon adding 10% Na nitroprusside a violet color was produced which disappeared when AcOH was added and reappeared when made alk. with  $\text{NH}_4\text{OH}$ . J. L. POWERS

**Colorimetric determination of turpentine vapors in air.** P. N. ANDREEV AND A. A. GAVRILOV. Obukh Inst. *J. Chem. Inst. (Moscow)* 5, 1282-7(1928). The concn. of turpentine vapors in the atm. is often detd. by their absorption in concd.  $\text{H}_2\text{SO}_4$  followed by an oxidation with a  $\text{CrO}_3$  mixt., yielding definite quantities of  $\text{CO}_2$ . In absence of other hydrocarbons in air this method is fairly reliable, but requires much time. A. and G.'s rapid method is based on the intensity of the color produced with concd.  $\text{H}_2\text{SO}_4$ . The results obtained vary between 99.9 and 101.6% of the real turpentine contents of the samples, provided the colorimetric comparison is made after 1-3 hrs. from the time the samples were made. On keeping the samples a longer time the intensity of the coloration increases more rapidly in the more concd. solns. of turpentine in  $\text{H}_2\text{SO}_4$  than in dil. solns. The presence of fairly large quantities of benzene and  $\text{C}_6\text{H}_6$  has practically no effect upon the results. BERNARD NELSON

**Highly accurate method for the analysis of urea.** MILLICENT TAYLOR. Univ. of Bristol, Eng. *J. Am. Chem. Soc.* 50, 3261-5(1928); cf. *C. A.* 23, 579.—For the titration, Miss Taylor used methyl red and not methyl orange and she meant by "soda"  $\text{NaOH}$  and not  $\text{Na}_2\text{CO}_3$ . W. T. H.

**Applications of the nitrile method. III. The hydrocyanic acid and formaldehyde numbers of sugars. 2. Their analytical significance. 3. Determinations of sugar.** FRITZ LIPPICH. Univ. Prague. *Z. anal. Chem.* 76, 401-8(1929); cf. *C. A.* 23,

3029.—The HCN no. of milk has been shown to be a definite characteristic due to the lactose and casein content. The no. is also characteristic of other sugars. To make the detn. dissolve 5 g. of sugar in 90 cc. of water in a graduated cylinder, bring the temp. to 19° and pour the soln. into 20 cc. of approx. 0.25 *N* KCN soln. and rinse out the cylinder with 10 cc. of water. After 10 min. distil off the excess cyanide as previously described. The following results were obtained; dextrose, 9.14; fructose, 16.77–18.46; levulose, 13.41; lactose, 3.54; maltose, 5.10. To det. the HCHO no., prepare a soln. of the same wt. of sugar and add 1 cc. of approx. 1.7 *N* HCHO soln. After 4 min. at 19°, add the KCN soln. as before and continue as usual. Deduct from the result the value found for the KCN alone. The results were: dextrose 2.91, fructose, 6.71, levulose 5.15, lactose 1.94, and maltose 2.22. Curves are given showing how these values depend upon the sugar concn. and from these plotted curves it is possible to est. the sugar content of solns. IV. 1. The significance of the hydrocyanic number of sugars in the analysis of sugar mixtures. 2. Determination of sugars in marmalade. *Ibid.*—Expts. were carried out with mixts. of *d*-glucose and *l*-glucose, cane sugar and either *d*- or *l*-glucose, and cane sugar mixed with both of these other sugars. Samples of marmalade were also analyzed for cane sugar and invert sugar. The results show that the effect of the fruit pulp in evapg. sugar solns. has little influence upon the HCN nos. of the sugars present and, although these expts. are not perhaps to be regarded as final, they indicate that the nitrile method may find some practical application in this field. ## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

A crude copper mat containing oldhamite. C. W. CARSTENS. *Norsk Geol. Tids.* 10, (No. 1-2) 39-47(1928). Chem., mineralogical and x-ray investigations have proved that 2 of the chief minerals occurring in a raw Cu mat contg. Cu are oldhamite (CaS) and troilite (FeS). In all probability the other minerals present in the mat are sphalerite and chalcocite, or a mineral resembling chalcocite. O. A. NELSON

A new etching solution for chalcopyrite. WALTER FACKERT. *Univ. of Freiburg. Metallwirtschaft* 7, 1172(1928).—The soln. recommended is 2.5 parts by vol. HNO<sub>3</sub> sp. gr. = 1.2), 4 parts by vol. HCl (sp. gr. = 1.19), 10 parts by vol. H<sub>2</sub>O and a pinch of KClO<sub>3</sub>. The smallest possible vol. of this soln. is used, and best results are obtained by several treatments with intervening polishing. The soln. is ready for use when the evolution of free Cl occurs. The reaction is slow in the presence of bornite; in this case it is recommended that the bornite be coated with a suitable lacquer. Photomicrographs are shown of etched specimens from various localities. H. STOERTZ

A genesis of some types of feldspars from granite pegmatites. OLAF ANDERSEN. *Norsk Geol. Tids.* 10, (No. 1-2) 116-205(1928); cf. *C. A.* 22, 2126.—At first there was probably simultaneous crystn. of Na-K feldspar and plagioclase from a magmatic soln. rich in volatile constituents, the 2 feldspars sepg. in individual crystals. The Na-K feldspar may have been a homogenous variety; the plagioclase was usually a soda-rich one, sometimes pure albite. Often there was formed antiperthitic intergrowths by a sythetical simultaneous crystn. of plagioclase and small quantities of K feldspar in parallel orientation. Exsolution, giving rise to perthite, went on at an early period and orption and replacement phenomena may have begun to play a part. Occasionally there was a simultaneous (not eutectic) crystn. of both feldspars, the plagioclase in the examples of this being an andesine. The second stage was characterized by a more active process of resorption and replacement. The platy variety of albite (cleavelandite) some of the pegmatites may belong in this stage, although its recrystn. may have begun earlier. A peculiar recrystn. of the microcline along incidental mech. cracks has

been going on during this stage and probably continued into the next. Sometimes this recrystn. has involved considerable parts of the feldspar. The effect of this recrystn. has been to destroy the regular cross-twinning of the microcline, either single crystals or irregularly twinned ones being produced. A const. feature of this stage, as of the next, is the continued formation of contraction cracks. Through many of these cracks communication with the remaining magmatic soln. has been established and the various fluids or gaseous emanations derived from the magmatic soln. has exerted their influence on the feldspar with which they may have come in contact. At first they have had a resorbing action, dissolving principally microcline, but also to some extent albite and poikilitic inclusions of quartz. Then they have effected the recrystn. of the microcline and have been agents of a replacement by which microcline, as a rule, has been carried away to be more or less replaced by albite. The replacement at this stage has not been carried to the extreme of removing all microcline; it has been confined to the production of perthitic veins of albite. During the closing of this stage the formation of film perthite through exsolution may have begun, and this process may have continued also through the next stage. The third stage is characterized by the extensive replacement of microcline by albite, giving rise to such peculiar feldspars as the chessboard albite and to the beautiful crystals of albite growing into cavities and often covering the outside faces of microcline-perthite. This replacement process is probably only an intensified continuation of the process leading to the formation of the perthite veins. O. A. N.

**Researches on the chemical composition of liparite.** C. CARONNI. Istituto di Chimica Generale, Reale Univ. Napoli. *Gazz. chim. ital.* 58, 801-8 (1928). Although liparite was discovered and analyzed long ago by Casoria (*Rel. soc. reale Borbonica* 3, 13, 325 (1844)); *Atti 7. adunanza straordinaria. Napoli*, II, 1156 (1846) there are no later data as to its compn. in the literature. A new sample from Lipari gave on analysis:  $\text{SiO}_2$  33.08,  $\frac{1}{2}\text{Fe}_2\text{O}_3$  1.79,  $\frac{1}{2}\text{Al}_2\text{O}_3$  1.19,  $\text{CaO}$  0.81,  $\text{MgO}$  2.07,  $\text{CuO}$  35.10,  $\text{H}_2\text{O}$  9.52,  $\text{H}_2\text{O}$  (by  $\text{CaCl}_2$ ) 16.98%,  $\text{CO}_2$  trace. The formula of the mineral dried over  $\text{CaCl}_2$  is essentially  $\text{CaO} \cdot \text{SiO}_2 \cdot 11\text{H}_2\text{O}$ , whereas in contact with air at  $25^\circ$  it is  $\text{CaO} \cdot \text{SiO}_2 \cdot 31\text{H}_2\text{O}$ . Analyses of various samples show, however, that the  $\text{H}_2\text{O}$  removable by  $\text{CaCl}_2$  varies considerably. A study of the rate of evolution of water over  $\text{CaCl}_2$  and of its reabsorption indicates that it is not  $\text{H}_2\text{O}$  of crystals but water such as that in zeolites. The liparite is strongly birefringent, has  $d_o = 2.080$ , and  $n_g = 1.51$ . The chem. compn. and particularly the character of the  $\text{H}_2\text{O}$  suggest that the liparite under investigation is like the type of chrysocolla termed *Asirolite* by Hermann (*Bull. soc. nat. Moscou* 30, 32 (1896); *Z. Krist.* 17, 625 (1900)). The term liparite should be confined to the mineral occurring on the Island of Lipari. C. C. DAVIS

**The Frood ore deposit:** a suggestion as to its origin. C. V. CORLESS. *Mining J.* 165, 281-2 (1929). The Frood ore body consists of mixtures of sulfides of Fe, Cu and Ni with small quantities of Au, Ag and platinum together with gangue. Pentlandite occurs in an almost const. ratio to pyrrhotite throughout the whole section. Below 800 ft. the ore can be directly smelted. From 800 to 1100 ft. depth the ore averages 2.1% Cu and 2.4% Ni, and increases gradually in tenor with depth. Cu enrichment below 2000 ft. is marked. On the 3100 ft. level the ore averages 21% Cu and 1.7% Ni, chalcopyrite here forms 65% of the ore. C. postulates this to be caused by the sudden injection of a large body of highly fluid magma, very rich in sulfides, along some local plane of weakness, which could easily have been caused by the intrusion of the Sudbury norite laccolith. Settling of the heavy sulfides and rise of the gangue caused the present vertical arrangement. ALDEN H. EMERY

**Notes on the nickel and copper deposits in the norite complex, west of the Pilansberg district, Rustenburg, Transvaal.** EDWARD R. SACHCH. *J. Chem. Met. Mining Soc. S. Africa* 29, 150-7 (1929).—Ni and Cu deposits occur as pipes (10 to 50 ft. in diam.) in a narrow zone following the base of the Pilansberg complex. The chief minerals are pyrrhotite, pyrite, pentlandite, chalcopyrite and malachite; all but the last are primary. Primary chromite, magnetite, Au, Ag and Pb and secondary sulfates of Fe, Ni and Cu occur as accessory minerals. The country rock is chiefly ironzinitite. The Ni is uniform in distribution; Cu is very irregular. The tenor is about 3.5% Ni and 1.0% Cu. There are 3 classes of ore: (1) massive sulfides, (2) coarsely disseminated ore, and (3) finely disseminated ore. These grade in this order from the center outward. A. H. E.

**An interesting mine in the Zoutpansberg.** O. SACERDOTE. *Mining J.* 165, 279-80 (1929).—The S. S. mine, producing Au and W, is described. Highly mineralized lodes occur in an area of schists and quartzites intruded by granite. ALDEN H. EMERY

**The radioactive ores of Britain.** A. WOKSLEY. *Mining J.* 164, 201-2 (1929).—The possibility of establishing a plant for producing Ra in Great Britain is considered. The compn. and occurrence of pitchblende, torbernite, autunite, bassettite, urano-

spathite, carnotite and a columbo-titanate of U from Madagascar are given. Devon and Cornwall are the districts in which search should center. ALDEN H. EMERY

**Radium and uranium ores in Portugal.** ANON. *Mining J.* 165, 279(1929).—Within one basin near the eastern boundary of Portugal, 90 concessions of 125 acres each have been granted in an area of proven U ore deposits. ALDEN H. EMERY

**Mining in Greenland.** S. O. CORP. *Tek. Tid., Uppl. C., Bergsvetenskap* 58, 33-9(1928).—An illustrated review. Greenland is rich in minerals, there being deposits of limestone, dolomite, asbestos, talc, coal, copper ore, graphite, cryolite, etc. Cryolite is so far the only mineral which is being exploited on a com. scale, about 25,000 tons being exported annually. C. A. ROBAK

**The deposits of ores, oil and precious stones of Birma (Burma), British India.** H. FOLKE SANDELIN. *Tek. Tid., Uppl. C., Bergsvetenskap* 58, 73-7(1928).—An illustrated review. C. A. ROBAK

**Tin ore deposits and tin mining in Siam.** W. GREDNER. Bangkok. *Mining J.* 165, 333-4(1929).—Siam produces about 5% of the world's Sn. This occurs as a primary deposit in pegmatite veins in granite outcrops, too low in grade to be com. The placer deposits formed by the weathering of these veins are the source of the production. Seventy % of the Siamese Sn output comes from 2 lines of granite. Wolframite occurs in these same districts and was mined during the war. Strip mining is customary, but hydraulic mining is sometimes employed. Underground mining is practiced only where the overburden is thick (over 12 m.) or the Sn content is low. Numerous small shafts are sunk about 12 m. apart and the miners work out from the bottom. Dredging now recovers 40% of the Sn from the harbor bottoms. ALDEN H. EMERY

**Notes on the theory of petroleum formation. III. The composition of primary tar from Chachareisky boghead coal.** G. STADNIKOV AND N. PROSKURNINA. *Brennstoff-Chem.* 9, 358-61(1928), (cf. C. J. 22, 4117-8).—The tar (495 g.) obtained by distn. with steam was freed from acids and bases and fractionated; 25° cuts were taken up to 200°, the largest amt. (42.5%) distg. between 15° and 200°. All fractions were highly unsatd. (I No 98 to 146), contained from 3.5 to 6% of O<sub>2</sub>, and oxidized readily on exposure. They also gave resinous polymerization products on standing. All fractions were oxidized with KMnO<sub>4</sub> and fatty acids were formed. Those from C<sub>2</sub> to C<sub>10</sub> were isolated as Ag salts. The small quantity of tar oils not oxidized by KMnO<sub>4</sub> was sepd. from the reaction products by distn. with steam; 13.3% of paraffin and 0.31% of asphaltenes were recovered from the tar oils not volatile with steam. The remainder was fractionated and found to consist mainly of oxygenated unsatd. compds. S. and P. conclude that this boghead coal is the product of an extensive polymerization of fats, waxes and fatty acids of algae. The process has produced compds. which are insol. in all org. solvents. Heating to 400° partly depolymerizes the coal, forming acids and anhydrides. These substances further decomp. into unsatd. hydrocarbons and oxygenated compds., probably ketones. J. D. DAVIS

**Optical analysis of volcanic rocks as a means of studying their genetical relationships.** S. TSUBOI. *Bull. Tokyo Univ. Earthquake Research Inst.* 4, 131-8(1928). (In English.) *Science Abstracts* 31A, 665.—The processes occurring when crystn. takes place on a solid magma and the successive changes occurring in the compn. of the liquid outlined. A curve is constructed called the paragenetic relation of the minerals in rocks, but as a preliminary, it is necessary to find the compn. of plagioclase and "mafic" material assocd. as phenocrysts in each of the rocks. An optical dispersion method is the most suitable. Actual examples of the results obtained by optical analysis are given. The advantage of this optical method of analysis is that, petrographically, similar rocks can be differentiated into genetically distinct groups. H. L. D.

**The clays of East Prussia and their properties.** PAUL G. KRAUSE. *Tonind. Ztg.*, 529-32(1929).—A description is given of the loams, clays and shale of East Prussia. R. F. FERGUSON

**The chemistry and biology of the clay pits and the distribution of the larvae of *Anopheles maculipennis* in them.** B. M. SEBENTZOV AND A. N. ADOVA. *Arch. Hydrobiol.* 20, 81-7(1929).—The water of 2 clay pits, a recent one (I) and an older one (II), subjected to chem. and biol. analysis. Though there was a difference in quantity of org. constituents present, the cond. was disproportionately greater in II than in I. A. assume that besides other factors the greater content of electrolytes was responsible for the abundance of larvae of *Anopheles maculipennis* in II and their only porary presence in I. G. SCHWOCH

**Methods proposed and in use for refining aluminous ores.** C. L. MANTELL. Pratt Inst. *Chem. Met. Eng.* **35**, 746-50 (1928). For the production of alumina from ores 12 processes are briefly described, Bayer, Hall, Pedersen, Haglund, Berger, Serpek, Svendsen, Blanc, Halvorsen, Sherwin, Laist and Speketer. Of these the Bayer is most widely used. Bauxite is the principal raw ore. Not much progress has been made in treating clay, feldspar, etc. G. B. TAYLOR

**What demands are placed on minerals, which are used in dressing experiments?** H. SCHNEIDERHÖHN. *Metall u. Erz* **25**, 499-504 (1928).—A theoretical paper in which the principal appearances and characteristics of inhomogeneity and mixed crystal formation, as occur in the most important ores and gangs capable of being dressed, are described. J. BALOZIAN

**Liquation phenomena and sampling.** C. STIELER. *Metall u. Erz* **25**, 540-50 (1928).—Analyses of a speiss from a Pb smelter (one set of samples being crushed and another from drillings) show the importance of liquation phenomena on the uniformity of the results. J. BALOZIAN

**Investigations on the theory of flotation.** WALTER LUYKEN and ERNST BIERBRAUER. *Mitt. Kaiser Wilhelm Inst., Eisenforsch., Düsseldorf*, **11**, No. 3, 37-52 (1929); cf. *C. A.* **23**, 2399.—It has been found possible to recover apatite by flotation with Na palmitate as a reagent. The authors believe this is due to the adsorption of the palmitate radical at the carboxyl end on the Ca of the mineral. The hydrocarbon chain of palmitate by virtue of its incompatibility with water attaches itself to the air bubble and carries up the solid particle. Adsorption measurements were made on several minerals by noting the change in the no. of drops per unit wt. of soln. before and after adsorption. The layer of adsorbed material was held very tenaciously and could not be washed off with water. When the layer was dissolved off in HCl or H<sub>2</sub>SO<sub>4</sub>, the resulting soln. showed no Na, but considerable palmitate, indicating that metathesis had taken place on the surface, resulting in the formation of an insol. palmitate. If the Ca is more insol. than its palmitate no adsorption takes place. This seems to be

the case with blende, but not with galena. The wetting of the minerals, as measured by the contact angles of a drop of the soln. with a flat surface of the mineral before and after adsorption, showed an inverse correlation between change in wetting power and amt. of palmitate adsorbed. Flotation expts. showed that minerals very slightly wetted gave the best concentrates. Cassiterite does not adsorb palmitate, but after a preliminary treatment with  $\text{Ca}(\text{OH})_2$  it adsorbs well and very good recovery may be obtained. An analogous role is played by the use of Na sulfide in the flotation of oxide ores, and various reagents used in selective flotation processes. A page of excellent photographs shows the results of various treatments on wetting power.

HANS C. DUUS

**The influence of adsorption on flotation processes.** E. PEETZ. *Metall u. Erz* 25, 494-9(1928).—The adsorption power of quartz and galena (as representative hydrophile and hydrophobe minerals, resp.) in aq. capric acid is studied, a relation between the adsorption and floating powers of the minerals in these systems being detd. In the quartz/capric acid system, quartz adsorbs capric acid only in an unmeasurable degree. However, because of the peptizing action of the acid, some of the quartz goes into soln. as a colloid and adsorbs a part of the acid. In the galena/capric acid system, galena is a good adsorbant of the acid. Orientation expts. show that the surface tension of capric acid increases on addn. of galena. In the dry state, galena possesses less adsorptive power than in the moist; the greater the no. of dryings, the greater is the loss in adsorbing power. In every adsorption process, the relation between the adsorbed material and that remaining in soln. is:  $\alpha = \beta \cdot c^{1/n}$ , where  $\alpha$  = the amt. adsorbed by the boundary faces,  $c$  = the equil. concn. in the soln., and  $\beta$  and  $1/n$  = consts. (are 67 and 0.5, resp., in the system galena/capric acid).

J. BALOZIAN

**Wetting and adsorption in relation to flotation.** E. BIERBRAUER. Kaiser Wilhelm Inst., Eisenforschung, Dusseldorf. *Z. tech. Physik* 10, 139-41(1929).—Recently the flotation of nonsulfidic minerals, e. g., apatite (*Mitt. K. W. Inst. Eisenf.* 10, 317(1928); *Arch. Eisenhüttenw.* 2, 355(1928/9)) has been successfully performed by means of Na palmitate. It is, therefore, concluded that previous theories of wetting and oil adsorption as criteria for flotation are incomplete. It was shown by Traube's method (drop counter) that Na palmitate is adsorbed by apatite because of the attraction of Ca ions in the apatite for the palmitate radical. A mol. model on the basis of the Langmuir and Harkins theories shows that the wetting ability of apatite must therefore decrease when Na palmitate is present (alkyl radical turned outward). Measurements of the capillary angles of water drops on apatite, calcite and quartz showed this influence on the first 2 minerals. The same quality of decreased wetting ability is conducive to flotation of the mineral (concn. of particles around air bubbles) as shown from comparative flotation curves of the same three. A practical application of the theory was obtained by flotation of  $\text{SnO}_2$  with Na palmitate after previous treatment of this mineral with  $\text{Ca}(\text{OH})_2$  to coat it superficially with Ca ions.

C. A. ROBAK

**A new method of direct steel production.** ASSAR GRÖNWALL. *Tek. Tid., Uppl. C*

(*Bergsv.*) 58, 25-6(1928).—In 1884 a patent was taken out by Siemens for the mfg. of steel in Martin furnaces from briquets made from slime ore and coke and charcoal powder with a small addn. of metallic Fe in the powder form. However, the idea was not carried into practice because at that time they were not able to make briquets which could stand the heat without crumbling. A briquetting process has been worked out by Kippe and Grönwall with a view to this development. Good briquets are obtained from a mixt. of 78% ore slime, 18% coke powder and 4% Fe powder, or 76% slime, 18% charcoal powder and 6% Fe powder. The Fe powder is obtained from granulated pig iron and may also be partly replaced by granulated Fe. Eventually some  $MgCl_2$  is added. For reduction in Martin furnaces the C content has to be increased by 10% to cover the loss by oxidation. A rough estn. of the smelting costs shows a decided economical advantage of using such briquets in Martin furnaces for replacing all or part of the pig iron.

C. A. ROBAK

**Formation of gas during solidification of steel.** T. HAGLUND. *Tek. Tid., Uppl. C (Bergsv.)* 58, 19-21(1928).—H. believes that the CO gas formed in solidifying steel is produced by a reaction between C and FeO and not by sepn. of dissolved CO. One reason supporting this theory is the fact that Bessemer steel which may be supposed to contain more FeO than Martin steel and very little if any dissolved CO usually develops much more gas during solidification than does Martin steel which should be likely to contain less FeO and more dissolved CO. There is very little reason, according to Haglund, to presume any considerable soly. of CO in liquid steel.

C. A. ROBAK

**Process and apparatus for cooling steel-plant molds.** SCHAEFER. *Metallhørse* 18, 2387-8(1928).—A process for cooling molds is given, designed to cool the inside more rapidly than the outside. It consists of a series of outlets, in the bottom of a cooling tank, provided with openings so arranged that the cooling water supplied through them is forced against the interior of the molds set over them, and then flows out to cool the exterior surface.

W. C. EBAUGH

**Nitrogen in iron and steel.** HIALMAR BRAUNE. *Industritidningen Norden* 44, 19-20(1928).—B. points to various problems concerning the detrimental effect of N in pig iron for the manuf. of quality steel. In pig iron from charcoal blast furnaces N is usually present in amts. of about 0.002-0.003% if the furnace is worked at moderate speed and without too hot blast. However, with hot blast and high-speed working the N content will be much higher, often 0.020-0.025%, because of the increased formation of CN compds. in the furnace. It has always been almost impossible to make a first-grade steel from hot-blast iron, a fact that is recognized as a function of the N content which causes brittleness in the hardened steel. Buyers of Swedish quality pig iron therefore often used to stipulate that the iron should be produced under certain fixed working conditions such as cold blast (not above 150°), moderate speed, etc., conditions which cannot easily be controlled by the consumer. It is recommended, therefore, in such cases to adopt the analytic detn. of the N content as the standard specification test since this can easily be detd. by either party and will give a clear evidence of the furnace-working conditions.

Tempering and cold-hardening. L. GRENET. *Aciers spéciaux* 3, 293-9 (1928).—The term "tempering" is used to designate rapid cooling whether or not hardening of the metal or alloy results. Thus, it is not sufficient to say that an alloy is tempered, and the term "tempered" is not used at the present time. The usual meaning of "tempered" implies a condition without evil. The maintenance by rapid cooling of the distribution of mols. obtained by heating to high temps. is not in itself the cause of hardening. Three cases are recognized and discussed. (1) The metal does not undergo any transformation with change of phase between room temp. and the temp. to which it is heated before tempering. Such metals are nickel, copper, aluminum, ferro-nickels rich in Ni, bronzes and brasses rich in Cu. (2) The metal, cooled slowly from a high temp., undergoes a transformation with change of phase but tempering prevents the transformation and maintains the metal at room temp. in the state in which it exists at the high temp. In this class are certain manganese steels, certain bronzes and brasses, and certain aluminum alloys. Metals in this class are said to be hypertempered. In some cases the hardness is increased and in others the metal becomes softer. (3) The metal, cooled slowly, undergoes a transformation with change of phase at a relatively high temp. but the same metal cooled rapidly undergoes the same transformation at a temp. much lower than if cooled slowly. Tempering or rapid cooling produces 2 effects: (a) The pre-existing state is partly retained and generally this is a softening effect. (b) The temp. of transformation is lowered and this causes systematic hardening. G. discusses in detail the parallelism between the action of tempering and that of cold-working or cold-hardening.

A. J. MONACK

The influence of finely divided precipitates on the coercive force (of alloys). W. KÖSTER. Vereinigte Stahlwerke, Dortmund. *Z. anorg. allgem. Chem.* 179, 297-308 (1929).—The magnetic properties, especially the coercive force, of ferromagnetic alloys depend particularly upon the size and arrangement of the fine particles which result from the decompn. of the supersatd. solid solns. The influence of quenching and annealing temp. on the magnetic properties of iron-carbon and iron-nitrogen alloys was studied. The change in the coercive force during crystal formation is independent of the change in hardness.

H. F. JOHNSTONE

The causes of failure of wrought-iron chain and cable. H. J. GOUGH AND A. J. MURPHY. *Proc. Inst. Mech. Eng.* (London) 1928, 293-352.—A series of tests disclosed three main causes of failure of wrought-Fe chain and cable. In the first case, a brittle state may be set up as a result of overheating or burning during one of the stages of manuf. Second, service shocks and strains tend to bring about a progressive deterioration of the weld. Heat treatment cannot cure either of these two types of defect. The third and most important cause of brittleness is a local hardening, with loss of ductility on the surface of the link, due to inter-link action, hammering on the ground, rattling through hawse pipes, etc. Either annealing at a dull red heat or normalizing at 1000° will restore the ductility by effecting recrystn. of the hardened surface layers of the chain links.

D. GORDON

Properties of cast iron are related to its structure. EDWARD E. MARBAKER. Mellon Inst. *Foundry* 56, 979-80 (1928).—Gray Fe contg. fine graphite uniformly distributed is of superior quality. With low Si and slow cooling, this may be attained in pearlitic Fe. A low total-C content gives similar results, as does also superheating of the liquid Fe. The details of these processes, and reasons for their effectiveness, are discussed.

GEO. F. COMSTOCK

Nickel-alloyed cast iron. HERMANN UNGER. *Giesserei Ztg.* 26, 181-8 (1929).—This is a survey of the improvement of cast iron by Ni, such as grain refinement, increased strength and hardness, and improved machinability. Micrographs show the effect of 0.73 and 3.13% Ni on the structure of cast iron contg. 3.5% C, 1.0% Si and 0.6%

Mn. Curves show the suitable ratio between Ni and Si contents of cast iron contg. 3.10-3.60% C for wall thicknesses of 3-65 mm. The reduction of combined C by 0.67-4.00% Ni in cast iron contg. 1.25 and 1.40% Si and 3.15 and 3.60% total C is shown in tabular form. For cast iron contg. 1.40% Si and 3.50% total C, 0-3.88% Ni increases the bending strength from 2.37 to 3.00 kg. per sq. mm. and increases the breaking strength from 15.3 to 23.2 kg. per sq. mm. The Brinell hardness of sand-cast specimens, 12.5 by 20 mm., containing 3.50% C and 1.40% Si is increased from 174 to 269 by the addn. of 0.459% Ni; and the specimens have good machinability. But 9.00% Ni, which raises the Brinell hardness to 350, renders the machinability poor. The uses of Ni cast iron, particularly in the automotive industry, are described.

**Cast iron for automobile engines.** JOHN W. W. SULLIVAN *Foundry Trade J.* **40**, 204 (1929) - The limits for Fe in most general use are: total C 3.0-3.9, Mn 0.70-1.0, P 0.2-0.6%, S 0.12% max., Si 1.4-2.0%. An Fe is also used for motorcycle cylinders contg. 2.90 to 2.50% Si. H. C. PARISH

**Test and research on iron and steel.** W. B. TIMM AND F. W. HARDY. *Iron & Steel Can.* **12**, 134-6 (1929). E. H. STOERTZ

**Harmful and useful effects of gases in steel.** F. RAPATZ. *Z. Metallkunde* **21**, 89-93 (1929) - An address in connection with the symposium on "gases in metals," held by the Deutschen Gesellschaft für Metallkunde at Dortmund in 1928. R. reviews the effect of O<sub>2</sub>, N<sub>2</sub>, H<sub>2</sub> and CO upon steel, with particular reference to "hardness sensitivity" and soft spots. Discussion is included. H. STOERTZ

**Thermal treatments—practical information macrographic tests.** L. PERSOZ. *Aciers spéciaux* **3**, 300-7 (1928) - Steel is often reheated to remove partially the effects of tempering. Tempering liquids in the order of decreasing intensity of tempering are: Cold H<sub>2</sub>O, hot H<sub>2</sub>O, lime water, kerosene, boiling H<sub>2</sub>O, rape oil, tallow, boiling brine soln. (saturated) and air. Saturation is defined and the proper thermal treatment described. The action of several metallic coatings (Zn, Cr, Mo, etc.) in case-hardening is discussed with respect to hardness, resistance to oxidation at high temps. and resistance to corrosion by acids. In regard to the regeneration of steel which has been overheated, 5 cases are considered with the proper thermal treatment for each case. Various macrographic tests are described and formulas are given for the solns. commonly employed. A. J. MONACK

**Diffusion of impurities in steel according to the investigations of K. Ziegler and his students.** P. SLAVINSKII. *Metallurgiste (Russia)* No. 2, 1926; *Rev. métal.* **26** (Extraits), 70-3 (1929) - S. reviews a whole series of investigations on the diffusion of impurities in steel which were interrupted by Z.'s death on Jan. 20, 1925. Z. considered diffusion as a reversible phenomenon, and if the impurities in the grains could be held in solid soln., their harmful effect was destroyed and the mech. properties of the steel improved. Each impurity has its own diffusion temp., which depends on the nature of the impurity and its soln. in the allotropic form of Fe which exists at that temp. The heat treatment suitable for a given impurity varies with the rate of diffusion of that impurity. The diffusion temp. of any given impurity cannot be found on the Fe-C heat diagram, but belongs to a more complex Fe-C-X diagram. When Fe is put in contact with Al, alloying begins as low as 650°, its compn. approximating or corresponding to Al<sub>3</sub>Fe, which can diffuse in Fe. The diffusion reaches an appreciable velocity at about 1000°. As the distribution of Al in Fe takes place in 2 stages, photomicrographs of the alloy show a banded or zoned structure. Tests on the diffusion of Mg into Fe gave neg. results, even at 1300° with an Fe contg. 0.15-0.30% C. MnO also gave neg. results. From his investigation of the diffusion of Fe phosphide, Z. concludes that: (1) In the diffusion of P and its alloys in soft Fe, the grains of solid soln. which are formed have a basaltic structure and acquire a considerable size. (2) The rate of diffusion of the phosphide, i. e., its depth of penetration, varies with the temp. (3) The film of phosphide existing between the grains of an ordinary metal can go into solid soln. and be kept in that condition by quenching. The time and temp. of decarburization was studied on steel contg.: C 1.03, Si 0.14, Mn 0.11, P 0.021, S 0.035%, in the form of cylinders 26 mm. in diam. and 100-mm. high; decarburization by atm. O does not set in at 650° but visible superficial decarburization is apparent after 8 hrs. at 750°. The explanation of the phenomenon is as follows: if oxidation of the cementite is theoretically possible below point A<sub>1</sub>, it can only be superficial because at this temp. fresh particles cannot diffuse to take the place of those that have been destroyed by oxidation; it is only above A<sub>1</sub>, when the pearlite has gone into soln., that diffusion of the cementite can occur from the center toward the outer layers. The depth of decarburization is almost directly proportional to the time of heating; up to 1000° it increases rather slowly with

rise in temp., from  $1000^{\circ}$  to  $1100^{\circ}$  it increases rapidly, and it is practically const. above that temp. Investigations on burnt steel seem to indicate that the outer layer of burnt steel can contain  $\text{FeO}$  in solid soln., the  $\text{FeO}$  sepg. out on cooling as a network and inclusions. There ensues the formation of several zones: from the outside inward, there is first a layer of Fe oxides, then ferrite with a network of oxides toward the edge of the zone, the network losing itself as points embedded in the mass of ferrite; finally there appear isolated spots of pearlite, gradually increasing in numbers till the normal steel structure is reached at a certain depth from the surface. A. PAPINEAU-COUTURE

**X-ray investigation of the internal stress of carbon steels.** SINKITI SEKITO. *Science Repts. Tôhoku Imp. Univ.* 1st ser. 17, No. 7, 1227-36(1928).—See C. A. 22, 4433. E. C. M.

**Standard specifications for quenched and tempered carbon-steel axles, shafts and other forgings for locomotives and cars.** Serial designation A19-27. BUR. OF FOREIGN AND DOMESTIC COMMERCE, *Industrial Standards* No. 12, 20 pp.—Text as adopted by the American Society for Testing Materials. Revised 1927. E. J. C.

**Standard specifications for quenched and tempered alloy-steel axles, shafts and other forgings for locomotives and cars.** Serial designation A63-27. BUR. OF FOREIGN AND DOMESTIC COMMERCE, *Industrial Standards* No. 62, 22 pp.—Text as adopted by the American Society for Testing Materials. Revised 1927. E. J. C.

**Standard specifications for carbon-steel bars for railway springs.** Serial designation A14-27. COMMERCE DEPT., *Industrial Standards* No. 10, 10 pp.(1928) (Spanish-English Ed.).—Text as adopted by the American Society for Testing Materials. Revised 1927. E. J. C.

**Relation of sampling to annealing temperature with respect to the mechanical properties and structure of cold rolled steels.** ANTON POMP AND LUDWIG WALTHER. *Mitt. Kaiser-Wilhelm Inst., Eisenforsch. Dusseldorf* 11, No. 2, 31-5(1929).—Samples taken at various times from refined sheet steels were cold-rolled and heat-treated for 3 hrs. at  $650^{\circ}$ ,  $750^{\circ}$  and  $920^{\circ}$ . The mech. and microscopic tests showed that annealing at  $920^{\circ}$ , regardless of the degree of working, resulted in the best mech. properties and the most uniform structure. Heat treatment at  $750^{\circ}$  gives nearly the same results as treatment at  $920^{\circ}$ , if a 20% excess cold working is employed. A 3-hr. heat treatment at  $650^{\circ}$  is insufficient to obviate cold hardening. It was found that the no. of samples taken was without influence on the results. HANS C. DUUS

**Grain size controls toughness.** THOMAS W. HARDY. Dept. of Mines, Ottawa, Canada. *Iron Age* 122, 1557-62(1928).—The basic elec. furnace is useful for making high-grade reliable steel for special engineering purposes. It permits the close chem. control of the steel that has recently become so necessary. Chem. analyses do not det. the quality of steel in all respects. The McQuaid-Ehn carburizing test often develops differences in grain-size between heats of steel of similar analysis, and hardenability, machinability and mech. properties vary in the same way as the grain-size after carburizing. When the latter was fine, the hardenability and machinability were inferior, and the notch-toughness as shown by the Izod impact test was greater, though heat-treatment, yield point, tensile strength and elongation were practically const. The addn. of 0.25% Mo to steels contg. about 1.5% Mn increased the impact value. Fine-grained steels give more latitude in heat-treating temp., without danger of inferior results, and when carburized, may be refined in both case and core by one operation. Photomicrographs are exhibited showing that the microstructure as rolled or quenched did not correspond in many instances with the grain-size revealed by the McQuaid-Ehn carburizing test, which alone gave evidence as to the phys. quality. G. F. C.

**Stainless steel in small arms.** HERBERT O'LEARY. Springfield Armory, Springfield, Mass. *Army Ordnance* 9, 172-6(1928).—Stainless steel or Fe contains 10 to 20% Cr; the former contains over 0.12% C, and the latter less. The former is too difficult to machine to be useful for barrels of small arms. Stainless Fe contg. 0.09 to 0.11% C and 11 to 14% Cr could be used for pistol barrels by drilling, reaming and rifling in the hardened condition, and leaving only the final machining until after drawing at  $1100^{\circ}$  F. There was greater wear on the tools, however, than with plain steel; so the cost of the finished barrel of stainless Fe was over 50% higher. Corrosion resistance was tested by intermittent salt spray, or by firing service ammunition followed by exposure to steam. The former test showed great, and the latter slight, superiority for the stainless Fe. The protective effect of polishing is lost sooner in the latter method. Tests for erosion caused by firing gave very poor results for a bronze barrel, and slightly better results for a steel barrel contg. 2.85% W, than for a standard barrel from stock. The stainless-Fe and steel barrels were about the same as the standard in the erosion test, but Cr-plated barrels were much better. In 0.50 caliber machine-gun barrels, and 0.30 caliber rifle and

machine-gun barrels erosion gives more trouble than corrosion, and the use of stainless Fe would not be worth while on account of its cost; but in 0.22 rifle barrels and 0.45 pistol barrels corrosion is the chief cause of deterioration, and the pistol barrels may be machined cheaply enough so that the use of stainless Fe in them would be economically advantageous to secure longer life.

GEO. F. COMSTOCK

**High-strength structural steels.** E. E. THUM. *Iron Age* 123, 797-800 (1928).—Higher-Mn alloys are being marketed in increasing tonnages in America since 1924 in competition with other low alloy steels. Nearly all tonnage steels now contain more than 0.30% Mn, and medium and hard grades are essentially alloys of Fe, C and Mn. The 1927 A. S. T. M. specifications for 60-lb. rails limit the C between 0.50 and 0.60%, Mn 0.6 and 0.9% and Si to a min. of 0.15%. For 85-lb. rails the limits for Mn and Si are the same as for 65-lb.; C is held between 0.62 and 0.77%; for 120- to 140-lb. rails C 0.72-0.89%, Mn 0.5-0.9 and Si 0.15% min. Experience with about 250,000 tons of rails contg. 0.53 to 0.65% C and 1.3 to 1.5% Mn shows that they have superior strength and wearing properties, lasting up to twice as long as the conventional analyses under heavy traffic. All portions of the hull contributing to the girder strength of British warships built in the last 8 years have used "D Steel" contg. about 0.33% C, 0.12% Si and 1.1 to 1.4% Mn with a min. proportional limit of 38,000 lbs. per sq. in. No defects have developed in service. Indications are that it is better to get added strength from Mn than C as the proportional limit, ductility and impact strength are better. A high-strength boiler plate is marketed in the U. S. as "Silicon Steel." Its chem. limits are 0.35% C max., Si 0.20 to 0.30 and Mn 0.60 to 0.90%. It is used for high-pressure work, as its ultimate strength is 70,000 to 83,000 lbs. per sq. in. A steel contg. 0.5% C and 1.25% Mn has been marketed for compressed-gas cylinders for many years. H. C. P.

**The process of manufacture of steel and the characteristics of endurance to alternate stresses.** R. CAZARD. *Aciers spéciaux* 4, 14-22 (1929).—C. discusses the differences between elec. and converter low Ni-Cr steels and lists the advantages of the elec. process of manuf. Differences in the 2 types of steel as shown by microscopic examn. after etching are explained and illustrated by photomicrographs. The fatigue tests were performed by the cantilever method. The results indicate a marked superiority of electric over converter low Ni-Cr steels.

A. J. MONACK

**Blister formation in the pickling of steel sheets by diffusion of hydrogen.** GUSTAV THANHEISER. Kaiser Wilhelm Inst. Eisenforsch., Dusseldorf. *Z. tech. Physik* 10, 143-6 (1929).—Several expts. are described to show the penetration of hydrogen in atomic form through steel; pressures of 300 atm. inside a steel bomb used as cathode in H<sub>2</sub>O electrolysis were measured. The same effect causes gas blisters to form under a metallic layer during the acid pickling of steel sheets. The influence of various factors on the H diffusion was examd. in a simple expt. with an iron sheet between two glass bells; the lower bell was filled with Hg and connected to a manometer tube; the upper bell contained acid. After satn. of the sheet with H, its diffusion increased linearly with time and was inversely proportional to the thickness of the sheet (0.75 to 8 mm). The amt. of H diffused increases with temp.; the percentage H diffusing of the total H evolved decreases with temp. Pickling admixts. which diminish the H evolution also cause a decrease in diffusion. Increase in C content of the steel causes the H diffusion to decrease. For the same C content spherical cementite allows considerably more diffusion than lamellar pearlite.

B. J. C. VAN DER HOEVEN

**Surface hardening of steel by nitrogen.** H. W. MCQUAID. *J. Western Soc. Eng.* 34, 239-48 (1929).—McQ. discusses nitriding in its successes, failures and shortcomings. Nitriding consists in general of heat-treating Al-Cr or Al-Mo steels in an atm. of NH<sub>3</sub>. Nitriding steels contain 0.30-0.50% C. The core strength of the nitrided pieces depends upon the alloy and the content. The cost of steels used in the nitriding process is greater than that of steel used for case-hardening, but nitrided steel lacks soft spots, warp and is much more resistant to corrosion. A curve shows the depth and hardness of nitride case obtained at temps. from 482° to 676° compared with a combination cycle. As the temp. increases between these temps. the surface hardness decreases but the depth of the nitriding effect is greatly increased for a given time. Circulation of the NH<sub>3</sub> during the nitriding reduces the time cycle. Nitriding increases the size of the piece 0.001 in. per in. of diam. and hardness is maintained at elevated temps. Mo tends to improve the toughness of the finished article. Elements which form carbides in steel apparently also form nitrides with a resultant increase in hardness.

W. H. BOYNTON

**High-quality chromium-nickel-steel castings.** VIKTOR ZSÁK. *Die Giesserei* 16, 193-205 (1929).—The effect of heat treatment on tensile properties and microstructure of Cr-Ni-steel castings with 0.55-0.95% Cr and 3-3.75% Ni was studied. Specimens solidifying with transcryst. fracture possess satisfactory properties on annealing at

sufficiently high temps. (best at 900°). Unannealed specimens show a ferrite-martensite structure (resembling the Widmannstätten), which begins to decompose at 650° (troostite appearing), consists entirely of peralite on annealing above 820°, and from which ferrite seps. at the grain boundaries on annealing at 1000°. Those which solidify with granular fracture show unfavorable properties on annealing, the structure consisting of pearlite with ferrite at the grain boundaries. Castings which have been hardened and then tempered show a sorbitic structure and properties which are much better than those simply annealed. The importance of the initial structure on the strength of the finished product is seen. Numerous micrographs are given. J. BALOZIAN

**A historical point in connection with the invention of high-speed tool steels.** L. DEMOZAY. *Rev. métal.* 26, 115-6(1929). L. DESCROIX. *Ibid* 117-8.—Credit is given to H. A. Brustlein, of Jacob Holtzer & Cie., for the invention of W and Cr high speed tool steels, which were used by Taylor and White in their investigations on the cutting of metals. A. PAPINEAU-COUTURE

**Medium-manganese rail a success.** E. E. THUM. *Iron Age* 123, 940-2(1929).—Open-hearth steel with C 0.550-0.70% and Mn 1.25-1.50% made in good rail practice makes much better rails than does the standard open-hearth C steel. While rejects are higher, there are fewer second-grade rails produced. Steels near the top limits on both C and Mn contents are likely to be brittle, while those with both elements near the lower limits will probably flow under traffic. W. H. BOYNTON

**Nickel as an alloy element with iron.** E. PIWOWARSKY. *Metallwirtschaft* 7, 530-5(1928).—A summary of the properties of Ni-Fe alloys and a discussion of the advantages of Ni in steel, cast iron, hard iron and malleable cast iron are given. Addns. of Ni to Fe confer a variety of properties to the resulting alloys. In no other binary series is there a summation of such differences in the physical consts. such as coeff. of expansion, heat and elec. cond., sp. heat and magnetic properties. C. H. LORIG

**Iron-beryllium and iron-boron alloys; the structure of iron boride.** FRANZ WEVER. Kaiser-Wilhelm Inst. Eisenforsch., Düsseldorf. *Z. tech. Physik* 10, 137-8 (1929).—The phase diagrams of the systems Fe-Be, Fe-B and Fe-C are compared. Whereas C enlarges the range of  $\gamma$  iron considerably, the action of B or Be is the reverse, the cause of these differences being found in the increasing atom radius of these elements. B in the range of its soly. in Fe gives a contraction of the Fe lattice parameter from  $2.856$  to  $2.854 \times 10^{-8}$  cm., which indicates that B forms a solid soln. by lattice substitution with  $\alpha$ Fe; the same holds for Be. With  $\gamma$ Fe the substitution is considered probable, although experimentally difficult to investigate. As a parallel to  $\text{Fe}_3\text{C}$  the compd.  $(\text{Fe}_2\text{B})_2$  occurs in Fe-B alloys; it is of the tetragonal scalenohedral space group  $V_6$  with internally centered translation group  $\gamma'$  and 4 mols.  $\text{Fe}_2\text{B}$  in the basis. The unit cell dimensions are  $a = 5.078 \times 10^{-8} \pm 0.005$  cm.,  $c = 4.223 \times 10^{-8} \pm 0.005$  cm. The av. distance of one Fe atom from its 5 neighbors is  $2.41 \times 10^{-8}$  cm.; it is an example of the relation of atom radius and coordination no. (Goldschmidt theory).  $\gamma$ Fe has 2.53 (coordination no. 12);  $\alpha$ Fe has 2.48 (coordination no. 8). Two parameters are necessary to locate the Fe atom positions. The B atoms are assumed to lie at (000) and  $(\frac{1}{2}, \frac{1}{2}, \frac{1}{2})$  or  $(00\frac{1}{2})$  and  $(\frac{1}{2}, \frac{1}{2}, 0)$ , thus giving a mol.  $\text{Fe}_2\text{B}_2$  with two non-equiv. B atoms. The structure of  $\text{Fe}_2\text{B}_2$  can be logically related to that of  $\gamma$ Fe with  $\text{Fe}_2\text{N}$  as intermediary step. B. J. C. VAN DER HOEVEN

**Applications of stainless iron in nitric acid industry.** WALTER M. MITCHELL. *Chem. Met. Eng.* 35, 734-6(1929).—Alloys of Fe-Cr resist corrosion by  $\text{HNO}_3$  if above 14% Cr. Carbon content must be 0.1% or less to secure proper working qualities in sheets, tubes, rivets, etc. For casting 0.3% C is used. Si up to 1% is an advantage; also Ni 8%, in fabricating equipment. For welding, Ni imparts desirable characteristics. G. B. TAYLOR

**Brass for lathe work.** P. DEJEAN. Établissements Schneider. *Rev. métal.* 26, 45-67(1929).—This grade of brass (sometimes improperly called 60-40 brass) contains approx. 60% Cu, 1.5% Pb and the rest Zn. It is a relatively cheap product obtained by remelting the scrap metal from lathes to which is frequently added a certain amt. of waste of higher grade brass together with the required amt. of Zn to give it the required compn. During the war the Creusot works undertook the manuf. of this product, preceding it by a thorough investigation of the optimum manufg. conditions, which is described at length in the article. The various operations to which the ingots are subjected are: hot rolling, annealing before drawing, drawing either with or without intermediate annealings. Hot rolling of brasses contg. over 61.5-62% Cu is very delicate and causes a high proportion of rejects. Cold drawing of brasses contg. less than 57.5-58% Cu causes considerable trouble through the formation of cracks during drawing or of season cracks. The optimum Cu content is therefore 58.5-61%. Curves are given showing

the effect of annealing on the mech. properties of such brasses contg. 56.8-61.4% Cu. Annealing gives fairly good results at 500°, best results at 600°, and should not be carried out above 700°. The presence of Pb is essential to proper working in the lathe, and should not fall below 1% or go above 2%.

**A. PAPINEAU-COUTURE**  
**The role of nickel in the automobile industry.** GALIBOURG. *Actes spéciaux* 3, 308(1928).—The properties and uses of nickel steels, cast nickel and nickel-chrome steels, and special alloys are discussed in detail.

**A. J. MONACK**  
**Heat treatment of standard silver.** MAX HAAS AND DENZO UNO. *Z. Metallkunde* 21, 94-6(1929); cf. C. A. 22, 2543, 3874. The effect of quenching and annealing upon standard Ag (92.5% Ag, 7.5% Cu) is studied by photomicrographic and differential dilatometric methods. The alloy was prepd. in wire form, cold rolled and given the heat treatment, elongation being followed by means of the *Chevenard differential dilatometer*. The solid soln. formed at high temps. is maintained when the material is suddenly quenched. By suitable annealing, sepn. of the excess Cu in a highly dispersed form occurs, the extent of the sepn. being greatest at about 240-300°. On extended annealing at 300° agglomeration of these Cu particles takes place and the specimen softens. The most favorable temp. for the heat treatment is 720 to 800°. Photomicrographs are included.

**H. STOERTZ**  
**Soft solders.** EDMUND R. THEWS. *Z. Met.* 26, 189-97(1929).—This is a survey (with data in tabular form) of solders contg. combinations of Pb, Sn, Cd, Zn, Bi, Sb and in some cases small amounts of Fe and As. The work of the following investigators is discussed: Saposhnikow, Calvert and Johnson, Long and Kuffer, Schwartz, Parkes and Martin, British Engineering Standards Association and Westinghouse Electrical and Manufacturing Company. There are also discussed the properties of soft solders, the impurities in Sn solders and the influence of the method of casting upon the appearance of Sn solders.

**JOHN W. W. SULLIVAN**  
**Light aluminum alloys of technical importance.** TORSEL BERGLUND. *Tek. Tid. (Uppf. C (Bergsvetenskap))* 58, 57-64(1928). A review on the manu. and properties of these alloys. The influence of certain methods of heat treatment upon the mech. properties is considered.

**C. A. ROBAK**  
**Aluminum-alloy pistons for oil motors.** ROBERT I. ANDERSON. *Metallwirtschaft* 7, 167-73(1928).—The main advantages of Al alloy pistons over cast iron pistons are low sp. gr. and high heat cond., the tensile strength of Al alloy "Y" permanent mold casting (Al-Cu-Mg-Ni, 92.5-4-1.5-2) after heat treatment may be as high as 35 kg./sq. mm. (duralumin, 42, gray cast iron, 15, cast steel, 12 kg./sq. mm.) with a Brinell hardness 120-130. By a special heat treatment a hardness of 180 can be obtained. Addns. of Fe, Mg and Ni to Al-Cu alloys tend to increase hardness at elevated temps. The conductivities of several Al alloys at 300° are given. Mg, Cr and Fe lower the cond. of an Al-Cu alloy; Ni raises it. The expansion coeff. varies between 0.000020 and 0.000033 (20-100°); cast iron 0.00009 (20-100°), and the sp. gr. from 2.65 to 3.00. Permanent-mold alloy castings possess higher mech. qualities than sand castings, they are much improved by a heat treatment. For the effect of heat treatment on Al alloy castings cf. C. A. 22, 2537. Photomicrographs of the more common Al alloys and their changes after heat treatment are given.

**R. D. BUMBACHER**  
**Development and future problems of the aluminum chill casting process.** H. OBERMÜLLER. *Metallwirtschaft* 7, 782-3(1928). Dimensions of Al chill castings are within the limits of 0.1 to 0.3 mm. The metal is dense and has physical properties superior to those of sand-cast metal. Lessening the time for making molds, reducing the oxidation losses in metal bath, adopting automatic methods of casting, and choosing suitable casting alloys are future problems.

**C. H. LORIG**  
**The development of magnesium alloys.** K. I. MEISSNER. *Metallwirtschaft* 7, 128-36, 252-8(1928).—Technically important Mg alloys and their properties are reviewed. References, tables, photomicrographs and curves accompany the article.

**R. D. BUMBACHER**  
**The binary system calcium-sodium.** RICHARD LORENZ AND ROBERT WINZER. *Inst. phys. Chem. Frankfurt a. M. Z. anorg. allgem. Chem.* 179, 281-6(1929).—Ca-Na alloys were investigated in steel bombs which were sealed in order to avoid the formation of Ca nitrides and Ca hydrides. Pure Na was used while the Ca contained 1.2% impurities, mainly SiO<sub>2</sub>, Al<sub>2</sub>O<sub>3</sub> and Fe<sub>2</sub>O<sub>3</sub>. The m. p. of Na was 97°, that of Ca 809°. The limit of soly. of Na in liquid Ca is 16 at. % Na at 700° while the amt. of Ca dissolved in liquid Na at 700° is 0.8 at. % Ca. The Na freezes out pure from all alloys studied at 97°. Attempts to det. the mutual soly. above 700° failed.

**H. S. V. KLOOSTER**  
**Microstructure of electric arc welds in structural steel.** H. L. PULLOW AND F. L. REYNOLDS. *Univ. of Mich. Mich. Expt. Sta. Bull. No. 21, 22 pp.*(1929).—The

various methods of elec. welding are described. Expts. on arc-welding structural steel plates, using direct current with the plate positive and using bare metallic electrodes, are described. The skill of the welder is of paramount importance. Photomicrographs are given of typical weld structures, both before and after annealing. Under the best conditions the deposited metal is very porous, with a tensile strength not more than one-fourth that of low-carbon cast steel.

ROBERT F. MEHL

**Welding in the chemical and process industries.** W. SPRARAGEN. *Ind. Eng. Chem.* **21**, 425-31 (1929).—A brief description is given of the following welding methods: forge, elec. arc, gas, resistance and aluminothermic. Some materials can be more satisfactorily welded than others. The structure should be designed for welding. Examples of welding in chem. industry are vessels for high temp. and pressure, as oil-cracking stills and piping systems.

A. W. HOLMES

**Autogenous welding with coal gas.** A. MÜLLER AND B. BIBUS. *Gas u. Wasser-fach* **71**, 566-9 (1929).—A flame temp. of  $1980^{\circ}$  is obtained when coal gas of a calorific value of 4230 kg.-cal. per cu. m. (444 B. t. u. per cu. ft.) is burned with O, as compared with a flame temp. of  $3200^{\circ}$  for the oxy-acetylene flame. The useful heat in kg.-cal. per cu. m. is about 2600 (max.) for the former and 3850 for the latter, with O consumptions per cu. m. of gas of about 0.45 and 1 cu. m., resp. Sheet iron up to 6 or 8 mm. may be welded with the oxy-coal gas flame as compared to about 100 mm. for oxy-acetylene in the same burner. Oxy-coal gas may be used for autogenous cutting up to 50 mm. and gives a very clean cut. It is especially useful in welding brass and Al and competes with the H flame for welding Zn, Sn and Pb, but is not adapted to cast Fe or Cu.

R. W. R.

**Welding copper and its alloys.** KALISCH. *Metallwerke* **18**, 933 (1928).

R. M. S.

**European hot sheet galvanizing.** HEINZ BABLIK. *Iron Age* **123**, 811-2 (1929); cf. following abstr. Al is added to the bath and no flux is used on the Zn bath. The product has the best bending qualities. It can be bent in every direction without damage to the Zn coating. The sheets are pickled in a highly concd. HCl bath, then washed in water and dipped in a highly concd. warm soln. of  $ZnCl_2$ . Next the sheets are dried and dipped into the molten-Zn bath. The Al content increases resistance to corrosion.

H. C. PARISH

**Acids used in galvanizing work.** HEINZ BABLIK. *Iron Age* **123**, 879-80 (1929); cf. preceding abstr. Scale consists of 2 compds.,  $Fe_2O_3$  and  $FeO$ , the proportion being detd. by the temp. and time of oxidation. When oxidation becomes stronger the scale layer becomes richer in  $FeO$ . Presumably the scale at the lower temps. of rolling and annealing contains more  $Fe_2O_3$  than 36.70%. The attack of the pickling acid is distributed on 3 compds. of different soly., i. e.,  $Fe$ ,  $Fe_2O_3$  and  $FeO$ . The soly. in HCl is different from that in  $H_2SO_4$ . A part of the scale is dissolved and a part removed mechanically by acid, which penetrates the pores and dissolves the Fe to which it adheres. With growing concn. of HCl there is a decrease in that part of scale removed mechanically and an increase in that dissolved, the soly. of the oxides in weak HCl being low. In  $H_2SO_4$  the soly. of Fe in all acid concns. is far higher than that of the oxides. The attack is therefore concd. on the Fe base. At the high temps. usually employed for  $H_2SO_4$  the attack is almost entirely on the metallic Fe. In pickling with 14%  $H_2SO_4$  the scale removed mechanically is 20 times that with 14% HCl, making it necessary to use an inhibitor with  $H_2SO_4$ .

H. C. PARISH

**Molecular structure and fatigue tests of steam boilers.** LUDWIG KAUL. *Metallwerke* **18**, 932-3 (1928).

E. M. SYMMES

**Galvanizing and tinning iron and steel wires.** P. KRUMME. *Metallwaren-Ind. u. Galvano-Tech.* **25**, 7-9 (1927).—A review of current practice.

J. H. HOEFER

**Metal decorating and etching.** G. BINDHARDT. *Metallwaren-Ind. u. Galvano-Tech.* **25**, 129-30 (1927).—A description of the three essential phases of damascening or metal etching.

J. H. HOEFER

**Metal etching.** H. WERNER. *Metallwaren-Ind. u. Galvano-Tech.* **25**, 48-50, 67-8 (1927).—Metal etching is reviewed as applied to (1) type setting, (2) photographic and lithographic work, (3) aluminum etching for making copies in printing work and (4) making reprints.

J. H. HOEFER

**Metal corrosion and metal etching.** RÖMER. *Metallwirtschaft* **7**, 535-8 (1928).—Corrosion and etching of metals are of importance in metallographic studies and in the coloring of metal surfaces. A soln. of  $(NH_4)_2S$  will develop a brown surface on bronze and red brass. To color Zn (or alloys high in Zn) a deep black soln. of 70 parts HCl, 25 parts  $H_2O$  and 5 parts  $SbCl_3$  is used. An elec. method of etching which has had no practical application as yet is described as follows: The object to be etched is put into a glass tube; this is filled with H at 1 mm. pressure. An elec. current is passed between the electrodes. The anode is of Al wire, and the cathode is a Cu tube arranged

to support the object. The charged electrons from the gas mols. unite with positive ions, which are swept back to the cathode and there, through their impact, remove metal atoms or even larger particles. C. H. LORIG

**Hot-wall effect as a cause of corrosion.** (BRNEDICKS. *Tek. Tid., Uppl. C (Bergsvetenskap)* 58, 17-9(1928).—The problem of explaining certain cases of local corrosion occurring in the cellulose industry has been studied. Local corrosion appears near the upper closed end of the so-called caloriser tubes used in sulfate cellulose plants for the heating of the black liquor. Steam at  $100-80^{\circ}$  ( $10-5$  kg. per sq. cm.) flows through an inner tube reaching forward to the closed top end of the caloriser tube, and since the liquor is flowing upward the top of the tube is at a higher temp. than the rest of the tube. Lab. expts. carried out in autoclaves with two tubes of the materials used in practice, one tube being heated internally by means of elec. heating elements, both tubes being heated in black liquor, showed clearly the corroding effect on local spots of higher temp. When the temp. in the autoclave was maintained at  $215-65^{\circ}$  for 65 hrs. the local corrosion appearing on the separately heated tube was found to resemble that which occurs in actual practice. So-called non-corroding Ni and Cr steels were not found superior to soft C steel in this respect, on the contrary they were attacked more severely than the C steel in the autoclave expts. C. A. ROBAK

**Corrosion tests.** J. M. POLYREAC. *Actes symposium* 4, 23(1929).—P. briefly reviews the subject of corrosion and corrosion tests. A. J. MONACK

**Corrosion of metals.** C. FROELICH. *Gesundh. Ing.* 52, 33-6(1929).—In pure water Fe goes into soln. but equil. is soon attained and very little corrosion takes place. However, in the presence of  $O_2$ , the slightly sol. ferrous ions are oxidized to the very slightly sol. ferric ions, and the reaction proceeds to a measurable extent.  $CO_2$  is also important in the corrosion of metals. When a metal is in contact with any soln. a definite potential, depending on the nature and the concn. of the soln., is set up. A table is given of the e. m. f. of various metals from Au to K in N, 0.1 N and 0.01 N solns. compared to the normal H electrode as zero. If the potential is less than the equil. value, the metal comes out of soln. but if the potential is greater than the equil. value, the metallic electrode goes into soln. Whether or not corrosion is stopped by polarization depends on (a) the difference in potential between the pair of electrodes, (b) the concn. of H ions and (c) the overvoltage of the metal. Two different metals are not necessary for electrolytic corrosion. Most metals have areas of different electrode potentials and these act as two metals. Such areas tend to cause local action with the result that pitting takes place. Protection can be obtained by use of a small elec. current whereby the metal is made the cathode. The creation of a passive state results in decreased corrosion. This is often accomplished by the use of chromates. Al forms a passive coat of  $Al_2O_3$ . The addition of Cr, Ni and Co to steels increases the resistance to corrosion. Oils have been used to protect against corrosion as also have tar and waxy substances. Hard rubber gives a very good protection against acids. W. L. DENMAN

**Anode and cathode elements in corrosion.** M. GROECK. *Gesundh. Ing.* 52, 53-8(1929).—All metals have areas of different potential. In any pair, one is anodic and the other cathodic. An elec. current is set up between these points and electrolysis takes place. The electrolyte has much to do with the extent of corrosion. W. L. D.

**Bureau of Standards soil-corrosion investigation.** K. H. LOGAN. *J. Am. Water Works Assoc.* 21, 311-7(1929); cf. *C. A.* 22, 3619. It was found impossible to distinguish between electrolytic and soil corrosion by observation, though it was thought that variation in  $pH$  of the adjacent soil might have some significance. More or less current was found flowing nearly everywhere and this was considered to be more the result of soil action than the cause of corrosion. D. K. FRENCH

**A new method for testing the porosity of anti-corrosion coatings.** J. COURNOT. *Rev. métal.* 26, 76-7(1929).—Filter paper is moistened with a soln. of  $K_3Fe(CN)_6$  and alkali chloride and applied immediately to the surface to be tested. Defects in the coating produce stains (the color depending on the nature of the metal to which the coating was applied) on the paper; and by washing out the  $K_3Fe(CN)_6$  and drying the paper, a permanent record of the test is obtained. The test can also be used on thin Al or Sn foil, by first placing the latter on a clean, polished steel plate and then applying the  $K_3Fe(CN)_6$  paper. A. PAPINEAU-COUTURE

**New rustproofing materials.** P. MARTELL. *Metalloberw.-Ind. u. Galvano-Tech.* 25, 32-4(1927).—A résumé of researches undertaken to find a chem. or electrochem. method of producing a protective layer of ferrous oxide, ferric phosphate or similar rust-resisting compds. on the metal surface. J. H. HOFFER

**Increasing the resistance to corrosion by means of protective coatings.** E. RIMY. *Gesundh. Ing.* 52, 234-6(1929).—The protective coating "Gabrit" is applied in solution

and the protective film is formed on drying. It protects against attack in acid, salt and alk. solns. It was proved in this work that protection is obtained in water and active-Cl preps. such as antiformin, hypochlorites and chloramines. However, if an imperfect film is obtained, immediate corrosion results. W. L. DENMAN

MEYERSBERG, G.: *Perlitguss.* Berlin: J. Springer. 111 pp. M. 7.50. Reviewed in *Iron Age* 121, 1194(1928).

**Metals and Alloys.** A new technical journal to be published monthly by The Chemical Catalog Co., Inc., of New York. One year, \$3; two years, \$5.

**Ores.** STEIN- UND THON-IND. GES. "BROTHAL." Ger. 474,939, Jan. 12, 1927. Refined ores and fuel are loaded in alternate layers for smelting in a blast furnace with a traveling grate.

**Ore treatment.** LUCIEN P. BASSET. Ger. 474,784, June 8, 1924. Fe and Fe alloys are produced from ores in a rotary furnace by mixing with C and flux and blowing in fuel and air so mixed that the chief combustion product is CO.

**Rotary-cage ore classifier.** KARL VIERTEL. Ger. 474,273, June 23, 1926.

**Cleaning device for ore-classifying grates.** FRANZ MESSNER. Ger. 474,491, May 31, 1927.

**Concentrating ores, coal, etc., by flotation.** I. G. FARBENIND. A.-G. Brit. 298,736, Aug. 19, 1927. Flotation agents are used which may be prepd. by oxidizing paraffin or montan waxes or similar materials by blowing air through the molten material at a temp. not exceeding 200° so that substantially no cracking occurs. A mixt. of acids and esters and unidentified compds. is produced which is preferably neutralized, at least in part, by NH<sub>3</sub>.

**Flotation reagent.** THOMAS H. DONAHUE and FREDERICK F. FRICK. U. S. 1,711,087, April 30. An aq. soln. of Na xanthate or other xanthate is treated with an excess of Cl<sub>2</sub> to prep. a reagent suitable for use in flotation of minerals.

**Ore treatment.** EISEN- UND STAHLWERK HOESCH A.-G. Ger. 474,594, Dec. 19, 1923. The temp. and reducing power of converter waste gas are raised by adding O and combustible materials containing C and H to the blast air.

**Ore roasting.** COMPAGNIE DES MÉTAUX D'OVERFELT-LOMMEL ET DE CORPHALIE. Belg. 354,465, Oct. 31, 1928. Relatively cold gases are introduced into the roasting furnace at the points most liable to be overheated, the SO<sub>2</sub> content increasing with the degree of cooling required.

**Device for taking samples of ore, etc., as it passes through a hopper.** W. DRYDEN and L. KNIGHT. Brit. 298,655, June 11, 1927.

**Tower for sintering earthy ores and foundry products.** ALBERT DAUB. Ger. 472,916, Jan. 25, 1927. Details are given of the arrangement of the ore, fuel, sintering material and air current.

**Preparing ore dust for treatment in a blast furnace.** CHARLES V. MCINTIRE (to Consolidation Coal Products Co.). U. S. 1,711,153, April 30. Ore dust such as that from blast furnace flue gas is mixed with coal and the mixt. is heated and agitated in a retort to form agglomerates of ore dust and semi-coke.

**Smelting non-ferrous ores.** THE BARRETT CO. Ger. 474,571, Dec. 2, 1924. The blast pressure required for smelting non-ferrous metals, such as Cu or bronze, in a cupola furnace is reduced by using coal-tar pitch as fuel.

**Treating lead ores, etc.** S. C. SMITH. Brit. 298,684, April 5, 1927. The process described in Brit. 264,569 (C. A. 22, 143) is carried out with the use of an app. having filters formed of, or protected by, perforated rubber material or woven rubber cord fabric which resists corrosion and erosion. The filtering may be assisted by air pressure and the process may comprise treating Pb ore or concentrate with HCl to effect chloridizing,

filtering, introducing further acid, followed by washing liquors and solvents for leaching out the Pb chloride. Various details of procedure and app. construction are described.

**Iron ore.** THE CROWELL & MURRAY CO. Ger. 472,631, Apr. 22, 1926. Iron ore contg. Cr, Al and Ni is subjected to a succession of operations. First the pulverized ore is roasted with  $\text{Na}_2\text{CO}_3$  to  $750-950^\circ$  in an oxidizing atm. until the Cr and Al are changed to water-sol. compds. The mass is then lixiviated with water. The residue is then roasted to  $460-700^\circ$  in an oxidizing atm. with pyrites or other S-containing material in order to convert the Ni into sol.  $\text{NiSO}_4$ . Finally, the Ni is removed by lixiviation and the ore, now free from valuable metals, is smelted in the usual way.

**Tin ore.** ZINNWERKE WILHELMSBURG, G. M. B. H. (Andreas Mertens, inventor). Ger. 472,515, Mar. 30, 1926. Sn ore contg. Sb is purified by lixiviating with acid which contains a reducing agent such as ferrous salt.

**Metallurgy.** WOLFGANG JOB. Ger. 471,759, July 3, 1925. The upper part of a shaft furnace for smelting ores of metals such as Pb and Zn, in which the metal is obtained as the oxide, is barrel-shaped and the lower part rectangular with nozzles 60-70 cm. apart.

**Metals.** HEINRICH THOLEN. Ger. 472,919, Aug. 5, 1926. Alloys and molten metals, especially Fe, are refined by a process involving stages whereby the scum from one stage acts on the metal at the next stage. The app. is described.

**Metals.** DEUTSCHE EDELSTAHLWERKE A. G. Ger. 472,859, Apr. 24, 1926. Metal objects, especially of Fe or steel, are burned by subjecting their surfaces to the action of alkali or alk. earth peroxides.

**Hardening metals.** AUBERT & DUVAL FRERES. Ger. 473,681, May 11, 1927. In hardening single parts of metal objects by nitrification, the parts not desired to be hardened are given a protective coating of a metal or alloy, such as Sn or Sn alloy, which does not permit the N to make contact with the object. A further coating of water glass or Al powder may be added, and the whole dipped into a bath of alkali nitrate soln., prior to the hardening.

**Zinc.** METALL-GES. A. G. (formerly Metallbank und Metallurgische Ges. A. G.). Brit. 298,636, Oct. 13, 1927. Reduction of ZnO or Zn oxide ores is effected under reduced pressure with a metal such as Cu or Mn, or, preferably, Fe, at a temp. of about  $800-900^\circ$  in the absence of C or other materials yielding gaseous reaction products. When Fe is used it may be converted into ferrous ferric oxide which is reduced for obtaining Fe for reuse in the process.

**Zinc.** HENRY J. STEHLI. Fr. 650,078, Feb. 22, 1928. In de-sulfurizing Zn ores the ore is roasted to a point where the S remaining in the ore is insufficient to effect conversion of the ore, mixed with a sufficient quantity of Zn residues to furnish the C necessary to liberate the heat and the reduction agent to decompose the sulfates contained in the ore, and an internal combustion of the S and the C matter is then brought about, e. g., by roasting in an oxidizing atm. to eliminate the sulfate and concrete the mass.

**Distilling zinc.** NEW JERSEY ZINC CO. Brit. 298,921, July 8, 1927. A charge comprising agglomerates such as sintered ore and a coked mixt. of ore and bituminous coal is passed progressively through a relatively long retort of large capacity without substantial breaking down or fusion of the agglomerates. The retort is externally heated, and the process may be conducted for the production of spelter, Zn dust or ZnO. Various details of the app. and of procedure are described.

**Distilling zinc.** NEW JERSEY ZINC CO. Brit. 298,922, July 8, 1927. In producing spelter without fusing the charge, a porous charge of agglomerates of zinciferous material and reducing agent is passed through an externally heated reducing chamber (such as an electrically heated vertical retort formed of a Ni-Cr-Fe alloy) at a temp. not exceeding  $1150^\circ$ . Zn vapor is withdrawn to a condenser such as described in Brit. 295,115 (C. A. 23, 1861). Various details of app. are described. Brit. 298,923 relates to an externally heated vertical retort for reduction of zinciferous material formed in sections (which may be made of Carborundum, alumina or Zr oxide) with the joints filled with Carborundum cement. Brit. 298,924 specifies inducing flow of gaseous products of reduction, in Zn-reducing app., by a controlled stack draught. Various structural features are described.

**Metal founding.** ERICH WILL. Ger. 474,621, Aug. 6, 1927. A founding machine has a mold cooled by an air current circulated by suction app.

**Molding.** JOHN BROWN & CO., LTD. Ger. 472,905, June 26, 1925. Hollow metal ware with thick walls is molded by means of a centrifugal app. with a rotary channel carrying many nozzles.

**Molding metals.** ELEKTRONMETALL, G. M. B. H. Fr. 648,718, Feb. 14, 1928. In molding metals, particularly Mg or its alloys such as electron, the tapping channel is in

the interior of the fusion heater and surrounded by molten metal to prevent oxidation of the metal.

**Molding sand.** FRANK G. BROTZ (to Kohler Co.). U. S. 1,711,136, April 30. A molding sand for general use (not limited to core material) comprises sharp sand and approx. 20% in vol. of wood fiber such as sawdust and a bonding agent such as fireclay and water.

**Foundry sand.** LE MAGNÉSIUM INDUSTRIEL. Fr. 649,683, July 5, 1927. Powd. graphite is mixed with foundry sand, particularly in casting easily oxidized metals such as Mg. The graphite may be mixed with aq.  $\text{NH}_3$ , and a mixt. of powd. graphite in aq.  $\text{NH}_3$  may be painted on to the finished mold.

**Ingot mold.** MARCEL BLAGÉ AND SOC. ANON. DES FORGES DE VIREUX-MOLHAIN. Ger. 474,045, Jan. 21, 1928.

**Ingot mold.** FRIEDRICH KLEIN (to Benjamin Hirsh). U. S. 1,710,931, April 30. A mold is provided with a separator of fusible material such as sheet metal bent upon itself so as to be retained against opposite internal walls of the mold by the resiliency of the material of which the separator is made. Different metals may be poured to form composite ingots.

**Steel ingots.** EMIL GATHMANN. U. S. 1,711,052, April 30. After the desired chem. analysis of the molten metal is attained, it is deoxidized, transferred to a pouring ladle and subjected to a further deoxidizing or finishing treatment, and then teemed into a mold for forming an ingot. Radiation of heat from the forming ingot is progressively accelerated by absorption from the bottom of the ingot towards the top for approx. 90% of the mass of the molten metal, and the absorption of heat from the ingot at its upper portion is substantially suspended and radiation of heat from the upper 5-10% is positively retarded, thus causing the upper portion of the mass to feed deoxidized molten metal to the forming ingot to compensate for shrinkage in the body of the ingot while the metal is cooling and solidifying, and to cause the physically defective or porous portion of the ingot to be confined within its upper 5-10%. A mold construction is described.

**Cast metal.** MECHANITE METAL CORP. Fr. 649,674, Feb. 24, 1928. In making cast metal by adding a graphitization agent to the molten mass, metallic Ca is added according to the degree of graphitization desired. Another graphitization agent such as metallic Mg, Bi, Sr or Li may be added as well. Cf. C. A. 22, 3876.

**Manufacture of internally flanged hollow cylinders, tubes, etc., by centrifugal casting.** OSTERMANN & FLÜS A. G. Ger. 474,240, Mar. 18, 1927.

**Die-casting machine.** ECKERT & ZIEGLER, G. M. B. H. Ger. 474,646, Apr. 12, 1927. Details of mold parts.

**Die-casting machine with a plurality of molds.** RICHARD TIETZ. Ger. 474,030, May 5, 1926.

**Charger for blast furnaces.** BUDERUS'SCHE EISENWERKE and MAX ZILLGEN. Ger. 474,367, Nov. 5, 1927. A charging hopper is constructed so that the finer parts of the charge are fed in towards the sides of the shaft while the coarser parts are fed in centrally.

**Tap-hole stopping apparatus for blast furnaces.** EDGAR E. BROSIUS. Ger. 474,563, May 26, 1927.

**Air-tight slag chamber for cupola furnaces.** JOSEF FRITZ. Ger. 474,303, Dec. 24, 1927.

**Furnace for annealing metal objects in an atmosphere of protective gas.** AKTIEN-GESELLSCHAFT BROWN, BOVERI & CIE. Swiss 130,213, Dec. 8, 1927.

**Furnace for pig iron.** FRANKEL & VIEBAHN. Ger. 474,528, Oct. 28, 1927. Addn. to Ger. 438,842. Details of arrangement.

**Rotating furnace for liquid steel.** SOC. TUBALCAIN. Fr. 648,895, Dec. 27, 1927.

**Reverberatory furnace suitable for heating steel bars.** D. WILLIAMS. Brit. 208,507, July 9, 1927. Structural features.

**Laboratory muffle suitable for metal recovery operations.** EDWIN B. FORSE (to Carborundum Co.). U. S. 1,710,870, April 30. That part of a muffle which is more directly exposed to the action of oxidizing or easily reducible materials is formed of refractory oxide material such as a fused  $\text{Al}_2\text{O}_3$  compn. and the principal heat-transfer portion of the muffle is formed of Si carbide.

**Treating cast iron.** THE OHIO BRASS CO. Ger. 474,368, July 25, 1923. See Brit. 227,873 (C. A. 19, 2632).

**Uniting steel stems to tappet valves of cast iron, etc.** GEORGE R. RICH (to Wilcox-Rich Corp.). U. S. 1,710,996-7, April 30. Mech. features.

**Steel.** EDMOND DOPPEL. Fr. 649,689, July 11, 1927. The final addn. of metals

or metalloids to steel or special casts is made by adding these before casting in the form of Al compds. which are absolutely free from S, P or C. Fe itself being present in only very small proportions; the content of Al is preferably above 9%. Cf. *C. A.* 23, 1611.

**Alloys.** HUBERT J. OVERALL. Australia 10,334, Nov. 10, 1927. An alloy suitable for bearings, etc., contains, *e. g.*, Sb 12, Sn 12, Cu 6-7%, the remainder Pb.

**Alloys.** MAX E. ROCK. Ger. 474,887, July 17, 1927. Alloys for dental work contain Cr 23-40, Ni 13-24, Cu 6.5-13, Au about 33.4, Ag, 3.5, and Mo 3.5%.

**Alloys.** THE INTERNATIONAL NICKEL CO., INC., AND EDWARD J. BOTHWELL. Fr. 649,574, Feb. 22, 1928. A Cu-Ni alloy which has special phys. properties and is resistant to acid and alk. corrosion and not affected by superheated steam contains Si 0.5-5%. Suitable compns. are Ni 55-80, Si 0.5-5, Fe 0.5-5, C 0.0-0.5, Mn up to 3% and the remainder Cu. The properties are improved by sudden cooling from about 1038°, followed by drawing at 482-870°.

**Alloys.** THE INTERNATIONAL NICKEL CO., INC. AND PAUL DIOR MERICA. Fr. 649,575, Feb. 22, 1928. Alloys which do not rust and are particularly suitable for food utensils contain, *e. g.*, Fe 0.82, Cr 10.99, C 0.11, Si 0.22, Mn 1.56% and the remainder Ni, or Ni 77.8, Fe 0.52, Cr 19.48, C 0.06, Si 0.18 and Mn 1.84%.

**Alloys.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 649,658, Feb. 24, 1928. "Resistance" alloys particularly suitable for machines and elec. app. contain Al 90, Mn 6 and Zn 4%.

**Magnetic alloy.** FELTEN & GUILLEAUME CARLSWERK A.-G. Ger. 472,623, Aug. 22, 1926. A magnet core is made from small strips of Fe-Ni alloy contg. 5-15% Ni and covered by a layer of acetylcellulose.

**Alloy particularly suited for the manufacture of cutting tools.** A. E. G. T. VON VEGESACK (to Uddeholms Aktiebolag). Swed. 64,369, Jan. 4, 1928. An alloy contains C 0.7-1.1, Cr 9-16, Mn 0.75-2.0% and the rest Fe without other constituents than the usual contaminations in technical iron of this C content.

**Iron alloys.** THE AMERICAN ROLLING MILL CO. Fr. 649,562, Feb. 22, 1928. Alloys of Fe having a small content of C are obtained by 1st making a bath of molten Fe contg. little C and little metalloids, pouring the Fe in the pure and molten state into an elec. furnace and deoxidizing to remove the O. completely or almost so, then forming a reducing slag on the surface of the Fe, and, while maintaining the heat, adding to the Fe an alloying metal free from C.

**Brazing iron-carbon alloys.** I. G. FARBENIND. A.-G. Ger. 474,460, Sept. 26, 1926. Fluxes for use in brazing Fe-C alloys comprise mixts. of alkali chlorides, borates and carbonates with acid oxides of Mo, Ce, Ti, Si or like alloy-forming elements, with or without powd. metals of high m. p. or alloy-forming non-metals. A suitable compn. comprises alkali borate 45, alkali chloride 25, alkali carbonate 25 and Ti(OH)<sub>4</sub> 5%.

**Refining nickel alloys.** WILLOUGHBY S. SMITH, HENRY J. GARNETT and JOHN A. HOLDEN. U. S. 1,710,846, April 30. In order to "minimize" the S content of alloys contg. over 50% Ni, the furnace charge is melted in the presence of a slag and an atm. of H, and, after removal of the reducing atm., an oxide of one of the constituent metals such as Fe<sub>2</sub>O<sub>3</sub> or Cu oxide is added to take up the absorbed H. Cf. *C. A.* 23, 2111.

**Coating metals.** AMERICAN MACHINE AND FOUNDRY CO. Ger. 472,888, Dec. 7, 1926. Metal objects are coated with molten Pb, which contains Sn and P. Cf. *C. A.* 22, 2352.

**Drum apparatus for galvanizing goods in bulk.** LANGBEIN-PEFANHAUSER-WERKE A.-G. Ger. 474,628, Feb. 9, 1928.

**Centrifugal apparatus for tinning goods by plunging them in molten metal.** ARTUR REICH. Ger. 472,710, May 28, 1927. Details of arrangement.

**Rust preventing.** WILLIAM H. COLE. Fr. 649,775, Feb. 1, 1928. Fe or steel is heated in the presence of electrically neutral dry powders such as a mixt. contg. emery, Zn, Sn and Al, to which finely ground CoCl<sub>2</sub>, NiSO<sub>4</sub> and SbCl<sub>3</sub> may be added. Cf. *C. A.* 23, 2691.

**Coating bands with lead.** MARTINSWERKE, G. M. B. H. Ger. 472,858, June 3, 1926. Bands are coated unequally at each side with Pb by passing them through an app. including a vat of molten Pb with scrapers adjacent to the vat at adjustable distances from the band surfaces.

**Leading iron.** AKTIEN-GESELLSCHAFT KÜHNLE, KOPP & KRAUSCH. Ger. 474,766, Oct. 27, 1927. A homogeneous coating of lead is applied to both sides of hollow iron objects, by using a perforated metal holder which allows the lead to flow to both sides.

**Coloring the surface of aluminum articles.** ALADAR PACZ. U. S. 1,710,743, April 30. Articles formed at least in part of Al are dipped in a soln. of sol. F compds. such as fluosilicates and a salt of one of the metals Ag, Ni, Sn, Co, Zn, Cd, Fe, Mn, Pb, Sb or Cu. A soln. contg. Zn and Sb produces a black coating.

**Crate for use in pickling metal plates and sheets.** CHARLES W. HALLER (to Wheeling Bronze Casting Co.). U. S. 1,711,054, April 30. Structural features.

**Decarbonizing ferrochromium.** FRIED. KRUPP A.-G. (Benno Strauss and Paul Klinger, inventors). Ger. 473,415, Oct. 9, 1926. A finely ground mixt. of ferrochromium and  $\text{Fe}_2\text{O}_3$  is heated to sintering and the CO produced by the decarbonization is continuously withdrawn or replaced by indifferent gas.

**Worming connecting rods or other articles of wrought metal.** CHARLES R. SHORT (to general Motors Research Corp.). U.S. 1,711,000, April 30. A blank of metal such as Al alloy is cast in a chill mold that is approx. a counterpart of, but somewhat larger than, the desired article, the cast blank is removed and it is then reduced to final size by working it under pressure.

**Tungsten tools.** OSCAR DIENER. Fr. 649,093, Feb. 15, 1928. Hard tools of W contg. more than 3% combined C are made by taking W powder of high C content produced in known manner and contg. C in combination, pressing it into refractory molds, heating it rapidly to about  $2000^\circ$  and applying pressure of 150–200 kg. per sq. cm. The tools may contain B up to 0.6, and B and Si together up to 1.5%. Cf. C. A. 23, 1863.

**Apparatus for cutting metals by flame fusion.** L. J. HANCOCK. Brit. 298,885, Sept. 28, 1927. Structural features.

**Blowpipe apparatus for cutting metals by fusion.** L. J. HANCOCK. Brit. 299,166, Sept. 28, 1927. Structural features.

**Welding cast iron.** INTERNATIONAL NICKEL CO. Brit. 298,781, Oct. 27, 1927. In welding cast iron or cast iron contg. Ni, a filler rod is used of a ferrous alloy contg. Ni 1–40% (suitably a Ni steel wire of low C content contg. Ni). Some of the Ni may be replaced by Cu. Various details and proportions are given.

**Electrodes for electric welding machines.** ALLGEMEINE ELEKTRICITÄTS-GES. (Hermann Blomberg, inventor). Ger. 474,780, May 7, 1927. The electrodes are formed from a Cu-Ag alloy, suitably from one contg. about 6% Ag.

**Electrodes for arc welding.** F. DWORZAK. Brit. 298,598, Oct. 12, 1927. Metal electrodes are provided with cores of substances for reducing the welding voltage and giving the weld the necessary properties. The cores may be formed of: (a) CaO 80, borax 10,  $\text{CaF}_2$  5 and  $\text{FeSiO}_3$  5%; or (b)  $\text{FeSiO}_3$  15, CaO 50,  $\text{SiO}_2$  10,  $\text{CaF}_2$  10, NaCl 10 and chrome iron ore 5%; or (c)  $\text{MnO}_2$  13, CaO 85 and  $\text{SiO}_2$  2%.

**Electrodes for arc welding.** B. TURNER AND FERRO-ARC WELDING CO., LTD. Brit. 299,163 Sept. 24, 1927. A twin electrode for welding and depositing metal by a. c., one phase of which is connected to the work and the other 2 to the electrode, is formed by use of a core-wire coating of highly elec. insulating Na silicate (such as so-called "adhesive silicate") or a soln. of shellac in "methylated spirit," and applying around the core a coating of flux or slag-forming material. Cf. C. A. 23, 2148.

**Device for regulating the length of the electric arc in welding apparatus.** ALEXANDER PERRIG. Swiss 129,941, Dec. 16, 1927.

**Flux for welding and soldering.** LEOPOLD ROSTOSKY. Ger. 472,711, Jan. 25, 1928. Addn. to Ger. 452,239. A non-hygroscopic flux for light metals contains mainly complex Be salts.

**Solder for aluminum.** ALUMINIUM-WALZWERKE SINGEN DR. LAUBER NEHER Co. G. m. b. H. (Felix Thomas, inventor). Ger. 474,597, Apr. 5, 1924. A solder for Al contains mineral or animal grease solvents which do not act on the Al, and org. acids which dissolve the thin film of oxide. Suitable mixts. are colophony, stearic acid, palmitic acid or  $\text{HCOOH}$ , with  $\text{C}_6\text{H}_6$  and methylhexaline and AcOH with tetraline.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

**Friedrich Kehrman.** H. DECKER. *Chem.-Ztg.* 53, 277(1929).—Obituary. E. H.

**Mechanism of the thermal decomposition of the normal paraffins.** ERNEST NOEL HAGUE AND RICHARD VERNON WHEELER. Univ. of Cambridge. *J. Chem. Soc.* 1929, 378–93.—A study is made of the 1st 6 hydrocarbons, using the stream method, in which large vols. of each gas were passed at a const. rate through a tube of quartz heated at a const. temp. Results are given of the gas analysis, the total liquid formed and the % of  $\text{C}_6\text{H}_6$ .  $\text{CH}_4$ : At  $1000^\circ$   $\text{C}_{10}\text{H}_8$  was formed; the liquids distg. below  $170^\circ$  consisted of 90% of  $\text{C}_6\text{H}_6$ ; the higher boiling liquids contained  $\text{C}_{10}\text{H}_8$  and  $\text{C}_{14}\text{H}_{10}$ .  $\text{C}_2\text{H}_6$ : There were no liquid products at  $700^\circ$ ; at  $800^\circ$   $\text{C}_{10}\text{H}_8$  was formed; at  $900^\circ$

the liquids contained much heavy oil, only about 50% distg. between 80-100°; at 950° much  $C_{10}H_8$  was formed and more than half of the liquid was  $C_6H_6$ . At 700° about 90% of the  $C_2H_6$  decompd. into  $C_2H_4$  and  $H_2$ .  $C_3H_8$ : At 750° a mobile liquid, d. 0.635, was obtained; the yield of liquid products reached a max. at 850°, representing 23% of the  $C_3H_8$  passed; the proportion of  $H$  increased continuously with the rise of temp. of decompn.; the proportion of  $CH_4$  reached a max. at 850° and of  $C_2H_4$  at 750°.  $C_4H_{10}$ : At 650° traces of a low-boiling oil were obtained; the gases contained a high % of  $C_2H_6$ ; at 700° an unsatd. oil, liquid at -80°, was produced; at 750° the bulk of the liquids boiled between 80-120°, the total yield of oils reached a max. at 850°, corresponding to 24.6% of the  $C_4H_{10}$  passed; at temps. above 750°  $C_6H_6$  was the chief liquid product.  $C_5H_{12}$ : At 750° decompn. of the  $C_5H_{12}$  appeared to be complete, most of the oil distg. between 80-4°; at 800° and 850°, also, the liquid distillate was mainly  $C_6H_6$ ; the chief constituent of the gases at all temps. was  $CH_4$ .  $C_6H_{14}$ : Decompn. was apparently complete at 725°, the yield of liquids increased to a max. at about 850°, 33.8% by wt. of the  $C_6H_{14}$  passed being transformed into liquid hydrocarbons (chiefly aromatic) at that temp. Results are also given for  $C_3H_4$  and  $C_2H_2$ . T. M. LOWRY points out an analogy with the mechanism of reversible isomeric changes.

C. J. WEST

**Preparation and properties of the isomeric heptanes. I. Preparation.** GRAHAM EDGAR, GEORGE CALINGAERT AND R. E. MARKER. Ethyl Gasoline Corpn. *J. Am. Chem. Soc.* **51**, 1483-91 (1929). The 9 isomeric  $C_7H_{16}$  have been prepd. and their phys. properties detd. (see part II below). The properties of the intermediates indicate distn. cuts rather than actual phys. properties.  $BuMgBr$  and  $Me_2CO$  give 92% of  $C_7H_{16}C(OH)Me$ , b. 137-41°, d.<sub>4</sub><sup>20</sup> 0.815, distn. with  $I$  gives 95% of  $C_7H_{16}CH_2CMe_2$ , b. 94.5-6°; catalytic reduction gives 82% of  $C_7H_{16}CHMe$ , b.<sub>760</sub> 89.7-90°. Similarly there were prepd.:  $PrEtC(OH)Me$ , b. 137-9°, d.<sub>4</sub><sup>20</sup> 0.823 (64% yield);  $Et_3COH$ , b. 140-2°, d.<sub>4</sub><sup>20</sup> 0.839 (83%);  $MeCHCHC(OH)Me$ , b. 127-9° (54%);  $EtMeCHC(OH)Me$ , b. 129-30.5°, d.<sub>4</sub><sup>20</sup> 0.805 (35%);  $MeCC(OH)Me$ , b. 130° (28%);  $PrC(:CHMe)Me$ , b. 93-6° (93%);  $EtCCHMe$ , b. 95-7° (95%);  $Me_2CCHCMe_2$ , b. 81-3° (91%);  $MeEtC:CMe_2$ , b. 92-5° (54%);  $Me_2CCMeCH_2$ , b. 76-8° (95%);  $PrCHMeEt$ , b.<sub>760</sub> 91.4-17° (87%);  $CH_3Et$ , b.<sub>760</sub> 93.2-3.5° (80%);  $CH_2(CHMe)_2$ , b.<sub>760</sub> 80.5-11° (81%);  $EtMeCHCHMe$ , b.<sub>760</sub> 98.5-9.9° (87%);  $Me_2CCHMe_2$ , b.<sub>760</sub> 80.9-12° (86%). The reaction product from  $PrMgBr$ ,  $Me_2CCl$  and  $HgCl_2$ , decompd. as usual, gives 21% of  $MeCPr$ , b.<sub>760</sub> 78.2-9.5°. Similarly  $EtMgBr$  and  $EtMe_2CCl$  give 13% of  $Et_2CMe_2$ , b.<sub>760</sub> 85.7-6.1°. The last 2 hydrocarbons could not be obtained from the corresponding alcs., because of rearrangements which took place on dehydration. A comparison of the phys. data with those in the literature is given. **II. Physical properties.** G. EDGAR AND G. CALINGAERT. *Ibid.* 1540-50. The following phys. properties of the 9 isomeric  $C_7H_{16}$  listed above are reported:

No.	Name	B. p., °C (760 mm.)	M. p., °C	$\Delta d/\Delta t$ (20 °C.)

9	18.60	3.541	72.4	0.00585	5.69	7.45	11470

In the above table,  $MR = (n^2 - 1)/(n^2 + 2) \times 1/d$ ;  $MR_\gamma - MR_\alpha =$  mol. dispersion for the H  $\alpha$  and  $\gamma$  lines;  $V =$  mol. vol.;  $B =$  adiabatic compressibility in cc./cc./atm.;  $\beta_T =$  the isothermal compressibility in cc./cc./atm.;  $\alpha =$  coeff. of thermal expansion in cc./cc./°C.; C.T.S. in PhNH<sub>2</sub> = the crit. soln temp in PhNH<sub>2</sub> at the concn giving the max temp. Tables are also given of data from the literature for isomeric C<sub>7</sub>H<sub>16</sub>, C<sub>8</sub>H<sub>18</sub>, C<sub>9</sub>H<sub>20</sub>, and C<sub>10</sub>H<sub>22</sub>. Certain definite regularities are found relating the phys. properties of these isomers to their structure and these relationships enable the phys. properties of paraffin hydrocarbons to be predicted with reasonable assurance from their structure. The original should be consulted for these discussions.

C. J. WEST

**Stereoisomeric carbonization theory.** D. WIELUCH. *Z. Oberschles. Berg- u. Hüttenmännisch. Ver. Katowice* No. 3, 6 pp (1928). The theory postulates that the mols. of carbonized substances contain "inorg." as well as "org." C linkings. Graphite belongs to the hydroaromatic series. Carbonization is not assocd. with aromatic structure.

B. C. A.

**The condensation of ethylene under the influence of sulfuric acid in the presence of mercurous and copper sulfates.** J. BÖRSEKEN AND N. MAX. *Techn. Univ., Delft. Rec. trav. chim.* 48, 486-8 (1929). - According to Damiens and Lebeau (*Bull. soc. chim.* [4], 33, 76 (1923)) the condensation of C<sub>2</sub>H<sub>4</sub> under the influence of 95% H<sub>2</sub>SO<sub>4</sub> contg. 5% anhyd. CuSO<sub>4</sub> and 2% Hg<sub>2</sub>SO<sub>4</sub> gives rise to the formation of a mixture of aliphatic and cyclic hydrocarbons. The formation of the cyclic compds. (naphthenes) may be explained easily by assuming the formation of a chain from the activated C<sub>2</sub>H<sub>4</sub> mols., which passes into cyclic compds. by catalytic cyclization. For the formation of paraffins, however, 2 atoms of H must be captured from other mols. and thus the formation of mols. more unsatd. than C<sub>2</sub>H<sub>4</sub> is also to be expected. In accordance with these considerations it was found that the reaction product contains a considerable amount of more unsatd. hydrocarbons, resembling the aliphatic and alicyclic terpenes. The expts. were carried out in the way described by D. and L., H<sub>2</sub>SO<sub>4</sub> of 93-95% being used. After some time, the oil floating on the surface, which consists of the satd. hydrocarbons, was decanted, the acid dild. with water and the unsatd. hydrocarbons distd. with steam; in this way only a part of the unsatd. compds. is obtained, a highly unsatd. black residue in the flask being not volatile with steam. The yield of satd. and unsatd. hydrocarbons was 25 and 20% resp. Fractionation of the satd. hydrocarbons and analyses of the several fractions showed the lower-boiling fractions (b<sub>10</sub> < 45°) to consist chiefly of paraffins with a small amount of cyclanes, whereas the higher-boiling fractions consist chiefly of cyclanes. The lower-boiling fractions of the unsatd. hydrocarbons contain alcs., the higher-boiling fractions having the character of aliphatic terpenes.

C. F. VAN DUIN

**Chemical products of ethylene and technical gases containing ethylene.** KAZI-

**MIERZ SMOLENSKI.** Warsaw Polytech., *Przemysl Chem.* 11, 146-82(1927).—In pyrogenating 100 kg. crude naphtha at 600° there is obtained 15 m.<sup>3</sup> of olefinic hydrocarbons, principally propylene, ethylene, and butylene; at 700° 15 kg. of mostly C<sub>3</sub>H<sub>4</sub>. The concn. of C<sub>3</sub>H<sub>4</sub> in the gas at 600° amounts to 35-7%, and at 700° to 20-2%. When the content of olefinic hydrocarbons is appreciable they can be obtained in a pure state by liquefaction from technical gases *e. g.*, oil gas. For obtaining chem. products according to methods here described, however, technical gases with a 20% by vol. content of C<sub>3</sub>H<sub>4</sub> are sufficient. In presence of Fe and Ni as contact agents C<sub>3</sub>H<sub>4</sub> at 700° decomps. to C (soot) and H<sub>2</sub> (80-50%). Technical gases with about 20% C<sub>3</sub>H<sub>4</sub> undergo a similar decompn. giving soot and 75% H<sub>2</sub>. At 700-50° without contact agents ethylene decomps. more slowly and in place of soot yields 60% of liquid and solid hydrocarbons. Researches on the industrial synthesis of *glycerol* from gases contg. *propylene* are continued. A method has been worked out for obtaining 1,2-dichloroethane by chlorinating technical gases contg. about 20% C<sub>3</sub>H<sub>4</sub>. The reaction is conducted in packed vertical columns, with the gas and Cl<sub>2</sub> passing downward. A scrubber using anthracene oil serves for washing out the vapor of C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> from the escaping gases. The yield from 100 l. of gas amounts to 75 g. of crude chlorides. 100 kg. crude, subjected to pyrogenation yields 45 kg. raw chlorides from which 40 kg. pure C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> is obtained. The reaction of sapon. C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> by means of H<sub>2</sub>O, aq. Na<sub>2</sub>CO<sub>3</sub> of various concns., aq. soda, HCO<sub>2</sub>Na with MeOH, etc., was investigated from the kinetic point of view. Investigations were made on obtaining *ethylene glycol* by sapon. of C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> by (a) Na<sub>2</sub>CO<sub>3</sub> at 140° for 6 hrs. whereby a 55% yield of pure glycol was obtained, (b) aq. Na<sub>2</sub>CO<sub>3</sub> at 120° for 3 hrs. with 64% yield, (c) HCO<sub>2</sub>Na with MeOH at 15° for 10 hrs. with a 78% yield. By splitting off HCl from C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> in "chlorol", a gas b. 17° is obtained. This polymerizes under light and in the dark in presence of catalysts like BCl<sub>3</sub>. Polymerization was studied as influenced by various factors, and is found to stop at 50-55% yield. The properties of the polymer (C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub>)<sub>n</sub> were especially studied, and suitable solvents for it have been found. *Lanterns* can be obtained from its solns. In checking up Gomberg's method of prep. *ethylene chlorohydrin* through the action of Cl<sub>2</sub> and H<sub>2</sub>O on C<sub>2</sub>H<sub>4</sub> a yield of about 85% chlorohydrin, and about 8% *dichloroethane* was obtained. Concn. of weak solns. of chlorohydrin up to about 40% presents no difficulty. *Anhyd. chlorohydrin* can be obtained from a 50-40% product by salting out and extg. with ether (with light b.). In studying the kinetics of sapon. of the chlorohydrin a method was worked out for prep. *ethylene glycol* from it. Concd. Na<sub>2</sub>CO<sub>3</sub> is slowly added dropwise to the boiling chlorohydrin, yield about 90%. By adding dropwise concd. NaOH to a cooling soln. of the chlorohydrin about 90% *ethylene oxide* is obtained.

**α-Diacetylenic hydrocarbons.** V. GRISSARD and T. CHOUTAKI. *Compt. rend.* 188, 357-61(1929).—In 1925 G. and Perrichon (C. 20, 1782) prepd. 2 α-diacetylenic hydrocarbons, and G. and T. have now prepd. others by the same method. Under strictly limited conditions 1 mol. of acetylene Mg compds. (2 mols.) react as follows: RC·CMgX + I<sub>2</sub> → RC·CI + RC·CC·CMgX → RC·CC·CR. To the org. Mg deriv. (free of excess EtMgBr) is added rapidly, while shaking, a concd. Et<sub>2</sub>O soln. of I. The product is hydrolyzed after a moment. Possibly the reaction

takes place as follows:

G. and T. prepd., in the aliphatic

series, 4,6-decadiene, b<sub>p</sub> 88°; 5,7-dodecadiene, b<sub>p</sub> 103°; and 6,8-tetradecadiene, b<sub>p</sub> 118-9°, the yields being 70-2%. These liquids slowly become yellow in the light. G. and T. prepd., in the aromatic series, 70% of 1,4-diphenyl-1,3-butadiene, m. 86.5-7.0°, previously prepd. by Strauss; 84% of 1,4-bis [2',4'-dimethylphenyl]-1,3-butadiene, m. 145-5-6.0°, previously obtained by G. and Perrichon, but less pure; 57% of 1,6-diphenyl-2,4-hexadiene, m. 101°; 62% of 1,8-diphenyl-3,5-octadiene, m. 118°. The mol. refractivities, normal for the aliphatic compds., are elevated for the aromatic compds.; the 2 triple bonds, conjugated with each other, become conjugated also with the aromatic nuclei. The di Mg deriv. (I) of CH<sub>2</sub>=CH is interesting. (1) I (1 mol.) and I (1 mol.) give a small quant. of IC·CH (II), b. 32°, and 65% of IC·CC·CH, (III) b. 71°, d<sub>4</sub><sup>20</sup> 1.824, n<sub>D</sub><sup>20</sup> 1.5058, unstable in the light. (2) With I (0.5 mol.) the yield of III is lower and half of the HC:CH is recovered unchanged. (3) With I (1.5 mol.) the products are a small amount of unchanged I, II, III, IC·CC·CI (IV), m. 101-5° (de-

16.08 g.  $\text{CH}_2\text{I}_2$  with 4.76 g. purified Sn sawings in a sealed tube at  $170-80^\circ$  for 26 hrs., 12.5 g.  $\text{SnI}_4$  were obtained. The reaction of dihalogen derivs. of  $\text{CH}_4$  with Sn also takes place in presence of high-boiling esters as solvents, at their b. p.

BERNARD NELSON

**Production of alcohols from the butenes and pentenes through interaction with sulfuric acid.** JAMES F. NORRIS and HAROLD S. DAVIS. Mass. Inst. Tech. *J. Soc. Chem. Ind.* **48**, 70-1T(1929).—Polemic; see Ormaudy and Craven, *C. A.* **22**, 2919, 1929.

A. S. CARTER

**Symmetrical tetrabromoethyl ether and "so-called" tetrabromobutyraldehyde.** HAROLD HIBBERT, STANLEY Z. PERRY and K. AUSTIN TAYLOR. McGill Univ. *J. Am. Chem. Soc.* **51**, 1551-5(1929). The cryst. product obtained by Freundler (*Compt. rend.* **140**, 794, 1693(1905)) in the bromination of paraacetaldehyde and described by him as  $\text{BrCH}_2\text{CHBrCBr}_2\text{CHO}$  is shown to be  $(\text{BrCH}_2\text{CHBr})_2\text{O}$ . The latter has been synthesized from divinyl ether by bromination in  $\text{CHCl}_3$ . Condensation with  $(\text{CH}_2\text{OH})_2$  gives 57.2% bromoethylidene glycol, b. p.  $80-82^\circ$ . Divinyl ether is simply prepd. in 54.9% yield by dropping 50 g.  $(\text{CICH}_2\text{CH}_2\text{O})_2$  onto 200 g. heated KOH during 12 hrs.

C. J. WEST

**Alkyl peroxides. II. Methyl ethyl peroxide and refractometric investigations on alkyl peroxides.** ALFRED RIECHE (with FRITZ HITZ). Univ. Erlangen. *Ber.* **62B**, 218-25(1929); cf. *C. A.* **22**, 951. *Methyl ethyl peroxide* ( $\text{EtO-O-Me}$ ) was obtained in good yield from  $\text{EtO}_2\text{H}$  and  $\text{Me}_2\text{SO}_4$  ( $\text{CH}_3\text{N}$  gives only traces of it) under the same conditions as  $\text{Me}_2\text{O}_2$ ; here, too, is obtained some  $\text{Me}_2\text{O}$ , and also some  $\text{Me}_2\text{O}_2$ , which are readily removed by fractionation.  $\text{I}$  is a colorless mobile liquid, b. p.  $19.1^\circ$ , d. 0.8327 (extraordinarily volatile, with an odor similar to but more penetrating than that of  $\text{Et}_2\text{O}$ , has a normal mol. wt. in vapor form, has only a weak oxidizing power, only slowly liberates traces of  $\text{I}$  from acidified KI soln.) and the peroxide O must therefore be detd. with  $\text{TiCl}_3$ . In all its properties it stands midway between  $\text{Me}_2\text{O}_2$  and  $\text{Et}_2\text{O}_2$ , especially in its sensitivity to heat and shock. Thrown to the ground in a test tube, it deflagrates and burns with a yellow flame, forming much  $\text{HCHO}$ . The peroxide O is also sensitive to shock and explode violently on superheating in a test tube without, however, shattering the glass; on a watch glass it deflagrates when a hot wire is brought near and it exploded violently in an attempt to burn it from a dish. In  $\text{N}$  although the part of the combustion tube in front of the mouth of the combustion tube is well cooled,  $\text{Et}_2\text{O}_2$  near its b. p. is exploded by shock but the velocity of decomposition is small and there is practically no noise. Solid  $\text{Me}_2\text{O}_2$  is not sensitive to shock and at  $-50^\circ$  it decomps. not much more violently than  $\text{Et}_2\text{O}_2$  at the b. p. A new detn. on  $\text{Me}_2\text{O}_2$  gave d. 0.848; it solidifies at  $-100^\circ$  to  $-105^\circ$ .  $\text{Et}_2\text{O}_2$  can be more conveniently prepd. with turbinol. When pure it b. p.  $64^\circ$ , d. 0.8267. The fractions near the b. p. of the pure product still contain considerable  $\text{Et}_2\text{O}$ . A fraction b. p.  $63^\circ$  could not be sep'd. by distn. or evapn., in *vacuo*, at room temp., and although its d. and  $\rho$  pointed to the presence of about 15%  $\text{Et}_2\text{O}$  analysis showed that it contained 9% at most, indicating the formation of a mol. compd. between the  $\text{Et}_2\text{O}$  and the  $\text{Et}_2\text{O}_2$ . The refractometric measurements show that the peroxide O cannot be present in pure ether-like combination; they give for the peroxide ( $\text{O}_2$ ) group the values  $M. R. \text{NaD}$  1.099,  $M. D. H_\beta \rightarrow H_\alpha$  0.053,  $M. D. H_\gamma \rightarrow H_\alpha$  0.095, the  $M. R.$  value agreeing with that for mol.  $\text{O}_2$ . The alkyl peroxides can therefore be better formulated as  $\text{R-O-O-R}$  than as  $\text{R-O-O-R}$ . An interesting fact is the difference in the exaltation value from that found by Bruhl for  $\text{H}_2\text{O}_2$ . For  $\text{I}$   $M. R.$  increases slightly with the temp., from 20.02 at  $10^\circ$  to 20.13 at  $28^\circ$ . Below are the values of  $n$  for  $\text{H}_\alpha$ ,  $\text{NaD}$ ,  $\text{H}_\beta$  and  $\text{H}_\gamma$ , resp.:  $\text{Me}_2\text{O}_2$  1.34843, 1.35029, 1.35440, 1.35788 at  $0^\circ$ ;  $\text{I}$ , 1.35723, 1.35898, 1.36336, 1.36703 at  $17^\circ$ ;  $\text{Et}_2\text{O}_2$  1.36971, 1.37156, 1.37615, 1.37997 at  $17^\circ$ .

C. A. R.

**Chlorination products of  $\alpha,\alpha'$ -dichlorodiethyl sulfide. II.** JOHN W. C. PHILLIPS, JOHN S. H. DAVIES and STANLEY A. MUMFORD. Expt. Sta., Porton. *J. Chem. Soc.* **1929**, 535-49; cf. *C. A.* **22**, 1325. An extended study of the chlorination of  $(\text{CICH}_2\text{CH}_2)_2\text{S}$  with 2 or more mols. of  $\text{Cl}$  has confirmed the view, previously advanced and independently of the work of Lawson and Dawson (*C. A.* **22**, 381) that the tri- and tetra- $\text{Cl}$  derivs. of Mann and Pope are vinyl derivs. and that the formation of chlorodiethyl sulfides, which are the 1st but less stable products of chlorination. Contrary to previous views, chlorination is not confined to 1 chain, as is proved by the isolation from among the products of direct chlorination of new tetra- and pentachlorinated ethyl vinyl sulfides and hexachlorodiethyl sulfides. Results are given for 16 quant. chlorination expts. Chlorination of  $(\text{CICH}_2\text{CH}_2)_2\text{S}$  with 2 mols.  $\text{Cl}$  gives  $\text{CICH}_2\text{CCl}_2\text{SCH}_2\text{CH}_2\text{Cl}$ ,

which, freed from HCl, has  $d_4^{20}$  1.53; heating at 90–100° at 2 mm. gives 80–90% of  $\beta$ -chloroethyl  $\alpha,\beta$ -dichlorovinyl sulfide (I),  $b_{15}$  107°,  $d_4^{20}$  1.4315,  $d_4^{25}$  1.4255,  $\eta^{20}$  0.028 dyne/sq. cm.,  $n_D^{20}$  1.5562; further chlorination of I gives  $\text{Cl}_2\text{CHCCl}_2\text{SCH}_2\text{CH}_2\text{Cl}$ , an unstable yellow liquid, losing HCl on heating and giving  $\beta$ -chloroethyl  $\alpha,\beta,\beta$ -trichlorovinyl sulfide (II),  $b_{15}$  122–4°,  $d_4^{20}$  1.5425,  $d_4^{25}$  1.5361,  $\eta^{20}$  0.039 dyne/sq. cm.,  $n_D^{20}$  1.5700. II and 1 mol. Cl give 90% of  $\text{CCl}_2\text{CHCl}_2\text{SCH}_2\text{CH}_2\text{Cl}$ ,  $b_{15}$  158–9°,  $d_4^{20}$  1.6849,  $d_4^{25}$  1.6794,  $\eta^{20}$  0.254 dyne/sq. cm. and  $n_D^{20}$  1.5683; further chlorination gives  $\text{C}_2\text{Cl}_6$ .  $(\text{ClCH}_2\text{CH}_2)_2\text{S}$  and 3 mols. Cl give the pentachlorodiethyl sulfide,  $d_4^{20}$  1.57. An unsatd. tetra-Cl fraction was always obtained when more than 2 mols. Cl were used and the product was subsequently decompd. by heating, but out of 20 expts., in 1 case only did this fraction appear to be identical with II; the higher-boiling fraction appears to be  $\beta$ -[ $\beta$ -chloroethylthiol]ethyl trichlorovinyl sulfide, m. 70.5°. In 5 other expts. there was formed  $\alpha,\alpha,\beta$ -trichloroethyl  $\beta$ -chlorovinyl sulfide (III),  $b_{15}$  122–3°,  $d_4^{20}$  1.5404,  $d_4^{25}$  1.5342,  $\eta^{20}$  0.057 dyne/sq. cm.,  $n_D^{20}$  1.5661. In the other 14 cases there appeared to be formed  $\alpha,\beta$ -dichloroethyl  $\alpha,\beta$ -dichlorovinyl sulfide,  $b_{15}$  120–1°,  $d_4^{20}$  1.544,  $d_4^{25}$  1.5378,  $d_4^{25}$  1.5315,  $\eta^{20}$  0.046 dyne/sq. cm.,  $n_D^{20}$  1.5673. The rate at which the chlorination was carried out did not, apparently, influence the course of the reaction to any great extent but the data indicate that production of unsatd. tetra-Cl fractions was favored by the employment of comparatively low pressures during the preliminary decompn. process. Chlorination of III (1 mol. Cl) gives  $\alpha,\alpha,\alpha',\beta,\beta',\beta'$ -hexachlorodiethyl sulfide,  $b_{15}$  159–60°,  $d_4^{20}$  1.6841,  $d_4^{25}$  1.6783,  $\eta^{20}$  0.204 dyne/sq. cm.,  $n_D^{20}$  1.5681; heating at 200° and 100–120 mm. for 3–4 hrs. gives 65–70% of  $\alpha,\beta,\beta$ -trichloroethyl  $\alpha,\beta$ -dichlorovinyl sulfide,  $b_{15}$  134–5°,  $d_4^{20}$  1.6293,  $d_4^{25}$  1.6236,  $\eta^{20}$  0.065 dyne/sq. cm.,  $n_D^{20}$  1.5778; addn. of 1 mol. Cl to this deriv. gives 60–70% of  $\alpha,\alpha,\alpha',\beta,\beta,\beta',\beta'$ -heptachlorodiethyl sulfide,  $b_{15}$  170–2°,  $d_4^{20}$  1.7473,  $d_4^{25}$  1.7415,  $\eta^{20}$  0.427 dyne/sq. cm.,  $n_D^{20}$  1.5471. Chlorination of certain intermediate tetra Cl fractions and repeated fractionation finally gives, presumably,  $\alpha,\alpha,\alpha',\beta,\beta,\beta',\beta'$ -hexachlorodiethyl sulfide,  $b_{15}$  157–9°,  $d_4^{20}$  1.6825,  $d_4^{25}$  1.6763,  $\eta^{20}$  0.273 dyne/sq. cm.,  $n_D^{20}$  1.5681; heated at 200° and 100–10 mm. for 3 hrs., this lost HCl giving possibly  $\alpha,\beta$ -dichloroethyl  $\alpha,\beta,\beta$ -trichlorovinyl sulfide,  $b_{15}$  133–4°,  $d_4^{20}$  1.6190,  $d_4^{25}$  1.6131,  $\eta^{20}$  0.063 dyne/sq. cm.,  $n_D^{20}$  1.5770; this adds Cl, giving possibly  $\alpha,\alpha,\alpha',\beta,\beta,\beta,\beta'$ -heptachlorodiethyl sulfide,  $b_{15}$  132–4°,  $d_4^{20}$  1.743,  $d_4^{25}$  1.737,  $\eta^{20}$  0.382 dyne/sq. cm.,  $n_D^{20}$  1.5741. Chlorination of  $(\text{ClCH}_2\text{CH}_2)_2\text{S}$  with 4 mols. Cl caused partial destruction of the hexachloro sulfides already formed, low-boiling chlorinated hydrocarbons and other degradation products being obtained on subsequent distn., together with a residual tetra Cl fraction. Among the products isolated were trichloroethyl sulfur chloride,  $b_{15}$  53–8°; a heptachlorodiethyl sulfide,  $b_{15}$  144–6°,  $d_4^{20}$  1.7373,  $d_4^{25}$  1.7325,  $n_D^{20}$  1.5739; and a compd.,  $\text{C}_4\text{H}_5\text{Cl}_5\text{S}$ ,  $b_{15}$  134–5°,  $d_4^{20}$  1.6248,  $d_4^{25}$  1.6195. A mechanism of the course of the chlorination is suggested.

C. J. WEST

**Non-existence of isomerism among the dialkyltelluronium dihalides.** HARRY D. K. DREW, Univ. of Birmingham. *J. Chem. Soc.* 1929, 560 9. —Vernon (C. A. 14, 1815, 2018, 15, 2413) obtained 2 forms of  $\text{TeMe}_2\text{I}_2$  and 2 distinct bases, and postulated planar distribution of the valencies of the Te atom. Lowry (C. A. 22, 1899) extended the theory to the di-Et homologs and appears to attribute the isomerism to the non-equiv. from the point of view of electron structure, of the halogen-Te linkings. D. believes that the compds. of the  $\alpha$ -series are of the normal types, in which Te has probably a tetrahedral valency distribution; they are broadly non-polar in character. The compds. of the  $\beta$ -series are not isomeric with the corresponding members of the  $\alpha$ -series but are complex substances of salt-like character, having the same empirical formula. The  $\beta$ -base is a mixed anhydride,  $\text{TeMe}_2\text{O} \cdot \text{TeMeO}$ , which reacts with HI to give  $\text{Me}_2\text{TeI}$  and *Me hydroxytellurium oxide*, or 1 of its anhydrides. The latter is readily converted by excess of HI into *methyltelluronium triiodide*,  $\text{MeTeI}_3$ , indigo-colored, hydrolyzed by hot  $\text{H}_2\text{O}$  but broadly non polar in character. These 2 iodides readily unite (in mol. proportions) in  $\text{Me}_2\text{CO}$  to give Vernon's  $\beta$ -iodide,  $\text{Me}_2\text{TeI} \cdot \text{MeTeI}_3$ . Warming the  $\beta$ -iodide with  $\text{Na}_2\text{CO}_3$  gives a chocolate-colored ppt., from which some  $\alpha$ -iodide was obtained; the filtrate from this gave a black ppt., analyzing for  $\text{TeMe}_2\text{O} \cdot \text{TeI}_3$ , and finally the compd.  $\text{TeMe}_2\text{I} \cdot 2\text{TeMeI}_3$ ,  $\text{KMnO}_4$  in color. Small quantities of  $\alpha$ -iodide are also obtained by treating the  $\beta$ -iodide with boiling  $\text{H}_2\text{O}$  alone. *Trimethyltelluronium bromide*, from the  $\beta$ -base and HBr, decomp. between 250–80°;

*methylytelluronium tribromide*, yellow, m. 156°. The following mixed "*β*-dihalides" were prepd. from their constituents:  $\text{TeMe}_2\text{I} \cdot \text{TeMeBr}$ , orange-brown, m. 120° (decompn.);  $\text{TeMe}_2\text{Br} \cdot \text{TeMeI}$ , purple-red with golden luster, decomps. below 90°. The work shows that the supposed isomerism of the dimethylytelluronium dihalides has no existence.

**Effect of rapid addition of halide on the yields of some Grignard reagents.** HENRY GILMAN, E. A. ZOELLNER AND J. B. DICKEY. Iowa State College. *J. Am. Chem. Soc.* 51, 1583-7 (1929).—A study of the drop in yield of Grignard reagents when the halide is added very rapidly to Mg in  $\text{Et}_2\text{O}$  is reported; this drop varies from 0.3 to 17.8%. In general the alkyl halides show a greater drop in yield on rapid addn. than do the aryl halides; with the alkyl halides the iodide shows a greater drop than the bromide and the bromide, in turn, shows a greater drop than the chloride; with an R group of a given wt., the branched-chain isomers show a greater drop than the straight-chain compd.

C. J. WEST

**Yields of some Grignard reagents. Alternating properties of normal alkyl halides.** HENRY GILMAN, E. A. ZOELLNER AND J. B. DICKEY. Iowa State College. *J. Am. Chem. Soc.* 51, 1576-83 (1929).—Using a standard procedure, the following yields of  $\text{RMgX}$  were obtained.  $\text{EtBr}$  93.1,  $\text{PrBr}$  91.7,  $\text{Me}_2\text{CHBr}$  84.0,  $\text{BuBr}$  94.0,  $\text{Me}_2\text{CHCH}_2\text{Br}$  87.2,  $\text{MeEtCHBr}$  77.7,  $\text{Me}_2\text{CBr}$  25.1,  $\text{AmBr}$  88.6,  $\text{Me}_2\text{CHCH}_2\text{CH}_2\text{Br}$  88.0,  $\text{PrMeCHBr}$  66.8,  $\text{Me}_2\text{EtCBr}$  23.7,  $\text{C}_6\text{H}_{13}\text{Br}$  92.0,  $\text{C}_7\text{H}_{15}\text{Br}$  88.8,  $\text{C}_8\text{H}_{17}\text{Br}$  88.4,  $\text{BuCl}$  91.2,  $\text{BuI}$  85.6,  $\text{PhCH}_2\text{Cl}$  93.1,  $\text{PhBr}$  94.7, *o*- $\text{MeC}_6\text{H}_4\text{Br}$  92.7, *m*- $\text{MeC}_6\text{H}_4\text{Br}$  88.0, *p*- $\text{MeC}_6\text{H}_4\text{Br}$  86.9,  $\alpha$ - $\text{C}_{10}\text{H}_7\text{Br}$  94.8,  $\beta$ - $\text{C}_{10}\text{H}_7\text{Br}$  83.8. The even-numbered halides give higher yields than the preceding halides with an odd no. of C atoms; with a given series, the order of decreasing yield is *n*-, *sec*-, and *tert*-. The lowest yields are with the iodide and the highest with the bromide of a given R group.

C. J. WEST

**Preparation of aldehydes and ketones with the help of the degradation of quaternary bases.** JULIUS V. BRAUN AND WILHELM TEUFELER in part with G. MANZ. Univ. Frankfurt a. M. *Ber.* 62B, 235-41 (1929). The reaction leading from isocampholic acid,  $\text{RCH}_2\text{CO}_2\text{H}$ , through the alc.  $\text{RCH}_2\text{CH}_2\text{OH}$ , its bromide and the quaternary base  $\text{RCH}_2\text{CH}_2\text{NMe}_3\text{OH}$  to the olefin  $\text{RCH}=\text{CH}_2$  and thence by oxidative degradation to the aldehyde  $\text{RCHO}$  (*C. A.* 23, 1405) is of general applicability and has been tested in a no. of cases where it seemed that it would be especially valuable (e. g., where acids or alcs. of the above type are readily available while the aldehydes and ketones with one C atom less are not, and in the prepn. of mixed ketones,  $\text{RCOR}'$ ). *d*-Dihydrocitronellol, prepd. from *d*-citronellol with Pd and  $\text{H}_2$ ,  $d_4^{20}$  0.835,  $[\alpha]_D^{20}$  3.85° (the greater rotation, as compared with that of the product formerly prepd. with Ni at 150°, confirms the suspicion, expressed at the time, that partial racemization occurs at 150°). The 2,6-dimethyloctyl bromide reacts quite rapidly with  $\text{NMe}_3$  in  $\text{C}_6\text{H}_6$  at 100°, giving in 5 hrs. 82% of the quaternary bromide,  $\text{C}_{10}\text{H}_{19}\text{NMe}_3\text{Br}$ , m. 255°, which, with  $\text{Ag}_2\text{O}$  and KOH and subsequent distn., yields 20% *β*-dimethyl-ethylidimethylamine,  $b_{11}$  95-8°,  $d_4^{20}$  0.7757,  $n_D^{20}$  1.4302,  $[\alpha]_D^{20}$  -4.70° (note: *lit.*, m. 241°, and 65% *β*-dimethyl-7-octene,  $b_7$  45-6°,  $b_7$  154°,  $d_4^{20}$  0.7921,  $n_D^{20}$  1.476,  $[\alpha]_D^{20}$  12.38°. The octene with  $\text{O}_3$  yields more than 50% isononylaldehyde (2,6-dimethyl-7-heptanal),  $b_{11}$  72-4°,  $b_{12}$  185-6°,  $d_4^{20}$  0.819,  $n_D^{20}$  1.4203,  $[\alpha]_D^{20}$  -9.1°, has an odor similar to but more pleasant than that of the isomeric *n*-nonylaldehyde, changes in the air into the acid,  $b_9$  127-30°,  $d_4^{20}$  0.837,  $n_D^{20}$  1.4287,  $[\alpha]_D^{20}$  -14.1°. Et octyl ketone (I) is described in the literature as a liquid, b. 227° (prepd. from  $\text{EtCO}_2\text{Et}$  and pelargonic acid vapors passed over  $\text{ThO}_2$ ), and as a solid, m. 4.5° (prepd. from  $\text{MeC}(\text{CC}_6\text{H}_5)_3$  by the addn. of  $\text{H}_2\text{O}$ ). Neither prepn. was pure. *Di-Et ethyloctylmalonate* (85% from  $\text{EtCH}(\text{CO}_2\text{Et})_2$ , Na and octyl bromide),  $b_{12}$  171-80°, free acid, m. 72°, gives on decarboxylation ethyloctylacetic acid,  $b_{12}$  186°, whose Et ester,  $b_{12}$  135-7°, gives with Na and alc. 60% of *β*-ethyl-*β*-octyl alc.; this and the bromide both boil at the same temp. as the ester. The quaternary bromide,  $\text{EtCH}(\text{C}_8\text{H}_{17}\text{CH}_2\text{NMe}_3\text{Br})$ , markedly hygroscopic, m. 225-7°, yields with  $\text{Ag}_2\text{O}$  and KOH 92% of a mixt. of [*β*-ethyl-*β*-octylethyl]dimethylamine,  $b_{11}$  124,  $d_4^{20}$  0.7913, and *asym*-ethyloctylethylene,  $b_{11}$  91-3°,  $d_4^{20}$  0.7703; the latter with  $\text{O}_3$  yields 85% of I (purified through the semicarbazone),  $b_{11}$  112°, m. 12.5°,  $d_4^{20}$  0.8272,  $n_D^{20}$  1.4306; semicarbazone, m. 91-2°. Unlike Mannich's prepn. the ketone has a considerably weaker odor than the isomeric Me nonyl ketone. *Di-Et [γ-phenylpropyl][β-phenylethyl]malonate* (45% from  $\text{PhCH}_2\text{CH}_2\text{CH}_2\text{CH}(\text{CO}_2\text{Et})_2$  and  $\text{PhCH}_2\text{CH}_2\text{Br}$ ), b. 216-7°; free acid, m. 124°. [*γ*-Phenylpropyl][*β*-phenylethyl]acetic acid,  $b_{11}$  203-5°; Et ester, boils about 10° lower, is reduced by the Ladenburg method to *β*-[*γ*-phenylpropyl]-*β*-[*β*-phenylethyl]ethyl alc.,  $b_{12}$  242-5°; bromide; quaternary bromide, unusually hygro-

scopic, yields, together with only a little  $[\beta-(\gamma\text{-phenylpropyl})-\beta-(\beta\text{-phenylethyl})\text{ethyl}]\text{dimethylamine}$ ,  $b_{\text{p}}$  200° (picrate,  $m$ . 109°), about 70% of *asym*- $[\gamma\text{-phenylpropyl}][\beta\text{-phenylethyl}]\text{ethylene}$ ,  $b_{\text{p}}$  199–200°,  $d_4^{25}$  0.915,  $n_D^{25}$  1.5517, which with  $O_3$  gives  $\beta\text{-phenylethyl } \gamma\text{-phenylpropyl ketone}$ ,  $b_{\text{p}}$  213–5°,  $m$ . 31°, has a very faint but pleasant odor.

**Action of aromatic acid chlorides on vinylidiacetonamine.** JOHN GRAYMORE. Univ. College, Nottingham. *J. Chem. Soc.* 1929, 587–8.—Pure dry vinylidiacetonamine (I), freshly distd. under reduced pressure, condenses in the cold in the expected manner with *m*- and *p*- $O_2NC_6H_4COCl$ , 4,2-Me( $O_2N$ ) $C_6H_3COCl$  and *p*-Me $C_6H_4SO_2Cl$  to give the *N*-acyl deriv. *N-m-Nitrobenzoylvinylidiacetonamine*,  $m$ . 159–60° (75% yield); *p*-deriv.,  $m$ . 170° (yield, theoretical); *N-o-nitro-p-toluyol deriv.*,  $m$ . 150–1°; *N-p-toluenesulfonyl deriv.*,  $m$ . 184° (yield, 75%). A concd. aq. soln. of  $NH_4OH$  and  $EtNH_2$  reacts with  $BzCl$  in the expected manner but in less than 5% soln. the *Bz* compds. do not form readily. It seems probable that I in  $H_2O$  combines with  $H_2O$  to form the  $NH_4OH$  deriv. and that a H atom in such a quinquivalent  $NH_4$  group is not displaceable, as is the case with certain  $HCl$  derivs.

C. J. WEST

**Process for the extraction and concentration of acetic acid from dilute aqueous solutions.** H. GUINOT. Distilleries des Deux-Sèvres. *Chimie et industrie* 21, 243–51 (1929); cf. Ricard, *C. A.* 22, 2170; Ricard and G., *C. A.* 22, 2754.—This is an adaptation and improvement of Suida's process (extg. the  $AcOH$  by means of cresol, extn. being carried out directly on the  $AcOH$  vapors, and the soln. being evapd. to drive off and recover the  $AcOH$ ), in which the cresol is replaced by a medium-boiling solvent (*b. p.* at least as high as that of  $AcOH$ , but such that it can be distd. at atm. pressure by means of steam at 95–110 lbs.; *e. g.*,  $BuOAc$ , mesityl oxide, iso- $AmOAc$ ). The extn. is carried out in a series of agitating tanks in which the  $AcOH$  soln. is intimately mixed with the solvent; with each agitating tank is associated a decantation tank in which the liquids are allowed to sep., and they travel in counter-current through the app. The method of calcg. the no. of elements required to obtain a given degree of extn. under given conditions is explained and illustrated by means of examples. In order to obtain max. efficiency in the extractor, the solvent should be de-acidified as completely as possible in the distn. stage of the process. Owing to the closeness of the *b. ps.* of the solvent and  $AcOH$  (usually a difference of about 7–9°) they cannot be sepd. by ordinary rectification; but with petroleum hydrocarbons *b.* 114–6° there is formed an azeotropic mixt. giving a const.-boiling (110.5°) distillate contg. 45%  $AcOH$ , and addn. of a very small amt. of  $H_2O$  causes it to sep. into 2 layers of practically pure hydrocarbons and  $AcOH$ . In carrying out the process, the  $AcOH$ -solvent mixt. is introduced toward the middle into a rectifying column contg. a suitable amt. of petroleum hydrocarbons (*b.* 114–6°). The completely de-acidified solvent is drawn off at the bottom, ready for re-use. The vapors at the top consist of  $H_2O$ ,  $AcOH$  and hydrocarbons, which, if condensed, would sep. into 2 layers giving a 70–5%  $AcOH$ . As  $H_2O$  and the hydrocarbons give a mixt. having a const. *b. p.* of 86.5°, which is 15° lower than the const. *b. p.* of the  $AcOH$ -hydrocarbon mixt., sepn. of the  $AcOH$  and its dehydration can be obtained simultaneously by withdrawing a binary mixt. having approx. the compn. of the azeotropic  $AcOH$ -hydrocarbon mixt. some distance below the top of the top column, while nearly all of the  $H_2O$  passes off at the top. The  $AcOH$ -hydrocarbon mixt. contains a trace of  $H_2O$  which makes it sep. into 2 layers, the lower one consisting of 90–7%  $AcOH$  contg. a small amt. of hydrocarbon. The  $H_2O$  and hydrocarbons are removed in a small auxiliary column, to yield strictly anhyd.  $AcOH$ ,  $m$ . 16.5°, while the recovered hydrocarbons contg. a little  $AcOH$  are returned to the main distg. column. The process has been successfully used in an exptl. app. (25 kg.  $AcOH$  per hr.): starting from 30%  $AcOH$ , the steam consumption is 3.5–4 kg. per kg. of anhyd.  $AcOH$  with a recovery of 97–8% of the acid, and with a 10%  $AcOH$  the steam consumption would be about 50% greater. The loss of solvent is very small. The method is particularly suitable for the recovery of  $AcOH$  from the acetylation of cellulose. It can be used also for the treatment of pyroigneous distillate, provided the tar is previously extd.: this can be done in an app. similar to that used for the extn. of the  $AcOH$ , using butylcresol as solvent.

A. PAPINEAU-COUTURE

**Properties of butyrates and isobutyrate.** F. KJELSBORG AND A. MÜLLER. *Deut. Parfümerieztg.* 14, 235–6 (1928).—Isobutyrate have smaller *d.* and *n* than the corresponding butyrates; differences in the odors of esters and in the ease of hydrolysis of esters are recorded. Terpinyl isobutyrate is specially resistant to hydrolysis.

B. C. A.

**Action of metallic sodium on the chloride of trimethylacetic acid.** V. I. EGOROVA. Leningrad State Univ. *J. Russ. Phys.-Chem. Soc.* 60, 1199–1210 (1928).—By the action

of Na on acid chlorides one used hitherto to obtain esters of the formula  $[\text{RC}(\text{CO}_2\text{R})]_2$  which, on being saponified, gave  $\alpha$ -HO ketones  $\text{RCOCH}(\text{OH})\text{R}$ . As a by-product, a small quantity of the corresponding  $\alpha$ -diketone usually accompanied the HO ketone, except in the case of  $\text{Me}_3\text{CCOCl}$  which always yielded the HO ketone free from diketone. E., however, obtained a totally different result by operating as follows: *Action of Na on the chloride of trimethylacetic acid*.—The chloride, twice the theoretical quantity of Na cut in thin plates, and 5 vols. of moist ether are placed in a flask connected with a reflux condenser. The reaction is started by heating slightly and then continues by its own heat; toward the end it is completed by heating to the b. p. of the ether. The expt. lasts 10–20 hrs., in the course of which the colors of the soln. and of the ppt. formed undergo several changes. When the reaction is ended the ether soln. is filtered, washed with  $\text{Na}_2\text{CO}_3$ , or with  $\text{NaOH}$ , and  $\text{H}_2\text{O}$  and dried with fused  $\text{Na}_2\text{SO}_4$ . After driving off the ether a yellow liquid is obtained which is first distilled *in vacuo* to get rid of tarry admixts., then fractionated at ordinary pressure, whereupon fractions 160–172° and 230–245° are obtained. The 1st of these fractions ppts. the diketone  $(\text{Me}_3\text{CCO})_2$ , yellow substance with camphor odor, b. 165–8°. The 2nd fraction is fractionated again, yielding a yellow fraction 226–238° which crystals after being cooled in a refrigerating mixt., and a colored fraction 238–245° which crystals at ordinary temp. All the crystals are pressed out and recrystd. from ether, colorless crystals with camphor odor, m. 37°. Composition  $\text{Me}_3\text{CCOCH}(\text{O}_2\text{CCMe}_3)\text{CMe}_3$  (ester of the HO ketone and of the trimethylacetic acid). A colorless cryst. substance, m. 180–1°, is obtained as a ppt. from the ether soln. before its decompn. with water; some more of the same substance ppts. after the decompn. of the ether soln. with  $\text{H}_2\text{O}$  during the evapn. of the ether; finally some of it is also recovered from the tarry admixt. The substance is poorly sol. in cold ether and is insol. in cold  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$  or  $\text{AcOH}$ , but readily dissolves in all these solvents on warming. After being recrystd. from ether it m. 178–9°. Its compn. is  $(\text{C}_{10}\text{H}_{18}\text{O}_2)_n$  (polymer of the diketone), where  $n$  could not be detd. The yield of all the enumerated pure products is not above 30–40%, on account of the formation of a large quantity of tar and of some intermediate fractions. The relative proportions of the pure products obtained are: diketone 70%, ester of the HO ketone 15%, polymer of the diketone 15%. The mechanism of the reactions according to Bouveault and Locquin is:  $2\text{RCOOR}' + 4\text{Na} \longrightarrow 2\text{NaOR}' + \text{RC}(\text{ONa})\cdot\text{C}(\text{ONa})\text{R}$ ; then, by the action of water,  $\text{RC}(\text{OH})\cdot\text{C}(\text{OH})\text{R} \longrightarrow \text{RCH}(\text{OH})\text{COR}$  (HO ketone), the formation of the diketone being due to oxidation of the HO ketone in presence of alkali. Since E. obtained the diketone as the main product of reaction, these views have to be revised, particularly as the HO ketone cannot be oxidized in presence of alkalies and only oxidizes on passing its vapor over Cu, or else with  $\text{KMnO}_4$  in acid soln. To obtain further confirmation of the suspicion that the diketone is obtained as a primary product of the reaction, E. repeated the reaction without access of air in a current of H and with the theoretical quantity of Na which was introduced in small portions, the subsequent decompn. being carried out in a current of N; the products obtained were the same. To establish the real mechanism of the reactions, E. made the following expts: *Action of Na on the diketone  $(\text{Me}_3\text{CCO})_2$* .—Na in thin slices and the diketone dissolved in 5–6 times its vol. of slightly moist ether were heated in a flask. The reaction lasted 10–12 hrs., after which the ether soln. was filtered, decompd. by  $\text{H}_2\text{O}$  and dried. After evapn. the ether the liquid was distilled at ordinary pressure. At 170° crystals began to distill and the distn. was discontinued. After cooling, the whole contents of the flask crystd. out, the crystals being the HO ketone. The residue obtained after filtering the ether soln. was freed from pieces of unreacted Na and decompd. by  $\text{H}_2\text{O}$ , whereupon crystals of the HO ketone pptd. The aq. soln. was extd. with ether and the ext. consisted of  $\text{CMe}_3\text{CO}_2\text{H}$ . When the reaction was repeated with exclusion of air by a current of H, only the HO ketone was obtained,  $\text{CMe}_3\text{CO}_2\text{H}$  being present only as a trace. The action of Na on the HO ketone  $\text{Me}_3\text{CCH}(\text{OH})\text{COCMe}_3$  was tried under the same conditions as that of Na on the diketone; it was also tried by varying the quantities of Na and the humidity of the ether and by introducing Pt black as catalyzer. The result, however, was the same: the HO ketone remained unchanged. These expts. tend to show that the real mechanism of the reaction between Na and the  $\text{Me}_3\text{CCOCl}$  is:  $2\text{Me}_3\text{CCOCl} + 2\text{Na} \longrightarrow 2\text{NaCl} + (\text{Me}_3\text{CCO})_2$ ; then part of the diketone formed reacts with Na, forming  $[\text{Me}_3\text{CC}(\text{ONa})]_2$  which, on being decompd. by  $\text{H}_2\text{O}$ , may yield the HO ketone, but may also react thus:  $[\text{Me}_3\text{CC}(\text{ONa})]_2 + \text{ClCOCMe}_3 \longrightarrow \text{NaCl} + \text{Me}_3\text{CC}(\text{ONa})\cdot\text{C}(\text{O}_2\text{CCMe}_3)\text{CMe}_3$ , and the latter compd. may, by the action of  $\text{H}_2\text{O}$ , give  $\text{CMe}_3\text{COCH}(\text{O}_2\text{CCMe}_3)\text{CMe}_3$  (ester of the HO ketone). The formation of  $\text{CMe}_3\text{CO}_2\text{H}$  from the diketone can be explained thus:  $(\text{Me}_3\text{CCO})_2 + \text{KOH} \longrightarrow \text{Me}_3\text{C}-$

$\text{CO}_2\text{K} + \text{OHCCMe}_3; \text{OHCCMe}_3 \longrightarrow \text{HO}_2\text{CCMe}_3$ . To find out whether another diketone would, under the same conditions, yield an acid, the action of Na on benzil was investigated. When refluxing 5 g. Bz<sub>2</sub>, 4 g. Na in thin slices and 30 cc. dry ether there was no reaction, but when 2–3 cc. moist ether were added, the reaction took place and, after 24 hrs., the products were found to be BzOH and Bz<sub>2</sub> contg. a trace of benzoin.

BERNARD NELSON

**Manufacture of ethylene chlorohydrin.** E. A. SHILOV. Ivanovo-Voznesensk Polytech. *J. Chem. Ind. (Moscow)* 5, 1273–6(1928).—Expts. were instituted by S. for the purpose of working out an industrial method of manufg.  $\text{CH}_2(\text{OH})\text{CH}_2\text{Cl}$ . It is best to manuf. chlorohydrin by addn. of  $\text{C}_2\text{H}_4$  to  $\text{HClO}$ . Ethylene is best manufd. conforming to Moser and Lindberger (*C. A.* 18, 49) by passing EtOH vapors through a tube filled with pumice moistened by  $\text{H}_3\text{PO}_4$  at  $250^\circ$ ; fused  $\text{HPO}_3$  cannot be used, at least not at this temp. The gas thus obtained contains 95%  $\text{C}_2\text{H}_4$ . To obtain  $\text{HClO}$  it is advisable to operate with Cl and alkali soln.  $\text{Cl}_2 + 2\text{NaOH} = \text{NaOCl} + \text{NaCl} + \text{H}_2\text{O}$ ;  $\text{Cl}_2 + \text{NaOCl} + \text{H}_2\text{O} = 2\text{HOCl} + \text{NaCl}$ . When thus decomp.  $\text{NaOCl}$  by Cl or by acid, the loss of active Cl has hitherto always been considerable, but S. found that the theoretical yield of  $\text{HClO}$  can be attained if instead of passing Cl into the alkali soln., the latter is added to a soln. into which Cl is being passed: the acidity which in that case is maintained in the soln. prevents the formation of  $\text{HClO}_2$ . The operation is effected by first passing Cl into a flask cooled by ice and contg. a little  $\text{H}_2\text{O}$ ; after the formation of a Cl hydrate ppt., a NaOH soln., or better a  $\text{NaClO}$  soln., is added with good stirring from a separatory funnel at such a rate that Cl always remains in excess; after the decompn. is ended, the excess of Cl is removed either by blowing air or by treating with a small quantity of  $\text{CaCO}_3$ . Thus 150 cc. of a soln. contg. 0.207 moles  $\text{NaClO}$  are dild. by 200 cc.  $\text{H}_2\text{O}$  and introduced during 55 min., while cooling with ice, to 50 cc.  $\text{H}_2\text{O}$  in which an uninterrupted current of Cl is passing; after blowing in  $\text{CO}_2$ , the soln. is found to contain 0.407 moles  $\text{HClO}$ , i. e., a 98% yield on the Cl. By this method S. obtained solns. contg. up to 1 mole  $\text{HClO}$  per l., i. e., 5.25%, and these solns. are at around  $0^\circ$  stable enough for the chlorohydrin synthesis. If the absorption of  $\text{C}_2\text{H}_4$  is begun immediately after the decompn. of  $\text{NaClO}$ , only 8%  $\text{HClO}$  turns into  $\text{HClO}_2$ . Expts. show that the velocity of  $\text{C}_2\text{H}_4$  absorption in  $\text{HClO}$  increases with the rate of stirring. It is established that  $\text{H}^+$  acts as a catalyst in the formation of the chlorohydrin. When the  $\text{H}^+$  concn. (and consequently also the  $\text{HClO}$  concn.), drops below the point of neutral reaction, the reaction slows down, and in alk. (to phenolphthalein) solns.  $\text{C}_2\text{H}_4$  absorption is very slow. The chlorohydrin formed is stable towards  $\text{HClO}$ , as the latter oxidizes it only to a slight extent. The chlorohydrin yield is about 80% (calcd. on the  $\text{HClO}$  present) when operating with dil solns. Dil solns. of chlorohydrin can be concd. by distn., in which case the chlorohydrin concentrates in the first fractions until they reach the compn. 41% chlorohydrin and 59%  $\text{H}_2\text{O}$ .

BERNARD NELSON

**Enzymic synthesis of  $\beta$ -hydroxyethyl dihydrogen phosphate.** HERBERT DAVENPORT KAY. London Hospital. *J. Chem. Soc.* 1929, 524–7. —The action of the esterase from the duodenal mucosa of a cat upon  $(\text{CH}_2\text{OH})_2$  and  $\text{Na}_2\text{HPO}_4$  caused the decrease in inorg. P from 3.27 to 2.06 and an increase in the ester P from 0.04 to 1.21 mg. per cc. of reaction mixt. in 21 days; the synthetic ester was identical with that prepd. from  $(\text{CH}_2\text{OH})_2$  and  $\text{POCl}_3$ . The identity was further confirmed by following the rate of enzymatic hydrolysis of the 2 products.

C. J. WEST

**Action of metallic sodium on brominated cyclic acetals.** HAROLD S. HILL AND G. J. C. POTTER. McGill Univ. *J. Am. Chem. Soc.* 51, 1509–14(1929); cf. Hill and Fidgeon, *C. A.* 22, 4467. —The results of this and earlier work indicate that the position of the halogen in brominated cyclic acetals has a marked influence on the course of their reaction with Na. If the Br is on the  $\alpha$ -C atom a vinyl deriv. is formed almost exclusively; a Br attached to the  $\beta$ -C atom, however, causes more complicated changes, for in addn. to the latter reaction, a Wurtz synthesis takes place. A Br on a  $\gamma$ -C atom would presumably still further increase the tendency toward the linking up of 2 mols.  $(\text{CH}_2\text{OH})_2$  and  $\text{CH}_2\text{:CHCHO}$  are condensed by  $\text{HBr}$  at  $0^\circ$  to give 65% of  $\beta$ -bromopropylideneglycol (I),  $b_{10}$  72–3°; using  $\text{MeCH:CHCHO}$  there results 56% of  $\beta$ -bromobutylideneglycol (II),  $b_{10}$  76–8°. I (54 g.) in 100 cc. abs.  $\text{Et}_2\text{O}$  and 14 g. Na give 7 g. propylideneglycol,  $b_{100}$  106–7°; 2 g. hydroxyethyl  $\beta$ -methylvinyl ether,  $b_{18}$  60–1° (the former is a secondary rearrangement product of the latter); 5 g. *di*-1,6-hexylideneglycol,  $b_{10}$  139–40°, and 5 g. of a residue. Similarly II and Na give 3 products: butylideneglycol,  $b_{100}$  132–3°; hydroxyethyl  $\beta$ -ethylvinyl ether,  $b_{18}$  60–5°; dimethyl*di*-1,6-hexylideneglycol,  $b_{18}$  150–70°. The mechanism of these reactions is discussed.

C. J. WEST

**Diamines and the amino alcohols.** NIK. PUTOKHIN. *Trans. Inst. Pure Chem. Reagents* (Moscow) No. 6, 10-21 (1927).—Gabriel (*Ber.* 20, 2224 (1887); 21, 566 (1888); 22, 1137 (1889)) developed a method for the prepn. of diamines by heating  $C_6H_4(CO)_2NK$  (I), with a dibromide of the corresponding hydrocarbon yielding a *N*-substituted phthalimide, which at 200° with concd. HCl in an autoclave is decompd. into phthalic acid and a diamine. P. obtained equal results at lower temp. and atm. pressure by substituting NaOH for HCl. This method had been tried by Gabriel (*Ber.* 21, 2670 (1888); 20, 2226 (1887)), Braun (*Ber.* 37, 3586 (1904)), Michels (*Ber.* 25, 3048 (1892)) with unsatisfactory results. P. employed more highly concd. lye, and on completion of sapon. the liquid was distd. to dryness giving nearly theoretical yields of diamines. Others than the I method result in mixts. of products often derived from materials difficult to obtain. This method of sapon. was also applied to monophthalimide substitution products,  $C_6H_4(CO)_2NCH_2CH_2CH_2Br$ , expecting to obtain trimethyleneamine; however, instead 90% of  $HOCH_2CH_2CH_2NH_2$  was obtained. This reaction was developed into a convenient method for prepn. of primary hydroxyamines previously not readily obtainable. Thus were prepd.  $HOCH_2CH_2NH_2$ ,  $HO(CH_2)_3NH_2$ , and the hitherto unknown 1,5-hexanediolamine, yields 80-90%, without by-products. Gabriel (*Ber.* 38, 2880 (1905)) studied these reactions and formulated the stages, but did not, as also in the case of diamines, carry the reaction to the end. The intermediate products are stable enough against strong alkalis even on heating. He used alc. 2 N KOH, extd. the product with  $H_2O$  or  $AcOH$ , or evapd. part of the alc. to crystn. As in the case of diamines, P. attained complete sapon., the KOH soln. was distd. to dryness, whereby the reaction was carried to the end, giving smoothly amino alcs. of high purity and yield. Gabriel (*Ber.* 21, 2670 (1888)) also synthesized amino alcs. with  $C_6H_4(CO)_2NBr$  using  $H_2SO_4$  instead of alkali with high temp. and pressure, obtaining poor yields requiring difficult purification. The common method—action of  $NH_3$  on halohydrins—produces a mixt. of primary, secondary and tertiary hydroxyamines (Wuerts, 121, 228; Morlog, *Ber.* 13, 222; Ladenburg, *Ber.* 14, 1877, 2406; Berend, *Ber.* 17, 511; Knorr, *Ber.* 22, 2088, 30, 900, 916, 918; Fournalau, *Compt. rend.* 138, 799), the same results are obtained with  $NH_3$  and organic oxides (Wuerts, *Ann.* 114, 51, 121, 227; Knorr, *Ber.* 30, 900; Krassusky, *J. prakt. Chem.* [2], 77, 87, 93); somewhat better results are given by Henry (*Ber.* 33, 3169) in the reduction of nitril and nitrile alcs. with Zn and HCl, or with metallic Na in alc. *Exptl. part.*—**Ethylendiamine** (II). Fraction of I: to 70 g. of  $C_6H_4(CO)_2NH$  in 1 l. of 96% alc. is added 24 g. KOH in 150 cc. of 96% alc., whereby there instantly sep. scales of I, which are rapidly cooled to avoid sapon., filtered by suction, washed with alc., and dried in the air, yield 50-55 g., or 85%. Prepn. of ethylenediphthalimide: 47 g. (0.25 mol.) of  $CH_2Br$  is poured over 92 g. (0.5 mol.) of powd. I and refluxed at 160-70°; after 3 hrs. of heating the reaction mass is allowed to cool, is broken up, and the heating contd. for 2 hrs. longer. The cooled contents are treated with 150-200 cc. of  $H_2O$  on the water bath to leach out the KBr and unchanged I, filtered on a Buchner, washed with  $H_2O$ , dried, and refined by refluxing with  $CH_2Br$  for about 30 mins. to remove  $C_6H_4(CO)_2NCH_2CH_2Br$ ; yield 65-70 g. or 85%, gray powder, recrystd. from glacial  $AcOH$ , m. 252°. Prepn. of II: 64 g. (0.2 mol.) of  $[C_6H_4(CO)_2NCH_2]_2$  in a cork-sealed flask is dissolved in 190 g. of KOH in 300 cc. of  $H_2O$  on standing 2 days at room temp., when the soln. is distd. to dryness. The 1st fractions with any  $NH_3$  odor are discarded, for only the later fractions with the increased concn. of KOH in the liquid contain appreciable quantities of II. The last traces of II are obtained by adding  $H_2O$  to the dry mass in the flask and distg. The joint fractions are exactly neutralized with dil. HCl, evapd. to 150 cc., filtered from brown flakes, the filtrate evapd. to 60 cc. when crystn. begins, 50 cc. of alc. are added, and the cryst. HCl salt of II after cooling is filtered, washed with alc. and dried; yield 15 g. The mother liquor on concn. and addn. of 25 cc. of alc. ypts. 10 g. more of pure crystals; total yield 25 g. or 95% based on  $[C_6H_4(CO)_2NCH_2]_2$ . The free base is obtained when 10 g. of the HCl salt is ground with 7.5 g. of NaOH, to which is added 10-12 g. of soda lime, and distd. over a direct flame. The base is freed from moisture with solid KOH and distd.; yield 5.5 g. or 85-90% of the hydrate of II,  $NH_2CH_2CH_2NH_2 \cdot H_2O$ , m. 118°. *Utilization of by-products.* **Phthalimide.**—The dry residue left in the flask after distn. of II consists of K phthalate and free KOH; it is dissolved in  $H_2O$ , filtered, acidified with excess of HCl, filtered, washed with  $H_2O$  and dried; yield of phthalic acid, 10 g.; this is evapd. with 100 cc. of 25%  $NH_4OH$ , the dry  $NH_4$  phthalate is heated in a flask over a direct flame until  $NH_3$  and  $H_2O$  are expelled, the melted I is poured in a tray, cooled and ground; yield 45 g. KBr. The aq. soln. obtained by leaching the product of interaction of  $(CH_2Br)_2$  and I contains

KBr contaminated with org. matter. The soln. is evapd. to dryness, incinerated, leached with  $H_2O$  and crystd. *Trimethylenediamine* (III) (1,3-diaminopropane) and *pentamethylenediamine* (IV) (1,5-diaminopentane) are prepd. by the same method as II. The proportions of the components are for III 92 g. (0.5 mol.) of I and 46 g. (0.25 mol.) of  $CH_2(CH_2Br)_2$ , and for IV 92 g. (0.5 mol.) of I and 50 g. (0.25 mol.) of  $CH_2(CH_2CH_2Br)_2$ , heated to 190–200°; 67 g. (0.2 mol.) of  $[C_6H_4(CO)_2NCH_2CH_2]_2CH_2$  and 100 g. of KOH in 250 cc. of  $H_2O$ ; 72 g. (0.2 mol.) of  $[C_6H_4(CO)_2NCH_2CH_2]_2CH_2$  and 110 g. of KOH in 300 cc. of  $H_2O$ . The HCl salts of the bases are obtained in the same way as in the case of II, however, the salt of IV is more hygroscopic, thus a higher concn. of the soln. of the salt is required to cause crystn. with alc. The yields are nearly theoretical, the III b. 135–6°, and IV b. 178–80°. *Amino alcs.— $\gamma$ -Hydroxypropylamine* (V).  $C_6H_4(CO)_2NCH_2CH_2CH_2Br$  was prepd. by the method of Gabriel (*Ber.* 21, 2671 (1888)); 60 g. of this with 80 g. of KOH in 350 cc. of  $H_2O$  as heated until dissolved, and then distd. As in case of diamines, the first 200 cc. is distd. with a dephlegmating column, the slightly alk. fractions are discarded, the distn. is continued without the column to dryness, the dry residue is treated with 40 cc. of  $H_2O$  and distd., this is repeated once more. 250 cc. of joint distillate contg. the entire hydroxylamine is obtained and is freed from  $H_2O$  by distn. (the amino alcs. are not volatile with steam) first with dephlegmator at 100° and then without the latter at 185–6°; yield 13.5–14 g. or 80–85%,  $d_4^{26.5}$  0.9824,  $n_D^{26.5}$  1.4570, M. R. 20.79 (calcd. 21.). *Hydroxyethylamine* (VI).  $C_6H_4(CO)_2NCH_2CH_2Br$  was prepd. by the method of Gabriel; 60 g. of this with 75 g. of KOH in 300 cc. of  $H_2O$  was converted to VI by the method described for V; yield 11.5 g., or 80%, b. 171–2°,  $d_4^{27}$  1.0111,  $n_D^{27}$  1.4508, M. R. 16.26 (calcd. 16.38). *1,5-Hydroxypentamethylenamine* (VII).  $Br(CH_2)_5Br$  was prepd. by the method of Braun (*Ber.* 37, 2915 (1904)); C. A. 2, 118, 130 g. of which with 32 g. of I was refluxed for 3 hrs. at 190–5° with frequent shaking. the excess of dibromide was expelled with steam, leaving a heavy oil which was dissolved in  $Et_2O$ , filtered, dried with calcined  $Na_2SO_4$ , the  $Et_2O$  evapd. resulting in a brown heavy oil of crude  $C_6H_4(CO)_2N(CH_2)_5Br$  (yield, 45 g., or 80%); 40 g. of this with 35 g. of KOH in 180 cc. of  $H_2O$  when treated in the manner described for V results in VII (yield about 6 g., or 55–60%), a colorless glycerol-like liquid with a faint  $NH_3$  odor, on standing solidifies to a cryst. mass, m. 26°, readily absorbs  $H_2O$  and  $CO_2$  from the air, miscible with  $H_2O$  and alc., in all proportions, sparingly sol. in  $C_6H_6$  and  $Et_2O$ , b. 221–2°,  $d_4^{17}$  0.9488,  $n_D^{17}$  1.4618, M. R. 29.85 (calcd. 30.24); chloroplatinate forms scales from alc. on addn. of  $Et_2O$ , m. 180°.

**Mechanism of organic reactions. I. Wandering of acyl groups in glycerol esters.** HAROLD HIBBERT and NEAL M. CARTER. McGill Univ. *J. Am. Chem. Soc.* 51, 1601–13 (1929). A review of the literature shows that the  $\beta$ -acyl group in  $C_6H_4(OH)_2$  derivs. readily undergoes migration to the  $\alpha$ -position. The mechanism of such migration is apparently that first proposed by E. Fischer, namely, the intermediate formation of an unstable cyclic acetal. There does not appear to be any reliable evidence in the literature indicating the migration of a Me or other alkyl group in the case of  $C_3H_7(OH)_2$  and other alkyl ethers. 1,3-Benzylideneglycerol 2-benzoate, m. 103°, on acid hydrolysis yields glyceryl  $\alpha$ -benzoate. 1,3-Benzylideneglycerol 2-*p*-nitrobenzoate (I), straw-colored, m. 156°; 1,2-benzylideneglycerol 3-*p*-nitrobenzoate, straw-colored, m. 90–1°. Hydrolysis of these gives the same compd., an  $\alpha$ -deriv., showing that in the case of I a migration of the  $\beta$ -acyl group has occurred. 1,3-Benzylideneglycerol 2-*p*-bromobenzoate, m. 146° (80% yield); 1,2-benzylideneglycerol 3-*p*-bromobenzoate, m. 72°; acetoneglyceryl  $\alpha$ -*p*-bromobenzoate, m. 39–40° (70% yield); hydrolysis of each of these gives glyceryl  $\alpha$ -*p*-bromobenzoate, m. 70°. Glyceryl  $\alpha,\alpha'$ -diisobutyl- $\beta$ -methyl ether, m. 158.5°, in 97% yield from  $CH(OH)(CH_2OCPh_3)_2$  and MeI, on hydrolysis yields  $MeOCH(CH_2OH)_2$ .

**Claisen ester condensation with ethyl thiolacetate.** R. B. BAKER and E. HENNET REID. Johns Hopkins Univ. *J. Am. Chem. Soc.* 51, 1567–70 (1929).—AcSEt, b. 116–7°,  $d_4^0$  1.0008,  $d_4^{25}$  0.9755,  $n_D^{25}$  1.4503. AcSEt condenses with Na to give 15% of *Et acetothiolacetate*, b. 60°,  $d_4^0$  1.0917,  $d_4^{25}$  1.0684,  $n_D^{25}$  1.4885; Br titration indicates 30.8% of the enol form; the Cu salt, bright green, decomps. 110° and is the only stable metallic salt. This shows the ketone and acid hydrolysis as does  $AcCH_2CO_2Et$ ; upon heating it decomps. to form dehydracetic acid. An equal mol. mixt. of AcSEt and AcOEt condenses with Na to form 98% of  $AcCH_2COSEt$  and 2%  $AcCH_2CO_2Et$ . AcSEt and  $Me_2CO$  do not condense with Na to form  $Ac_2CH_2$ ; MeCN condenses to form  $NCCH_2Ac$  (7% yield).

**Acetonesugars. XVI. *l*-Altromethylose, quinovose and digitoxose.** The system

of the methylpentoses. KARL FREUDENBERG AND KLAUS RASCHIG. Univ. Heidelberg. *Ber.* 62B, 373-83 (1929); cf. *C. A.* 23, 107.—It had been shown that diacetonegalactose 6-iodohydrin (I or II) in Et<sub>2</sub>O with Na and H<sub>2</sub>O gives the diacetone deriv. of *d*-fucose, thus establishing that the configuration of the latter is III. In this connection it was important to prove that the I is replaced directly by H; if the reaction proceeded through the unsatd. compd. IV (or the analogous compd. derived from II) the mixt. of diacetone compds. would give 2 methylpentoses differing in the configuration about C atom 5. This possibility was excluded by showing that alkalis do not split off HI from the iodohydrin even at 100°, and furthermore the sugar on evapn. of its alc. soln. crysts. quickly and completely, *i. e.*, is homogeneous. F. and R. have now succeeded in prepg. IV from I with NaOMe at 130°; hydrogenation of this IV with Pt and H gives a mixt. of diacetone-methylpentoses, 1 of which (V) is diacetone-*d*-fucose (I or II with H instead of I) and the other has the structure VI (or the corresponding structure derived from II), *i. e.*, is the diacetone deriv. of a new methylpentose designated *l*-altromethylose (VII). The mixt. contains about 70-80% V and 20-30% VI, and as its sp. rotation is -61° and that of pure V is -52.4°, VI must have a rotation of about -90°. As the crude V obtained from I with Na and H<sub>2</sub>O has a rotation of only -43° (probably because of slight contamination with inactive material), this is further evidence that it contains no VI. The same is true of a crude V, with a rotation of -45.6°, obtained from I with Zn dust and AcOH. The sepn. of VII from III offered difficulties which were finally overcome by removing most of the III as its difficultly sol. *p*-toluenesulfonylhydrazone (VIII) and isolating the VII as its *p*-bromophenylhydrazone (IX). As about 3 parts of III to 1 of VII are obtained, this series of reactions through IV affords a better method of synthesizing III. VII, which is *l*-rotatory, has not yet been obtained in cryst. form; it yields a hitherto unknown phenylosazone (X) and *p*-bromophenylosazone, and two IX, the higher-melting of which can be converted into the other. VII must have the same osazone as the still unknown epimeric *l*-allomethylose (XI). The osazones of the 3 other epimeric pairs, rhamnose-epirhamnose, fucose-epifucose, gulomethylose-idomethylose, are known and as they are apparently different from that of quinovose (XII) Votoček classified XII as VII or XI, but its phenylosazone, m. 191°, is certainly different from X. On converting a sample of  $\beta$ -quinovin, 1 of the cinchona bark glucosides from which XII has been obtained, into the Et quinoviside, distg. this in a high vacuum and hydrolyzing it, pure *d*-epirhamnose was obtained and no other sugar was present in the mother liquors. The name quinovose should therefore be stricken from the literature. Windaus and Schwarte obtained from the anhydride of digitoxose a cryst. methylpentose (XIII) to which they assigned the structure XII. Seeding of the sirupy VII with XIII, however, did not induce crvstn., the rotation of XIII is different from that of VII and its *p*-bromophenylosazone (XIV), while it melts at about the same temp. as that of VII and depresses the m. p. of the latter only slightly, is *l*-rotatory whereas that of VII is about as strongly *d*-rotatory. VII and XIII are therefore certainly different and the configuration of digitoxose remains as uncertain as ever. Accepting (7), in the accompanying table, as the configuration of III, and adopting the nomenclature suggested by Votoček, the methylpentoses can be arranged as follows (the symbols (+) and (-) represent the direction of the rotation of the equil. sugar, and the names in parentheses are the old names): (1) *d*-Allomethylose, (2) *d*(+)-altromethylose, (3) *d*(+)-glucumethylose (*d*(+)-epirhamnose, quinovose, isorhodeose, *d*-isorhamnose), (4) *d*(-)-mannomethylose (*d*(-)-rhamnose, epiisorhodoce), (5) *d*(-)-gulomethylose, (6) *d*-idomethylose, (7) *d*(+)-galactomethylose (*d*(+)-fucose, rhodoese), (8) *d*(+)-talomethylose (*d*(+)-epifucose).

OH	H	OH	H	OH	H	OH	H
OH	OH	H	H	OH	OH	H	H
OH	OH	OH	OH	H	H	H	H
OH	OH	OH	OH	OH	OH	OH	OH
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)

*Diacetone-d-galacto-5,6-enose* (diacetone-*d*-galactoseene) (IV) (yield, 20-70%), m. 85°, b<sub>18</sub> 133°, easily volatile with steam, sublimes below 100° with partial decompn., immediately decolorizes Br in Me<sub>2</sub>CO, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -128° in (CHCl<sub>3</sub>)<sub>2</sub>, mol. wt. in camphor 243. VII, from IX with BzH in H<sub>2</sub>O under CO<sub>2</sub> at 90°, sweet sirup, [ $\alpha$ ]<sub>D</sub><sup>23</sup> -18° (H<sub>2</sub>O). *Phenylhydrazone*, m. 132°, [ $\alpha$ ]<sub>D</sub> about -1° (C<sub>6</sub>H<sub>5</sub>N). IX, unstable prisms, m. 178°, rearranged by boiling AmOH into leaflets, m. 155° (the *p*-bromophenylhydrazone of III seps. from boiling AmOH unchanged in needles, m. 183°). *p*-Bromophenylosazone, obtained from IX on attempted recrystn. from 50% AcOH, m. 203° depresses

the m. p. (205°) of the III deriv. to 190°. X, light yellow, m. 185°,  $[\alpha]_D$  about 75° (2% soln. in  $C_6H_5N$ -EtOH (2:3 by vol.)). VIII, m. 175°,  $[\alpha]_D^{17}$  17.1° ( $C_6H_5N$ ); *l*-*glucose deriv.*, m. 174°,  $[\alpha]_D^{19}$  -17.0° ( $C_6H_5N$ ).

C. A. R.

Organic catalysts. III. Formation of oxamide from dicyanogen in the presence of aldehydes. WOLFGANG LANGENBECK. Univ. Münster i. W. *Ann.* 469, 16-25 (1929); cf. C. A. 22, 2749.—The formation of  $(CONH_2)_2$  from  $C_2N_2$  by the action of  $H_2O$  in the presence of AcH and EtCHO at the ordinary temp., followed by heating, is due to the aldehyde reacting in the enolic form. AcH in the presence of dil. AcOH, HCHO, BzH, chloral hydrate and dextrose does not promote the change. When a mixt. of AcH,  $C_2N_2$ , and  $H_2O$  is allowed to remain at 15° for some days and then evapd. at 30° and 15-7 mm., the intermediate compd.,  $H_2NCOC(:NH)OCH:CH_2 \cdot H_2O$ , m. 150° (decompn.) on rapid heating, is produced. This is decompd. by warming with dil acids into  $(CONH_2)_2$ ,  $(CO_2H)_2$ , and AcH, while decompn. with a few drops of 0.1 N NaOH causes immediate production of AcH and  $(CONH_2)_2$ . When heated at 150° *in vacuo* the above intermediate yields  $(CONH_2)_2$ . C. J. WEST

Action of semicarbazide hydrochloride and of 2,4-dinitrophenylhydrazine hydrochloride on aldoximes and their derivatives. OSCAR L. BRADY AND FRANK H. PEAKIN. Univ. College, London. *J. Chem. Soc.* 1929, 478-9.—Aldoximes in soln., treated at room temp. with a soln. of an equiv. amt. of  $H_2NNHCONH_2 \cdot HCl$ , are slowly converted into the semicarbazones, which crystallize; the conversion is almost complete. This replacement does not lead to the production of stereoisomeric semicarbazones when stereoisomeric oximes are employed. Apparently the formation of the semicarbazone is preceded by hydrolysis of the oxime to the aldehyde. *N*-Me derivs. react more rapidly than the oximes themselves. 2,4-( $O_2N$ ),  $C_6H_3NHNH_2 \cdot HCl$  reacts somewhat readily at room temp. with aldoximes and their derivs., giving practically quant. the 2,4-dinitrophenylhydrazones of the corresponding aldehydes; the reaction provides a method for the quant. detn. of small quantities of oximes. PhCH:NOMe reacts quant. with this reagent; BzH can be obtained by warming the hydrazone with  $H_2SO_4$ . C. J. WEST

Synthesis of a new methylcytosine. FRANCIS H. CASE AND ARTHUR J. HILL. Yale Univ. *J. Am. Chem. Soc.* 51, 1590-2 (1929).—2-Ethylmercapto-6-chloropyrimidine, heated with 4 mol. proportions of MeNH<sub>2</sub> in abs. EtOH at 150°, gives the HCl salt, m. 262°, of 2,6-di[methylamino]pyrimidine, m. 132°. Using 3.5 mols. MeNH<sub>2</sub>, at 50-60° there results the HCl salt, m. 216°, of 2-ethylmercapto-6-methylaminopyrimidine, m. 58°. Digestion of the latter with concd. HCl gives the HCl salt, decomps. 320°, of 2-keto-6-methylaminopyrimidine, m. 270°; the *picrate*, m. 220-5°. C. J. W.

Sugars. J. MIRSIC. *Vestník Král. Čes. Spol. Nauk. Cl. II*, 18 pp. (1928).—The following compds. of importance in sugar syntheses are described: *rhamnohexon*—

amide, m. 194°,  $[\alpha]_D^{20}$  -47.26°, after 2 days unchanged, after 2 hrs. on the water bath -21.48°; rhamnohexonic acid, m. 151° (NH<sub>4</sub> salt; nitrile, m. 145°,  $[\alpha]_D^{20}$  -23.47°). Mannoheptononitrile, CH<sub>2</sub>(OH)[CH.OH]<sub>5</sub>CN, m. 121-2°,  $[\alpha]_D^{20}$  31.4 to 23.11° (final); mannoheptonamide, m. 188-9° (slow heating), 200° (rapid heating); NH<sub>4</sub> mannoheptonate, m. 154°,  $[\alpha]_D^{20}$  31.31° to 7.22° (final).  $\alpha$ -Pentaacetylglucose, m. 111.5-2°,  $[\alpha]_D^{20}$  101.4°; tetraacetyl-d-gluconolactone, m. 103°,  $[\alpha]_D^{20}$  13.46°. Acetylation of NH<sub>4</sub> rhamnohexonate affords tetraacetyl-rhamnohexonolactone, m. 128.5-9°,  $[\alpha]_D^{20}$  9.66°. Hexaacetyl- $\alpha$ -rhamnohexonamide, m. 71-2°; pentaacetyl- $\alpha$ -rhamnohexononitrile, m. 85-6°,  $[\alpha]_D^{20}$  76.43°; heptaacetyl- $\alpha$ -galactheptonamide, m. 125.5-6°,  $[\alpha]_D^{20}$  21.79° to 23.86° (after 24 hrs.); hexaacetyl- $\alpha$ -mannoheptononitrile, m. 124.5-5°,  $[\alpha]_D^{20}$  31.45°. B. C. A.

An attempt to transform pentaacetyl- $\alpha$ -glucose into pentaacetyl- $\beta$ -glucose. ALFRED GEORG. *Helv. Chim. Acta* 12, 261-3(1929).—G. reviews the recorded cases of the transformation of pentaacetyl- $\beta$ -glucose (I) into pentaacetyl- $\alpha$ -glucose (II) and observes that no method is available for the reverse transformation. Since the acetylation of  $\alpha$ -glucose (III) with Ac<sub>2</sub>O in the presence of NaOAc yields more I than II, he attempts to carry out the transformation of II into I by this reagent; but "within the limit of the precision of my observations," no I is formed, but practically all the II is recovered unchanged. G. therefore concludes that the formation of I by the acetylation of III must be due to a change from  $\alpha$  to  $\beta$  after the acetylation of some or all of the alc HO groups but before the acetylation of the pseudo-aldehydic hydroxyl. M. A. D.

New compounds of glucose with phosphoric acid. B. HELFERICH AND H. DU MONT. Univ. Greifswald. *Z. physiol. Chem.* 181, 300-8(1929).—A new type of glucose phosphoric acid ester is obtained by esterification of acetylated glucose derivs. in which a free OH is present in the 6-position. 1,2,3,4-Tetraacetyl- $\beta$ -glucose (I) in pyridine reacts with POCl<sub>3</sub> at a low temp. to yield 52% of cryst. tri[1,2,3,4-tetraacetyl- $\beta$ -d-glucose]-6-phosphate (II), m. 236-7°, sol. in pyridine and CHCl<sub>3</sub>, difficultly sol. in EtOH, insol. in Et<sub>2</sub>O, H<sub>2</sub>O and ligroin. Sapon. to remove the Ac groups converts it into tri-d-glucose phosphate (III), amorph. and hygroscopic. It reduces Fehling soln., and during the prepn. of the osazone it splits off H<sub>3</sub>PO<sub>4</sub>. Reacetylation gives only a small yield of II. In the reaction between I and POCl<sub>3</sub> if the proportions are 1:1 instead of 3:1 as above, the product is 1,2,3,4-tetraacetyl- $\beta$ -d-glucose 6-chlorohydrin, previously described. 2,3,4-Triacetyl- $\alpha$ -methyl-d-glucoside in pyridine reacts with POCl<sub>3</sub> at -20° to yield 62% of tri[2,3,4-triacetyl- $\alpha$ -methyl-d-glucoside]-6-phosphate (IV), m. 185°,  $[\alpha]_D^{18}$  in CHCl<sub>3</sub> 151.9°. Heating in a sealed tube with NaI in MeAc at 135-40° for 15 hrs. converts it into 30% of the corresponding iodohydrin. Removal of the Ac by sapon. converts IV into 68% tri[ $\alpha$ -methyl-d-glucoside]-6-phosphate, amorph. and somewhat hygroscopic, with no characteristic m. p. It reduces Fehling soln. only after hydrolysis by mineral acid,  $[\alpha]_D^{20}$  in H<sub>2</sub>O 145.7°. Reacetylation gives a much better yield (56%) of IV, compared to the yield of II from III. A. W. D.

New unsaturated anhydrosugars. II. KURT MAURER. Univ. Jena. *Ber.* 62B, 332-8(1929); cf. C. A. 21, 2880.—Although his investigation has not been completed, M. reports the results he has obtained so far because of the appearance of the paper of Zemplén and Bruckner (C. A. 23, 1622). In accordance with Helferich's proposed nomenclature (C. A. 23, 104), the anhydrosugar obtained from acetobromoglucose with aliphatic secondary amines is designated tetraacetyl-1,2-glucoseene (I). As was to be expected, it rapidly decolorizes KMnO<sub>4</sub> in Na<sub>2</sub>CO<sub>3</sub> and under the proper conditions gives K triacetyl-d-arabonate almost quant., thus proving the 1,2-position of the double bond. Long heating in AcOH with PhNHNH<sub>2</sub> gives oily products, but if the mixt. is boiled only a short time and then allowed to stand at room temp. the yellow needles of glucosazone sep. in about 20 mins., the Ac groups being smoothly split off, which does not occur with tetraacetylglucose. In spite of many attempts by different methods it has not been possible to obtain the free 1,2-glucoseene (II) in cryst. form. With NH<sub>3</sub> in MeOH the amorphous sapon. products contain N, with NaOMe, Na; with NaOH 5, not 4, mols. NaOH are consumed per mol. sugar, the 5th being fixed in some way on the sugar. That an enolate is not formed is indicated by the complete neutrality of the aq. soln. of the sapon. product which cannot be reacetylated and with KMnO<sub>4</sub> (which it immediately decolorizes) gives only sirups. I cannot be catalytically hydrogenated under the most varied conditions, nor can H<sub>2</sub>O be added at the double bond. It adds 2 atoms of halogen but no cryst. products are obtained as halogen acid is always split off in a secondary (apparently substitution) reaction; if dry Cl is passed into the soln. in abs. Et<sub>2</sub>O as long as the Cl color disappears and

the soln. is then evapd. there is obtained a light sirup of penetrating odor which splits off HCl on standing and completely decomps. in a few days; in Et<sub>2</sub>O with Ag<sub>2</sub>CO<sub>3</sub> and a few drops of H<sub>2</sub>O it evolves CO<sub>2</sub> vigorously and in a few min. there seps. a finely cryst. substance C<sub>14</sub>H<sub>20</sub>O<sub>11</sub> (III) which contains four Ac groups and is apparently a partially acetylated glucosone hydrate, HOCH<sub>2</sub>.C(OH)(OAc).CH(OAc).CH(OAc).CH(CH<sub>2</sub>OAc).O, formed by replacement

of the Cl atoms in the di-Cl addn. product by HO groups. The part of the sirup which does not react with Ag<sub>2</sub>CO<sub>3</sub> contains very firmly bound Cl which it loses only to hot NaOMe or to PhNHNH<sub>2</sub> (with formation of PhNHNH<sub>2</sub>.HCl). III reduces cold Fehling soln., quickly decolorizes KMnO<sub>4</sub> but not Br, and shows mutarotation. It does not react with PhNHNH<sub>2</sub> in AcOH but if previously treated with alkali it gives glucosazone even in the cold. Acetylation gives a beautifully crystd. product, whose mol wt., however, is smaller than that of the original III. Under special conditions short chlorination of I gives another cryst substance. On longer chlorination the substitution reaction predominates and from the sirup can be isolated a cryst. product which apparently contains to each sugar complex three Cl atoms which, however, are so firmly held that it has thus far not been possible to remove or replace them. When I is heated in aq. phosphate soln. the amount of inorg. phosphate decreases in a certain relation to that of I present; parallel expts. with pure glucose or tetraacetylglucose showed no decrease of phosphate. Na<sub>4</sub>P<sub>2</sub>O<sub>7</sub> gave the best results in the addn. expts. The method of prep. I has been somewhat improved; from 40 g. acetobromoglucose with 12 g. NH<sub>4</sub>Et<sub>2</sub> in 20 cc. C<sub>6</sub>H<sub>6</sub> at 60° is obtained 17 g. I, m. 65–6°, [α]<sub>D</sub><sup>20</sup> –20.71° (abs. alc.). III m. turbid 116°, clear 118°, [α]<sub>D</sub><sup>21</sup> in H<sub>2</sub>O 14.2° immediately after soln., 54–45° (const.) after 5 days. C. A. R.

**The preparation of mixed acylated sugars.** MAX BERGMANN AND F. K. V. KOCH. Kaiser-Wilhelm Inst. f. Leder-Forschung, Dresden. *Ber.* 62B, 311–3(1929); cf. Ohle and Spencker, *C. A.* 21, 63.—Just as O. and S. obtained from triacetyllevoglucosan with HBr-AcOH an acetobromoglucose which with MeOH and Ag<sub>2</sub>CO<sub>3</sub> gave the known tetraacetyl-β-methylglucoside, so tribenzoyllevoglucosan gives an *acetyltribenzoylglucose bromohydrin* (I) (not isolated), yielding with MeOH and Ag<sub>2</sub>CO<sub>3</sub> 6-acetyl-2,3,4-tribenzoyl-β-methylglucoside (II). On the other hand, with AgOAc was obtained 1,6-diacetyl-2,3,4-tribenzoylglucose (III). The proof of these structures is given in the following abstr. II (yield, 65%), m. 150–1° (cor.), [α]<sub>D</sub><sup>17</sup> –5.15° in (CHCl<sub>3</sub>)<sub>2</sub>, [α]<sub>D</sub><sup>20</sup> –6.5° in CHCl<sub>3</sub>, does not reduce Fehling soln. III, m. 172–3° (cor.), [α]<sub>D</sub><sup>17</sup> 24.75° in (CHCl<sub>3</sub>)<sub>2</sub>. C. A. R.

**Constitution of levoglucosan.** KARL JOSEPHSON. Kaiser-Wilhelm Inst. f. Leder-Forschung, Dresden. *Ber.* 62B, 313–6(1929); cf. preceding abstr.—It seemed possible that in the long continued reactions, carried out in the heat, by which Irvine and Oldham and Karrer and Smirnov apparently confirmed the structure assigned by Pictet to levoglucosan (I), there might have occurred a shifting of the O bridge and of a Me or Ac group which would invalidate the conclusions drawn as to the structure of I. In connection with certain investigations on some new acyl derivs. of glucose prep. from I (see following abstr.) it seemed desirable to establish as definitely as possible, by an independent method, the structure of I and the monoacetyltribenzoylmono-methylglucose (II) (see preceding abstr.) obtained from it. The new method, which confirmed the earlier formulation of I with a 1,6-O bridge, is based on the use of Helferich's Ph<sub>3</sub>C compds. of sugars. The trityl group was introduced into β-Me glucoside and the resulting 6-trityl deriv. (III) benzoylated to 6-trityl-2,3,4-tribenzoyl-β-methylglucoside (IV) from which the Ph<sub>3</sub>C group was removed by treating some hrs. at 0° with HBr in AcOH-CHCl<sub>3</sub>. Into the tribenzoylmethylglucoside thus obtained an Ac group was introduced in the 6-position with Ac<sub>2</sub>O in C<sub>6</sub>H<sub>6</sub>N, the product proving to be identical with II, which is therefore in all probability 6-acetyl-2,3,4-tribenzoyl-β-methylglucoside, as the danger of an acyl migration under such mild conditions must be very small; assuming that in the formation of II from I no unknown interchange of position of the groups has occurred, it may be concluded that I itself, in addn. to the 1,5-O bridge probably present in the β-Me glucoside, contains a 1,6-O bridge and is therefore glucosan- < 1,5 > < 1,6 >. IV, crystals with 1 MeOH, m. 99–100°. C. A. R.

**New acyl derivatives of glucose and of the β-methyl glucoside from levoglucosan.** KARL JOSEPHSON. Kaiser-Wilhelm Inst. f. Leder-Forschung, Dresden, and Univ. Stockholm. *Ber.* 62B, 317–21(1929); cf. preceding abstrs.—In attempts to split off the 6-Ac group only of 6-acetyl-2,3,4-tribenzoyl-β-methylglucoside (I) by treatment

with 1 or slightly more than 1 mol. alkali, about 0.5 of the I was recovered unchanged and from the sapon. products could be isolated only a *disbenzoyl-β-methylglucoside* (II). Probably, in the 2,3,4-tribenzoyl-β-methylglucoside (III), which is perhaps formed primarily, 1 of the Bz groups is very loosely held and rapidly split off by the alkali. The structure of II was established by analysis and by conversion with  $\text{Ac}_2\text{O} \cdot \text{C}_6\text{H}_5\text{N}$  into *diacetyldibenzoyl-β-methylglucoside* (IV) and with  $\text{BzCl} \cdot \text{C}_6\text{H}_5\text{N}$  into the tetra-Bz deriv. (V). The 6-acetyl-2,3,4-tribenzoylglucose bromohydrin obtained from levoglucosan with  $\text{HBr} \cdot \text{AcOH}$  gives with  $\text{BzOAg}$  a 6-acetyl-1,2,3,4-tetrazobenzoylglucose (VI); attempts to remove the 6-Ac group by mild acid hydrolysis resulted in the splitting off also of a Bz group (certainly that in position 1), giving a compd. (VII) which, if no migration has occurred in the acid hydrolysis, must be 2,3,4-tribenzoylglucose; with  $\text{Ac}_2\text{O} \cdot \text{C}_6\text{H}_5\text{N}$  it yielded a *diacetyltribenzoylglucose* (VIII) which, however, was apparently not homogeneous. II, m.  $167.5-8.5^\circ$  (cor.). IV, m.  $166^\circ$ , depresses the m. p. of II to  $150-1^\circ$ . VI, m.  $183-4^\circ$  (cor.). VII, m.  $189-91^\circ$  (cor.). VIII, sinters about  $167^\circ$ , m.  $178-83^\circ$ . C. A. R.

**Results of recent researches on the chemistry of natural humic acids.** BRETISLAV G. SRMEK. *Brennstoff-Chem.* 9, 381-5(1928).—A new method for sepn. and grouping of natural humic acids is developed. The groups are: (1) Ether-sol. resin acids, (2) EtOH-sol. hymatomelanic acid, (3) EtOH-insol., pyridine-sol. humus acids, (4) insol. residue. Relatively well defined nitro, halogen, amino and azo derivs. were prepd. The latter were coupled with β-naphthol and  $\text{PhNMe}_2$  to form dyes. The chem. behavior of natural humic acids studied indicates that they have aromatic structure.

J. D. DAVIS

**Progress in the chemistry of lignin and humic acids.** WALTER FUCHS. *Brennstoff-Chem.* 9, 363-5(1928); cf. C. A. 23, 1623.—Recent methods of attack involve direct treatment of the impure lignin without isolation from the wood in which it occurs, with such reagents as  $\text{Ac}_2\text{O}$ , Br and  $\text{HNO}_3$ . Derivs. are thus formed without destroying the original wood structure. By treating wood with  $\text{Ac}_2\text{O}$ , triacetylcellulose together with lignin acetate are formed. By complete bromination and isolation of the lignin by hydrolysis, it is found that practically all the Br originally entering the wood which is not removed by  $\text{AcONa}$  soln. is combined with the lignin. Stoichiometric relationships between Br compds. of lignin in which the Br is removable [by  $\text{AcONa}$ ] and those in which the Br is not removable indicate a tetrahydrobenzene ring as one of the elements of its structure. The mol. wt. of lignin is approx. 800. In the light of recent work lignin may be looked upon as a HO-rich (7-8 free groups) reduction product of wood-cell walls. The mol. also contains 4-5-MeO groups and one  $\text{CH}_2\text{C}=\text{O}$  group. The largest structural elements probably are: an unsatd. hexose complex, a p-substituted guaiacol complex, and tetrahydrobenzene. The fact that lignin and humic acids yield similar nitration products indicates that the latter was formed from the former in accord with the Fischer-Schrader theory of the lignitic origin of coal.

J. D. DAVIS

**Artificial humification of carbohydrates, particularly the conversion of cellulose into humic acids.** W. FUCHS. *Brennstoff-Chem.* 9, 400-2(1928).—Data available in the literature on humification of carbohydrates are assembled in tabular form. F. concludes from a critical study thereof, that by powerful chem. agents carbohydrates can be converted into humin-like compds. with good yields, but that yields of compds. similar to humic acids are small. The humic acids so obtained show little similarity to natural humic acids. Furthermore, it seems probable that the former were formed from simple sugars (e. g., glucose), present as decompn. products of cellulose, rather than from the cellulose itself or from "oxycellulose."

J. D. DAVIS

**Gossypol. V. Action of chromic acid upon some gossypol derivatives.** E. P. CLARK. U. S. Dept. Agr. *J. Am. Chem. Soc.* 51, 1475-8(1929); cf. C. A. 22, 2753.—Oxidation of 2 g. hexaacetyl-gossypol (I) in 50 cc. boiling AcOH with 10 cc. of a 10% aq.  $\text{CrO}_3$  by boiling 1 min. and then adding 100 g. ice gives 1.6 g. amorphous and 0.6 g. cryst. *tetraacetyl-gossypolone*,  $\text{C}_{33}\text{H}_{30}\text{O}_{12}$ , bright yellow, darkens  $210^\circ$ , and becomes a black mass at  $230^\circ$  without melting;  $n_D$  1.559,  $n_D$  1.676; the  $\text{PhNH}_2$  condensation product, chocolate-colored, m.  $255-6^\circ$  (cor.). Oxidation of I with Kiliani's  $\text{CrO}_3$  mixt. gives 29% of *tetraacetyl-pogossypolone*,  $\text{C}_{30}\text{H}_{28}\text{O}_{10}$ , sinters  $220^\circ$ , m.  $230^\circ$  (cor.).  $n_D$  1.530,  $n_D$  1.645. Oxidation of apogossypol hexa-Me ether with Kiliani's mixt. gives *tetramethoxypseudogossypolone*,  $\text{C}_{28}\text{H}_{34}\text{O}_8$ , yellow, m.  $210^\circ$  (cor.),  $n_D$  1.585,  $n_D$  1.700. VI. The action of boiling hydriodic acid as used in the Zeisel method upon gossypol and some of its derivatives. A semi-micro Zeisel methoxyl method. *Ibid* 1479-83.—In the Weishut-Zeisel MeO detn., gossypol and some of its derivs., although contg. no alkoxy groups, yield upon prolonged boiling a small quantity of AgI. The AgI thus

formed is responsible in some cases for the abnormally high values obtained in the Zeisel detn. of the MeO groups in several oxymethylgossypol derivs. The explanation is advanced that under the conditions of the Weishut-Zeisel detn. the gossypol nucleus is disrupted in such a manner as to yield an alkyl iodide, which, however, is not MeI. An app. is described and a procedure outlined for the detn. of MeO groups in samples of the order of 20 mg. In this method an ordinary anal. balance sensitive to 0.1 mg. is employed.

C. J. WEST

**Influence of sugars on the stability of bisulfite solutions.** ERIK HAGGLUND, with T. JOHNSON AND S. SILANDER. *Akad. Åbo (Finland). Ber.* 62B, 84-90(1929).—The influence of sugars on the stability of sulfites was briefly mentioned in a preliminary communication (*Ingeniörsvetenskaps-Akad. meddelanden* 1928, No. 86); 2 g. glucose in 100 cc. of  $\text{NaHSO}_3$  ( $\text{Na}_2\text{O}$  1%,  $\text{SO}_2$  4%) was found to accelerate the decompn.  $3\text{H}_2\text{SO}_3 = 2\text{H}_2\text{SO}_4 + \text{S} + \text{H}_2\text{O}$ . In the sulfite cooking of cellulose it is important that the sulfite should remain as stable as possible in order that the acidity of the cooking acid shall not become too high. It is therefore to be feared that with cooking acids produced partly from "wet relief" liquor, which may contain more or less large quantities of sugar, the quality of the cellulose may under certain conditions suffer, as has been verified (*C. A.* 23, 701). To study the influence of sugars sealed tubes contg. 3 g. glucose and 150 cc.  $\text{NaHSO}_3$  soln. (4.02 g.  $\text{SO}_2$ , 1.00 g.  $\text{Na}_2\text{O}$  or 0.082 g.  $\text{H}_2\text{SO}_4$ ) were heated to 135° and the contents analyzed at the end of 6 hrs. (when the max. temp. was attained), 9, 12, 15 and 18 hrs. After 10-12 hrs. (4-5 hrs. after the max. temp. had been reached) the content of  $\text{SO}_2$  suddenly decreased and that of  $\text{H}_2\text{SO}_4$  increased and at this point there was also a rapid increase in "loosely bound"  $\text{SO}_2$  which, however, greatly decreased later. At this stage considerable quantities of dithionic and polythionic acids are present in the soln. Control tubes without sugar also showed a decrease in  $\text{SO}_2$  after 18 hrs. but only about as much as after 6 hrs. in the sugar tubes. The sugar content, as measured with Fehling soln., continuously decreases to hardly more than 0.5 after 18 hrs. but there is every reason to believe that the decrease is only apparent and due to an oxidation, not a degradation, of the sugar. Expts. in which the "total"  $\text{SO}_2$  was kept const. and the  $\text{Na}_2\text{O}$  increased showed that the greater the sulfite concn., the more unstable is the bisulfite soln., just as would have been expected had there been no sugar present. The concn. of the sugar influences the velocity of the decompn., as was also to be expected. Mannose, xylose and arabinose have about the same effect as glucose, while fructose has a considerably weaker effect, noticeable only about 3 hrs. later than that of glucose. The acceleration of the sulfite decompn. very probably depends on the reactive C:O group of the sugars. That the  $\text{H}_2\text{SO}_4$  is not produced by reduction of the sugars by the  $\text{SO}_2$  is certain. The "catalytic" action probably consists chiefly in the increased ease of formation of those intermediate products (especially thiosulfate ions) in the sulfite transformation which make possible and accelerate the decompn., reduction of 1 part, with oxidation of another part, of the  $\text{SO}_2$  or  $\text{HSO}_3$  ion being necessary; it is conceivable that the reaction is facilitated by the formation of bisulfite compds. of the sugar.

C. A. R.

**Composition of gum arabic.** C. L. BUTLER AND LEONARD H. CRETCHER. *Mellon Inst. J. Am. Chem. Soc.* 51, 1519-25(1929).—Analysis of arabic acid (the ash-free gum from gum arabic cordofan from *Acacia senegal* (L.) Willd.) gave the following results: galacto-glucuronic acid 28.3%, hexose (as galactose) 29.5%, pentose (as arabinose) 34.4%, methylpentose (as rhamnose hydrate) 14.2%. Hydrolysis of 500 g. gum arabic,  $[\alpha]_D^{25} = -34.05^\circ$ , with 2%  $\text{H}_2\text{SO}_4$  by heating 20 hrs. and adding  $\text{CaCO}_3$  gave 64 g. of the Ca salt,  $[\alpha]_D^{25} 1.8^\circ$  (1.25 g. in 25 cc.  $\text{H}_2\text{O}$ ), of aldobionic acid; the liberated acid contained 79.5% acid and 20.5% lactone. Hydrolysis of the acid indicated that it was galactosoglucuronic acid. Rhamnose, *d*-galactose and *l*-arabinose have been identified in the sugar fraction of the hydrolysis product.

C. J. WEST

**The behavior of polysaccharides in solution. I. The solutions of glycogen in resorcinol.** R. O. HERZOG AND W. REICH. *Ber.* 62B, 495-9(1929).—Glycogen forms opalescent solns. in  $\text{H}_2\text{O}$ , but dissolves quickly at 120° in resorcinol, forming solns. which show no Tyndall effect. Quant. measurements show a particle size  $(\text{C}_6\text{H}_{10}\text{O}_5)_4$ . Glycogen recovered from its resorcinol soln. by dissolving out the resorcinol with alc. shows no difference from the original product used for the expts. The similar properties were checked by the degree of polarization in  $\text{H}_2\text{O}$ , non-reduction of Fehling soln., color with I, and diastase cleavage.

ARTHUR FLEISCHER

**The production and uses of tartaric acid.** G. MALCOLM DYSON. *Chem. Age (London)* 20, 331-3(1929)

E. H.

**Synthesis of truxinic and truxillic acids.** F. BACHM. *Univ. Rostock. J. prakt.*

*Chem.* **120**, 301-38(1929); cf. *C. A.* **22**, 2147.—Attempts to synthesize truxinic and truxillic acids by direct methods have generally been unsuccessful. Thus, attempted condensation of  $(\text{PhCHBr})_2$  and  $[\text{KC}(\text{CO}_2\text{Et})_2]_2$  yields  $(\text{PhCH:})_2$ ;  $\text{Bz}_2$ ,  $(\text{BrCHCO}_2\text{Et})_2$  with Zn give  $[\text{PhCH}(\text{OH})_2]_2$ ;  $\text{PhCH}[\text{CNa}(\text{CO}_2\text{Et})_2]_2$  and  $\text{PhCHCl}_2$  give  $\text{PhCH:C}(\text{CO}_2\text{Et})_2$ . Reduction of  $\text{PhCH:C}(\text{CO}_2\text{Me})_2$  with Al-Hg in MeOH gives about 20% of the 2 forms of  $[\text{PhCHCH}(\text{CO}_2\text{Me})_2]_2$ , m. 163-4° and 167-8°, resp. Di-Me di-H 3,4-diphenylcyclobutane-1,1,2,2-tetracarboxylate, m. 203-5°, after elimination of  $\text{C}_1$ , at 210°, gives, in addn. to Me  $\gamma$ -truxinate, a small amt. of Me  $\delta$ -truxinate, m. 75-6°. Thus, 2 of the 3 theoretically possible truxinates are obtained from the *dl*-diphenylbutanetetracarboxylates. The Me ester, m. 167-8°, is not convertible into a cyclobutane deriv., but on hydrolysis and elimination of  $\text{CO}_2$  it yields the high-melting (*meso*) form of  $\beta,\gamma$ -diphenyladipic acid, thus demonstrating that the original ester is probably the *meso*-form and that ring formation is not possible unless there is a swinging of the spatial configuration. Addn. of K to  $\text{PhCH:C}(\text{CO}_2\text{Me})_2$  in PhMe in a H atm. and decompn. of the resulting product with HCl, gives, in addn. to oily products, some  $[\text{PhCHCH}(\text{CO}_2\text{Me})_2]_2$ , m. 165-7°. The intermediate K deriv. does not appear to be identical with that derived from the ester and KOMe. Condensation of  $\text{Bz}_2$  with  $\text{CNCH}_2\text{CO}_2\text{Et}$  with piperidine or  $\text{Et}_2\text{NH}$  gives *Et desyldenecyanoacetate* (I), m. 141° (*Me ester* (II), m. 125°), also from  $\text{Bz}_2$  and  $\text{NCCHBrCO}_2\text{Et}$  with Zn in  $\text{C}_6\text{H}_6$ . When a relatively large amt. of base is used in the above condensation, by-products are obtained, 1 of which is probably *Et  $\alpha,\alpha'$ -dicyano- $\beta$ -benzoyl- $\beta$ -phenylglutarate*, m. 172°. Hydrolysis of I or II with  $\text{EtOH-KOH}$  affords *desyldenecyanoacetic acid* (III), m. 135°, while catalytic reduction with H in  $\text{EtOH}$  gives *Et(IV)* and *Me  $\alpha$ -cyano- $\beta$ -benzoyl  $\beta$ -phenylpropionate*, m. 83° and 118°, resp. Similar reduction of the Na salt of III in  $\text{H}_2\text{O}$  gives  *$\alpha$ -cyano- $\beta$ -benzoyl  $\beta$ -phenylpropionic acid*, m. 190° (decompn.). When bromodeoxybenzoin is condensed with  $\text{NCCHNaCO}_2\text{Et}$  IV results. IV, dissolved in piperidine or  $\text{Et}_2\text{NH}$ , gives a *compd.*, m. 150°, having the same compn. as IV. The analogous *compd.* from the Me ester, m. 152°. *Et  $\alpha,\beta$ -dibenzoylthane- $\alpha,\alpha,\beta,\beta$ -tetracarboxylate*, m. 91°. Attempts to reduce this caused elimination of the Bz groups. Both forms of  $(\text{PhCH}(\text{OH})\text{CH}_2)_2$  give with  $\text{PBr}_5$  the same Br deriv., m. 139°; the I deriv., m. 140°. The di-Br deriv., reduced with Zn with or without KI, gives KI, 1,2-diphenylcyclobutane (?).

C. J. WEST

**Anomalies of condensation and cyclization.** R. CORNUBERT AND CH. BORREL. *Compt. rend.* **188**, 919-21(1929).— $\alpha$ -Methyl- $\alpha'$ -benzyladipic acid is prepd. and sepd. by fractional crystn. into 2 isomers, m. 133-5° and 103-6°. Upon treating the first with  $\text{Ac}_2\text{O}$ , an almost theoretical yield of  $\alpha$ -methyl- $\alpha'$ -benzylcyclopentanone (I) is obtained. The 2nd treated in the same manner also yields I but a considerably greater time is required for the reaction. These 2 ketones, treated with  $\text{BzH}$  under the influence of HCl, give an excellent yield of the same pyrone deriv., m. 156.5°. The 2 ketones also yield the same semicarbazone, m. 188-9°, when treated in the cold.

R. P. WALTON

**Chemistry of the three-carbon system. XX. Cyclopentylidenemethyl ethyl ketone and cyclopentylidenemethyl ethyl ketone.** ALFRED H. DICKINS, WILFRED F. HUGH AND GEORGE A. R. KON. Imp. College Sci. Tech., London. *J. Chem. Soc.* **1929**, 572-80; cf. *C. A.* **23**, 96.—Cyclopentylidenemethyl *Et ketone* (I),  $b_{20}$  96°,  $d_4^{22.9}$  0.93179,  $n_D^{22.9}$  1.47801,  $[R_L]_D$  41.96 (calcd., 41.21), is obtained in about 30% yield, and isolated as the semicarbazone, m. 174°, the semicarbazidosemicarbazone, m. 215° (decompn.), also being formed.  $\Delta^1$ -Cyclopentenylmethyl *Et ketone* (II),  $b_{21}$  90°,  $d_4^{22.5}$  0.92429,  $n_D^{22.5}$  1.46509,  $[R_L]_D$  41.31 (calcd., 41.21), again isolated as the semicarbazone, m. 135°; condensation with  $\text{CHNa}(\text{CO}_2\text{Et})_2$  and hydrolysis give *cyclopentane-spiro-4-methylcyclohexan-3,5-dione*, m. 174-5°. The equil. mixt. of I and II contains 89.5% of the  $\alpha,\beta$ -ketone, which is probably too high because any error due to impurity of the  $\alpha,\beta$ -ketone would have a considerable effect. With  $\text{N-EtOH-EtONa}$ , equil. is reached in about 20 mins. The 2 Me ketones give an equil. mixt. contg. about 84% of the  $\alpha,\beta$ -ketone; the equil. is reached in about 10 mins.

C. J. WEST

**New phenolic combinations obtained by coupling chaulmoogric acid with resorcinol.** W. S. HINEGARDNER AND TREAT B. JOHNSON. Yale Univ. *J. Am. Chem. Soc.* **51**, 1503-9(1929).—Fusion of chaulmoogric acid (I) and  $m\text{-C}_6\text{H}_4(\text{OH})_2$  with  $\text{ZnCl}_2$  gave only 6% of an impure chaulmoogrylresorcinol (II). The dihydro deriv. of I gave 50% of dihydrochaulmoogrylresorcinol, m. 89.5°; using the acid chloride in the Friedel-Crafts reaction gave 70% of the same product; *oxime*, m. 169-70°. The acid chloride of I and  $m\text{-C}_6\text{H}_4(\text{OMe})_2$  with  $\text{AlCl}_3$  in  $\text{CS}_2$  give a mixt. of 1-chaulmoogryl-2-hydroxy-4-methoxybenzene (III), m. 65°, and -2,4-dimethoxybenzene (IV), m. 46°, sepd. by crystg. from EtOH and  $\text{Me}_2\text{CO}$ . III has  $[\alpha]_D^{25}$  6.98° (1.2967 g. made up to 50.1 cc.  $\text{CHCl}_3$ );

IV has  $[\alpha]_D^{25}$  18.78° (1.2470 g. made up to 27 cc.  $\text{CHCl}_3$ ); if the reaction temp. is kept at 30–5° and  $\text{AlCl}_3$  is added to the mixt., 40% of IV is obtained. The reaction between  $m\text{-HOC}_6\text{H}_4\text{OK}$  and the chloride of I gave *resorcinol dichaulmoograte*, b. 270–81°, m. 51°,  $[\alpha]_D^{25}$  45.93°. The chloride of I and  $m\text{-C}_6\text{H}_4(\text{OH})_2$  with  $\text{AlCl}_3$  in  $\text{CS}_2$  gave II, m. 83°,  $[\alpha]_D^{25}$  1.38° (1.284 g. made up to 50.8 cc.  $\text{CHCl}_3$ ); *oxime*, m. 161°. Reduction of I by the Clemmensen method gives *1-cyclopentyl-13-[2,4-dihydroxyphenyl]tridecane*, b. 245–7°, m. 68°; *4-Me ether*, m. 47.5°,  $[\alpha]_D^{25}$  6.15° (0.3890 g. made up to 27.1 cc.  $\text{CHCl}_3$ ); *2,4-di-Me ether*, b. 250–2°,  $d_4^{25}$  0.955,  $n_D^{25}$  1.5414,  $[\alpha]_D^{25}$  9.53° (1.070 g. made up to 10 cc.  $\text{CHCl}_3$ ). *1-Cyclopentyl-13-[2,4-dihydroxyphenyl]tridecane*, m. 73–4°. Preliminary expts. with I indicate a very low toxicity when given by mouth to rabbits or intramuscularly to rats; I exerts little bactericidal or antiseptic action against *B. thypusum*.

**Synthesis of chaulmoogric acid from hydnocarpic acid.** W. M. STANLEY AND ROGER ADAMS. Univ. of Illinois. *J. Am. Chem. Soc.* 51, 1515–8(1929).—Hydnocarpic acid was converted into the Et ester, b. 143–4°,  $d_4^{25}$  0.9087,  $n_D^{25}$  1.4582,  $[\alpha]_D$  70.5° (0.5186 g. made up to 25 cc. in  $\text{CHCl}_3$ ); reduction gave hydnocarpyl alc., b. 144–5°, m. 23°,  $d_4^{25}$  0.8022,  $n_D^{25}$  1.4709,  $[\alpha]_D$  75.2° (0.8592 g. made up to 15 cc. in  $\text{CHCl}_3$ ); the bromide, b. 156–7°,  $d_4^{25}$  1.0763,  $n_D^{25}$  1.4857,  $[\alpha]_D$  27.4° (0.7604 g. made up to 15 cc. in  $\text{CHCl}_3$ ); *di-Et hydnocarpylmalonate*, b. 182–3°,  $d_4^{25}$  0.9519,  $n_D^{25}$  1.4601,  $[\alpha]_D$  25.6° (0.6717 g. made up to 15 cc. in  $\text{CHCl}_3$ ); hydrolysis and splitting off of  $\text{CO}_2$  gives hydnocarpylacetic acid, identical with natural chaulmoogric acid.

**Nitration of phenylcyclohexane and of its *p*-halogen derivatives.** HORACE A. MAYES AND EUSTACE E. TURNER. Univ. of London. *J. Chem. Soc.* 1929, 500–8.—Cyclohexyl chloride (62 g.), 160 g.  $\text{PhCl}$  and 14 g.  $\text{AlCl}_3$  give 74 g. *p*-chlorophenylcyclohexane (I), b. 134°, b. 140°, b. 145°,  $d_4^{25}$  1.065,  $n_D^{25}$  1.5386. Oxidation gives *p*- $\text{ClC}_6\text{H}_4\text{CO}_2\text{H}$ . The *p*-Br deriv. (II), b. 160°,  $d_4^{25}$  1.283,  $n_D^{25}$  1.5584, results similarly in 65% yield. The *p*- $\text{NH}_2$  deriv., through the diazo reaction, gives the *p*-I deriv. (III), b. 185°, b. 174°,  $d_4^{19}$  1.448,  $n_D^{25}$  1.5900. Nitration of phenylcyclohexane in  $\text{AcOH}$  at 0° gives 62.2% of the *p*- $\text{NO}_2$  deriv., m. 57.5–8.5°; the *o*- $\text{NO}_2$  deriv., b. 174°,  $d_4^{23}$  1.111,  $n_D^{25}$  1.5472. With  $\text{HNO}_3$  (d. 1.5) at 0° there results the *p*- $\text{NO}_2$  deriv. and the *2,4-di-NO}\_2 deriv., pale yellow, m. 57°. *p*-Aminophenylcyclohexane, m. 55°, results almost quantitatively by reducing with Fe and very dil.  $\text{HCl}$ ; *Ac deriv.*, m. 129°; *2-NO}\_2* deriv., yellow, m. 65°, reduced to the *2,4-di-NH}\_2* deriv., m. 108° (*Ac deriv.*, m. 268°). I, added to 8 times its wt. of  $\text{HNO}_3$  (d. 1.5) at 0° to –5°, gives the *2,5-di-NO}\_2* deriv. (IV), m. 92°; *1-piperidino deriv.*, orange-yellow, m. 108°. Nitration of I in  $\text{AcOH}$  at 5–10° gives about 56% of the *3-NO}\_2* deriv. Nitration of II gives 38% of the *3-NO}\_2* compd. III and  $\text{HNO}_3$  give *p*- $\text{IC}_6\text{H}_4\text{NO}_2$ . *p*-Acetylphenylcyclohexane, m. 68–9°, in 60% yield from phenylcyclohexane,  $\text{AcCl}$ ,  $\text{AlCl}_3$  and  $\text{CS}_2$ ; *phenylhydrazone*, yellow, m. 105°. Oxidation gives *p*-cyclohexylbenzoic acid, m. 199° (*Na salt*, needles). Reduction of IV gives *1-chloro-2,5-diaminophenylcyclohexane*, m. 95–6°.*

**The ortho-para ratio in aromatic substitutions.** A. LAPWORTH AND R. ROBINSON. *Memors Proc. Manchester Lit. Phil. Soc.* 72, 43–52(1927).—A consideration of factors affecting the ortho-para ratio in aromatic substitutions; relation between constitutional conditions and rate of substitution in the *o*- and *p*-positions and cognate phenomena. It is assumed that the reaction of the reagent is cationoid and accordingly seeks the anionoid centers in the mol. of the aromatic substance; substitution will occur more rapidly at centers of relatively high electron density and availability. Highly negatively charged centers are not necessarily the more powerful anionoid centers because electrons may not tend to associate with sp. foreign nuclei. It is assumed that the ratio of the rates of completed substitution in 2 positions is equal to the ratio of electron availabilities in these positions. The elec. field in the mol. or surrounding medium due to the presence of the substituents control to a certain extent the availability of the electrons as shown in the diagram below.

If A is a group exerting a smaller attraction on electrons than H does, then, as the result of the potential gradient in the mol. field, the electron availability in the *o*-position will be greater than in the *p*-position; group B attracting electrons more strongly

than H will be the converse. Groups (e. g., Me) of the type A have a tendency to yield *o*-substitution products; groups (e. g., Cl, OMe) of the type B tend to form *p*-substitution products. If the side chain is modified in the direction of group A or group B the *ortho-para* ratio is correspondingly altered. Several reactions supporting these principles are cited.

J. T. WOLF

**Mobile anion tautomerism. III. Comparison of the activation of three-carbon anionotropic systems by alkyl and by aryl groups.** HAROLD BURTON. Univ. of Leeds. *J. Chem. Soc.* 1929, 455-8; cf. *C. A.* 22, 3403.—B. has shown that the activation of the 3-C anionotropic system (I)  $\text{PhCHXCH:CH}_2 \longrightarrow$  (II)  $\text{PhCH:CHCH}_2\text{X}$  by the Ph group causes a complete conversion of I into II in suitable solvents; the conditions for the change are dependent on the anionic stability of X and also on some mol. property of the solvent closely related to its dielec. const. In the system  $\text{MeCHXCH:CH}_2 \rightleftharpoons \text{MeCH:CHCH}_2\text{X}$  the mobility of X is much smaller; each alc. yields its own Ac deriv.; the *p*-nitrobenzoates resemble the acetates in their stability;  $\alpha$ -methylallyl *p*-nitrobenzoate, m. 43-4°, is unchanged after boiling for 6 and 24 hrs. with  $\text{Ac}_2\text{O}$ .  $\alpha$ -Phenyl- $\gamma$ -methylallyl alc.,  $b_{14}$  121.5-3.5°, results in 70% yield from  $\text{PhMgBr}$  and  $\text{MeCH:CHCHO}$ ; the *p*-nitrobenzoyl deriv. was an ill-defined solid, m. about 60°, which is also true of the deriv. from  $\text{PhCH:CHCH(OH)Me}$  (III); either alc. gives  $\gamma$ -phenyl- $\alpha$ -methylallyl acetate,  $b_{14}$  141-4°; hydrolysis gives III. This behavior shows the remarkable property of activating anionotropic systems possessed by the Ph group.

C. J. WEST

**The action of acetylene on benzene in the presence of aluminum chloride.** J. BÖRSEKEN AND A. A. ADLER. Techn. Univ., Delft. *Rec. trav. chim.* 48, 474-85 (1929).—The object of this research was to investigate whether a substance with a triple bond behaves like a substance with 2 sepd. or as one with 2 conjugated double bonds, when acted upon by benzene in the presence of a powerful catalyst such as  $\text{AlCl}_3$ . In this reaction with alkynes an addn. occurs:  $\text{C}_6\text{H}_6 + \text{C}_n\text{H}_{2n} \longrightarrow \text{C}_6\text{H}_5\cdot\text{C}_n\text{H}_{2n+1}$  while with unsatd. compds. with 2 sepd. double bonds the formation of diphenylalkylanes is to be expected. On the other hand, unsatd. compds. with conjugated systems undergo polymerization without reacting with the benzene (cf. B. and Bastet, *C. A.* 8, 1270; B. and Noorduyne, *C. A.* 10, 188). The results of the investigations, published already, on the interaction of  $\text{C}_2\text{H}_2$  with benzene in the presence of  $\text{AlCl}_3$ , are in contradiction with one another. Varet and Vienne (*Compt. rend.* 164, 1375 (1886)) obtained 80% styrene and 15%  $\text{Ph}_2\text{CHMe}$ ; while Cook and Chambers (*C. A.* 15, 1526) obtained only traces of these compds. and *meso*-dimethyldihydroanthracene as the principal product. Expts., carried out with  $\text{Al-HgCl}_2$  as a catalyst gave a small quantity of an oil,  $b_{760}$  265-85°, which behaved like the reaction product described by Cook and Chambers (l. c.). With  $\text{AlCl}_3$  prepd. from Al and HCl, the reaction always was very slow, an active catalyst, which provoked an energetic reaction, only being obtained from Al and dry  $\text{Cl}_2$ . On passing  $\text{C}_2\text{H}_2$  at about 20° during 5 hrs. through 110 cc. benzene contg. 30 g.  $\text{AlCl}_3$ , a reaction product was obtained, consisting of 50 cc. benzene and 65 g. of a bright yellow mass, contg. 4.9%  $\text{Al}_2\text{O}_3$ , and also some O, which is present in the form of water, which has entered the reaction product on decomp. this with water. The first mentioned results show already that 1 mol.  $\text{C}_2\text{H}_2$  has been fixed on 1 mol. benzene; this result was confirmed by analysis which showed an at. relation C:H = 6.7:6.6, allowance being made for the  $\text{Al}_2\text{O}_3$  and the water, bound chem in the reaction product. The latter being completely insol. in all org. solvents, its mol. wt. could not be detd. but interesting results were obtained on distg. it in a cathodic vacuum at 310°. Only during the beginning of the distn. a small amount of styrene may be collected in a receiver cooled with liquid air, while during the whole course of the distn. a brown viscous oil is collected in a receiver cooled with water. As styrene itself is polymerized in a quite different way in benzene under the influence of highly active  $\text{AlCl}_3$ , this compd. cannot be the intermediate compd. in the condensation process of benzene and  $\text{C}_2\text{H}_2$ , and B. and A. conclude, that under the influence of the  $\text{AlCl}_3$  a very active combination  $\text{C}_8\text{H}_8$  is formed which polymerizes to the reaction product obtained. This highly reactive compd.  $\text{C}_8\text{H}_8$ , called *protostyrene*, is still present in the reaction product in small quantity and is obtained as *styrene* by distn. in a high vacuum. This course of the reaction only takes place with a highly active catalyst; with less active catalysts the *protostyrene*, first formed, passes into *styrene* which polymerizes to polystyrenes while in the first case the *protostyrene* at once passes into *polyprotostyrenes*. It was expected, that, on replacing the benzene by a less reactive compd., e. g.,  $\text{PhCl}$ , the initial product of the reaction, the *protochlorostyrene*, would have time to pass into *chlorostyrene*, which condenses further to *polychlorostyrenes*, analogous to the products obtained from  $\text{C}_2\text{H}_2$  and benzene under the influence of mod-

erately active catalysts; i. e., these reaction products should be sol. in org. solvents, have a low mol. wt. and should *not* give any chlorostyrene on distillation. All these presumptions were verified by condensation expts. under the same conditions as those between benzene and  $C_6H_2$ , mentioned above, the mol. wt. of various reaction products being 713 and 295, resp., while not even a trace of chlorostyrene was obtained on distn. When *p*-chlorostyrene polymerizes in  $PhCl$  under the influence of  $AlCl_3$ , a quite analogous product was obtained with a mol. wt. of about 600. From these results it follows that the triple bond is to be compared in this respect with a single double bond.

C. F. VAN DUIN

Highly polymerized compounds. XIV. Polystyrene, a model of rubber. H. STAUDINGER, M. BRUNNER, K. FREY, P. GARBSCH, R. SIGNER AND S. WEHRLI. Eidgenöss. Tech. Hochschule Zürich and Univ. Freiburg i. B. *Ber.* 62B, 241–63 (1929); cf. C. A. 23, 822.—The investigation of polystyrene (previously designated as metastyrene) was undertaken because it promised to serve as a model for the structure of rubber, just as polymeric  $HCHO$  does for that of cellulose. Rubber and polystyrene must both be built up in the same way; both are hydrocarbons forming in org. solvents ( $C_6H_6$ ,  $CHCl_3$ ) highly viscous colloidal solns. In the solid state they are different, to be sure; polystyrene at room temp. is a hard tenacious glass extraordinarily difficult to work but at 100–20° becomes elastic and pliant; it may be compared to rubber cooled to a low temp. A direct elucidation of the constitution of rubber is difficult for a no. of reasons: (1) The possible relation between the most important properties of rubber and impurities (e. g., proteins); these are difficult to remove and there is no way of judging if the structure of the rubber is altered in the process of purification. (2) The differences between synthetic and natural rubber, possibly because in the polymerization of isoprene the isoprene mols. add to each other unsym. or, especially in the presence of catalysts, are altered by cyclization. (3) The autooxidizability of rubber. These complications are not to be feared with polystyrene; it is a pure hydrocarbon and its colloid nature can be due only to the peculiar structure of the mol., not to impurities; its mols. have a very simple structure as the individual mols. can combine with each other only in long chains; it is not autooxidizable. Contrary to Stöbke, there is not only 1 polystyrene; depending on the conditions of formation there are obtained products which are mixts. of members of a polymer-homologous series, i. e., of mols. of the same structure but of different lengths, having different phys. but the same chem. properties. Styrene polymerizes very slowly in the cold (months or yrs.) but more rapidly at higher temps. (in a few hrs. at 180°); even at 250° polymers can still be obtained, since depolymerization occurs only above 300°. The products obtained at the higher temps. have not the same properties as those prepd. in the cold. As the temp. of prepn. increases the products become more brittle (that prepd. at 240° can be powd. readily); the hardness changes very little, if at all, but the breaking strength is extraordinarily affected; the soly. is increased, the pulverizable products dissolving easily in  $Et_2O$  without previously swelling; the viscosity of the solns. decreases; the mol. wt. (in freezing  $C_6H_6$ ) decreases (values up to 8000–10,000 can be detd. with an accuracy of about 15%). Below are the properties of the products obtained at 240°, 190°, 160°, 130°, 75°, 15° (initial product of polymerization), 15° (copolystyrenes whose properties vary widely with their source), resp.: av. mol. wt. 3500, 6000, 6500, 10,000, 16,000, 20,000, about 100,000; av. degree of polymerization 33, 38, 62, 100, 150, 200, about 1,000; liquefying temp. 120–60°, 130–80°, 130–80°, 145–90°, 170–250°, 200–70°, 250–300°; time of flow of a 0.5 *N*  $C_6H_6$  soln. ( $t_f$  38.4 sec.) 59, 73, 81, 114, 356, 1000, not determinable;  $\eta$  in 0.2 *N* soln. ( $C_6H_6$  = 1) 1.22, 1.32, 1.38, 1.65, 3.19, about 7, 50–600; soly. in  $Et_2O$ , easily, easily, partially, partially, difficultly, difficultly, almost insol. The first 4 dissolve in  $C_6H_6$  without swelling, the next 2 swell somewhat, the last swells greatly. The first 3 are easily powd., the next 2 form a more viscous powder, the 6th viscous flocks which cannot be powd., the last an extraordinarily viscous mass. The first 5, which are classified as hemi-colloids, can also be obtained by polymerization in dil. soln. in the cold with  $SnCl_4$  and similar acid halides. A product so obtained, with av. mol. wt. 2500 and  $\eta$  1.16, was sep'd. by means of solvents into 5 fractions ranging from av. mol. wt. 1100,  $\eta$  1.09, to av. mol. wt. 13,000,  $\eta$  1.45. It might be concluded, from the soly. of the above products with mol. wts. 3000–10,000, i. e., contg. 30–100 *Ph* groups, that they are not mol. dissolved but as assocn. products of smaller mols. Their soly. is explained, however, by the fact that they are amorphous and cannot be compared with the paraffins; moreover they show the same mol. wts. in solns. of different concns. and also, as recently found by W. HILBER, in camphor as well as in  $C_6H_6$ ; finally, their sep'n. into different fractions shows that they are not assocn. products. The mols. of the eucolloids (estd.

mol. wt. 100,000–200,000), formed at the lowest temps., are assumed to be identical with the primary colloid particles and are designated macromols. The construction of polystyrene from such macromols. explains its peculiar phys. properties, as the macromols. possess especially powerful intermol. forces. As the result of their size they are unstable; heating "cracks" them. Thus, the viscosity of the 0.2 *N*  $C_6H_5$  soln. of such a product diminished from 370 to 108, 85, 30, 1.8 ( $C_6H_5 = 1$ ) on heating 60 hrs. at 130° and 160° and 24 hrs. at 187° and 240°, resp. This change in viscosity is irreversible. On the other hand, the viscosity of solns. of the hemi-colloids, whose mols. are relatively stable, does not change on heating. With the hemi-colloids of relatively low mol. wt. the viscosity of the solns. is proportional to the concn. whereas with those of mol. wt. 10,000 and higher the viscosity increases much more rapidly than the concn.; the mols. of the solute are so long that they obstruct the normal motions of the solvent mols. With polystyrene it has been possible for the first time to confirm experimentally Katz' views that swelling depends on the existence of large mols. and to follow quant. the relation between swelling and mol. wt.; the phenomenon of swelling is, as suggested by K., an intermol., not an intermolecular process. Polystyrene likewise affords for the first time a means of establishing that tenacity depends on mol. wt. As to the definite structure of the mols. nothing can as yet be said. The authors are inclined to believe that they are made of strings of styrene mols., the end valences of which unite to form a ring:  $CH_2 \cdot CHPh \cdot (CH_2 \cdot CHPh)_x \cdot CH_2 \cdot CHPh$ . Rubber is thought to be

similarly made of strings of some 1000 polyprene mols. bound to each other by normal covalences. **XV. Reduction of polystyrene.** H. STAUDINGER, E. GEIGER AND E. HUBER. *Ibid* 263–7.—From the fact that, unlike aliphatic polyvinyl compds and rubber, polystyrene depolymerizes on heating chiefly into monomeric styrene, it might be concluded that the individual styrene mols. in it are not bound to each other by normal valences but by supermol. forces, as assumed by Bergmann for polymeric carbohydrates. Such a conception is improbable in view of the existence of a whole series of polystyrenes with characteristic differences (see preceding abstr.) and the easy decompn. by heat can readily be explained in another way. Double bonds, as is well known, loosen substituents on an adjacent C atom and it is easy to see why

$CH:CH \cdot CH:CH \cdot CH:CCH_2 \cdot \vdots R$  should be more unstable than  $RCH:CHCH_2 \cdot \vdots R$ .

In harmony with this is the fact that hexahydropolystyrene (I) is much more stable than polystyrene and does not decomp. in as simple a manner. The I was prepd., like hydorrubber, from polystyrene with Ni at 250° and is a white powder with the properties of a hydroaromatic compd. (is not attacked by concd.  $H_2SO_4$  and gives no color with  $C(NO_2)_4$ ). It decomp. only at 350–400°, giving a mixt. of hexahydrostyrenes from which can be isolated a small quantity of the monomer but which consists chiefly of the di-, tri- and tetramers. Mol. wt. detns. indicate that I is a hemi-colloid with an av. mol. wt. of 3000–4000. It can be sep'd. into a more and a less easily sol. part, differing in mol. wt. and in the viscosity of their solns. C. A. R.

**Tetra-*p*-tolylethylene.** HENRY GILMAN AND FULTON B. FLICK. Univ. of Ames, Iowa. *Rec. trav. chim.* 48, 461–3 (1929).—In a reaction between toluene,  $CHCl_3$  and  $AlCl_3$ , Schwartz (*Ber.* 14, 1516 (1885)) obtained a hydrocarbon, m. 215°, to which he assigned the structure of tetra-*p*-tolylethylene. Later Elbs and Wittich (*Ber.* 18, 347 (1885)) showed that S.'s compd. must be a dimethylantracene, inasmuch as it could be readily and almost quant. oxidized to a dimethylantraquinone. Another compd., m. 151°, called tetra-*p*-tolylethylene, was obtained by Staudinger and Goldstein (*C. A.* 11, 597–8) when (*p*- $MeC_6H_4$ ) $_2CN_2$  was allowed to decomp. at room temp. in  $CS_2$ . It is now shown by G. and F. that the hydrocarbon of St. and G., m. 151°, is really tetra-*p*-tolylethylene; on oxidation with  $CrO_3$ - $AcOH$  it gave 67% of di-*p*-tolyl ketone and it was identical with the tetra-*p*-tolylethylene prep'd. in the following ways: (a) By heating the reaction product of (*p*- $MeC_6H_4$ ) $_2CHOH$  and  $HCl$  or  $HBr$ , alone or with pyridine; (b) By heating the blue thioketone from di-*p*-tolyl ketone and  $P_2S_5$  with  $Cu$ ; (c) By treating the di-*p*-tolyl ketene-quinoline compd. (cf. following abstr.) with di-*p*-tolyl ketene; (d) By reduction of di-*p*-tolyl ketone and *p*-tolylpinacol according to the method of Steinkopf and Wolfram. The structure of the compd., m. 151°, as tetra-*p*-tolylethylene is thus definitely established. C. F. VAN DUIN

**Di-*p*-tolyl ketene.** HENRY GILMAN AND CHESTER E. ADAMS. Univ. of Ames, Iowa. *Rec. trav. chim.* 48, 464–5 (1929); cf. preceding abstr.—In connection with the study on tetra-*p*-tolylethylene the prep'n. of di-*p*-tolyl ketene by means of a standard reaction had to be carried out. *p*-Tolualdehyde (*Ber.* 30, 1622 (1897); 31, 1149 (1898))

was converted into *p*-toluoin, which again was oxidized to *p*-tolil (cf. *Ber.* 22, 380 (1889)). By means of a slight excess of  $N_2H_4$  the *p*-tolil was converted into hydrazo-*p*-tolil (cf. Curtius and Kastner, *C. A.* 5, 2649 (1911)), which was oxidized to azo-*p*-tolil (cf. *Ibid.*). The benzene soln. of azo-*p*-tolil was dried and the benzene distd. off in a vacuum; the residue was then heated up to 80–90° until the evolution of N ceased. The reaction product was identified as di-*p*-tolyl ketene by its conversion into  $(p-MeC_6H_4)_2CHCO_2H$  by means of water and into  $(MeC_6H_4)_2CHCO_2Et$  with alc. The quinoline compd. of the reaction product yielded tetra-*p*-tolylethylene on treatment with di-*p*-tolyl ketone (cf. preceding abstr.).

C. F. VAN DUIN

**Nature of the alternating effect in carbon chains. XXX.** Nitration of phenylbromocyanonitromethane, with special reference to an alleged example of intramolecular *m*-rearrangement. JOHN WM. BAKER AND CHRISTOPHER K. INGOLD. Univ. of Leeds. *J. Chem. Soc.* 1929, 423–47; cf. *C. A.* 22, 4502.—The theoretical discussion shows that Flurschein and Holme's alleged evidence that  $PhCBr(NO_2)CN$  passes by intramol. migration of Br into *m*- $BrC_6H_4CH(NO_2)CN$  is valueless, that free Br is present under all conditions in which *m*-Br products, including *m*- $BrC_6H_4CBr(NO_2)CN$ , are formed, and that a large body of cogent evidence exists which points unmistakably to the conclusion that these *m*-Br products are formed by extramol. bromination of the nucleus. It follows from this that no "proved case" of the intramol. *m*-migration of a substituent from a side chain has as yet been discovered. The intramol. *m*-migration of a side-chain substituent and indirect *m*-substitution dependent upon this mechanism, are conceptions foreign to a theory of aromatic substitution, which postulates inductive *m*-deactivation in *m*-orientation. The formation of *o,p*-products through an internal change involving the migration of a substituent from a normally *m*-directing side chain is, however, possible on this theory, since it envisages tautomeric *o,p*-activation (but not *m*-). The available evidence favors the suggestion that in the lateral decompn. of  $PhCBr(NO_2)CN$  *p*- $NO_2$  products are formed in this way, the alleged contrary evidence of F. and H. having been controverted. The original should be consulted for the mass of exptl. evidence, presented in the form of tables. *m*-Bromobenzyltrimethylammonium bromide, m. 216°; picrate, m. 150°. Benzyltrimethylammonium bromide, m. 235°. *p*-Nitrophenylbromoacetone, m. 96°.

C. J. WEST

**Preparation of  $\beta$ -phenylethylamine derivatives (synthesis of 3-methoxy-4-ethoxy-1- $\beta$ -aminoethylbenzene).** T. KONDO, Y. SHINOZAKI AND S. ISHII. *J. Pharm. Soc. Japan* 48, 1166–9 (1928).—With K.'s method for the prepn. of homoveratrylamine (*C. A.* 22, 3414) good yields of 2,4-(MeO) $_2$ C $_6$ H $_3$ (CH $_2$ ) $_2$ NH $_2$ , 3,4-MeO(EtO)C $_6$ H $_3$ (CH $_2$ ) $_2$ NH $_2$  (I) and 4-MeOC $_6$ H $_4$ (CH $_2$ ) $_2$ NH $_2$  were obtained. The synthesis of I is given as an example. Twenty-seven g. 3,4-MeO(EtO)C $_6$ H $_3$ CHO and 9.2 g. MeNO in 100 cc EtOH are mixed with 14 g. KOH in 30 g. cold MeOH. After 1 hr. the above mixt. is poured into 10% HCl contg. some ice. Twenty-eight g. of 3,4-MeO(EtO)C $_6$ H $_3$ CHCHNO $_2$  (II), m. 150°, are obtained. Electrolytic reduction of II. Cathode, Pb plate. Cathodic fluid, 200 cc. 5% HCl to which a little EtOH and 5 g. of II are added. Anodic fluid, 20% H $_2$ SO $_4$ . Temp. 65°, 12 v., 5 amps. After the reduction is complete (3 hrs.), the soln. is made alk. and 3,4-MeO(EtO)C $_6$ H $_3$ (CH $_2$ ) $_2$ NH $_2$  is extd. with EtO and purified as the oxalate (III), decomp. 195°. Yield of the free base, obtained by the decompn. of III, 3 g. Chloroplatinate, decomp. 204°. Chloroaurate, m. 209° (decompn.).

NAO UYEI

**Action of acetic anhydride on Schiff bases.** M. PASSERINI AND M. PIA MACEN-TELLI. Reale Univ. Firenze. *Gazz. chim. ital.* 58, 641–6 (1928).— $PhCH:NPh$  (10 g.) boiled 6 hrs. with Ac $_2$ O (10 g.), cooled, a slight excess of satd. aq. Na $_2$ CO $_3$  added, filtered, washed with water and then with a little Et $_2$ O, and the residue crystd. from Et $_2$ O, yields 8 g. of the compd.  $PhAcN(:CHPh)OAc$ , m. 127–9°. It is easily decompd. by boiling with alkalis in MeOH, with aq. alk. carbonates, with dil. EtOH or even with water to BzH, PhNHAc and AcOH. At room temp. the dry compd. slowly hydrolyzes in air. Anisalaniline (5.5 g.) refluxed 2 hrs. with Ac $_2$ O (5.5 g.), cooled, satd. Na $_2$ CO $_3$  added, filtered, washed and recrystd. from EtOH, yields the compd.  $PhAcN(:CHC_6H_4OMe)OAc$ , m. 89–91°, hydrolyzes like the preceding compd. to PhNHAc, AcOH and anisaldehyde. The reaction between the 2-hydroxynaphthyl-1-glyoxal dianil and Ac $_2$ O was so slow that only after boiling for 8 hrs. did the reaction proceed far enough for analysis of the products. The initial product was an uncrystallizable pitch which, extd. with petr. ether and recrystd. from C $_6$ H $_6$ , yielded the compd. C $_{20}$ H $_{18}$ O $_3$ N, m. 155–7°. The yield was too small for extensive study, but its constitution was probably AcOC $_{10}$ H $_7$ C(:NPh)CHO or AcOC $_{10}$ H $_7$ C(:O)CH:NPh. The brown resin left from the petr. ether extrn. was extd. with C $_6$ H $_6$ , which yielded a small quantity of a rose-colored compd., m. 155–6°, which could not be identified. The residue from the C $_6$ H $_6$  extrn.,

treated with hot EtOH, and the EtOH ext. let stand several days, yielded a substance which recrystd. repeatedly from EtOH, yielded the *acetyl-2-hydroxynaphthyl-1-glyoxal dianil*,  $\text{AcO}(\text{C}_6\text{H}_4)_2\text{C}(\text{NPh})\text{CH}(\text{NPh})$ , m.  $185^\circ$ . In this reaction therefore the result hoped for was not obtained, the reaction with  $\text{Ac}_2\text{O}$  being only partial, with attack of only 1 of the 2 anil groups. C. C. DAVIS

**Elimination of the nitroso group from nitrosoamines.** WM. G. MACMILLAN AND THOMAS H. READ. Univ. of Aberdeen. *J. Chem. Soc.* 1929, 585-6.—The use of  $\text{CO}(\text{NH}_2)_2$  or  $\text{CS}(\text{NH}_2)_2$  is recommended for the removal of the NO group; 20 g. *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{NMeNO}$  and 15 g.  $\text{CO}(\text{NH}_2)_2$  in 75 cc.  $\text{H}_2\text{O}$  and 75 cc.  $\text{H}_2\text{SO}_4$  at  $50^\circ$  give 90-95% of the sec. amine; the *p*-deriv. is obtained in 80-90% yields;  $\text{CS}(\text{NH}_2)_2$  also gives 80-90% yields. Nuclear NO compds. were recovered unchanged. C. J. WEST

**New method for preparing substituted diphenylamines.** ARTHUR WM. CHAPMAN, Univ. of Sheffield. *J. Chem. Soc.* 1929, 569-72.—The method consists in hydrolysis of the acyl compds. obtained by heating *N*-arylaryliminoaryl ethers at  $200-300^\circ$  ( $\text{RC}(\text{OR}')\text{:NR}' \rightarrow \text{RC}(\text{NR}')\text{R}' \rightarrow \text{NHR}'\text{R}'$ ). The presence of "negative" substituents in the phenol facilitates the rearrangement of the imino ether, whereas in the amine their presence retards the change. When possible, it is preferable to employ the more acidic phenol and the more basic amine, so that the rearrangement may occur at the lowest possible temp. *N*-*o*-Chlorophenylbenziminio-2,4,6-trichlorophenyl ether (I), m.  $99-100^\circ$ ; heating for 2 hrs. at  $250-70^\circ$  gives the *Bz* deriv., m.  $131-2^\circ$ , of 2,4,6,2'-tetrachlorodiphenylamine, m.  $87-8^\circ$ . The *p*-Cl deriv. of I, pale yellow, m.  $121-2^\circ$ , rearranged after 2 hrs. at  $250-70^\circ$  to the *Bz* deriv., m.  $154^\circ$ , of 2,4,6,4'-tetrachlorodiphenylamine, m.  $63-4^\circ$ . *N*-2,4-Dichlorophenylbenziminio-2,4-dichlorophenyl ether, viscous oil, rearranged after 2 hrs. at  $280-300^\circ$  to the *Bz* deriv., m.  $153-4^\circ$ , of 2,4,2',4'-tetrachlorodiphenylamine, m.  $141-2^\circ$ . 2,4,6-Trichlorodiphenylamine, m.  $43-4^\circ$ . Chlorination of 50 g.  $\text{Ph}_2\text{NH}$  in 250 cc. AcOH until the gain in wt. is 40 g. gives 55 g. of (2,4- $\text{Cl}_2\text{C}_6\text{H}_3$ ) $_2\text{NH}$ ; if the gain in wt. is 60 g., there results a *hexa-Cl* deriv., m.  $138-9^\circ$ , probably the 2,4,6,2',4',6'-compd. C. J. WEST

**Influence of some substituent groups in the aniline molecule on the formation of isonitriles.** M. PASSERINI AND G. BANTI. Reale Univ. Firenze. *Gazz. chim. ital* 58, 636-40 (1928).—The influence of substituent groups in the  $\text{C}_6\text{H}_5$  nucleus on the formation of isonitriles by the Hofman reaction ( $\text{CHCl}_3$ , KOH and aromatic amines) was studied. It is already known that some groups, e. g., alkyl chains, do not influence the reaction, and *vice versa*. In the present work, the effects of  $\text{CO}_2\text{H}$ , OH,  $\text{NO}_2$ , CO, Br and arsonic acid groups were studied.  $\text{CHCl}_3$  (16 g.) added at  $60^\circ$  to a mixt. of *o*- $\text{H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$  (6 g.) and KOH (20 g.) in EtOH, the excess  $\text{CHCl}_3$  evapd., EtOH added, filtered, evapd. to dryness, dissolved in water, acidified with dil.  $\text{H}_2\text{SO}_4$  and filtered, leaves a small residue of *o*- $\text{HO}_2\text{CC}_6\text{H}_4\text{NHCHO}$ . Following the same procedure, but extg. the ppt. (by acidification) with  $\text{Et}_2\text{O}$ , and purifying with  $\text{Et}_2\text{O}$ , *p*- $\text{HOC}_6\text{H}_4\text{NH}_2$  yields a very little *p*- $\text{HOC}_6\text{H}_4\text{NHCHO}$ .  $\text{CHCl}_3$  (8 g.) added to *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{NH}_2$  (3 g.) in alc. KOH (10 g.), the excess  $\text{CHCl}_3$  and EtOH evapd., water added and extd. with  $\text{C}_6\text{H}_6$ , yields no reaction product, but only the original compds. in the  $\text{C}_6\text{H}_6$  ext. and in the  $\text{C}_6\text{H}_6$ -insol. part. Following the same procedure  $\text{CHCl}_3$  (5 g.), atoxyl (2 g.) and alc. KOH (7 g.) failed to react.  $\text{CHCl}_3$  (20 g.) refluxed with *p*- $\text{H}-\text{NC}_6\text{H}_4\text{Ac}$  (15 g.) in alc. KOH (25 g.), the excess  $\text{CHCl}_3$  and EtOH evapd., water added, extd. with  $\text{Et}_2\text{O}$ , the ext. agitated with dil. HCl, sepd., concd., the residue fractionally distd. *in vacuo*, yields *p*- $\text{AcC}_6\text{H}_4\text{NC}$  and diphenylformamidine. With the foregoing procedure, *o*- $\text{BrC}_6\text{H}_4\text{NH}_2$  (20 g.), KOH (48 g.), EtOH (120 g.) and  $\text{CHCl}_3$  (30 g.) were recovered for the greater part unaltered, with a very little liquid with odor of an *isonitrile*,  $b_{34}$   $125-7^\circ$ . The results show that  $\text{CO}_2\text{H}$ , OH,  $\text{NO}_2$  and arsonic acid groups inhibit the formation of isonitriles by the Hofman reaction, whereas the CO group has no influence on the reaction. A halogen group impedes but does not inhibit the reaction. C. C. DAVIS

**Nitration of *m*-acetamino-*tert*-butylbenzene.** JOHN B. SHOSMITH AND ALEXANDER MACKIE. Edinburgh Univ. *J. Chem. Soc.* 1929, 476-7; cf. Gelzer, *Ber.* 21, 2949 (1888).—*m*- $\text{Me}_2\text{CC}_6\text{H}_4\text{NHAc}$  and  $\text{HNO}_3$  (d. 1.46) at  $25-30^\circ$  during 15 mins. give the 4- $\text{NO}_2$  deriv., pale yellow, m.  $116^\circ$  (G. states that the 2- $\text{NO}_2$  deriv., m.  $105.5^\circ$ , results); hydrolysis gives 4,3- $\text{O}_2\text{N}(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{CMe}_3$ , m.  $91-2^\circ$  (G. gives  $124^\circ$ ); reduction to the diamine and condensation with phenanthraquinone gives phenanthra-*tert*-butylphenazine, yellow, m.  $148.5-9^\circ$  (G. gives  $144^\circ$ ), also obtained from 3,4- $\text{H}_2\text{N}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{CMe}_3$ . C. J. WEST

**Formation of heterocyclic compounds from ethylxanthicformate.** PRAPHULLA CHANDRA GUHA AND DEVENDRA NATH DUTTA. Dacca Univ. and Indian Inst. of Science, Bangalore. *J. Indian Chem. Soc.* 6, 65-82 (1929).— $\text{EtO}_2\text{CSCSOEt}$  (I) in

EtOH was cooled to 0° and PhNH<sub>2</sub> added. After standing 2-3 hrs. and after removal of excess PhNH<sub>2</sub>, there was obtained *thiodicarboxymonothiodiphenylamide*, PhNHCS-CONHPh, m. 63-4°, sol. in dil. alkali, insol. in dil. acid, decompd. by boiling with concd. HCl. Heated with FeCl<sub>3</sub> it forms an Fe salt. *Di-o-tolylamide*, from I and *o*-MeC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> in EtOH, m. 205°. *Di-p-tolylamide*, m. 85°, sol. in dil. alkali, insol. in dil. acid. *Di-m-nitranilide*, m. 105°, sol. in dil. alkali, insol. in dil. acid; *di-Ac deriv.*, m. 114-5°. *Di-p-nitranilide*, m. 95-6°, sol. in dil. alkali, insol. in acid. *Di-β-naphthylamide*, m. 90°, insol. in acid, sol. in alkali. H<sub>2</sub>NNHPh reacts with I in EtOH to give *Et monothiodiphenylcarbazinate* (II), PhNHNHCSOEt, m. 73-4°, sol. in alkali, insol. in acid. Heated with concd. HCl II gave NH.CO.S.CO.S (III), m. 135°, sol.

in alkali, pptd. by acid. II was decompd. when heated alone at 140-50° or when boiled with aq. KOH (20%). *p-Nitrophenylcarbazinate*, m. 108-9°, sol. in alkali, insol. in acid. When heated with concd. HCl it gave III. *Ethylphenylcarbazinate*, m. 242°. Reaction of *o*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> with I in EtOH gave *N-carbethoxy-o-phenylene-thiourea* (IV), m. 93-4°, sol. in dil. acid and caustic alkali, insol. in dil. NH<sub>4</sub>OH. Steam was passed through the filtrate from IV for 3-4 hrs. to remove oily matter; on cooling there sepd. *o*-phenyleneurea (V). Reaction of *o*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> with I at room temp. without any solvent gave *N-thiocarbethoxy-o-phenyleneurea* (VI), m. 122-3°, sol. in dil. alkali. Addn. of dil. NH<sub>4</sub>OH to the filtrate from VI gave a ppt. of IV. IV heated with 20% KOH for 30 mins. gave *o*-phenylenethiourea, m. 301-2°. VI heated with 20% KOH for 30 min. gave V. 1,2-C<sub>10</sub>H<sub>6</sub>(NH<sub>2</sub>)<sub>2</sub> (1.5 g.) was added to 2 g. I and the mixt. cooled with ice. After 15 mins. EtOH was added. The mixt. was allowed to stand at room temp. 3-4 hrs. The product was *4,5-naphthylene-2,7-endoxy-1,3,6-thioheptadiazine*, m. 250°, insol. in dil. acid and dil. alkali. With the same method, except that after 1 hr. the mixt. was heated for 2 hrs., the product was *1-carbethoxy-amtmonaphthyl-4,5-naphthylene-2,7-endoxy-1,3,6-heptatriazine*, m. 304°, insol. in dil. acid and in alkali. Action of 8 g. I with 2.4 g. C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> (VII) in EtOH with cooling gave *ethylene monothiodiurethan* (VIII), m. 110-1°, insol. in dil. acid and alkali. Reaction of I with VII without a solvent and at room temp. gave *ethylenethiourea* (IX), m. 193-1°, sol. in alkali; *HCl salt* m. 304-5°. Addn. of EtOH to the oily filtrate from IX gave VIII. VIII heated with concd. HCl for 30 min. or heated with aq. KOH (20%) at 60-70° gave IX. NH<sub>2</sub>CONHNH<sub>2</sub>. HCl dissolved in the least quantity of H<sub>2</sub>O was treated with anhyd. Na<sub>2</sub>CO<sub>3</sub> to liberate the free base. EtOH was added, and the soln. was then added to I. After 2 hrs. at room temp. the mixt. was heated 30 mins. The product was *Et semicarbazidemonothiocarboxylate*, H<sub>2</sub>NCONHNHCSOEt, m. 161°, sol. in dil. acid and alkali, decompd. by boiling with concd. HCl. I and H<sub>2</sub>NCSNHNH<sub>2</sub> were heated 1 hr. in alc. On cooling there sepd. *Et thiosemicarbazidecarboxylate* (X), m. 155-6°, sol. in dil. alkali, insol. in dil. acid. Heated with concd. HCl for 30 mins. X gave *2-amino-4-carboxylic-5-keto-4,5-dihydro-1,3,4-thiadiazole*, H<sub>2</sub>NC:N.N(CO<sub>2</sub>H).CO.S,

m. 189°, *benzylidene deriv.* m. 158-9°. I was allowed to react with NH<sub>2</sub>NHCSNHNHPh at room temp. for 2 hrs., then EtOH added and the mixt. heated 30 mins. The product was *Et 4-phenylthiosemicarbazidecarboxylate*, PhNHCSNHNHCO<sub>2</sub>Et, m. 149-50°, sol. in dil. alkali, pptd. by dil. acid. Prepd. in a similar way were the following: *Et p-tolylthiosemicarbazidecarboxylate*, m. 183-4°, insol. in dil. acid, sol. in alkali. *Et β-naphthylthiosemicarbazidecarboxylate*, m. 287-8°, sol. in alkali, pptd. by acid. I in EtOH was added to benzidine cooled in ice. The mixt. was allowed to stand at room temp. 2-3 hrs. and then heated for 30 mins. The product was *p,p'-diphenylmonothiodiurethan*, m. 211°, sol. in dil. alkali, insol. in dil. acid. I with tolidine gave *p,p'-ditolidylmonothiodiurethan*, m. 125-6°, sol. in alkali, insol. in acid.

LOUISE KELLEY

Preparation of *p*-azoxyanisole and derivatives. WM. DAVIES and RALPH A. R. DOWNS. Univ. of Melbourne. *J. Chem. Soc.* 1929, 586-7.—MeOH-MeONa (contg. 100 g. Na per l.) (69 cc.) and 31.5 g. *p*-ClC<sub>6</sub>H<sub>4</sub>NO<sub>2</sub> boiled 12 hrs., 51 cc. MeOH-MeONa added, MeOH distd. off, and the residue again boiled 12 hrs., give 64% of *p*-azoxyanisole. Similarly prepd. is 3,3'-dichloro-*p*-azoxyanisole, yellow, m. 182° (yield, 10.5 g. from 19.2 g. 1,2,4-Cl<sub>3</sub>C<sub>6</sub>H<sub>3</sub>NO<sub>2</sub>).

C. J. WEST

Formation of di-*p*-tolyl incidental to the preparation of benzylmagnesium chloride. The probable preliminary formation of free radicals in the preparation of Grignard reagents. HENRY GILMAN and JAMES E. KIRBY. Iowa State College. *J. Am. Chem. Soc.* 51, 1571-6 (1929).—Decompn. of a 1 mol. prepn. of PhCH<sub>2</sub>MgCl by iced HCl gives 72.1% PhMe, 3.1% (PhCH<sub>2</sub>)<sub>2</sub>, and 0.3% (*p*-MeC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>. PhCH<sub>2</sub>Cl and *p*-MeC<sub>6</sub>H<sub>4</sub>Cl (0.1 mol. each) with 0.2 mol. Mg gave, after decompn. of the reagent with CO<sub>2</sub>, 51% of PhCH<sub>2</sub>CO<sub>2</sub>H and 87.3% *p*-MeC<sub>6</sub>H<sub>4</sub>Cl. PhCH<sub>2</sub>MgCl and CuCl<sub>2</sub> give

70% of  $(\text{PhCH}_2)_2$  and a trace of  $(p\text{-MeC}_6\text{H}_4)_2$ ; 1 mol.  $\text{PhCH}_2\text{MgCl}$  and 0.44 mol.  $(\text{PhN})_2$  give 53.2%  $(p\text{-H}_2\text{NC}_6\text{H}_4)_2$  and 37% of  $(\text{PhCH}_2)_2$ ;  $\text{PhCH}_2\text{MgCl}$  and  $\text{HCHO}$  give 26.9%  $o\text{-MeC}_6\text{H}_4\text{CH}_2\text{OH}$  and a little  $(p\text{-MeC}_6\text{H}_4)_2$ . The presence of  $(p\text{-MeC}_6\text{H}_4)_2$  is advanced as additional evidence for the preliminary formation of free radicals in the prepn. of Grignard reagents.

C. J. WEST

**Diphenylaminearsonic acid. I. Derivatives of diphenylamine-4-arsonic acid.** HARRY J. BARBER. May and Baker, Ltd., Wandsworth. *J. Chem. Soc.* 1929, 471-6.—4- $\text{ClC}_6\text{H}_4\text{AsO}_3\text{H}_2$  with  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$ , heated 1 hr. on the  $\text{H}_2\text{O}$  bath, gives 85% of the 3- $\text{NO}_2$  deriv. (I); Ca salt, needles; Ba salt, plates. Heating 28 g. I in 2 N  $\text{NaOH}$  (50 cc.) and  $\text{H}_2\text{O}$  (150 cc.) with 10 g.  $\text{PhNH}_2$  16-20 hrs. on a steam bath gives nearly quant. 2-nitrodiphenylamine-4-arsonic acid, purified through the Na salt, fine yellow needles; reduction with  $\text{Fe}(\text{OH})_2$  at 80-90° gives 80% of the 2- $\text{NH}_2$  deriv. (II), m. 170.5°, turns blue in the air; HCl salt, needles, readily hydrolyzed by  $\text{H}_2\text{O}$  and slowly loses HCl in air; attempts to recryst. from  $\text{Me}_2\text{CO}$  gives the compd.  $\text{C}_{16}\text{H}_{17}\text{O}_3\text{N}_2\text{As}$ , which is either the 2-isopropylidene deriv. or *N*-phenyl-2,2-dimethyl-2,3-dihydrobenzimidazole; treatment of the base with  $\text{HNO}_2$  gives quant. *N*-phenylbenzotriazole-5-arsonic acid. The Ac deriv. (III) of II, diamond-shaped plates, on boiling with 2 N HCl gives *N*-phenyl-2-methylbenzimidazole-5(6)-arsonic acid. I and  $p\text{-H}_2\text{NC}_6\text{H}_4\text{OH}$  give 2-nitro-4'-hydroxydiphenylamine-4-arsonic acid, reddish brown needles; 2- $\text{NH}_2$  deriv., gray needles very susceptible to atm. oxidation; 4'-hydroxy-1-phenyl-1,2,3-benzotriazole-5-arsonic acid, needles. 2-Nitro-4'-acetamidodiphenylamine-4-arsonic acid, red needles; 2- $\text{NH}_2$  deriv., flat needles; this yields a di-Ac deriv., needles. Hydrolysis gives the 2,4'-di- $\text{NH}_2$  deriv., slender prisms. 2-Nitro-3'-acetamido-4'-hydroxydiphenylamine-4-arsonic acid, yellow needles; 2- $\text{NH}_2$  deriv., needles. 2'-Carboxy-2-nitrodiphenylamine-4-arsonic acid, yellow needles. *o*- and *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{NH}_2$  do not condense with I. Nitration of III gives a 2',4'(?)-di- $\text{NO}_2$  deriv., yellow needles. 3,3'-Diamino-4,4'-dianilinoarsenobenzene and the 4,4'-di-*p*-Ac deriv. were prepd. by reduction of the arsonic acids; they are both yellow amorphous powders, which oxidize rapidly in the air. A table is given of the tolerated dose and the curative dose for the above compds. The introduction of an unsubstituted Ph group in the 4- $\text{NH}_2$  group of 3,4-( $\text{H}_2\text{N}$ ) $_2\text{C}_6\text{H}_3\text{AsO}_3\text{H}_2$  results in a very marked increase in toxicity, despite the lower As content and somewhat greater trypanocidal effect. Substitution in the non-arsenated Ph nucleus results in modification of the toxicity and curative action, which follows, in general, that of similar substitutions in  $\text{PhAsO}_3\text{H}_2$ . The introduction of an Ac group in the  $\text{NH}_2$  group results in a decrease of both toxicity and curative action.

**Organic derivatives of silicon. XXXVIII. Formation of tri- and tetraphenylsilicane and complex synthetic products from octaphenylcyclotetrasilicetetrane.** FREDERICK S. KIPPING AND ARTHUR G. MURRAY. Univ. College, Nottingham. *J. Chem. Soc.* 1929, 360-7; cf. *C. A.* 22, 3401.—Destructive distn. of cryst. octaphenylcyclotetrasilicetetrane gave tetraphenylsilicane, m. 235.6°, and triphenylsilicane, oil which does not solidify at 0°. The residue of the distn. contains about 20% Si (2Si:3Ph) and with the aid of solvents may be sepd. into fractions having graded properties, some of which have mol. wts. probably exceeding 4000. Octaphenylsilicetetrane, treated as above, also yields  $\text{Ph}_4\text{Si}$  and  $\text{Ph}_3\text{SiH}$  but does not yield the cyclic isomer.

C. J. WEST

**Compounds of the tryparsamide type. I. Resolution of *N*-phenylalanine-4-arsonic acid and of its amide.** CHARLES S. GIBSON, JOHN D. A. JOHNSON AND BARNETT LEVIN. Univ. of London. *J. Chem. Soc.* 1929, 479-88.—dl-*N*-Phenylalanine-4-arsonic acid (I), decomp. 207-10°, is obtained from  $\text{EtCHBrCO}_2\text{H}$  and atoxyl; soly. 0.5% in cold, 6% in boiling  $\text{H}_2\text{O}$ ; Et ester, m. 175.7° (decompn.); Me ester, m. 181° (slight decompn.); amide, m. 233-40°. Attempted reduction of I gave no definite products. Brucine salt, crystals with 7  $\text{H}_2\text{O}$ ,  $[\alpha]_{5461}^{20}$  -10.61° ( $\text{H}_2\text{O}$ , *c* 1.1446); decompn. of this salt gives d-I, m. 220-1° (decompn.),  $[\alpha]_{5461}^{20}$  -56.40° (as di-Na salt, *c* 0.8562); the mother liquors of the brucine salt gave the l-I, with  $[\alpha]_{5461}^{20}$  -55.94° (di-Na salt, *c* 0.8942). d-Et ester, decomp. 275-6°,  $[\alpha]_{5461}^{20}$  127.9° (EtOH, *c* 0.4464), 103.0° (as Na salt, *c* 0.4118); l-Et ester,  $[\alpha]_{5461}^{20}$  -125.8° (EtOH, *c* 0.7132), -102.8° (Na salt, *c* 0.3960). d-Me ester, m. 277-8° (decompn.),  $[\alpha]_{5461}^{20}$  117.6° (Na salt, *c* 0.6194); l-Me ester,  $[\alpha]_{5461}^{20}$  -116.3° (Na salt, *c* 0.4982). The Me esters were converted into the amides; l-amide, m. 242-3° (decompn.);  $[\alpha]_{5461}^{20}$  -13.3° (Na salt, *c* 0.6114); d-amide acid,  $[\alpha]_{5461}^{20}$  13.9° (Na salt, *c* 0.6536). The quinine salt of the amide acid has  $[\alpha]_{5461}^{20}$  -123.8° ( $\text{H}_2\text{O}$ , *c* 0.2412); decompn. of the salt gave an amide acid

with  $[\alpha]$   $-17.88^\circ$  and the mother liquor an amide acid with  $[\alpha]$   $16.5^\circ$ . These results indicate that racemization takes place during the conversion of the active ester into the amide and also during the hydrolysis of the amide to the acid. C. J. WEST

**Action of aromatic Grignard reagents on arsenic trioxide.** F. F. BLICKER AND F. D. SMITH. Univ. of Michigan. *J. Am. Chem. Soc.* **51**, 1558-65 (1929).—A reaction mechanism has been suggested to account for the products which are formed from the interaction of aromatic Grignard reagents and  $As_2O_3$ . Improved methods have been described for the prepn. of  $(Ph_2As)_2O$ ,  $[(p-MeC_6H_4)_2As]_2O$ ,  $[(p-MeOC_6H_4)_2As]_2O$  and  $[(\alpha-C_{10}H_7)_2As]_2O$ . *Tetra-p-biphenylarsyl oxide*, m.  $150-2^\circ$ . In the reaction of  $PhMgBr$  and  $PhAsO$ , a large excess of  $PhMgBr$  favors the formation of  $Ph_3As$ . The following new halides were prepd.: *di-p-tolylarsyl bromide*, m.  $65-6^\circ$ ; *iodide*, m.  $64-5^\circ$ ; *di-p-anisylarsyl bromide*, m.  $60-2^\circ$ ; *iodide*, m.  $40-2^\circ$ ; *di- $\alpha$ -naphthylarsyl bromide*, m.  $172-3^\circ$ ; *iodide*, m.  $140-1^\circ$ ; *dibiphenylarsyl chloride*, m.  $145-7^\circ$ ; *bromide*, m.  $147-9^\circ$ ; *iodide*, m.  $140-1^\circ$ . C. J. WEST

**Reaction of organic mercury compounds with organic halides.** II. FRANK C. WHITMORE AND E. N. THURMAN. Northwestern Univ. *J. Am. Chem. Soc.* **51**, 1491-503 (1929); cf. *C. A.* **17**, 2276.—Org. halides (32) of widely varying types have been treated with  $(p-MeC_6H_4)_2Hg$  and some of them with  $Bu_2Hg$  and  $Ph_2Hg$ . In general the Hg compds. are extraordinarily unreactive toward the halides studied. With the 5 halides which gave definite reactions the behavior of the Hg compds. was analogous to that of other types of bases with the same halides. In most cases it was necessary to heat the solns. at  $110^\circ$  for about 300 hrs. to bring about the reactions; even under these conditions 18 of the halides were recovered unchanged, while 7 others gave tarry products which could not be purified.  $CHBr(CO_2Et)_3$  and  $(p-MeC_6H_4)_2Hg$  give  $p-MeC_6H_4HgBr$ ,  $CH_2(CO_2Et)_2$ ,  $p-MeC_6H_4Br$  and a small quantity of an ester  $b_p$  205-10°; the products sepd. accounted for 91% of the starting materials.  $Ph_2CHBr$  and  $(p-MeC_6H_4)_2Hg$  give 80% of  $p-MeC_6H_4CHPh_2$ ; with  $Ph_2Hg$ , 90% of  $Ph_3CH$  was obtained; with  $Bu_2Hg$  there results  $BuHgBr$ , Hg, a trace of  $HgBr$ , a little  $(Ph_2CH)_2$  and 35% of  $Ph_2CHBu$ .  $Me_3CBr$  and  $(p-MeC_6H_4)_2Hg$  in  $CCl_4$  react almost quant. to give  $p-MeC_6H_4HgBr$ ,  $PhMe$  and  $Me_2C:CH_2$ ;  $Ph_2Hg$  gave similar results but seemed to react slightly more rapidly than the tolyl compd.  $EtMe_2Cl$  gave similar results with  $(p-MeC_6H_4)_2Hg$  and  $Ph_2Hg$ ; when an excess of iodide was used with  $(p-MeC_6H_4)_2Hg$  the products were  $HgI_2$ ,  $PhMe$  and  $Me_2C:CHMe$ .  $(EtO_2C)BrCHCH(CO_2Et)_2$  and  $(p-MeC_6H_4)_2Hg$  give  $(EtO_2C)_2C:CHCO_2Et$ , 9-Bromofluorene and  $(p-MeC_6H_4)_2Hg$  give  $p-MeC_6H_4HgBr$  and bisdiphenylacetylene;  $Ph_2Hg$  behaves similarly.  $PhCH=CHBrPh$  and  $(p-MeC_6H_4)_2Hg$  give  $PhCH:CHPh$ ,  $p-MeC_6H_4Br$  and  $p-MeC_6H_4HgBr$ . 2,4,6-( $O_2N$ ) $_3$  $C_6H_2HgCl$  and I give picryl iodide as does  $[2,4,6-(O_2N)_3C_6H_2]_2Hg$ . C. J. WEST

**Rearrangement of phenyl benzyl ethers.** WALLACE F. SHORT AND MARTIN L. STEWART. Univ. of New Zealand. *J. Chem. Soc.* **1929**, 553-9; cf. *C. A.* **22**, 1966.—van Alphen (*C. A.* **22**, 410) considers that the rearrangement of  $PhOCH_2Ph$  is intramol. but S. and S. consider it to be intermol. because (a) 2,4-( $PhCH_2$ ) $_2$  $C_6H_3OH$  is one of the main products under all the conditions tried; (b)  $PhOCH_2Ph$  is attacked by  $HCl$  at  $100^\circ$ , forming  $PhCH_2Cl$  and  $PhOH$ ; the necessity for a catalyst and the absence of  $(PhCl)_2$  show that the  $PhCH_2$  does not migrate as a free radical; (c) when the rearrangement is carried out in the presence of  $PhOMe$ , more than half of the  $PhCH_2$  becomes attached to the  $PhOMe$  nucleus.  $PhONa$  and  $PhCH_2Cl$  in dry  $PhMe$  give  $PhOH$ , 2- $HOC_6H_4CH_2Ph$  (I),  $PhOCH_2Ph$  and 2,6-dibenzylphenol,  $b_p$  237.5-8° (benzyl ether, m.  $65^\circ$ ;  $\alpha$ -naphthylurethan, m.  $165-6^\circ$ ). A modified method is given for the prepn. of 4- $HOC_6H_4CH_2Ph$  (II). The benzyl ether of I m.  $38^\circ$ ; of II,  $49.5^\circ$ . II, Na,  $PhCH_2Cl$  and  $PhMe$  give 36% of 2,4-dibenzylphenol (III),  $b_p$  252-4° ( $\alpha$ -naphthylurethan, light yellow, m.  $143-4^\circ$ ).  $PhOCH_2Ph$  was rearranged under 3 conditions; heating 100 g. with 40 g.  $ZnCl_2$  at  $160^\circ$ , with 2 g.  $ZnCl_2$  and  $HCl$  at  $100^\circ$  and with  $HCl$  alone at  $100^\circ$ , the 1st for 1 hr., the last 2 for 3 hrs. The following products, in g., were obtained:  $PhOH$ , 23.8, 13.4, 25.0;  $PhCH_2Cl$ , —, —, 9.0; I, 9.0, —, 7.6; II, 19.4, 28.4, 12.6; III, 40.4, 15.0, 12.6; resinous material, 27.4, 36.6, 33.2. Condensation of  $PhOMe$  and  $PhOH$  with  $PhCH_2Cl$  and rearrangement of  $PhOCH_2Ph$  in the presence of  $PhOMe$  give the following products: I and II, 17.0, 14.0; III, 6.6, 12.6; 4- $MeOC_6H_4CH_2Ph$ , 21.7, 28.5; 2,4-( $PhCH_2$ ) $_2$  $C_6H_3OMe$ , 1.9, 3.4; partition of  $PhCH_2Cl$ ,  $PhOMe/PhOH$ , 1.07, 1.35. 2- $HOC_6H_4OMe$  and  $PhCH_2Cl$  with  $ZnCl_2$  give 2-hydroxy-4-methoxydiphenylmethane, m.  $77^\circ$ ,  $b_p$  200°. C. J. WEST

**Some aromatic compounds containing tellurium.** F. P. MAZZA AND E. MELCHIONNA. Inst. of Org. Chem. and Pharm. of R. Univ. Naples. *Rend. accad. sci. Napoli* [3], **34**, 54-9 (1928).—Org. Te compds. are of interest because of their possible

application in therapy. Org. compds. of S, Se and Te are chem. very similar. Selenoindigo, prepd. by Lesser and Weiss (C. A. 6, 2737) by oxidation of 3-hydroxyselenonaphthene, resembled Friedländer's thioindigo. M. and M. could not obtain telluroindigo similarly. They found the prepn. of  $K_2Te$  inconvenient and the yield poor from KOH and  $H_2Te$  (made by Ernyei's method, Z. anorg. Chem. 25, 314, by electrolysis of 50%  $H_2SO_4$  with a Te cathode). Hence they made  $Na_2Te$  by Hugot's method (Compt. rend. 134, 1209; 136, 1709). Six g. powd. Te, 3 g. Na and excess liquid  $NH_3$  were cooled in liquid air and left 24 hrs. with frequent agitation in a large test tube closed with glass wool in a steel autoclave with a side tube. The excess  $NaNH_3$  was filtered through the glass wool into the side tube. The cooling and filtering were repeated 2-3 times. The  $Na_2Te$  in the tube was quickly dissolved in  $H_2O$  deprived of air and to it were added the calcd. amt. of  $Na_2CO_3$  (no air), and, shaking in a current of  $H_2$  and cooling with ice, a soln. of diazotized anthranilic acid (6 g. acid in 11 cc. concd. HCl and 3 g.  $NaNO_2$  in the smallest amt. of  $H_2O$ ). The red soln. was heated to the b. p. a few mins., filtered hot and acidified with HCl.  $H_2Te$  was evolved, and *diphenyl-tellurodi-o-carboxylic acid* (I),  $(HOOCCH_2)_2Te$ , yellow microcrystals, m.  $215^\circ$ , sep'd. *Di-Na salt*, white anhyd. prisms. I reduced with excess of hot 10% KOH and powd. Zn, filtered into the calcd. amt. of  $CH_2ClCO_2Na$ , heated 15 mins. to the b. p., acidified with  $H_2SO_4$ , gave *phenyl-telluroglycolic-o-carboxylic acid* (II),  $HOOCCH_2TeCH_2COOH$ , m.  $195^\circ$ . Refluxed 2 hrs. with  $NaOAc$  (equal wt.) and  $Ac_2O$  (8 parts), the  $Ac_2O$  distd. off, the residue boiled with 10% NaOH, filtered, cooled, acidified with HCl, (II) lost  $CO_2$ , forming 3-hydroxytelluronaphthene (telluro-2-hydroxybenzofuran),  $C_8H_7TeCH_2COH$ ,

yellowish white powder, decomp. at  $160^\circ$  and m.  $200^\circ$ , sol. in alk. hydroxides and yielding an Ac deriv. It could not be oxidized to telluroindigo. J. D S

Study of the germicidal activity of diaryl sulfide phenols. GUIDO E. HILBERT AND TREAT B. JOHNSON. Yale Univ. J. Am. Chem. Soc. 51, 1526-36 (1929). —  $p$ - $MeOC_6H_4SPh$  (cf. Hinsberg, Ber. 36, 107 (1903)),  $b_p$   $194-5^\circ$ , results in 10% yield from  $PhOH$  and  $PhSO_3H$ , followed by  $Me_2SO_4$ ; demethylation by  $HBr$  and  $Ac_2O$  gives 68.5% of  $p$ - $HOC_6H_4SPh$ ,  $b_p$   $164-5^\circ$ , monoclinic, m.  $50-1^\circ$ , soly. in  $H_2O$  34 parts in 100,000; *nitrobenzoate*, yellow, m.  $74-5^\circ$ . The structure was established by heating with 21%  $HBr$ - $AcOH$  at  $60^\circ$  for 20 hrs., giving  $p$ - $BrC_6H_4OH$  and  $Ph_2S_2$ . Heating 32 g.  $PhSO_3H$  and 11.5 g.  $PhOH$  on the water bath for 2 hrs., shaking with  $Na_2CO_3$ , steam distg. to remove  $PhOH$ , acidifying with  $HCl$ , extg. the oil which seps. with  $Et_2O$  and distg., gives directly 30% of pure  $p$ - $HOC_6H_4SPh$ . Oxidation of  $p$ - $MeOC_6H_4SPh$  with  $H_2O_2$  in  $AcOH$  gives 52% of the sulfone, m.  $90-1^\circ$ , hydrolyzed by  $HBr$  in  $Ac_2O$  to the  $p$ - $HOC_6H_4SO_3Ph$ , m.  $136-7^\circ$ .  $p$ - $MeOC_6H_4SPh$  is also obtained from  $PhSO_3Cl$  and  $p$ - $MeOC_6H_4MgBr$  in 31.6% yield and in 66% yield by a modification of Ziegler's method (Ber. 23, 2469 (1890)).  $o$ - $MeOC_6H_4SPh$ ,  $b_p$   $150-2^\circ$ ;  $o$ - $HOC_6H_4SPh$ ,  $b_p$   $140^\circ$  (*p*-nitrobenzoate, yellowish green, m.  $72-3^\circ$ ). *m*-Methoxydiphenyl sulfide, from  $PhSNa$  and *m*- $MeOC_6H_4N_2X$ ,  $b_p$   $156^\circ$  (34.7% yield). *m*-Hydroxydiphenyl sulfide,  $b_p$   $159-61^\circ$  (*p*-nitrobenzoate, yellow, m.  $103^\circ$ ). *p*-Methoxy-*p'*-methylidiphenyl sulfide,  $b_p$   $181-2^\circ$ , m.  $45-6^\circ$ ; *p*-HO deriv., m.  $67-8^\circ$ . The comparative  $PhOH$  coeffs. are:  $p$ - $HOC_6H_4SO_3Ph$ ,  $< 10$ ;  $o$ - $HOC_6H_4SPh$ , 33;  $p$ - $HOC_6H_4SC_6H_4Me$ , 50; *m*- $HOC_6H_4SPh$ , 68;  $p$ - $HOC_6H_4SPh$ , 115. The min. lethal dose of  $p$ - $HOC_6H_4SPh$  for small rabbits is 1.5 g. per lb. A comparison is given of the antiseptic strength of  $PhOH$  and  $p$ - $HOC_6H_4SPh$ . C. J. WEST

Salicylaldehyde and its methyl ether. MAURICE COPISAROW. Univ. of Manchester. J. Chem. Soc. 1929, 588-9. — (*o*- $MeC_6H_4$ ) $_2CO_3$  (in 83% yield from passing  $COCl_2$  into 108 g. *o*- $MeC_6H_4OH$  and 42 g.  $NaOH$  in 300 cc.  $H_2O$  at  $70-5^\circ$ ) gives a di-Cl deriv. which could not be purified; 380 g. of this product, 1200 cc.  $MeOH$  and 260 g.  $NaOH$  in 500 cc.  $H_2O$ , heated 1 hr. at  $100^\circ$ , give 50% of *o*- $HOC_6H_4CHO$ . Combined hydrolysis and methylation gives 38% *o*- $MeOC_6H_4CHO$  and 13% of *o*- $HOC_6H_4CHO$ . C. J. WEST

Polyhydroxychalcones, polyhydroxyhydrochalcones and polyhydroxyflavanones. II. Synthesis of naringenin and sakuranetin. J. SHINODA AND S. SATO. Tokushima Higher Tech. School. J. Pharm. Soc. Japan 48, 933-7 (1928). — In a previous publication (C. A. 23, 836) S. and S. reported on the synthesis of polyhydroxyflavanones. Employing the same method S. and S. succeeded in synthesizing naringenin (I) and sakuranetin (II).

gave naringenin di-Me ether (III), m.  $118^\circ$ , which did not depress the m. p. ( $117^\circ$  of sakuranetin mono-Me ether (Asahina, Shinoda and Inubuse, C. A. 22, 1692). and  $NH_2OH \cdot HCl$  gave an oxime, m.  $231^\circ$ . I (1 mol.) in  $Et_2O$  and  $CH_3N_2$  (1 mol.)

gave sakuranetin (IV), m. 150°, which did not depress the m. p. of natural sakuranetin. The oxime of IV, m. 195–6°, did not depress the m. p. of the oxime prepd. from natural sakuranetin. III. Synthesis of hesperetin. J. SHINODA AND M. KAWAGOE. *Ibid* 938–41.—Isovanillin in NaOH and  $\text{ClCO}_2\text{Et}$  gave isovanillin Et carbonate (I), m. 61–2°. I, malonic acid, pyridine and piperidine gave  $\text{EtO}_2\text{COC}_6\text{H}_4\text{MeCH:CHCO}_2\text{H}$  (II), m. 199°. II and  $\text{SOCl}_2$  gave the chloride (III), of II. III and phloroglucinol in  $\text{PhNO}_2$  with  $\text{AlCl}_3$  gave a compd. (IV), m. 227–8°, which did not depress the m. p. of natural naringenin, m. 225°. The oxime of IV, m. 229–30°, gave a dark violet color with  $\text{FeCl}_3$ .

F. I. NAKAMURA

**Influence of substituents on the Reimer-Tiemann reaction.** HERBERT H. HODGSON AND THOMAS A. JENKINSON. Tech. College, Huddersfield. *J. Chem. Soc.* 1929, 469–71; cf. *C. A.* 22, 949.—With 2 methods of isolating the HO aldehydes (in the 1st, the *o*-deriv. was removed by steam and detd. as the *p*-nitrophenylhydrazone, while the *p*-deriv. was detd. in the residue in the same manner; in the 2nd method, the reaction mixt. was dissolved in AcOH and divided into 2 parts, 1 of which was steam distd and the *o*-deriv. detd., while the total aldehydes were detd. in the 2nd half (the 2nd method is considered more reliable)), the following ratios of *o*/*p*-HO aldehydes were found: PhOH, 0.72, 0.6; *o*- $\text{MeC}_6\text{H}_4\text{OH}$ , 0.56, 0.48; *m*- $\text{MeC}_6\text{H}_4\text{OH}$ , 0.52, 0.46; *o*- $\text{ClC}_6\text{H}_4\text{OH}$ , 2.1, 1.6; *m*- $\text{ClC}_6\text{H}_4\text{OH}$ , 0.79, 0.71; *m*- $\text{BrC}_6\text{H}_4\text{OH}$ , 0.94, 0.72; *m*- $\text{IC}_6\text{H}_4\text{OH}$ , 0.94, 0.78. These results indicate that the *p*-position in PhOH is more reactive than the *o*. The influence of Cl in the 5-position is probably exerted in its combined general (direct) and inductive effects, since then the 4-position would be deactivated more than the 2-position; this view is supported by the behavior of *m*- $\text{MeC}_6\text{H}_4\text{OH}$ .

C. J. WEST

**Scission of diaryl ethers and related compounds by means of piperidine.** II. The nitration of 2,4,4'-trichlorodiphenyl ether and of 2,4-dichlorodiphenyl *p*-toluenesulfonate and benzoate. LESLIE G. GROVES, EUSTACE E. TURNER AND GLADYS IRENE SHARP. Univ. of London. *J. Chem. Soc.* 1929, 512–24; cf. *C. A.* 21, 2673.—2,4- $\text{Cl}_2\text{C}_6\text{H}_3\text{OH}$  is obtained in 80% yield from *p*- $\text{ClC}_6\text{H}_4\text{OH}$ ; the *p*-toluenesulfonate, m. 125°; nitration gives 2,4-dichloro-5-nitrophenyl *o*-nitro-*p*-toluenesulfonate (I), m. 103°; reduction with Fe and a little AcOH gives the diamino deriv., m. 159–61°; the diazo soln., with  $\text{CuCl}\cdot\text{HCl}$ , gives a red gum which, refluxed 3 hrs. with piperidine, gives 2,4,5- $\text{Cl}_3\text{C}_6\text{H}_2\text{OH}$ , m. 66–7°. 1-*p*-Toluenesulfonylpiperidine, m. 103°; *o*- $\text{NO}_2$  deriv. (II), pale greenish yellow, m. 112°. Heating I with  $\frac{1}{2}$  of its wt. of piperidine for 1.5 hr. at 100° gives II and 2,4-dichloro-5-nitrophenol (III), m. 105–6°. *N*-2,4-Dichlorophenylphthalimide, m. 155°;  $\text{HNO}_3$  in concd.  $\text{H}_2\text{SO}_4$  gives the 5- $\text{NO}_2$  deriv., pale yellow, m. 217–9°, saponif. by 90%  $\text{H}_2\text{SO}_4$  to 2,4,5- $\text{Cl}_2(\text{O}_2\text{N})\text{C}_6\text{H}_2\text{NH}_2$ . 2,4- $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{Cl}$  and 2,4- $\text{Cl}_2\text{C}_6\text{H}_3\text{OH}$  in KOH give 2,4-dichloro-2',4'-dinitrodiphenyl ether, pale greenish yellow, m. 118–9°; nitration gives the 5,2',4'-tri- $\text{NO}_2$  deriv., m. 128°; scission with piperidine gives III, while  $\text{PhNH}_2$  gives III and 2,4- $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{NHPH}$ . 4,4'-Dichloro-2-aminodiphenyl ether, m. 67°, results in 90% yield by reduction of the  $\text{NO}_2$  deriv. with Fe and a little AcOH; through the diazo reaction there results 2,4,4'-trichlorodiphenyl ether,  $b_p$  183°, m. 54–5°; 2'- $\text{NO}_2$  deriv., m. 86–7°, decompd. by piperidine into 2,4- $\text{Cl}_2\text{C}_6\text{H}_3\text{OH}$  and 4-chloro-2-nitrophenylpiperidine. The 5,2'-di- $\text{NO}_2$  deriv., pale yellow, m. 103–4°, is decompd. by piperidine to give III. 2,4,4'-Trichloro-5,2'-diaminodiphenyl ether, m. 93–4°. 2,4,4'-Trichloro-5,2,5'-trinitrodiphenyl ether, yellowish green, m. 155–7°; piperidine gives III and 4-chloro-2,5-dinitrophenylpiperidine, red, m. 70–1°. 4-Chloro-2,6-dinitrophenylpiperidine, golden, m. 165–6°, results from 4,2,6- $\text{Cl}(\text{O}_2\text{N})_2\text{C}_6\text{H}_2\text{OMe}$ . 2,4-Dichloro-5-nitrophenyl *m*-nitrobenzoate, m. 154°; 2,4-dichlorophenyl *m*-nitrobenzoate, m. 115–6°, gives the same product on nitration. 2,4-Dichloro-6-nitrophenyl *m*-nitrobenzoate, m. 149–50°, was prepd. for purposes of comparison. Chlorination of *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{OH}$  gives 2,4-dichloro-3-nitrophenol, pale yellowish green, m. 85–7°; *p*-5-chloro-2-nitrophenyl deriv., m. 122°, reduced by Fe and a little AcOH to the 3- $\text{NH}_2$  deriv., m. 113–14°; the diazo soln., treated with  $\text{CuCl}\cdot\text{HCl}$  and the crude product heated with piperidine, gives 2,3,4-trichlorophenol, m. 80–1°, identical with that obtained by chlorinating 3,4- $\text{Cl}_2\text{C}_6\text{H}_3\text{OH}$ . III does not react with  $\text{SOCl}_2$  and gave no definite product with  $\text{PCl}_5$ . 4,5,1,2- $\text{Cl}_4\text{C}_6\text{H}_2(\text{NO}_2)_2$  and  $\text{PhOK}$  give 4,5-dichloro-2-nitrodiphenyl ether, yellow, m. 69–70°. 4,5,4'-Trichloro-2-nitrodiphenyl ether, pale yellow, m. 131–2° decompd. by piperidine, giving 4-chloro-2-nitrophenylpiperidine. 4,5,2',4'-Tetrachloro-2-nitrodiphenyl ether, pale yellow, m. 125–6°; the 2- $\text{NH}_2$  deriv. m. 97–8°.

C. J. WEST

**The products of autocondensation of the ethyl esters of hexahydro- and  $\Delta^4$ -tetrahydroanthranilic acid.** F. P. MAZZA (with MARIA FERRAJOLO). Univ. Naples. *Rend. accad. sci. Napoli* [3], 33, 229–36(1927); cf. *C. A.* 21, 2468.—By autocondensation the

Et esters of hexahydro- and  $\Delta^4$ -tetrahydroanthranilic acid give products similarly as  $H_2NCH_2CO_2H$  gives diketopiperazine. *Anhydride of the dipeptide of hexahydroanthranilic acid (I)* (by allowing Et hexahydroanthranilate to stand for several weeks), colorless, fatty to the touch; *Ag salt*, white, giving Ag hexam. 300–5° (decompn.), boiling with  $H_2O$ ; *Cu salt*, azure; *di-Ac deriv.*, m. 210–1°. By hydroanthranilate on boiling with  $H_2O$ ; *Cu salt*, azure; *Et ester-HCl*, m. 210–1°. By boiling with 25% KOH for 5 mins. I was transformed to hexahydroanthranilic acid. *Dipeptide of hexahydroanthranilic acid (II)* (from I with 10 parts of N NaOH at room temp. for 15 to 20 mins. and acidifying with 10 parts of N HCl), decomp. about 250°, temp. for 15 to 20 mins. and acidifying with 10 parts of N HCl, decomp. about 200°; *free ester*, m. 102°; *Cu salt* (with 2  $H_2O$ ), azure; *Et ester-HCl*, decomp. about 200°; *free ester*, m. 102°, giving I on heating to about 150° or allowing it to stand in  $H_2O$ . On boiling I with fuming HCl for 2 or 3 mins. the HCl salt of II (with 1  $H_2O$ ), m. about 200°, was obtained. *Anhydride of the dipeptide of  $\Delta^4$ -tetrahydroanthranilic acid (III)* (prepd. similarly to I), m. 280°, white; *Ag salt*, white, decomp. on boiling with  $H_2O$ , giving Ag anthranilate; *Cu salt*, azure. By boiling with 25% NaOH in a  $H_2$  current, III was decompd. to  $\Delta^4$ -tetrahydroanthranilic acid. *Dipeptide of  $\Delta^4$ -tetrahydroanthranilic acid*, m. 270°, colorless, was prepd. similarly to II; *Cu salt*, azure; *Et ester-HCl*, m. 220–5° (decompn.); *free ester*, m. 106–8°, colorless, giving III by heating it to 110–5°. Et  $\Delta^2,6$ -dihydroanthranilate did not undergo autocondensation.

**Relative affinitive capacities of several radicals as exhibited in the rearrangement of trisubstituted ethylene oxides.** JEANNE LÉVY AND A. TABART. *Compt. rend.* 188, 402–4 (1929); cf. C. A. 20, 2850.—L. and T. detd. the relative affinitive capacities of certain radicals by studying the rearrangement by heat of several trisubstituted ethylene oxides,  $PhCH.O.CRR'$ . This rearrangement follows the rupture of one of the bonds

of the bridging O; the position of the rupture is detd. by the value of the affinitive capacity of R and R'. (1)  $Ph-CH-C=Me_2 \rightarrow Ph-CH-C=Me_2 \rightarrow OHC-$

In (2) one of the radicals, R and R', migrates exclusively or in large part. The rearrangement products have been isolated and identified by comparison with synthetic substances of known constitution. Following are the rearrangements. Relative affinitive capacities of radicals are indicated in parentheses and the migrating radicals are in italics.  $PhCH.O.CMe_2$  gives  $PhMe_2CCHO$ ; ( $Ph + H < Me +$

$Me$ ).  $PhCH.O.CEt_2$  gives  $PhEt_2CCHO$  and  $PhEtCHCOEt$ ; ( $Ph + H = Et + Et$ ).

$PhCH.O.CMeEt$  gives  $PhMeEtCCHO$  and  $PhEtCHCOMe$ ; ( $Ph + H = Me + Et$ ).

$PhCH.O.CMePr$  gives  $PhMePrCCHO$  and  $PhMcCHCOPr$ ; ( $Ph + H = Me + Pr$ ).

$PhCH.O.C(CH_2Ph)Me$  gives  $Ph(PhCH_2)CHCOMe$ ; ( $Ph + H > Me + PhCH_2$ ).

$PhCH.O.C(CH_2Ph)Et$  gives  $Ph(PhCH_2)CHCOEt$ ; ( $Ph + H > Et + PhCH_2$ ).

$PhCH.O.C(CH_2Ph)Pr$  gives  $Ph(PhCH_2)CHCOPr$ ; ( $Ph + H > Pr + PhCH_2$ ).

$PhCH.O.C(CH_2Ph)_2$  gives  $Ph(PhCH_2)CHCO(CH_2Ph)$ ; ( $Ph + H > PhCH_2 + PhCH_2$ ).

The affinitive capacity of Ph associated with H is less than that of 2 Me radicals, about equal to that of 2 Et radicals or of Me and Et or of Me and Pr, greater than that of 2 acyclic radicals of which one or both are  $PhCH_2$ . The acyclic radicals which migrate by preference (2) are always those of low affinitive capacity.

**Mobility of symmetrical triad (prototropic) systems. IV. Mobility in the simple three-carbon system terminated by aryl groups.** CHRISTOPHER K. INGOLD AND CHARLES W. SHOPPEE. Univ. of Leeds. *J. Chem. Soc.* 1929, 447–55; cf. C. A. 23, 121.— $p$ -MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CH·CHPh (I),  $b_p$  211 3°,  $n_{D_{461}}^{26}$  1.60194;  $p$ -MeOC<sub>6</sub>H<sub>4</sub>CH·CHCH<sub>2</sub>Ph

(II),  $b_{14-18}$  211–5°,  $n_{D_{461}}^{26}$  1.60659; no interconversion occurs in the presence of hot dil. alkali; on ozonolysis each isomer yields exclusively products corresponding to its constitution. Interconversion was effected in 1.45 *N* EtOH-NaOEt at 85°; the equil. mixt. contains 29.5% I and 70.5% II; velocity coeff. ( $k_1 + k_2$ ) = 0.79 hr.<sup>-1</sup>;  $k_1/k_2$  = 0.42;  $k_1$  = 0.23;  $k_2$  = 0.56. *p*-MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>C(CO<sub>2</sub>H):CHPh (III), m. 165.5°; *p*-MeOC<sub>6</sub>H<sub>4</sub>CH: C(CO<sub>2</sub>H)CH<sub>2</sub>Ph (IV), m. 171.5°; interconversion was effective by heating either acid with NaOEt for various times up to 48 hrs. The equil. mixt. contains 44% III and 56% IV; f. p. of mixts. of III and IV are given. Since the numerical data cannot be expressed as velocity coeffs., the Me and Et esters were studied. *Me α-p-methoxybenzylcinnamate*,  $b_{14-18}$  237–8°,  $n_{D_{583}}^{19}$  1.58904,  $n_{D_{583}}^{19}$  1.59084,  $n_{D_{461}}^{19}$  1.60221; *Et ester*,  $b_{14-18}$  235°,  $n_{D_{583}}^{22}$  1.58334,  $n_{D_{461}}^{22}$  1.58972; *Me p-methoxy-α-benzylcinnamate* (V),  $b_{11-12}$  245°, m. 55°; *Et ester* (VI),  $b_{10-11}$  240–1°, m. 45°; alk. hydrolysis of the esters showed that no interconversion of isomers takes place in the presence of HO ions at 100°. The interconversion of the Me esters was slow, so that the Et esters were studied. The Et esters gave an equil. mixt. contg. 43.5% V and 56.5% VI; velocity coeff.,  $k_1 + k_2$  (mean) 0.0585 hr.<sup>-1</sup>;  $k_1/k_2$  = 0.770;  $k_1$  = 0.0255;  $k_2$  = 0.0330.

C. J. WEST

**Phenylhydroxymaleic anhydride.** J. BOUGAULT AND BL. LEROY. *Compt. rend.* 188, 921–3(1929); cf. *C. A.* 10, 1984.—PhC:C(OH).CO.O.CO, (I), reacts with amines

giving products only slightly sol. in ether. These combinations are all cryst. and have a definite m. p. Accordingly, I constitutes a valuable reagent for the characterization of amines.

R. P. WALTON

**1,3-Dimethyl-2-phenoxyacetic acid.** RALPH L. BROWN AND BRIANT F. BRANTING. Bureau of Mines. *Reports of Investigations, Dept. of Commerce*, No. 2912 (1929).—Hydroxyacetic acid derivs. of phenols are easily prepd. in good yield and are useful in studying mixts. of phenols. 1,3-Dimethyl-2-phenoxyacetic acid (I) is the 5th of 6 isomeric derivs. to be reported in the literature. The consts. of all 5 isomers are given. To 3 g. of 2,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>OH, of which the constitution had been definitely established, was added 3.3 g. ClCH<sub>2</sub>CO<sub>2</sub>H and 11 cc. of 25% NaOH. The mixt. was refluxed 2 hrs., acidified with HCl and filtered. On cooling, the filtrate gave 3.9 g. of I, m. 141° after recrystn.

MARGARET W. MCPHERSON

**Coumarin condensations. I. Condensation of allylacetoacetic ester with phenols.** KIRVERJI GOSAI NAIK, RANCHHODJI DAJIBHAI DESAI and HARIBHAI RANCHHODJI DESAI. The College, Baroda. *J. Indian Chem. Soc.* 6, 83–7(1929); cf. *C. A.* 20, 1965.—Condensation of phenols with allylacetoacetic ester (I) gave the following *benzo-α-pyrone*s: 7-hydroxy-3-allyl-4-methyl, 3.8 g. from 2 g. *m*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub> (II), 3 g. I and 20 g. concd. H<sub>2</sub>SO<sub>4</sub>, m. 221–2° (*Ac deriv.*, m. 152–3°); 3-allyl-4,7-dimethyl, 3.2 g. from 3 g. *m* cresol, 3 g. I and 10 g. concd. H<sub>2</sub>SO<sub>4</sub>, yellowish white, m. 126–7°; 5,7-dihydroxy-3-allyl-4-methyl, 2 g. from 1.5 g. anhyd. 1,3,5-C<sub>6</sub>H<sub>3</sub>(OH)<sub>3</sub>, 1.5 g. I and 10 g. H<sub>2</sub>SO<sub>4</sub>, pale brown, m. 207–8° (*Ac deriv.*, m. 130–1°); 7,8-dihydroxy-3-allyl-4-methyl, 2.5 g. from 2 g. 1,2,3-C<sub>6</sub>H<sub>3</sub>(OH)<sub>3</sub>, 2 g. I and 1.5 g. POCl<sub>3</sub>, m. 175–6° (*Ac deriv.*, m. 145–6°). The product obtained by condensing II with I in AcOH with dry HCl as condensing agent m. 200–1° and is probably 7-hydroxy-3-chloropropyl-4-methylbenzo-α-pyrone; *Ac deriv.*, m. 122–3°; *Bz deriv.*, m. 193°. Condensation of α-C<sub>10</sub>H<sub>7</sub>OH (2 g.) with I (2 g.) in the presence of concd. H<sub>2</sub>SO<sub>4</sub> (20 g.) gave 3 g. 3-allyl-4-methyl-5,6-naphtho-α-pyrone, yellowish white, m. 155–6°. PhOH gave with I no solid product; *o*-C<sub>6</sub>H<sub>4</sub>(OH)<sub>2</sub>, guaiacol, thymol, β-C<sub>10</sub>H<sub>7</sub>OH and quinol did not undergo condensation with I.

LOUISE KELLEY

**Menthol studies. II. Menthyl esters of the 2-nitro-4-carboxyphenylarsonic and phenylarsenious acids.** K. LUCILLE MCCLUSKEY. Chicago Municipal Tuberculosis Sanitarium. *J. Am. Chem. Soc.* 51, 1462–5(1929); cf. *C. A.* 21, 907.—Directions are

1. the arsonic acid in H<sub>2</sub>O by SO<sub>2</sub>-KI gives 2-nitro-4-carboxyphenyldihydroxyarsine, light yellow, does not melt or decomp. below 290°. Refluxing I with SOCl<sub>2</sub> for 1 hr. and treating the chloride with menthol gives the menthyl 2-nitro-4-carboxyphenylarsenite, light yellow, which does not melt sharply but evolves a gas above 100°. Oxidation of this ester with H<sub>2</sub>O<sub>2</sub> in Me<sub>2</sub>CO gives the corresponding arsonate, decomp. 210–1°; Na salt crystallizes with 4 H<sub>2</sub>O; both the hydrated and anhyd. forms are very sol. in H<sub>2</sub>O.

C. J. WEST

Optical activity and the polarity of substituent groups. X. Influence of ionizable

groups on the rotatory power of *l*-menthyl benzoate. H. GORDON RULE and W. EOGHAN MACGILLIVRAY. Univ. of Edinburgh. *J. Chem. Soc.* 1929, 401-9; cf. *C. A.* 22, 3405.—*l*-Menthyl salicylate, from the acid chloride and menthol in 60% yield,  $b_{D,1}$  156°; the *m*-hydroxybenzoate,  $b_{D,1}$  182° (20% yield); *p*-hydroxybenzoate, pale yellow,  $b_{D,1}$  178° (10% yield); reduction of the *o*-nitrobenzoate gives the *anthranilate*,  $b_{D,1}$  156°,  $m$ . 62.5-3.5°; *HCl* salt,  $m$ . 150-70°; the EtOH soln. has a violet fluorescence; *m*-aminobenzoate,  $b_{D,1}$  168° (40% yield); *p*-aminobenzoate,  $b_{D,1}$  175° (10% yield); *o*-dimethylaminobenzoate,  $m$ . 36-7°,  $b_{D,1}$  170°. Rotatory powers are given for the homogeneous salicylate and for the HO esters in EtOH, EtOH + NaOEt and KOEt and piperidine and for the NH<sub>2</sub> esters in EtOH and EtOH + HCl. The compds. exhibit normal and complex dispersion. The *o*-derivs. differ considerably in rotatory power from the unsubstituted ester. In these compds. the introduction of an *o*-CO<sub>2</sub>H group results in a marked rise in rotation, which is changed to a fall when the substituent ionizes to -COO'. On the other hand, an *o*-Me<sub>2</sub>N group depresses the rotatory power of the benzoate but raises the value in the presence of acids and NMe<sub>2</sub>H<sup>+</sup>. The optical changes are, therefore, related to the orienting power of the groups in C<sub>6</sub>H<sub>5</sub> substitution, the *m*-directive CO<sub>2</sub>H and NMe<sub>2</sub>H radicals raising the rotation and the *o*,*p*-directive Me<sub>2</sub>NH and COO' anion lowering the value. The exceptional behavior of the HO and NH<sub>2</sub> derivs. is ascribed to the chelated condition of these compds. C. J. WEST

Irreversible catalysis of unsaturated cyclic hydrocarbons. VI. Contact transformations of nopinene, terpinene and terpinolene. N. D. ZELINSKII and R. J. LEVINA. I. Univ. Moskau. *Ber.* 62B, 339-43 (1929); cf. *C. A.* 21, 2469.—It was shown in earlier papers that irreversible catalysis is general not only for the simplest unsatd. derivs. of cyclohexane but also for some mono- and bicyclic terpenes (limonene, pinene, thujene) and the results in the present paper show that this is also true for other terpene hydrocarbons. The nopinene used  $b_{742}$  163.5 5.5° almost completely,  $n_D^{20}$  1.4766. On 1 hydrogenation over Pd-charcoal at 170-5° it gave a completely hydrogenated product, whose  $n$  did not change on a 2nd hydrogenation. The part remaining adsorbed on the Pd-charcoal was displaced with H at 240° and also showed the same  $n$ . The dihydro product was indifferent towards KMnO<sub>4</sub>,  $b_{737}$  167-7.5° completely when distd over Na,  $d_4^{20}$  0.8521,  $d_4^{16}$  0.8563,  $n_D^{16}$  1.4628,  $M_D$  43.76 (calcd. 43.93). Nopinene, therefore, gives but 1 product on reduction whereas the reduction mechanism of pinene has been shown to depend on the temp. and the nature of the catalyst. When nopinene is slowly passed (6-8 drops per min.) over Pd-asbestos at 190° there is obtained a catalyzate whose  $n$  does not change on repeating the operation; it has the characteristic odor of cymene and when it is shaken with fuming H<sub>2</sub>SO<sub>4</sub> (7%) to remove the cymene there remains about 50% of dihydronipene,  $b_{732}$  166-8°,  $d_4^{21}$  0.8447,  $d_4^{18}$  0.8470,  $n_D^{21}$  1.4554. Like pinene, then, nopinene in contact with Pd smoothly changes into cymene and dihydronipene, probably first isomerizing into  $\alpha$ -pinene. Terpinene and terpinolene, similarly passed slowly in CO<sub>2</sub> over Pd-asbestos at 190° and 160-70°, resp., gave cymene and menthane. The position of one of the double bonds (within or without the nucleus) in monocyclic terpene hydrocarbons has no influence, therefore, on the end result. Pd-charcoal can also be used instead of Pd-asbestos, but on account of the greater adsorptive power of the latter a considerable part of the hydrocarbon is retained within the micellae and thus protected from contact with the active surfaces of the catalyst so that it must be passed over the catalyst repeatedly.

C. A. R

Some new camphor bases. HANS W. EGLI. *Helv. Chim. Acta* 12, 270-7 (1929).—A by-product of the prepn. of isonitrosocamphor, reported by Bredt (cf. *C. A.* 12, 902) is identical with the product obtained by Tiemann (cf. *Ber.* 33, 2960 (1900)) by treating camphoric  $\alpha$ -nitrile  $\beta$ -amide (I) with alkali. E. assigns the tautomeric formulas IIa

and IIb to this compd., *camphoric imide  $\alpha$ -ketimide*,  $m$ . 278°; *HCl* salt,  $m$ . 250°; *picrate*, yellow,  $m$ . 269°; *phenylthiourea*,  $m$ . 234°; *Bz* deriv.,  $m$ . 204°. Similarly, from camphoric  $\alpha$ -amide  $\beta$ -nitrile, E. preps. *camphoric imide  $\beta$ -ketimide*,  $m$ . 238°; *HCl* salt,  $m$ . 230°; *picrate*,  $m$ . 293°.  $\alpha$ -Aminocamphor condensed with AcCH<sub>2</sub>CHAcCO<sub>2</sub>Et in

glacial AcOH yields  $\alpha$ -[2-methyl-4-carbethoxymethyl-1-pyrryl]camphor (III), m. 139°. Sapon. of III with alc. KOH yields  $\alpha$ -[2-methyl-4-carboxymethyl-1-pyrryl]camphor (IV), m. 232°. Heating IV above its m. p. yields  $\alpha$ -[2,4-dimethyl-1-pyrryl]camphor (V), m. 90°, b<sub>0</sub> 176°, which is also formed in poorer yield by condensing (AcCH<sub>3</sub>)<sub>2</sub> with  $\alpha$ -aminocamphor. V reduced with Sn and HCl yields a Sn double salt of  $\alpha$ -[2,4-dimethyl-1-pyrrolino]camphor (VI), (C<sub>10</sub>H<sub>15</sub>ON·HCl)<sub>2</sub>·SnCl<sub>2</sub>, m. 149°; HCl salt, C<sub>10</sub>H<sub>15</sub>ON·HCl, m. 232°; picrate, m. 194°, yellow. Attempts to prep. condensed ring systems of camphor by the action of MeCOCH<sub>2</sub>Cl failed to yield the desired products, but gave small yields of a white, cryst., indifferent substance, m. 226°, and a basic compd., m. 186°, together with some camphorquinone.

M. A. DAHLEN

**Phytochemistry.** V. Allobetulin. O. DISCHENDORFER AND O. POLAK. *Techn. Hochschule, Graz. Monatsh.* 51, 43-58 (1929).—Oxidation of allobetulin C<sub>28</sub>H<sub>46</sub>O·CH(OH)·CH<sub>2</sub> (I) with a mixt. of fuming HNO<sub>3</sub> and AcOH below 0° gives

oxyallobetulinic acid, C<sub>28</sub>H<sub>44</sub>O<sub>2</sub>(CO<sub>2</sub>H)<sub>2</sub> (II), m. 283-4°, [ $\alpha$ ]<sub>D</sub> about 57°. The same acid may be obtained in a similar way from allobetulone, C<sub>28</sub>H<sub>44</sub>O·CO·CH<sub>2</sub> (III), and

from oxyallobetulin, C<sub>28</sub>H<sub>44</sub>O<sub>2</sub>·CH(OH)·CH<sub>2</sub> (IV). Heating II with Ac<sub>2</sub>O forms an

anhydride, m. 290-2°, [ $\alpha$ ]<sub>D</sub> about 86°, and this reverts to the original when heated with dil. AcOH or alkali. When II is distd. at 300° it loses H<sub>2</sub>O and CO<sub>2</sub>, and forms a ketone (C<sub>28</sub>H<sub>44</sub>O<sub>2</sub>)<sub>2</sub>CO (V), [ $\alpha$ ]<sub>D</sub> about 153°.

J. J. WILLAMAN

**New derivatives of diphenyl.** A. ANGELETTI AND D. GATTI. *Reale Univ., Torino. Gazz. chim. ital.* 58, 630-5 (1929); cf. C. A. 21, 578.—Six new Ph<sub>2</sub> derivs. were prepd. For the partial diazotization of [H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>]<sub>2</sub>, the method of Täuber (cf. *Ber.* 1894, 2627) was found to give a higher yield than that of Bamberger (cf. *Ann.* 390, 160). The product, C<sub>12</sub>H<sub>9</sub>NC<sub>6</sub>H<sub>4</sub>C<sub>6</sub>H<sub>4</sub>N<sub>2</sub>Cl, heated on a water bath for 1 hr. with aq. CuCN, filtered, washed with water, dissolved in dil. HCl, repptd. with NH<sub>4</sub>OH, the purification repeated, and the compd. recrystd. from PhMe, yields 4-cyano-4'-aminodiphenyl, red, m. 157°, burns with great difficulty. 4-Iodo-4'-aminodiphenyl (cf. *Ber.* 39, 4177 (1906)) (2.5 g.) in dil. HCl (20 g. 5 N HCl + 500 cc. water) diazotized at 5° by concd. NaNO<sub>2</sub> (0.65 g.), heated 1 hr. on a water bath, the ppt. dissolved in hot dil. NaOH, dil. HCl added, and the ppt. purified by sublimation, yields 4-iodo-4'-hydroxydiphenyl, pale yellow, m. 194°. From all solvents it seps. as a yellowish, amorphous powder. It was also prepd. by diazotizing 4-amino-4'-hydroxydiphenyl and subsequent formation of the I deriv. 4-Chloro-4'-aminodiphenyl (cf. *Ber.* 39, 4177 (1906)) (2 g.) in dil. HCl (10 g. 5 N HCl + 350 cc. water) diazotized with concd. NaNO<sub>2</sub> (0.75 g.), filtered, the soln. heated 1 hr. on a water bath, the ppt. dissolved in dil. NaOH, repptd. with dil. HCl and crystd. successively from water and from petr. ether, yields 0.8 g. of 4-chloro-4'-hydroxydiphenyl, m. 146-7°. 4-Bromo-4'-aminodiphenyl (cf. *Ber.* 39, 4177 (1906)) (2 g.) in dil. HCl (10 g. 5 N HCl + 300 cc. water), diazotized with concd. NaNO<sub>2</sub> (0.65 g.) and the same procedure followed as before, yields 0.5 g. of 4-bromo-4'-hydroxydiphenyl, iridescent, silky, pale yellow, m. 155-6°. By further concn. of the petr. ether, a trace of an unidentified halogenated, HO compd., m. 108-9°, was obtained. 4-Chloro-4'-aminodiphenyl (2 g.) in dil. HCl (10 g. 5 N HCl + 350 cc. water) diazotized with concd. NaNO<sub>2</sub> (0.75 g.), filtered, the filtrate poured slowly, with continuous agitation, into hot 50% aq. CuBr (strongly acidified with H<sub>2</sub>SO<sub>4</sub>), boiled, let stand overnight, filtered, the residue washed with H<sub>2</sub>SO<sub>4</sub> (1:2), then with warm, dil. NaOH (to remove a little 4-chloro-4'-hydroxydiphenyl which is also formed), with water and with hot EtOH, and the product sublimed, yields 0.5 g. of 4-chloro-4'-bromodiphenyl, pale yellowish, m. 151-2°. Following the same procedure in the diazotization of 4-chloro-4'-aminodiphenyl, and then pouring the soln. into 30% KI, boiling, decolorizing with SO<sub>2</sub>, and crystg. the product from EtOH by diln. with water, yields 0.6 g. of 4-chloro-4'-iododiphenyl, light yellow, m. 147-8°. In the prepn. of 4-iodo-4'-nitrodiphenyl (cf. C. A. 21, 578), a HO compd., m. 170-1°, was obtained which was apparently identical with the compd. considered by Schmidt and Schultz to be 4-hydroxy-4'-nitrodiphenyl (cf. *Ann.* 207, 347 (1881)). By fractional crystn. from EtOH was also obtained an unidentified hydroxynitrodiphenyl deriv., m. 200-1°. Bell and Kenyon (cf. *J. Chem. Soc.* 1926, 3044) have prepd. 4-nitro-4'-hydroxydiphenyl, m. 203°, and have furthermore concluded that the compd. of Schmidt and Schultz was the 3,4'-dinitro-4-hydroxydiphenyl, m. 172°, obtained by B. and K. Expts. by A. and G. on these compds. show that the compd., m. 171°, is 3,4'-dinitro-4-hydroxydiphenyl as believed by B. and K., while the compd. previously described by Angeletti (cf. C. A. 21, 578) which m. 200-1° is 4-hydroxy-4'-nitrodiphenyl.

C. C. DAVIS

**Orientation effects in the diphenyl series. VII. The effect of substituents in one nucleus on the ratio *ortho*-*para* nitration in the other.** The nitration of 2- and 4-nitro- and 2,4- and 2,4'-dinitrodiphenyl and of diphenyl-4-carboxylic acid. HERBERT C. GULL AND EUSTACE E. TURNER. Univ. of London. *J. Chem. Soc.* 1929, 491-500; cf. *C. A.* 22, 2377.—4-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>Ph, on nitration, gives 37 and 63%, resp., of the 2',4'- and 4',4'-di-NO<sub>2</sub> derivs.; the 2-NO<sub>2</sub> deriv. gives 39 and 61%, resp., of the 2',2'- and 2,4'-di-NO<sub>2</sub> derivs. In neither case was the 2,4-di-NO<sub>2</sub> deriv. formed; its formation was not expected in view of the known retarding influence of the NO<sub>2</sub> group on further substitution in the same nucleus. Ph<sub>2</sub>, nitrated at 50°, gives 29.8% of the 4,4'-di-NO<sub>2</sub> deriv., (4-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>)<sub>2</sub> and HNO<sub>3</sub> give 2,4,4'-trinitrodiphenyl, pale yellow, m. 176°; further nitration gives [2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>]<sub>2</sub>. F. p. curves are given for the 2,2'- and 2,4'-di-NO<sub>2</sub> derivs. (eutectic with 39% of the 2,2'-deriv.). 2,4-Dinitrodiphenyl, golden yellow, m. 110°, results from PhI and 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Cl with Cu bronze at 225-30°; nitration gives a mixt. of 55% of 2,4,4'- and 45% of 2,4,2'-tri-NO<sub>2</sub> derivs., for which mixt. a f. p. curve is given. Nitration of (2-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>)<sub>2</sub> gives 80-5% of 2,4,2'-trinitrodiphenyl, pale yellow, m. 150-1°; further nitration gives [2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>]<sub>2</sub>. Nitration of the 2,4'-di-NO<sub>2</sub> deriv. gives 52.5% of 2,4,4'- and 47.5% of 2,4,2'-tri-NO<sub>2</sub> deriv. Picryl chloride and PhI with Cu bronze at 205° give 2,4,6-trinitrodiphenyl, pale yellow, m. 130°. 4-HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>Ph, on nitration in concd. H<sub>2</sub>SO<sub>4</sub>, yields sulfonation products; nitration is complete in AcOH only when 4 mols. HNO<sub>3</sub> are used at the b. p. In HNO<sub>3</sub> (d. 1.5) at -15° only di-NO<sub>2</sub> derivs. result; the mixt. contains 49% of the 2,4'-di-NO<sub>2</sub> deriv., m. 265°; the other product is the 2,2'-di-NO<sub>2</sub> acid, m. 194-5°. Their structure was detd. by removal of the CO<sub>2</sub>. C. J. WEST

**Diphenyl and its derivatives (and dinaphthyls). Cleavage into optical antipodes of compounds which do not contain asymmetric atoms. II.** L. MASCARELLI. Reale Univ. Torino. *Gazz. chim. ital.* 58, 627-30(1928).—Establishment of the principles governing the existence of optical isomers (cf. M., *C. A.* 22, 68) suggested that  $\beta,\beta$ -diamino- $\alpha,\alpha$ -dinaphthyl (I) might also be subject to the same rules and throw further light on the subject. Besides having the theoretical structure to give the isomers in question, its 2 NH<sub>2</sub> groups allow, by salification with optically active acids, the completion of the cleavage into antipodes. Scarcity of I and difficulties of crystn. and purification of the salts prevented anything more than indications of all the results hoped for, but did prove conclusively that I can be resolved into 2 optical antipodes. On the other hand  $\alpha,\alpha$ -diamino- $\beta,\beta$ -dinaphthyl (II) gave no evidence of the existence of optically active forms, which conforms to the theory that mol. asymmetry is absent because rotation of the 2 naphthyl nuclei around their axis of conjugation is not prevented by the presence of the 2  $\alpha$ -NH<sub>2</sub> groups. It is intended to expt. with a larger quantity of II or with  $\alpha,\beta$ -dinaphthyl derivs., for the latter should show interesting phenomena of isomerism. It is also suggested that dipyrrolyl, dipyridyl, diquinolyl, diindyl, dicarbazolyl, diacrydyl, dianthracyl, dianthraquinonyl and diphenanthryl derivs. should behave like Ph<sub>2</sub> derivs., and even some aliphatic compds. should show a suppressed rotation, with consequent mol. asymmetry. C. C. DAVIS

**Constitution of Bandrowski's base.** JOHN J. RITTER AND GUNTHER H. SCHMITZ. New York Univ. *J. Am. Chem. Soc.* 51, 1587-9(1929).—Bandrowski (*Monatsh.* 10, 123(1889)) obtained on oxidation of *p*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> with K<sub>3</sub>Fe(CN)<sub>6</sub> a base to which he assigned the structure [2,5-(H<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>N:]<sub>2</sub>C<sub>6</sub>H<sub>4</sub>; since there is the possibility that the isomer 2,5,1,4-C<sub>6</sub>H<sub>2</sub>(NH<sub>2</sub>)<sub>2</sub>:(NC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>(*p*))<sub>2</sub> might be formed, the base was oxidized with PbO<sub>2</sub> and H<sub>2</sub>SO<sub>4</sub>. The yield of O:C<sub>6</sub>H<sub>4</sub>:O confirms the structure first assigned to the base; this structure can yield but 1/3 of a mol. of O:C<sub>6</sub>H<sub>4</sub>:O on oxidation, while the 2nd formula should yield 2/3 mol. C. J. WEST

**Nitration of 4-chloro-4'-bromobenzophenone and -diphenyl sulfone and the attempted nitration of 4-chloro-4'-bromodiphenyl.** LESLIE G. GROVES AND EUSTACE E. TURNER. Univ. of London. *J. Chem. Soc.* 1929, 509-11.—PhCl (32 g.), 50 g. *p*-BrC<sub>6</sub>H<sub>4</sub>COCl and 32 g. AlCl<sub>3</sub> in 100 cc. CS<sub>2</sub>, boiled 2 days, give 25 g. 4-chloro-4'-bromobenzophenone, very pale brown, m. 150° (all m. ps. cor.); nitration with KNO<sub>3</sub> in H<sub>2</sub>SO<sub>4</sub> gives 51% of the 3-NO<sub>2</sub> and 49% of the 3'-NO<sub>2</sub> deriv., the mixt. being analyzed by means of piperidine. 4-Chloro-4'-bromodiphenylsulfone, m. 157°; nitration gives 34% of the 3-NO<sub>2</sub> and 66% of the 3'-NO<sub>2</sub> deriv.; HNO<sub>3</sub> gives the 3,3'-di-NO<sub>2</sub> deriv., pale yellow, m. 219°. 4-Chloro-4'-bromodiphenyl, m. 147°, was prepd. from the 4,4'-ClC<sub>6</sub>H<sub>4</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub> through the diazo compd.; HNO<sub>3</sub> causes degradation. C. J. W.

**Constitution of phenol-formaldehyde condensation product. II. When an acid is used as a condensing agent.** SHUNZO SUGIMOTO. *Repts. Imp. Ind. Research Inst. Osaka* (Japan) 9, No. 2, 1-28(1928); cf. *C. A.* 22, 142.—The condensation of PhOH and HCHO is greatly accelerated by the presence of a small amt. of acid. The condensa-

tion takes place even at room temp. if the reaction mixt. is left standing for a long time. When the amt. of acid is small, the rate depends on the H ion concn., whereas in presence of a greater quantity of acid, the reaction becomes complicated due to the presence of the undissociated acid. The application of heat also accelerates the reaction. Due to the difference in the mode of application of heat, sometimes sol. and sometimes insol. condensation products are obtained. This is due to the difference in the proportion of HCHO which combines with PhOH. PhOH and HCHO were condensed by using an acid (HCl) as a condensing agent. The oily product thus obtained was steam distd. From the residual fluid pure cryst. *o*- and *p*-dihydroxydiphenylmethane were isolated. The resinous residue left after repeated steam distn. has a definite compn.,  $n(C_7H_6O)$ , and is free from PhOH, HCHO or  $CH_2(C_6H_4OH)_2$ .  $HNO_3$ ,  $H_2SO_4$  and  $H_2C_2O_4$  gave practically the same results as HCl. From the above facts, it is concluded that the condensation of PhOH and HCHO when an acid is used as a condensing agent proceeds as follows:  $PhOH + HCHO \rightarrow HOC_6H_4CH_2OH$ . The hydroxybenzyl alc. (I) thus formed dehydrates itself to form a resinous substance (II) with the compn.  $n(C_7H_6O)$ . It also combines with PhOH and gives *o*- and *p*-dihydroxydiphenylmethane (III) and a mol. of  $H_2O$ . Thus,  $PhOH + HOC_6H_4CH_2OH \rightarrow (HOC_6H_4)_2CH_2 + H_2O$ . In the beginning of the reaction, I is not dehydrated and since it is sol. in  $H_2O$ , no oily product is obtained, but as the reaction proceeds, the formation of II and III takes place with an increased production of  $H_2O$ . Both II and III are slightly sol. in hot  $H_2O$ , but they are more sol. in PhOH and HCHO. The mixt. of II, III, PhOH and HCHO forms an oily phase which seps. from the  $H_2O$  layer. When the amt. of II reaches about 40% of the total oily product the reaction mixt. becomes emulsified and henceforth the sepn. of the oily layer takes place. Thus the oily product which heretofore was thought to be an intermediate product of condensation is not such but is a mixt. of II and III in PhOH and HCHO. On the 2nd stage of heating a further reaction of the free PhOH and HCHO takes place to give an increased production of II and finally these condensation products form a transparent resinous solid soln. If excess of PhOH is present, III combines with it to form an insol. substance, but if an excess is not present III exists in a free state and can be isolated from the alc. soln. of the sol. condensation product. From the above it is seen that the main constituent of the sol. condensation product is II mixed with a small amt of III, PhOH and HCHO.

NAO UYEI

**Aldehydophenolphthalein and dyes derived from it.** RAJENDRA NATH SEN AND KALI CHARAN KAR. Presidency College. *J. Indian Chem. Soc.* 6, 53-63(1929).—Phenolphthalein (12.5 g.) in 16 g. NaOH and 32 cc.  $H_2O$  heated on the  $H_2O$  bath and treated during 12 hrs. with 14 cc.  $CHCl_3$  gave 20% of aldehydophenolphthalein (I), yellowish, m. 97-99°, sol. in NaOH and glacial AcOH, insol. in dil. acids. Phenylhydrazone, yellow, m. 148°, sol. in NaOH and  $Na_2CO_3$  with violet color. Dioxime, yellow, decomp. 235°. Phenolphthaleinoin, yellow, m. 152°. By the condensation of I with amines the following azomethin dyes were prepd.: phenolphthaleinal-*p*-toluidine, 90% yield, light orange, m. 140°;  $\beta$ -naphthylamine, 90% yield, yellow, m. 154°, dyes wool and silk light yellow; aminoazobenzene, 90% yield, red, decomp. 235°, dyes wool and silk yellow; diphenolphthaleinalbenzidine, 80% yield, orange, m. 191°, dyes wool and silk orange; *p*-phenylenediamine, 70% yield, yellowish brown, softens 230°, dyes wool and silk light orange; *o*-phenylenediamine, 80% yield, yellow, m. 218°, dyes wool and silk straw-yellow; chrysoidine, 90% yield, red, dyes wool and silk yellowish brown; safranin, 90% yield, red, dyes wool and silk scarlet-red; triphenolphthaleinalrosaniline, 85% yield, violet-red, dyes wool and silk brilliant red. These dyes are in general hydrolyzed by hot mineral acids. By condensation of I with phenols in the presence of concd.  $H_2SO_4$ , the following pyronine dyes were obtained: diresorcinolphthaleinein, 60% yield, orange, with a green fluorescence in alk. or EtOH solns.; tri-K salt, red, dyes wool and silk deep yellow; di- $\beta$ -naphthol deriv., 80% yield, grayish, decomp. 260; mono-K salt, red; dihydroquinone deriv., 80% yield, grayish black, decomp. 250°, shows slight yellow-green fluorescence in alk. soln., dyes wool and silk light brown; tri-K salt; dipyrrogallol deriv., 65% yield, grayish black, decomp. 260°, dyes Al-mordanted wool dark brown and Fe-mordanted wool grayish black; phenolphthaleinalrhodamine, 90% yield, violet, dyes wool and silk red. The following triphenylmethane dyes were prepd.: I and  $PhNMe_2$  heated on the  $H_2O$  bath for 24 hrs with the addn. of concd. HCl gave tetramethyldiaminodiphenylphenolphthaleinmethane, 90% yield, greenish white, softens 187°. Oxidation with  $PbO_2$  gave the carbinol, the HCl salt of which is a deep bluish green, producing a bluish green shade on wool, silk and tanned cotton. A paste made from 3 g. I, 1.5 g. *o*-cresotinic acid and 2 cc. concd.  $H_2SO_4$  was allowed to stand overnight. From it was obtained di-

*methyl-dihydroxydicarboxylicdiphenylphenolphthaleinmethane*, 80% yield, yellow, softens 215°. Oxidation with nitrosyl sulfate at 50–60° gave a red product which dyes wool red, deepening to black when after-chromed. LOUISE KELLEY

**Hydroxyhydroquinonesulfonephthalein**, 2',4',5'-trihydroxybenzoylbenzene - *o* - sulfonic acid (the intermediate acid) and some of their derivatives. W. R. ORNDORFF AND MARY L. WILLARD. Cornell Univ. *J. Am. Chem. Soc.* 51, 1466–74 (1929).—1,2,4-C<sub>6</sub>H<sub>3</sub>(OH)<sub>3</sub> (100 g.) and 36 g. *o*-sulfobenzoic anhydride, heated at 100° for 8 hrs., give 2',4',5'-trihydroxybenzoylbenzene-2-sulfonic acid, crystals of tabular to thin platy habitus, rhomboidal, probably triclinic (NH<sub>4</sub>, Ba, Zn and Na salts; tetra-Ac deriv.). Heating the above mixt. 30 hrs. at 130° gives 30% of hydroxyhydroquinonesulfonephthalein (I) (also obtained in 40% yield from C<sub>6</sub>H<sub>3</sub>(OH)<sub>3</sub> and *o*-ClSO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>COCl and in 80% yield from the anhydride and C<sub>6</sub>H<sub>3</sub>(OAc)<sub>3</sub>; ZnCl<sub>2</sub> gives only 15% yield), green, forming a reddish orange powder; the H<sub>2</sub>O or 2% NaOH soln. is red with green fluorescence; concd. H<sub>2</sub>SO<sub>4</sub> gives a yellow soln.; there was a change from OY to R at *p*<sub>H</sub> 7.2 and from VR to RV at 12.0. I absorbs 4 mols. NH<sub>3</sub>, giving a bluish brown powder; over H<sub>2</sub>SO<sub>4</sub> a stable red mono-NH<sub>4</sub> salt results; Ba salt, red; Zn salt, orange-red; K salt, red; tetra-Ac and tetra-Bz derivs., colorless. I, MeI and MeCO give a mixt. of the *di*-Me and *tri*-Me ethers, red (Na salt of the latter, red). I gives a PhNH<sub>2</sub> salt, red needles, do not m. 300°. In abs. EtOH I yields a *di*-Br deriv., green, crystg. with 2.5 H<sub>2</sub>O; the dil. NaOH soln. is red, a more concd. soln., blue; a color change is noted at *p*<sub>H</sub> 6.4 from RO to VR. The tri-NH<sub>4</sub> salt and tetra-Ac deriv. were prepd. I and concd. H<sub>2</sub>SO<sub>4</sub> give sulfoneviolet, C<sub>15</sub>H<sub>10</sub>O<sub>7</sub>S, green. Reduction of I gives hydroxyhydroquinonesulfonephthalein, which is colorless; tetra-Ac deriv. (Ag salt). These are easily oxidized in the air. C. J. WEST

**Employment of pyridine as catalyst in production of dimethyl- $\alpha$ -naphthylamine.** FREDERICK G. GERMUTH. Bureau of Standards, Baltimore. *J. Am. Chem. Soc.* 51, 1555–7 (1929).—The employment of C<sub>5</sub>H<sub>5</sub>N as catalytic agent in the production of  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NMe<sub>2</sub> from  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub> and Me<sub>2</sub>SO<sub>4</sub> increases the yield from an av. of 51.3% to 65.8%, when the base is utilized in the proportion of 4 cc. of C<sub>5</sub>H<sub>5</sub>N per mol. of  $\alpha$ -C<sub>10</sub>H<sub>7</sub>NH<sub>2</sub>. Larger amts. do not increase the yield. C. J. WEST

**Reduction of naphthol yellow by means of stannous chloride.** J. G. F. DRUCE. *Chem. News* 138, 209 (1929).—Addn. of 5 g. of naphthol yellow to a hot soln. of 5 g. of SnCl<sub>2</sub> in 50 cc. of concd. HCl and 50 cc. of H<sub>2</sub>O gave a colorless soln., which upon cooling pptd. crystals of the stannichloride of 3,4,6-diamino-8-naphtholsulfonic acid, m. 112°, insol. in Et<sub>2</sub>O and CCl<sub>4</sub>, slightly sol. in H<sub>2</sub>O and hot EtOH. A. S. CARTER

**Dyes derived from acenaphthequinone. Acenaphthimidazoles and acenaphthoxazoles.** ANUKUL C. SIRCAR AND NIRMAL C. GUHA-RAY. Dacca Univ. and B. N. College, Patna. *J. Indian Chem. Soc.* 6, 93–8 (1929); cf. C. A. 17, 2880; 19, 2335.—Acenaphthequinone (I) was thoroughly mixed with m-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CHO and dissolved in hot AmOH. Dry NH<sub>3</sub> was passed through the hot soln. for 2 hrs. On cooling there sepd. 3'-nitro-2-phenylacenaphthimidazole, orange, does not m. 220°. Conc'd. H<sub>2</sub>SO<sub>4</sub> gives a reddish brown soln. Cr-mordanted and unmordanted wool is dyed orange-yellow from an acid bath. 2-Phenylacenaphthimidazole (II), prep'd. in the same way, dark red, does not m. 290°. Conc'd. H<sub>2</sub>SO<sub>4</sub> gives a blood-red soln. with reddish violet fluorescence. Wool is dyed red from an acid bath. The following derivs. of II were prep'd. by the same method: 2'-HO, yellow, m. 268° (decompn.), sol. in warm dil. alkali or conc'd. H<sub>2</sub>SO<sub>4</sub> with yellow color; 4'-MeO, red, m. 268°, sol. in conc'd. H<sub>2</sub>SO<sub>4</sub> with deep red color; 3'-methoxy-4'-hydroxy, rose-colored, m. 263°, sol. in conc'd. H<sub>2</sub>SO<sub>4</sub> with orange-red color, dyes wool light red from an acid bath; 4'-Cl, rose-colored, m. 264°, sol. in conc'd. H<sub>2</sub>SO<sub>4</sub> with brownish red color; 3,4-dinitro-2'-hydroxy-5'-bromo (III), does not m. 290°, sol. in conc'd. H<sub>2</sub>SO<sub>4</sub> with dark red color, dyes wool chocolate-brown from an acid bath; 3,4-dinitro-4'-methoxy, resembles III; 3-nitro-2'-hydroxy, resembles III; 3-nitro-3'-methoxy-4'-hydroxy, dyes wool light brown, resembles III. Dry NH<sub>3</sub> was passed through a soln. of I and *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CHO in hot AmOH for about 2 hrs. On standing 5 days a ppt. sepd. which was 2'-nitro-2-phenylacenaphthoxazole, orange-red, does not m. 290°. Conc'd. H<sub>2</sub>SO<sub>4</sub> gives a dark red soln. Wool is dyed orange-yellow from an acid bath. The following derivs. of 2-phenylacenaphthoxazole were prep'd. in the same way: 4'-dimethylamino, rose-colored; 3,4-dinitro-3'-nitro, dark brown, dyes wool a dark chocolate shade; 3,4-dinitro-3',5'-di-hydroxy, dyes wool a chocolate-brown; 3',5'-di-HO, dyes wool light brown; 3-nitro-3',5'-di-hydroxy, dyes wool brown. LOUISE KELLEY

**Constituents of the kawa root. VII. Pseudomethysticin.** W. BORSCHKE AND W. PERTSCH. Univ. Frankfurt a. M. *Ber.* 62B, 380–7 (1929); cf. C. A. 22, 404.—In the *Ber.* J. D. Riedel A.-G. there is a report on the existence in kawa root, besides

(V), then tetrahydromethysticinic acid (VII),  $\text{CH}_2\text{O}_2\text{C}_6\text{H}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{C(OMe):}-\text{CHCO}_2\text{H}$ , and finally the hexahydro acid (VIII). Under proper conditions the reduction to V takes place in a few mins. Like I, V is optically active and chem. neutral but is rearranged by alkalis into the optically inactive VI, which on fusion loses  $\text{CO}_2$  and on heating with  $N \text{ H}_2\text{SO}_4$  yields dihydropiperinoylacetic acid or dihydromethysticic acid (6-[methylenedioxyphenyl]- $\Delta^8$ -hexen-2-one) (IX). In the change from I to V, therefore, the H adds on the CH:CH group joining the 2 halves of the mol. and not on the C(OMe).CH grouping. I can never be reduced quantitatively to V, however; some VII is always formed even when the quantity of  $\text{H}_2$  consumed is strictly limited to 1 mol. With 2 mols.  $\text{H}_2$  the I can be completely converted into VII but after the disappearance of the I the formation of VII is slowed up extraordinarily. The catalytic reduction of I or V is, therefore, not practical for the prepn. of VII. On heating with  $\text{H}_2\text{O}$  under pressure or with dil. mineral acids, VII gives tetrahydromethysticic acid,  $\text{CH}_2\text{O}_2\text{C}_6\text{H}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{C(OMe):}-\text{CHCO}_2\text{H}$  (X), whereas on distn., *in vacuo*, it loses only  $\text{CO}_2$ , forming the pure enol-tetrahydromethysticic acid Me ether (6-[methylenedioxyphenyl]-2-methoxy- $\Delta^1$ -hexene) (XI), which is likewise readily demethylated to X by acids. Although VII has an ethylene union adjacent to the  $\text{CO}_2\text{H}$  group it can be reduced to VIII only with the greatest difficulty; the same passive resistance to catalytic hydrogenation has been encountered in XI, kawaic acid and MeC(OMe):CHCO $_2\text{H}$  and its Et ester. The method of prepn. V has been somewhat modified. It is obtained in 4.5 g. yield from 5 g. I and 0.05 g. colloidal Pd in 150 cc. MeOH shaken about 20 mins. with  $\text{H}_2$  under a slight overpressure and seps. in prisms, m.  $117-8^\circ$ ,  $[\alpha]_D^{25} 20.57^\circ$  (MeOH, 0.729% soln.); at the same time is formed about 0.5 g. VII. VI forms colorless prisms, m.  $146-7^\circ$  (decompn.) (Goebel's product, m.  $133-4^\circ$ , was evidently impure and he did not recognize its true compn. any more than that of VII). IX, yellowish, strongly refractive oil,  $b_D 196-8^\circ$ ; 2,4-dinitrophenylhydrazide, ruby-red, m.  $147-8^\circ$ . Methysticic acid, 2,4-dinitrophenylhydrazide, red-brown, m.  $236-7^\circ$  (gas evolution). XI, refractive oil,  $b_D 176-7^\circ$ . 2,4-Dinitrophenylhydrazide of X, cinnabar-red, m.  $129-30^\circ$ . VIII (2.5-3 g. from 5 g. VII in 120 cc. MeOH and 0.1 g. colloidal Pd in 5 cc.  $\text{H}_2\text{O}$  shaken under a slight overpressure with  $\text{H}_2$  until no more is absorbed (if 0.1 g. fresh catalyst is added every 24 hrs., this requires about 70 hrs.)), m.  $66-7^\circ$ , dissolves unchanged in  $\text{NH}_4\text{OH}$  or alkali carbonates, gives no color with  $\text{FeCl}_3$  even after several days and can be heated to  $220^\circ$  without any visible change. VIII. Kawaic acid. *Ibid* 368-73.—The product  $\text{C}_{11}\text{H}_{12}\text{O}_3$ , m.  $164-5^\circ$ , and designated as kawaic acid (I), which B. and Roth obtained from crude kawa resin, was not pure but admixed with nearly related acids, the sepn. of which has finally been effected only after many unsuccessful attempts. The pure I m.  $185-6^\circ$  and has the compn.  $\text{C}_{11}\text{H}_{14}\text{O}_4$ ; it is evidently the  $\text{CH}_2\text{O}_2$ -free mother substance of methysticinic acid (II), i. e.,  $\gamma$ -cinnamal- $\beta$ -methoxycrotonic acid. Its Me ester on partial sapon. with alc. HCl gives the same PhCH:CHCH:CHCOCH $_2$ CO $_2$ Me as is obtained by deacetylation of PhCH:CHCH:CHCOCHAcCO $_2$ Me. On catalytic reduction with colloidal Pd, I behaves just like II, taking up at first only 2 mols.  $\text{H}_2$  and giving tetra-

*hydrokawaic acid* (III), which on distn. *in vacuo* smoothly yields *6-phenyl-2-methoxy- $\Delta^1$ -hexene* (IV), with acids is decompd. into MeOH, CO<sub>2</sub> and *6-phenyl-2-hexanone* and on further shaking with H<sub>2</sub> and Pd is only very slowly reduced to *hexahydrokawaic acid*. III has been synthesized by treating PhCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>COCH<sub>2</sub>CO<sub>2</sub>Me with a large excess of CH<sub>3</sub>N<sub>2</sub> and sapon. the alkali-insol. part of the product with NaOH. A similar synthesis of I has not yet been effected because the double bonds in PhCH<sub>2</sub>:CHCH:CHCOCH<sub>2</sub>CO<sub>2</sub>Me react too easily with CH<sub>3</sub>N<sub>2</sub> to form stable addn. products contg. N. I is obtained by B. and R.'s method from the kawa resin under exactly the same conditions as II from methysticin and it is, therefore, quite possible that I also does not exist in the resin as such but as a doubly unsatd. lactone, *kawain*, PhCH<sub>2</sub>:CHCH:CH<sub>2</sub>.C(OMe):CH.CO.O. I seps. from Et<sub>2</sub>O in yellow, elongated, 6-cornered

tablets, sol. in concd. H<sub>2</sub>SO<sub>4</sub> with purple color, gives in MeOH with FeCl<sub>3</sub> a faint brown color only after several hrs.; heated at 190° until the evolution of CO<sub>2</sub> ceases, it yields a brown, glassy resin whose MeO content corresponds approx. to *6-phenyl-2-methoxy- $\Delta^{1,3,5}$ -hexatriene* but which decomp. on attempted distn. under 14 mm. In N H<sub>2</sub>SO<sub>4</sub> on the H<sub>2</sub>O bath I gives cinnamalacetone whose *2,4-dinitrophenylhydrazone*, which can be obtained directly from I with HCl in boiling MeOH, brown-red, m. 218-20°. III, m. 109-10°, begins to evolve CO<sub>2</sub> about 125°, gives no color in alc. with FeCl<sub>3</sub>. IV, refractive oil of faint odor, b<sub>16</sub> 136-8°.

C. A. R.  
Is *2,3-diphenylindone* resolvable into optically active antipodes? JAKOB MEISENHEIMER and WALTER THEILACKER. Univ. Tübingen. *Ann.* **469**, 26-30 (1929).—M. and T. have been unable to repeat Schlenk, Bergmann and Müller's resolution of *2,3-diphenylindone* (C. A. **22**, 4493). The small rotation observed by these authors is probably due to impurity. *N*-Diphenylindenylidenebornylamide, m. 126°,  $[\alpha]_D^{232}$  (0.2456 g. in 10 cc. CHCl<sub>3</sub>); S. gives 124°.

C. J. WEST  
The development of the catalytic oxidation of anthracene to anthraquinone. HORST BRÜCKNER. *Chem. Ztg.* **53**, 258 (1929).—A review with literature and patent references is given of the various methods for oxidation of anthracene to anthraquinone.

N. A. LANGE  
**1,2,5,6-Tetrahydroxyanthraquinone and 1,2,7,8-tetrahydroxyanthraquinone.** GUSTAV HELLER. *Z. angew. Chem.* **42**, 170-5 (1929).—The sulfonation of anthraflavic acid with 15% oleum followed by a treatment with a mixt. of HNO<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub> gives *1,8-dinitro-2,6-dihydroxyanthraquinone-3,7-disulfonic acid* (I) sepd. as the Na salt (II). Heating II with dil. H<sub>2</sub>SO<sub>4</sub> in a sealed tube for 6 hrs. at 170° gives *1,8-dinitro-2,6-dihydroxyanthraquinone* (III). Reduction of III with Na<sub>2</sub>S yields *1,5-diamino-2,6-dihydroxyanthraquinone*; Na salt, forms violet crystals which in weak AcOH dye wool a wine-red color. I and Na<sub>2</sub>S give *1,5-diamino-2,6-dihydroxyanthraquinone-3,7-disulfonic acid* (IV); di-Na salt, forms red needles. Diazotization of IV in concd. HCl yields *1,5-dinitrosamino-2,6-dihydroxyanthraquinone-3,7-disulfonic acid* (V). The addn. of Cu<sub>2</sub>Cl<sub>2</sub> to V in concd. HCl gives *1,5-dichloro-2,6-dihydroxyanthraquinone-3,7-disulfonic acid* (VI), which dyes wool an orange-red, and brown-orange with a Cr mordant. V treated with boiling CuSO<sub>4</sub> gives *1,2,5,6-tetrahydroxyanthraquinone-3,7-disulfonic acid* (VII), which in acid bath dyes wool a bright orange. Heating VII with dil. H<sub>2</sub>SO<sub>4</sub> in a sealed tube for 4 hrs. at 175-85° yields *1,2,5,6-tetrahydroxyanthraquinone* (VIII) which dyes Cr-mordanted wool red-violet; Ac deriv., m. 260-3° (decompn.). VIII and 20% oleum at 135-40° for 0.5 hr. give VII. VII in AcOH with Br gives *3,7-dibromo-1,2,5,6-tetrahydroxyanthraquinone*. **1,2,7,8-Tetrahydroxyanthraquinone** (IX), prepd. by the alk. fusion of chrysazindisulfonic acid, forms red prisms, m. 315° (darkening and sublimation); di-Ac deriv., m. 242° (decompn.); tetra-Ac deriv., m. 236-8° (decompn.). Sulfonation of IX gives *1,2,7,8-tetrahydroxyanthraquinone-3,6-disulfonic acid* (X). X and Br in alc. yield *dibromo-1,2,7,8-tetrahydroxyanthraquinone*.

FREDERICK C. HAHN  
**Polynuclear aromatic hydrocarbons and their derivatives. I. Dibenzanthracenes and their quinones.** F. CLAR. Tech. Hochschule Dresden. *Ber.* **62B**, 350-9 (1929).—For a systematic study of the condensed aromatic hydrocarbons, of which those with 4 condensed C<sub>6</sub>H<sub>6</sub> nuclei are all known, it was first undertaken to prep. the as yet mostly unknown 5-ring compds. *1,2,7,8-* (I) and *1,2,5,6-Dibenzanthracene* (II) were obtained by heating *2-methyl-1,1'* (III) and *2-methyl-1,2'-dinaphthyl ketone* (IV) which were readily prepd. by the Friedel-Crafts reaction from 1- and 2-C<sub>10</sub>H<sub>7</sub>COCl with 2-C<sub>10</sub>H<sub>7</sub>Me. That the C<sub>10</sub>H<sub>7</sub>CO group enters the C<sub>10</sub>H<sub>7</sub>Me in the  $\alpha$ -position adjacent to the Me residue is rendered very probable by the directing influence of the Me group and confirmed by the fact that if 2-C<sub>10</sub>H<sub>7</sub>COCl should condense in the  $\beta$ -position, it would yield *1,2,6,7-dibenzanthracene* (V) whereas the actual condensation product

(IV) gave only 1 compd. (II), identical with that obtained by Weitzenböck and Klingler by a method excluding the possible formation of V. The similarity of I and II to each other is remarkable. While the ketones III and IV differ considerably in their consts., I and II show no appreciable differences in soly. and fluorescence, their m. ps. differ by only 1°, the mixed m. p. is intermediate, the m. ps. of the picrates are within 2° of each other, those of the quinones (VI and VII) within 1°. In ultra-violet light, however, the green-yellow I has an intensely green-yellow emission while the very faintly greenish yellow II shows the phenomenon to a much less degree. The absorption in ultra-violet light, on the other hand, is the same for I and II. VI and VII were readily obtained with  $\text{CrO}_3\text{-AcOH}$ . They show the characteristic property of anthraquinones of forming with alk.  $\text{Na}_2\text{S}_2\text{O}_4$  vats from which they are reprecipd. unchanged by the air. The product obtained by Homer (C. A. 5, 1076) from  $(\text{CHBr})_2$ ,  $\text{C}_{10}\text{H}_8$  and  $\text{AlCl}_3$  and to which she assigns the structure I bears no similarity to C.'s compd. Comparison of its absorption curve with that of the true I indicates that she had an impure product, probably a mixt. of isomers. The reaction whereby Hönig obtained a "dicarbonyldinaphthylene or naphthanthraquinone" (fusion of 1- $\text{C}_{10}\text{H}_7\text{OH}$  with  $(\text{CO}_2\text{H})_2$ ) is represented in Houben-Weyl's *Methoden d. org. Chem.* as resulting in the formation of VI. A repetition of his work, however, gave a product (VIII) having none of the properties of an anthraquinone. Treatment with  $\text{PhMgBr}$  showed the presence of only one C:O group. The other O atom can, therefore, be present only in ether combi-

nation and the VIII must be 1,2,7,8-dibenzoanthrone,  $\text{C}_{10}\text{H}_6$    $\text{C}_{10}\text{H}_6$ . The 9-phenyl-

dibenzoanthranol (IX) formed with  $\text{PhMgBr}$  can form oxonium salts with mineral acids. The product obtained from *p*- $\text{MeC}_6\text{H}_4\text{COCl}$ , phenanthrene and  $\text{AlCl}_3$  is not homogeneous but consists for the most part of *o*-tolyl 9-phenanthryl ketone. Condensation by heating gives a mixt. of hydrocarbons, the largest, most easily sol. and lowest-melting part of which is 1,2,3,4-dibenzanthracene (X) as seems established by the fact that even with an excess of an oxidizing agent it forms only a monoquinone, 1,2,3,4-dibenzanthraquinone or 9,10-phthaloylphenanthrene (XI), while the higher-melting isomers give diquinones (phthaloylphenanthrenequinones). The phthaloylphenanthrene ("phenanthraquinone") prepd. according to Ger. pat. 194,328 from *o*-phenanthrolylbenzoic acid and  $\text{P}_2\text{O}_5$  is not homogeneous but a mixt. of isomers in which XI may well predominate. III (yield, 90%), faintly greenish yellow, m. 140–1° sol. in concd.  $\text{H}_2\text{SO}_4$  with orange-red color. The crude product, freed from Al salts by repeated washing in  $\text{C}_6\text{H}_6$  with dil. HCl, when gently boiled about 20 mins., gives around 20% of I, m. 260–1°, shows green-blue fluorescence in soln., dissolves in concd.  $\text{H}_2\text{SO}_4$  with faint red color; picrate, red, m. 212°. Quinone (VI), obtained almost quant., orange, m. 243–4°, sol. in  $\text{H}_2\text{SO}_4$  with deep violet color, forms a red vat in alk.  $\text{Na}_2\text{S}_2\text{O}_4$ . IV, m. 170–1°. II, m. 262°; dipicrate, m. 214°. Quinone (VII), m. 244–5° (W. and K., 249°). VIII, m. 297°, seps. from  $\text{PhNO}_2$  in solvated leaflets, becomes faintly brown and then dirty green in the air, does not dissolve in cold concd.  $\text{H}_2\text{SO}_4$ . IX, leaflets with 1 mol.  $\text{C}_6\text{H}_5\text{N}$  from which it cannot be freed by heating without decompn., begins to decomp. 175°, m. 195°, sol. in concd.  $\text{H}_2\text{SO}_4$  with blue-violet color (red in thick layers),  $\text{H}_2\text{O}$  pptg. a red substance. X (20 g. from 60 g.  $\text{MeC}_6\text{H}_4\text{COCl}$  and 100 g. phenanthrene), yellow, m. 196–7°, shows yellow fluorescence (blue in soln.) in the light of a quartz-Hg lamp, slowly dissolves in concd.  $\text{H}_2\text{SO}_4$  with faint violet-red color; picrate, red, m. 207°. XI, yellow, m. 179°, sol. in  $\text{H}_2\text{SO}_4$  with bluish green color, forms a red vat in alk.  $\text{Na}_2\text{S}_2\text{O}_4$ .

C. A. R.

**Thermochemical studies in the furan series.** PHILIPPE LANDRIEU, FRANÇOIS BAYLOUQ AND JOHN R. JOHNSON. *Bull. soc. chim.* 45, 36–49 (1929).—L., B. and J. measured the heats of combustion of furan and typical derivs. and of corresponding members of the benzene series, and thereby detd. the thermochem. increment involved in passing from the furan ring to the benzene ring. App. employed was the Landrieu calorimeter (C. A. 20, 1748), the Moureu bomb (C. A. 19, 2284) and a specially calibrated Baudin thermometer. The heat capacity of the calorimeter system was detd. by the method of Moureu, Dufraisse and Landrieu (C. A. 18, 933) and by the combustion of a standard sample of BzOH from the U. S. Bur. of Standards. The mean value found was 2463 cal. (20°). The combustion of liquids required special technic. Furfurylthylene was weighed in ampoules having a capillary neck; a ring of  $\text{C}_{10}\text{H}_8$  around the neck served as an auxiliary combustible. Other liquids were weighed and sealed in short neck ampoules; these, with a wick of guncotton, were set in a weighed amount of melted paraffin in a recess in the combustion cup. Consists. of the substances employed were: furan,  $b_{754}$  31–2°,  $n_D^{19.3}$  1.4217,  $n_D^{20.3}$  1.4214,  $d_4^{20}$  0.9026,  $d_4^{19.7}$  0.9388; feryl-

ethylene,  $b_{760}$  99–100°,  $n_D^{18.5}$  1.4992,  $d_4^{18.5}$  0.9445; furfuryl alc.,  $b_{16}$  74–5°,  $n_D^{20}$  1.4876,  $d_4^{20}$  1.1330; tetrahydrofurfuryl alc.,  $b_{16}$  72–3,  $n_D^{20}$  1.4530; furfural,  $b_{16}$  60–1°,  $n_D^{20}$  1.5261,  $d_4^{20}$  1.1756,  $d^{20}$  1.1612; furoic acid, m. 133–4°; furylacrylic acid, m. 140–1°; benzyl alc.,  $b_{28}$  105–6°,  $n_D^{20}$  1.5403,  $d^{20}$  1.0638,  $d^{20}$  1.0498; hexahydrobenzyl alc.,  $b_{28}$  91–2°,  $n_D^{20}$  1.4654,  $d^{20}$  0.9470,  $d^{20}$  0.9360; BzH,  $b_{28}$  78–9°,  $n_D^{20}$  1.5450,  $d^{20}$  1.0626,  $d^{20.1}$  1.0463; cinnamic acid, m. 134–5°. Mol. heats of combustion at const. vol.,  $Q_v$ , at const. pressure,  $Q_p$ , and mol. heats of formation,  $Q_f$ , in 20° cal., for comparable substances in the 2 series are, (1) furan, 500.1, 500.4, 14.8; benzene, 782.9, 783.8, —11.0, (data for benzene from Richards and Davis, *C. A.* 14, 2881); (2) furylethylene, 767.9, 768.5, 4.3; styrolene, 1052.0, 1052.5, —22.5; (3) furfuryl alc., 608.5, 609.0, 69.5; benzyl alc., 891.1, 891.9, 44.2; (4) furfural, 560.3, 560.3, 49.2; BzH, 844.3, 844.8, 22.4; (5) furoic acid, 488.4, 488.1, 121.4; BzOH, 772.6, 772.9, 94.2; (6) furylacrylic acid, 755.6, 755.6, 111.5; cinnamic acid, 1040.6, 1041.1, 83.6; (7) tetrahydrofurfuryl alc., 708.6, 709.5, 107.0; hexahydrobenzyl alc., 1046.6, 1048.4, 94.7, resp. Detus. were precise to about 1 part in 1000. At. wts. O = 16, H = 1.008, C = 12, and heats of combustion,  $C \rightarrow CO_2 + 94.3$  cal.,  $H_2 \rightarrow H_2O + 69$  cal. were used in computations. For the above pairs of substances  $\Delta Q_p$  and  $\Delta Q_f$  are: (1) 282.8, 283.4, —25.8; (2) 284.1, 284.0, —26.8; (3) 282.6, 282.9, —25.3; (4) 284.0, 284.5, —26.8; (5) 284.2, 284.8, —27.2; (6) 285.0, 285.5, —27.9; (7) 338.0, 338.9, —12.3, resp. When cor. for the difference of 2 H in the rings  $\Delta Q_p$  and  $\Delta Q_f$  for substances (7) become 283.0 and 283.9, resp. (cf. *Compt. rend.* 137, 979(1903)). The difference in heats of combustion of similar substances in the furan series and in the benzene series is 284 cal. This figure may safely be used to calc. heats of combustion of furan compds. from those of benzene.

MARGARET W. MCPHERSON

**Secondary valence forces of pyrrole nitrogen.** O. SCHMITZ-DUMONT. Univ. Bonn. *Ber.* 62B, 226–34(1929).—Very few mol. compds. of pyrrole derivs. are known, and in spite of its interest for the understanding of the blood pigment and chlorophyll no systematic study has been made of the secondary valence forces of pyrroles. S.-D. has, therefore, undertaken a study of the reaction of pyrroles with Sn tetrahalides. Pyrrole itself with SnCl<sub>4</sub> gives a light yellow compd. SnCl<sub>4</sub>.2C<sub>4</sub>H<sub>5</sub>N, from which, if it were a pure addn. product, it should be possible to recover the pyrrole unchanged and quantitatively. This, however, could in no way be effected and it may be assumed that, for lack of basic properties of its N, pyrrole cannot add SnCl<sub>4</sub>, but rather undergoes polymerization to a compd., the hitherto unknown *dipyrrole*, which can form such an addn. product. In attempts to isolate this dipyrrole, it at once changed into a black resin in the air, but it must be relatively strongly basic since it cannot be displaced from its SnCl<sub>4</sub> compd. by C<sub>4</sub>H<sub>5</sub>N. Tripyrrole gives both a SnCl<sub>4</sub> and a SnBr<sub>4</sub> compd., having the compns. SnCl<sub>4</sub>.(C<sub>4</sub>H<sub>5</sub>N)<sub>3</sub> and SnBr<sub>4</sub>.2(C<sub>4</sub>H<sub>5</sub>N)<sub>3</sub>, resp. Introduction of Me groups can so increase the additive power of pyrrole that SnCl<sub>4</sub> is added directly to form a stable product, without previous polymerization. Thus, 2,4-dimethylpyrrole gives a crvst. compd. SnCl<sub>4</sub>.2Me<sub>2</sub>C<sub>4</sub>H<sub>3</sub>N, from which the base can be recovered quant. Replacement of the imido H atom apparently does not materially increase the additive power; from *N*-methylpyrrole could be obtained no SnCl<sub>4</sub> compd. from which the base could be recovered.  $\alpha,\beta$ -Bis-*N,N'*-[2,5-dimethyl]pyrrolethane (I), however, when treated in CS<sub>2</sub> with SnCl<sub>4</sub> and evapd. *in vacuo* yields a yellowish crst. product I.2SnCl<sub>4</sub>, from which the I can be recovered quant. The above pyrrole derivs. do not add SnBr<sub>4</sub> but  $\alpha$ -acetylpyrrole (II) forms both SnCl<sub>4</sub> and SnBr<sub>4</sub> compds. of the type SnX<sub>4</sub>.2II, and so does 2,5-diacetylpyrrole; it seems, therefore, that the addn. takes place on the N, not the O of the C:O grouping. Bis[2,4-dimethyl-3-carbethoxy-pyrrol]methene (IV) adds 1 mol. SnCl<sub>4</sub>, indicating that both N atoms are completely equiv. to each other in filling the 2 free coordination positions of the SnCl<sub>4</sub>. From analogy it was to be expected that the 4 imido N atoms in the 16-membered ring compd. obtained by Chelintzev by the condensation of pyrrole with Me<sub>2</sub>CO would add 2 mols. SnCl<sub>4</sub> but the substance does not add SnCl<sub>4</sub> at all, indicating the necessity of assuming in the blood pigment pyrroline along with pyrrole N to explain its inner complex nature. The presence of 2 imido N atoms over against each other, as in C.'s compd., does not prevent the addn. of SnCl<sub>4</sub> for the pyrrole-cyclohexanone condensation product likewise prepd. by C. forms a normal 1:1 addn. product with SnCl<sub>4</sub>. With SnBr<sub>4</sub> the reaction is more complicated, both addn. and substitution products being formed. The HBr thus set free conditions the compn. of the addn. product, 3C<sub>6</sub>H<sub>5</sub>N<sub>2</sub>.2HSnBr<sub>4</sub>. These results show that the coordinative valence of the pyrrole compds. studied (except tripyrrole) is equal to the no. of their N atoms.

C. A. R.

**Action of sulfur on heptane and butane.** R. B. BAKER AND E. EMMET REID.

Johns Hopkins Univ. *J. Am. Chem. Soc.* **51**, 1566-7(1929).— $C_7H_{10}$  (40 g.) and 12.8 g. S, heated at 300–50° for 24–48 hrs., give 2 g. of a thiophene of the formula  $C_7H_{10}S$ , b. 160–1°,  $d_4^{20}$  0.9332,  $d_4^{25}$  0.9221.  $C_8H_{10}$  (32 g.) gives 1 g. of thiophene. These results are analogous to those of Friedmann for  $C_8H_{12}$  (*C. A.* **11**, 940). C. J. WEST

Removal of thiophene from benzene and a new method for the preparation of thiophene-free benzene on a laboratory scale. E. G. R. ARDAGH AND C. M. FURBER. Toronto Univ. *J. Soc. Chem. Ind.* **48**, 73–5T(1929).—A check of 13 recommended methods for the removal of thiophene (I) showed them all to be unsatisfactory; passing  $C_6H_6$  contg. I over Ni with  $H_2$  gave a product free from I, but the catalyst failed rapidly. It was found impossible to make this method successful by varying the temp. or catalyst. To detect I, a trace of isatin was mixed with 1 cc. of the  $C_6H_6$  in a test tube followed by 2 cc. of concd.  $H_2SO_4$ . In the presence of I a deep blue develops upon standing; with small amts. of I, the color becomes pale green or greenish yellow. A. and F. found that on heating  $C_6H_6$  contg. I with red HgO and stearic acid and distg. off the  $C_6H_6$ , it was freed of I and a *Hg-stearic acid compd.* of I remained. Stirring was found to reduce the necessary period of heating from 3 hrs. to 90 mins. at 80°. A trace of moisture was found necessary, but more than that usually present in the reagents and  $C_6H_6$  slowed up the reaction. Expts. on the optimum mol. ratios indicated that 8 mols. of HgO and 10 mols. of stearic acid per mol. of I should be used. MgO, PbO and ZnO in place of HgO gave negative results. Bibliography.

A. S. CARTER

Phenylisatogen. M. BAKUNIN AND T. VITALE. Eng. School Naples. *Rend. accad. sci. Napoli* [3], **33**, 270–8(1927).—As has been shown in earlier expts., phenylisatogen (I), m. 186–7°, red, is obtained as a by-product in the prepn. of  $o$ - $O_2NC_6H_4$ -CH  $CHPhCO_2H$  by Perkin's synthesis. While with  $H_2NOH \cdot HCl$  and I in EtOH the *C*-oxime, m. 236°, and the *N*-oxime, m. 167–8°, were obtained (Pfeiffer, *C. A.* **10**, 1334), mainly formation of 3-nitroso-2-phenylindole took place when using  $H_2NOH \cdot HCl$  and an excess of alc. NaOH. With NaOH in boiling EtOH, I was decompd. BzH and a compd.  $C_{14}H_{12}ON_2$ , m. 209–10°, could be isolated from the reaction product. A nitrophenylisatogen, m. 220°, golden yellow, with the  $NO_2$  group in the 5-, 7-, 3'- or 4'-position was obtained by action of concd.  $HNO_3$  on I in  $CHCl_3$ , with  $H_2SO_4$ ,  $FeCl_3$  or  $P_2O_5$  as a catalyst.

G. SCHWOCH

Isatide or isatin pinacol. GUSTAV HELLER AND HELLMUTH LAUTH. Univ. Leipzig. *Ber.* **62B**, 343–50(1929).—Hantzsch observed some yrs. ago that dioxindole dissolves in alkalis, in absence of O, without color and that a violet color appears only when air is admitted; hence the colored solns. contain isatide salts. The color reaction is best obtained in  $C_6H_5N$  on addn. of 10%  $Ba(OH)_2$ . He correlates this peculiar halochromism phenomenon with Schlenk's metal ketyls and believes that halving of the mols. and formation of radicals is the common cause of color in both cases, although S. states expressly that with his substances the appearance of color depends on the complete exclusion of  $H_2O$ . That H.'s views, which are supposed to prove the pinacol structure (I) of isatide, have no significance is shown by the fact that not only the isatide of phenyldioxindole but the oxindole itself forms vividly colored salts in the complete absence of O, and with *N*-diacetyl isatide the violet color with  $Ba(OH)_2$  is stable for about 2 days. Kohn and Osterstetzer's tetraacetyl isatide (II), unlike isatide, is unchanged by long treatment with Zn dust and AcOH, which led to the suspicion that in the acetylation the isatide may undergo rearrangement and the II have a structure different from that of isatide. With AcOH and HCl at 50°, II first loses two Ac groups, yielding a substance (III) isomeric with the *N*-diacetyl isatide obtained by cautious reduction of *N*-acetyl isatin. III is also obtained from II in hot alc. with  $PhNHNH_2$ . On long standing in AcOH-HBr or on soln. in concd.  $H_2SO_4$  the remaining Ac groups are removed; the resulting product is not homogeneous and, because of its insol., cannot be recrystd. but by cautious addn. of HCl to its  $C_6H_5N$  soln. it can be made to sep. gradually in needles which are not yet quite homogeneous and consequently only partly regenerate II under the same conditions as III (boiling with  $Ac_2O$  or treatment in cold  $C_6H_5N$  with  $AcCl$ ). Dithioisatide, which from its close relationship to isoinidigo must certainly have the pinacol structure (I) with SH instead of OH, has properties quite different from those of isatide, and H. and L. conclude isatide has not the pinacol structure (I) but is a quinoxaline-like compd. (IV or V) which on acetylation probably rearranges into the pinacol; II would then be tetraacetyl isatin pinacol. The hydrazones (VI) formed by the action of  $PhNHNH_2$  on *N*-acetyl- and *N*-benzoyl isatin yield on longer treatment with  $PhNHNH_2$  w substances having the compn. of osazones but lacking their color and still longer treatment they decomp. into the original VI and isatin phenyl-

hydrazone. Heller had previously obtained a similarly almost colorless compd. from *N*-hydroxyoxindole and  $\text{PhNHNH}_2$ ; possibly they are osotetrazines. Provisionally they are designated as *isoacylisatin osazones*. H.'s *O*-benzoyldioxindole can also be obtained from K dioxindole with  $\text{BzCl}$  in  $\text{C}_6\text{H}_6$ , and the same is true of Suida's *O*-Ac compd.; with  $\text{PhNHNH}_2$  at room temp. they give isatin  $\beta$ -phenylhydrazones and are, therefore, not *N*-acyl derivs. *Diacylisatin pinacol* (III), begins to darken  $280^\circ$ , m. about  $317^\circ$  (evolution of gas, depending on the manner of heating), sol. in alkalies and recovered practically unchanged if at once pptd. with acids but if the soln. is allowed to stand, acids ppt. increasing amounts of isatin. The non-homogeneous *isatin pinacol* obtained from III and concd.  $\text{H}_2\text{SO}_4$  or  $\text{AcOH-HBr}$  (or still better  $\text{AcOH-H}_3\text{PO}_4$  at  $125^\circ$ ) is a violet-gray powder, decomps. about  $265\text{--}70^\circ$ , sol. in cold alkalies without color and without conversion to any great extent into an isatin; it is also obtained, but even less smoothly, from isatyde and concd.  $\text{H}_2\text{SO}_4$ . In  $\text{C}_6\text{H}_5\text{N}$  in a current of  $\text{H}_2$ , III with 10%  $\text{Ba(OH)}_2$  gives a faint pink color which, on stratifying with more  $\text{Ba(OH)}_2$ , becomes red-violet and soon after lighter again. III and the Ac-free product become only faintly red, the rearranged isatyde yellow. It was confirmed that in the absence of *O* dioxindole gives no color with  $\text{C}_6\text{H}_5\text{N-Ba(OH)}_2$  while isatyde gives a very vivid violet color. With *N*-diacylisatyde is obtained an intense steel-blue color which persists 2 days, while the deacetylated isatin pinacol and dithioisatin pinacol give no color. With *N*-dibenzoylisatyde the blue-violet color is also very intense but less stable. Acetyldioxindole gives no color. *Iso-N-benzoylisatin osazone*, from *N*-benzoylisatin refluxed 2.5 hrs. in alc. with  $\text{PhNHNH}_2$  or from *N*-dibenzoylisatyde in alc. heated 3 hrs. on the  $\text{H}_2\text{O}$  bath with an excess of  $\text{PhNHNH}_2$ , m.  $211\text{--}2^\circ$ , difficultly sol. in aq., more readily in hot alc. alkali, sol. in concd.  $\text{H}_2\text{SO}_4$  with blood-red color, mol. wt. in camphor 429, unchanged by cold  $\text{HBr-AcOH}$ , apparently brominated in the nucleus on heating. *Ac analog*, prisms with 1 mol.  $\text{Me}_3\text{CO}$ , m. about  $130^\circ$ .

C. A. R.

**Isatin derivatives and their isomerization to quinoline.** N. I. PUTOKHIN. Samara Rural Econ. Inst. *J. Russ. Phys.-Chem. Soc.* **60**, 1179-90(1928); cf. C. A. **22**, 77, 3409.—*Na isatin*, which is easily prepd. with a 91.6% yield by Heller's method (C. A. **1**, 1703) and presents a fine black powder, was made to react with different esters. The condensation with *Et chloroacetate* was effected by refluxing 8 g. of the latter with 10 g. *Na isatin* and 50 cc. absolutely dry  $\text{C}_6\text{H}_6$  for 4 hrs. The ppt. having turned from black to orange, 5 g. of the ester was added and the heating was continued 5 hrs. When the liquid became orange and acid to litmus, 300 cc.  $\text{C}_6\text{H}_6$  was added and the mixt. was heated to dissolve as much of the ppt. as possible, after which the  $\text{C}_6\text{H}_6$  soln. was filtered and the residue was again extd. with 200 cc.  $\text{C}_6\text{H}_6$ , which was also filtered. Both  $\text{C}_6\text{H}_6$  solns. were united, the solvent was driven off by evapn. till the vol. was reduced to 40-50 cc., and the latter was left to cryst. *Et isatin-N-acetate*,  $\text{C}_6\text{H}_4 \cdot \text{CO} \cdot \text{CO} \cdot \text{NCH}_2\text{CO}_2\text{Et}$ , crystd. in spherically disposed needles, m.  $114^\circ$ . The

yield was 7 g. The product obtained was very stable and not hydrolyzable either by  $\text{H}_2\text{O}$  or by acids. It was, however, hydrolyzed on heating 4 g. of it on a steam bath for 2 hrs. with 30 g. of aq.  $\text{HI}$  (d. 1.6) in presence of 3 g. red P. At the end of the reaction 30 cc.  $\text{H}_2\text{O}$  was added, the liquid was heated and filtered hot; on standing, the filtrate yielded 2-2.5 g. crystals which, on being recrystd. from alc. with the addn. of petroleum ether, were pink and m.  $219\text{--}20^\circ$ . The reaction went further

than mere hydrolysis, and partial reduction took place,

being formed. For the condensation of *Na isatin* with *di-Et chloromalonate* 10.5 g. of the former, 12.5 g. of the latter and 50 cc. absolutely dry  $\text{C}_6\text{H}_6$  were refluxed 10 hrs., viz., till the color of the ppt. changed to orange. The hot liquid was filtered by suction, most of  $\text{C}_6\text{H}_6$  was distd. off, and crystals, m.  $82^\circ$ , sepd. overnight; 5.2 g. of *di-Et isatin-N-malonate* were thus obtained. The ester could not be hydrolyzed on being heated with  $\text{H}_2\text{O}$  or with acids; heating with aq. alkali gave no definite result. The ester was sol. in  $\text{CHCl}_3$ ,  $\text{EtOH}$ ,  $\text{C}_6\text{H}_6$ , insol. in  $\text{H}_2\text{O}$  or in petroleum ether. To condense *Na*

*isatin with ethylene bromide* 12.5 g. of the former and 30 cc. absolutely dry  $C_6H_6$  were refluxed 20 hrs., then 4 g. of the bromide and 20 cc.  $C_6H_6$  were added and the refluxing continued. After that, 3 more addns. of bromide, 4 g. each, were made every 20 hrs., ( $C_6H_6$  not being added again). Altogether 23.5 g. bromide were introduced: a large excess over the theoretically needed. Refluxing, which had to be carried on until the ppt. became orange, lasted 60–80 hrs. more. Three g. dark orange crystals of *isatin-N-ethylbromide* was obtained which, after recrystn. from  $C_6H_6$ , m.  $130^\circ$ . After filtering off the  $C_6H_6$  soln. of the latter substance, the residue, on being extd. in a Soxhlet app., yielded 2.5 g. light orange needles, m.  $190^\circ$ , of *ethylenediisatin*, ( $C_6H_4 \cdot CO \cdot CO \cdot NCH_2$ )<sub>2</sub>. *Condensation of isatinethyl bromide with sodiomalonic ester.*

$NaCH(CO_2Et)_2$  (prepd. from 3.5 g.  $CH_2(CO_2Et)_2$  and 0.6 g. Na in 25 cc. abs. EtOH) was added to a soln. of 5 g. isatinethyl bromide in 40 cc. abs. EtOH and the mixt. was refluxed 6 hrs. on a water bath. At the end of the reaction the excess of Na was neutralized by  $H_2SO_4$ , the dark liquid obtained was filtered and the EtOH was distd. off, leaving behind a dark sirup which could neither be crystd. nor distd. On decomp. the sirup with  $Ca(OH)_2$  and heating above  $230^\circ$ , an oil distd. accompanied by abundant  $CO_2$  evolution; the oil apparently presented a mixt. of *N-propylaniline* with an unidentified substance which strongly reduced  $PtCl_4$  and easily resinified with evolution of  $CO_2$  by the action of HCl. Dry distn. of *ethylenediisatin* with  $Ca(OH)_2$  was carried out after triturating in a porcelain mortar 5 g. of the former with 50 g. of the latter. An oil passed accompanied by an evolution of  $CO_2$ . The oil consisted chiefly of *aniline* and contained some *quinoline*. To prove the presence of the latter, P. worked out a method of sepg. *quinoline* from *aniline* based on the property of *quinoline* (not possessed by *aniline*) of giving a cryst. compd. with  $AgNO_3$ . BERNARD NELSON

**Structure of furazan oxides. II.** CORLISS R. KINNEY. Univ. of Utah. *J. Am. Chem. Soc.* **51**, 1592–600 (1929); cf. *C. A.* **21**, 908.—It is shown that the isomeric oxides of phenyl-*p*-methoxyphenylfurazan (I) are not isomorphous; the structural differences between them have been clearly demonstrated by the reaction with  $O_3$  followed by a stepwise decompn. The detn. of the individual structures of the oxides by means of the  $O_3$  reaction gives further proof that the configuration of the oximes, to which the oxides are closely related, are correct as set forth by Meisenheimer (*C. A.* **19**, 2819). *p*-MeOC<sub>6</sub>H<sub>4</sub>COCH(OH)Ph results in 100–10 g. yields from 272 g. *p*-MeOC<sub>6</sub>H<sub>4</sub>CHO, 212 g. BzH and 50 g. KCN in 350 cc.  $H_2O$  and 700 cc. 95% EtOH; oxidation to BzCOC<sub>6</sub>H<sub>4</sub>OMe (II) was best carried out with  $C_6H_5N \cdot CuSO_4$ . II (40 g.) and slightly less than 1 equiv. of  $NH_2OH \cdot HCl$ , refluxed in EtOH for 1.5 hrs., give 25 g. of the  $\gamma$ -dioxime, from which the  $\alpha$ -oxide of I was prepd. according to M. Details of the prepn. of the  $\beta$ -oxide from the mixed dioximes are given. An alternative method for the  $\beta$ -oxide consists in prepg. BzCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe, transforming this into the  $\beta$ -monoxime of II, m.  $169–70^\circ$  (yield), and oxidizing. Diphenylfurazan reacted slowly with  $O_3$  and did not produce acids as did the oxides. Upon treating the oxides of I with  $O_3$  and decomp. the ozonides, the  $\alpha$ -oxide yielded anisic acid, while the  $\beta$ -oxide yielded BzOH. The oxides of I and PhMgBr both yield PhOH and Ph<sub>2</sub>. C. J. WEST

**N-Alkyl- and aryl-4,5,6,7-tetrahydroindazoles.** K. v. AUWERS, J. CONRAD, A. ERNECKE AND B. OTTENS. Univ. Marburg. *Ann.* **469**, 57–82 (1929); cf. *C. A.* **18**, 834, 20, 389.—Condensation of substituted Et cyclohexanone-2-oxalates with alkyl- and arylhydrazines affords a mixt. of 1- and 2-alkyl- or aryl-4,5,6,7-tetrahydroindazole-3-carboxylates. When  $N_2H_4$  is used tetrahydroindazole-3-carboxylates result. Subsequent alkylation of these affords mixts. of the 1- and 2-derivs. Elimination of  $CO_2$  from the alkylated indazolecarboxylic acids gives the corresponding indazoles. Et cyclohexanone-2-oxalate and  $H_2NNHMe \cdot AcOH$  in EtOH and NaOH give a mixt. of esters which, after hydrolysis with EtOH-NaOH, affords 2-methyl- and 1-methyl-4,5,6,7-tetrahydroindazole-3-carboxylic acids, m.  $205–6^\circ$  and  $207.5–8.5^\circ$ , resp. These acids are sepd. by partial esterification with 3% MeOH-HCl; the former is unaffected and the Me ester from the latter is then rehydrolyzed. Thermal decompn. of the acids yields 2

141–  
after

hydroindazole-3-carboxylic

m.  $103–4^\circ$  and  $150–1^\circ$ , resp., have been described previously as the 1- and 2-derivs., resp. 2-Benzyl-, m.  $187–7.5^\circ$ , and 1-benzyltetrahydroindazole-3-carboxylic acid, m.  $157.5–8.5^\circ$  (Me ester, m.  $69–70^\circ$ ) are obtained similarly. The corresponding indazole picrates m.  $132–3^\circ$  and  $128–9^\circ$ , resp. Et 4-methylcyclohexanone-2-oxalate and  $N_2H_4 \cdot H_2O$  give Et 5-methyl-4,5,6,7-tetrahydroindazole-3-carboxylate (I), b<sub>1</sub>  $208–10^\circ$ ,

m. 110–1° (free acid, m. 274°), while condensation with MeNHNH<sub>2</sub> in AcOH gives, after hydrolysis, 2,5-dimethyltetrahydroindazole-3-carboxylic acid, m. 195–5.5°, as the principal product. If the condensation with MeNHNH<sub>2</sub> is effected by H<sub>2</sub>SO<sub>4</sub> at 0°, 5-dimethyltetrahydroindazole-3-carboxylic acid, m. 185–6° (Me ester, m. 114–5°), is the main product. Methylation of I (MeI and alkali) gives about equal quantities of the 1,5- and 2,5-derivs. 1,5-Dimethyltetrahydroindazole, b<sub>11</sub> 115–6° (picrate, m. 155°). Ethylation of I gives 5-methyl-2-ethyl-, m. 184–5°, and 5-methyl-1-ethyltetrahydroindazole-3-carboxylic acids, m. 147.5–9.5° (Me ester, m. 44.5–5.5°); the m. p. of the corresponding indazole picrates should be interchanged. Benzoylation of I gives 40% of 2-benzyl-5-methyl-, m. 186–7°, and 60% of 1-benzyl-5-methyltetrahydroindazole-3-carboxylic acids, m. 142.5–3.5° (Me ester, m. 98–9°), which, on loss of CO<sub>2</sub>, yield 2-benzyl-5-methyl-(picrates, m. 115–6° and 135–6°) and 1-benzyl-5-methyltetrahydroindazoles, b<sub>11</sub> 191–2° (picrate, m. 128–9°). Condensation of the above oxalate with PhNHNH<sub>2</sub> gives 80% of Et 1-phenyl-5-methyl-4,5,6,7-tetrahydroindazole-3-carboxylate, m. 128–9° (Me ester, m. 119–20°; free acid, m. 196.5–8.5°), and 20% of 2-phenyl-5-methyl-4,5,6,7-tetrahydroindazole-3-carboxylic acid, m. 202–3°. Et 6-methylcyclohexanone-2-oxalate and N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O give 43% of Et 7-methyl-4,5,6,7-tetrahydroindazole-3-carboxylate, b<sub>11</sub> 182°, m. 87–8° (free acid, m. 212–4°); MeI and MeONa give approx. equal quantities of 2,7-dimethyl-, m. 128–30°, and 1,7-dimethyltetrahydroindazole-3-carboxylic acids, m. 169.5–70.5° (Me ester, b<sub>11</sub> 185–7°). 1,7-Dimethyltetrahydroindazole, b<sub>11</sub> 111–2° (picrate, m. 155.5°). Ethylation gives about equal quantities of 7-methyl-2-ethyl-, m. 43–9°, and 7-methyl-1-ethyltetrahydroindazole-3-carboxylic acids, m. 94° (with 1 mol. H<sub>2</sub>O), m. 127.5–8.5° (anhyd. Me ester, b<sub>10</sub> 182–3°, d<sub>4</sub><sup>25</sup> 1.0899, n<sub>D</sub><sup>20</sup> 1.50485). 7-Methyl-1-ethyltetrahydroindazole, b<sub>10</sub> 111–1.5° (picrate, m. 136–7°). Benzoylation gives 80% of 1-benzyl-7-methyltetrahydroindazole-3-carboxylic acid, crystg. with 1 H<sub>2</sub>O, m. 119–21° (Me ester, b<sub>11</sub> 242–6°), and 20% of the 2-benzyl deriv., m. 154–5°. 1- and 2-Benzyl-7-methyltetrahydroindazoles, b<sub>11</sub> 188–91° and b<sub>12</sub> 189–90°, resp., are obtained in the usual manner. Condensation of the above oxalate with PhNHNH<sub>2</sub> in HCl or AcOH gives 65% of 1-phenyl-7-methyltetrahydroindazole-3-carboxylic acid, m. 177–8° (Me ester, b<sub>12</sub> 238–40°), and 35% of the 2-Ph acid, m. 180–1°. Methylation of Et 4,6-dimethyl-4,5,6,7-tetrahydroindazole-3-carboxylate, b<sub>12</sub> 197° (Me ester, b<sub>12</sub> 197°, m. 90–1°; free acid, m. 269–70°), affords 83% of 1,4,6-trimethyltetrahydroindazole-3-carboxylic acid, m. 176–7° (Me ester, m. 73–5°), together with 17% of the 2,4,6-tri-Me deriv., m. 179–80°. The picrates of 1,4,6- and 2,4,6-trimethyltetrahydroindazoles, m. 175–6.5° and 145–6°, resp., have been previously described as the 2,4,6- and 1,4,6-derivs. 4,6-Dimethyl-1-ethyltetrahydroindazole-3-carboxylic acid, m. 141–1.5° (Me ester, b<sub>11</sub> 188–9°, m. 64.5–5.5°), gives 4,6-dimethyl-1-ethyltetrahydroindazole, b<sub>11</sub> 126° (picrate, m. 137–8°, previously named 2-picrate), and 4,6-dimethyl-2-ethyltetrahydroindazole-3-carboxylic acid, m. 145–6.5°, yields the corresponding indazole (picrate, m. 117–8°, previously termed the 1-picrate). 2-Benzyl-4,6-dimethyl-, m. 159.5–60.5°, and 1-benzyl-4,6-dimethyltetrahydroindazole-3-carboxylic acids, m. 137–8° (Me ester, b<sub>11</sub> 242–3°, m. 112–3°) are also described. 1-Phenyl-4,6-dimethyltetrahydroindazole-(perchlorate, m. 183–4°) is obtained from the corresponding 3-carboxylic acid, m. 192.5–3.5° (Me ester, b<sub>11</sub> 240°, m. 87–8°). 2-Phenyl-4,6-dimethyltetrahydroindazole-3-carboxylic acid, m. 223° (decompn.). Spectrochem. data are given for 14 of the above derivs. (1-Me, 1,5-di-Me, 1-benzyl-5-Me, 1,7-di-Me, 1-Et-7-Me, 2-Et-7-Me, 1-benzyl-7-Me, 2-benzyl-7-Me, 1-Ph-7-Me, 2-Ph-7-Me, 1,4,6-tri-Me, 1-Et-4,6-di-Me, 1-benzyl-4,6-di-Me, 2-benzyl-4,6-di-Me).

C. J. WEST

**Synthesis and fission of quaternary tetrahydroindazolium salts.** K. v. AUWERS, J. CONRAD and A. ERNECKE. Univ. Marburg. *Ann.* **469**, 82–92(1929).—The following substituted 4,5,6,7-tetrahydroindazolium iodides have been prepd. from the requisite indazole and alkyl or aralkyl iodide at 100°: 1,2-dibenzyl-, m. 153°; 1-benzyl-2-ethyl-, m. 125–7°; 1,2,5-trimethyl-, m. 137.5° (bromide, an oil); 1,5-dimethyl-2-ethyl-, m. 84°; 2,5-dimethyl-1-ethyl-, m. 67–9°; 5-methyl-1,2-diethyl-, m. 115–7°; 2-benzyl-1,5-dimethyl-, m. 139–40°; 1-benzyl-2,5-dimethyl-, m. 175–6°; 2-benzyl-5-methyl-1-ethyl-, m. 167–8°; 1-benzyl-5-methyl-2-ethyl-, m. 142–4°; 1,2,7-trimethyl-, m. 121–3°; 7-methyl-1,2-diethyl-, oily; 2-benzyl-1,7-dimethyl-, m. 175°; 1-benzyl-2,7-dimethyl-, m. 175–6°; 1,2,4,6-tetra-methyl-, m. 155°; 1,4,6-trimethyl-2-ethyl-, oily; 2,4,6-trimethyl-1-ethyl-, m. 116–8°; 2-benzyl-1,4,6-trimethyl-, oily; 1-benzyl-2,4,6-trimethyl-, m. 119.5–20.5°. The compds. previously described as 1-benzyl-1-ethyl- and 2-benzyl-2-ethyltetrahydroindazolium iodides are the 1-benzyl-2-ethyl and 2-benzyl-1-ethyl derivs., resp. The methiodide of 7-methyl-2-ethyltetrahydroindazole, m. 102–3°, is the quaternary 2,7-dimethyl-1-ethyl salt. The methiodide, m. 175°, from 2-benzyl-7-methyltetrahydroindazole is also obtained from 1,7-dimethyltetrahydroindazole and PhCH<sub>2</sub>I, and is, therefore,

2-benzyl-1,7-dimethyltetrahydroindazolium iodide. Fission of the above salts is accomplished by heating in a vacuum above the m. p. and converting the bases formed into the picrates. With the 1,2-dimethyl, 1,2-diethyl and 1,2-dibenzyl derivs., approx. equal quantities of the 1- and 2-alkyltetrahydroindazoles are produced; occasionally an excess of the 2-derivs. results. When dissimilar groups are attached to the 1- and 2-positions the 1 with the least affinity demand (e. g., benzyl) is eliminated, in agreement with the results previously obtained. In some of the decompns. a partial wandering of an alkyl group occurs. Thus, 1-benzyl-2,7-dimethyltetrahydroindazolium iodide affords in addn. to 2,7-dimethyltetrahydroindazole a small amt. of the 1,7-di-Me deriv. 1,4,6-Trimethyl-2-ethyltetrahydroindazolium iodide gives 1,4,6-trimethyl-, 4,6-dimethyl-1-ethyl- and 4,6-dimethyl-2-ethyltetrahydroindazoles in the ratio of 2:1:3. Similarly, 2,4,6-trimethyl-1-ethyltetrahydroindazolium iodide yields 1,4,6-trimethyl-, 4,6-dimethyl-1-ethyl-, and 2,4,6-trimethyltetrahydroindazoles in the proportion 3:3:1.

**Aminobenzothiazoles. XI. Synthesis of 5,4'-disubstituted 1-anilinobenzothiazoles from nuclear substituted thiocarbonylides.** GEORGE M. DYSON, ROBERT F. HUNTER AND CHARLES SOYKA. Imp. College Sci. Tech., London. *J. Chem. Soc.* 1929, 458-66; cf. *C. A.* 23, 835.—(*p*-BrC<sub>6</sub>H<sub>4</sub>NH)<sub>2</sub>CS and Br in CHCl<sub>3</sub> yield a perbromide, which, on heating, gives a *hydropentabromide*(I), C<sub>12</sub>H<sub>8</sub>N<sub>2</sub>Br<sub>5</sub>S.HBr.Br., orange-red needles, m. 170° (decompn.) and rapidly loses Br on exposure to moist air; suspended in H<sub>2</sub>SO<sub>4</sub> and treated with SO<sub>2</sub>, there results *5,4'-dibromo-1-anilinobenzothiazole*(II), m. 221°; *Ac deriv.*, m. 205-6°; *HBr salt*, m. 250° (decompn.); Br gives I. *1-Chloro-5-bromobenzothiazole*, m. 89°, b<sub>11</sub> 157-9°, results by heating *p*-BrC<sub>6</sub>H<sub>4</sub>NCS and PCl<sub>5</sub> 30-40 hrs. at 170-80°; warming with *p*-BrC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> gives II. *p*-BrC<sub>6</sub>H<sub>4</sub>NHCSNHPH and Br in CHCl<sub>3</sub> give the *hydrotribromide*, m. 148° (decompn.), which is reduced to *4'-bromo-1-anilinobenzothiazole*(III), m. 214-5°, also obtained from 1-chlorobenzothiazole and *p*-BrC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>. Bromination of III gives II. 1-Anilinobenzothiazole yields a *hexabromide*, m. 140°, which yields II on being dissolved in boiling abs. EtOH. Hagershoff's dibromoanilinobenzothiazole (*Ber.* 36, 3121(1903)) appears to consist mainly of II, although the m. p. could not be raised above 200°. Bromination of II gives an unstable orange *hexabromide*, m. 254°, which gives with hot abs. EtOH a *tetra-Br substitution deriv.*, m. 196-8°. (*p*-ClC<sub>6</sub>H<sub>4</sub>NH)<sub>2</sub>CS and Br in CHCl<sub>3</sub> yield a *hydrotribromide*, orange, m. 165-7° (decompn.); reduction gives *5,4'-dichloro-1-anilinobenzothiazole*, m. 224°; *Ac deriv.*, m. 186-7°; *HBr salt*, yellow, m. 217°; *hexabromide*, orange, m. 253° (decompn.). *p*-ClC<sub>6</sub>H<sub>4</sub>NHCSNHPH yields a *Br addn. compd.*, orange, m. 130° (decompn.); *4'-chloro-1-anilinobenzothiazole*, m. 196°; this is also obtained from 1-chlorobenzothiazole and *p*-ClC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>. (*p*-IC<sub>6</sub>H<sub>4</sub>NH)<sub>2</sub>CS and Br in CHCl<sub>3</sub> yield a red *bromide*, m. 185°, and a yellow, m. 211°; both, on reduction, yield *5,4'-diiodo-1-anilinobenzothiazole*, m. 193° (decompn.); this also results by treating 1-anilinobenzothiazole in AcOH with ICl, warming the soln. and dilg. with H<sub>2</sub>O. (*p*-FC<sub>6</sub>H<sub>4</sub>NH)<sub>2</sub>CS gives a *hydrotribromide*, orange, m. 150-2° (decompn.); *5,4'-difluoro-1-anilinobenzothiazole*, m. 227-8°. *5,4'-Dinitro-1-anilinobenzothiazole*, brilliant yellow, m. 280°; this also results on nitration of 1-anilinobenzothiazole. (*p*-NCC<sub>6</sub>H<sub>4</sub>NH)<sub>2</sub>CS and Br give an *addn. product*, golden, m. 159-60° (decompn.); *5,4'-dicyano-1-anilinobenzothiazole*, m. 222°. (*p*-EtO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>NH)<sub>2</sub>CS yields a *hydropentabromide*, orange, m. 110° (decompn.); reduction gives *Et 1-anilinobenzothiazole-5,4'-dicarboxylate*, m. 190-2°; hydrolysis gives the free acid, does not m. 290°. (*p*-MeOC<sub>6</sub>H<sub>4</sub>NH)<sub>2</sub>CS yields a brick-red *bromide*, m. 137° (decompn.), reduced to a *dibromo-5,4'-dimethoxy-1-anilinobenzothiazole*, m. 240°. PhNHCSNHPH yields a *hydrotribromide*, orange, m. 167° (decompn.); the same compd. is obtained from 1-acetanilinobenzothiazole, HBr and Br (Hagershoff, *Ber.* 36, 3136(1903)); Br in CHCl<sub>3</sub> gives an orange *hexa-Br addn. compd.*, m. 163° (decompn.).

C. J. WEST

**Fission of the benz- $\alpha,\beta$ -isoxazole ring.** HANS LINDEMANN AND HANS CRÄGE. Tech. Hochschule Braunschweig. *Ann.* 469, 44-57(1929).—Me 6-nitrobenzisoxazole-3-carboxylate (Borsche, *C. A.* 6, 2422), when heated with slightly dild. H<sub>2</sub>SO<sub>4</sub> 20 mins. on the H<sub>2</sub>O bath, gives *6-nitrobenzisoxazole-3-carboxylic acid*(I), m. 189-90° (evolution of CO<sub>2</sub>), alk. hydrolysis gives a I which crysts. with 1 H<sub>2</sub>O, lost in vacuo over P<sub>2</sub>O<sub>5</sub>. I and N<sub>2</sub>H<sub>4</sub>.H<sub>2</sub>O in EtOH give the corresponding *hydrazide*, m. 170° (*Ac deriv.*, m. 213-4°), converted by HNO<sub>3</sub> into the corresponding *amide*, m. 135° (decompn.) Decompn. of this with AcOH gives *di[6-nitrobenzisoxazole-3]carbamide*, m. 342°, while with Ac<sub>2</sub>O and a little concd. H<sub>2</sub>SO<sub>4</sub> there results a mixt. of *6-nitro-3-acetamido-*, m. 230° (not sharp), and *6-nitro-3-diacetamidobenzisoxazole*, m. 133°. Warming either *Ac deriv.* with 2 N NaOH gives *3,4'-nitro-2'-hydroxyphenyl-5-methyl-1,2,4-oxadiazole*, m. 124° (*Ac deriv.*, m. 162°), thus demonstrating fission of the isoxazole ring and

subsequent reaction between the oximino and acetamido groups. Hydrolysis of the Ac derivs. with fairly concd.  $\text{H}_2\text{SO}_4$  gives 6-nitro-3-aminobenzisoxazole(II), m.  $234^\circ$ , converted by  $\text{HNO}_2$  into 6-nitro-3-hydroxybenzisoxazole(III), m.  $85-8^\circ$  (decompn.). Treating III with AcOH or II with  $\text{HNO}_2$  in AcOH gives 4-nitro-2-hydroxybenzacetilhydroxamic acid, m.  $184^\circ$ , then at  $241^\circ$ , hydrolyzed by 10% NaOH to the corresponding hydroxamic acid, m.  $214^\circ$ . Either acid, heated with MeOH-KOH, gives 6-nitrobenzoxazol-2-one, m.  $241^\circ$ . The mechanism of the fission is explained by assuming the addn. of 1 mol.  $\text{H}_2\text{O}$ :

If the group R has no depressant action (e. g., HO, NHAc) on the conjugated system fission occurs, but when R depresses the conjugation (e. g., alkyl,  $\text{NH}_2$ ) fission is inhibited.

C. J. WEST

***o*-Benzidine rearrangement of 3-methyl-4-phenylhydrazo-5-phenylisoxazole.** G. WITTIG, H. KLEINER AND J. CONRAD. Univ. Marburg. *Ann.* **469**, 1-16(1929).—Reduction of 3-methyl-4-phenylazo-5-phenylisoxazole either electrolytically or with Al powder in EtOH contg. a small amt. of NaOH gives 3-methyl-4-phenylhydrazo-5-phenylisoxazole, m.  $136^\circ$  (decompn.). Warming with *N* HCl causes rearrangement, giving a mixt. of 3-methyl-5-gem-phenyl-5-anilinoisoxazole-4-one(I), m.  $130^\circ$  (decompn.) and 3-methyl-5-gem-phenyl-5-*o*-aminophenylisoxazole-4-ketimine(II), m.  $179-80^\circ$  (decompn.). Thermal decompn. of I at  $130^\circ$  gives CO and BzNHPh, while acid or alk. hydrolysis gives BzOH and PhNH<sub>2</sub>. I does not react with  $\text{KMnO}_4$  or with  $\text{NH}_2\text{OH}$ . Br gives 2,4-Br<sub>2</sub>C<sub>6</sub>H<sub>4</sub>NHBz, m.  $139.5^\circ$ . PhMgBr and I give 4-hydroxy-5-anilino-4,5-diphenyl-3-methylisoxazoline, m.  $173.5^\circ$ , hydrolyzed by *N* AcOH in Me<sub>2</sub>CO to  $\alpha$ -isomitosoethylbenzoin, m.  $179-80^\circ$  (decompn.), further hydrolyzed by mineral acid to Bz<sub>2</sub>. MeMgI and I give 4-hydroxy-5-anilino-5-phenyl-3,4-dimethylisoxazoline, m.  $201^\circ$  (slight decompn.), hydrolyzed by 2*N*  $\text{H}_2\text{SO}_4$  to 2-benzoyl-3-isonitrosobutan-2-ol, m.  $145^\circ$ . II does not react with *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NHNH<sub>2</sub>; Br gives the HBr salt, m.  $172.5^\circ$ , of 5-phenyl-5-*p*-bromo-*o*-aminophenyl-3-methylisoxazole 4-ketimine, m.  $175^\circ$ . II yields an Ac deriv, m.  $254^\circ$ , and a benzylidene deriv, m.  $195.5-6^\circ$ . SnCl<sub>2</sub> gives an addn. product, 2II.SnCl<sub>4</sub>, m.  $127^\circ$ . II is hydrolyzed by 30% KOH to 2-amino-3-hydroxy-3-phenylindole, m.  $204^\circ$ , also formed by the action of an excess of MeMgI on II; fusion with alkali gives *o*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>Bz, m.  $104-5^\circ$ , and HCN. Boiling II with dil. AcOH 5-6 hrs. gives 2,3-dihydroxy-3-phenylindole, m.  $209-10^\circ$ .

**Ring closure of hydrazomonothiodicarboxamides with acetic anhydride. Formation of iminothiodiazolones and iminothioltriazoles.** PRAPHULLA C. GUHA AND TARINI K. CHAKRABORTY. Dacca Univ. and Indian Inst. of Science, Bangalore. *J. Indian Chem. Soc.* **6**, 99-110(1929); cf. *C. A.* **17**, 2286.—This paper gives the results of a study of the ring-closing action of Ac<sub>2</sub>O on substituted hydrazodicarboxamides prepd. by the action of  $\text{H}_2\text{NCONHNH}_2$  with mustard oils.  $\text{H}_2\text{NCONHNH}_2 \cdot \text{HCl}$  was dissolved in the least quantity of H<sub>2</sub>O, and Na<sub>2</sub>CO<sub>3</sub> added to liberate the free base. A mol. proportion of MeNCS in EtOH was added and the mixt. warmed, whereupon there sepd.  $\text{H}_2\text{NCONHNHCSNHR}$  (I, R = Me) (II), m.  $212^\circ$ . Heated with Ac<sub>2</sub>O I gave 2-methylimino-4-acetyl-5-keto-2,3,4,5-tetrahydro-1,3,4-thiodiazole (III), m.  $197^\circ$ . Hydrolyzed by boiling with concd. HCl this gave the free thiodiazole, m.  $232^\circ$ . I, (R = C<sub>6</sub>H<sub>5</sub>), m.  $202^\circ$ , gave when heated with Ac<sub>2</sub>O on a water bath the 2-allyliminoanalog of III, m.  $171^\circ$ . Heated with moderately concd. HCl this gave the free thiodiazole, m.  $210^\circ$ . I, (R = Ph) heated with Ac<sub>2</sub>O and AcONa gave the 3-Ac deriv, m.  $173^\circ$ , and the 3,4-di-Ac deriv., m.  $213^\circ$ , of 2-phenylimino-5-keto-2,3,4,5-tetrahydro-1,3,4-thiodiazole (IV). Hydrolyzed by concd. HCl both Ac derivs. gave IV, m.  $206^\circ$ , sol. in cold dil. alkali with a pale green color. I, (R = *o*-MeC<sub>6</sub>H<sub>4</sub>), m.  $201^\circ$  (decompn.), gave with Ac<sub>2</sub>O and AcONa the 2-*o*-tolyliminoanalog of III, m.  $183^\circ$ . Hydrolyzed by fuming HCl this Ac deriv. gave the free thiodiazole, m.  $210^\circ$ . I (R = *p*-MeC<sub>6</sub>H<sub>4</sub>), m.  $192^\circ$ , reacted with Ac<sub>2</sub>O to give (1) 2-*p*-tolylimino-5-keto-2,3,4,5-tetrahydro-1,3,4-thiodiazole, m.  $247^\circ$ , insol. in alkali, unchanged by boiling with fuming HCl, and (2) 2-*p*-tolylimino-3-acetyl-5-thiol-2,3-dihydro-1,3,4-triazole, m.  $154^\circ$ , sol. in alkali, acted on by FeCl<sub>3</sub>, H<sub>2</sub>O<sub>2</sub> and I<sub>2</sub> soln. I (R = Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>), m.  $200^\circ$  (decompn.), reacts with Ac<sub>2</sub>O in the presence of AcONa to give the 2-xylimino analog of III, m.  $218^\circ$ . Boiled with fuming HCl it gave the free thiodiazole, m.  $232^\circ$ , sol. in cold dil. alkali with a pinkish color. I (R =  $\beta$ -C<sub>10</sub>H<sub>7</sub>), m.  $210^\circ$  (decompn.), when heated with Ac<sub>2</sub>O is decompd. completely. H<sub>2</sub>NCSNHNHCONHPh (V), heated with Ac<sub>2</sub>O and AcONa gave both the 3-Ac deriv., m.  $275^\circ$ , and the 3,4-di-Ac deriv., m.  $160^\circ$ , of 2-imino-5-keto-2,3,4,5-tetrahydro-1,3,4-

*thiodiazole*. Boiled with excess  $\text{Ac}_2\text{O}$ , **V** was decompd. into  $\text{CO}(\text{NHPh})_2$ .  $\text{AcNHPh}$ , a trace of acetylminothiodiazolone and 2 more compds., m.  $92-3^\circ$  and  $115^\circ$ .  $\text{PhNH}\cdot\text{CONHNHCSNHPh}$ , m.  $208^\circ$ , heated with excess  $\text{Ac}_2\text{O}$  10 mins. gave as the main product  $\text{CO}(\text{NHPh})_2$ .  $\text{H}_2\text{NCSNHNHCONHC}_{10}\text{H}_7\cdot\alpha$ , m.  $213^\circ$ , heated with  $\text{Ac}_2\text{O}$  and  $\text{AcONa}$  gave sym.  $-(\alpha\text{-C}_{10}\text{H}_7\text{NH})_2\text{CO}$ .  $(\text{NHCONH}_2)_2$ , heated with  $\text{Ac}_2\text{O}$  in a sealed tube at  $200^\circ$  for 2 hrs., gave sym.  $-(\text{NHAc})_2$ , m.  $138^\circ$ ; *di-HCl salt*, m.  $200^\circ$ . L. K.

The condensation of dichloroacetaldehyde with phenols. FREDERICK D. CHATTAWAY AND ALEXANDER A. MORRIS. *J. Chem. Soc.* 1928, 3241-6.—The condensation of phenols with aldehydes to form a dioxin ring,  $\text{C}_6\text{H}_4\cdot\text{O}\cdot\text{CH}_2\cdot\text{O}\cdot\text{CH}_2$ , is not confined

to chloral.  $\text{Cl}_2\text{CHCHO}$  reacts more readily when its alcoholate is added slowly to a cool soln. of  $p\text{-O}_2\text{NC}_6\text{H}_4\text{OH}$  in concd.  $\text{H}_2\text{SO}_4$ , and yields 6-nitro-2,4-bis(dichloromethyl)-1,3-benzodioxan, (**I**), m.  $113-5^\circ$ ,  $\text{C}:\text{CH}\cdot\text{C}(\text{NO}_2):\text{CH}\cdot\text{CH}:\text{C}\cdot\text{O}\cdot\text{CH}(\text{CHCl}_2)\cdot\text{O}\cdot\text{CHCHCl}_2$ .

**I** is converted by alc.  $\text{KOH}$  into  $\text{C}:\text{CH}\cdot\text{C}(\text{NO}_2):\text{CH}\cdot\text{CH}:\text{C}\cdot\text{O}\cdot\text{CH}(\text{CHCl}_2)\cdot\text{O}\cdot\text{C}:\text{CHCl}$

or  $\text{C}:\text{CH}\cdot\text{C}(\text{NO}_2):\text{CH}\cdot\text{CH}:\text{C}\cdot\text{O}\cdot\text{C}:(\text{CHCl})\cdot\text{O}\cdot\text{CHCHCl}_2$ , (**II**), m.  $108^\circ$ , which does

not react with  $\text{Br}$  in spite of its unsatn. If the temp. is not controlled, 5-nitro-2'-ethoxymandelic acid is obtained. **I** is reduced by  $\text{Fe}$  and  $\text{HCl}$  to the corresponding amino deriv., m.  $108.5-9.5^\circ$ , (*HCl salt*, m.  $210^\circ$  (decompn.)); *Ac deriv.*, m.  $149-50^\circ$ ; *di Ac deriv.*, m.  $145^\circ$ . From this amine, the diazonium chloride was prepd., and this was converted into the *perbromide*, which decompd.  $128-9^\circ$  or when heated with

$\text{AcOH}$ , to give  $\text{C}:\text{CH}\cdot\text{CBr}:\text{CH}\cdot\text{CH}:\text{C}\cdot\text{O}\cdot\text{CH}(\text{CHCl}_2)\cdot\text{O}\cdot\text{CHCHCl}_2$ , m.  $91.5^\circ$ . When

$\text{PhOH}$  is dissolved in concd.  $\text{H}_2\text{SO}_4$  and treated with the alcoholate of  $\text{Cl}_2\text{CHCHO}$ ,

$\text{C}:\text{CH}\cdot\text{C}(\text{SO}_3\text{H}):\text{CH}\cdot\text{CH}:\text{C}\cdot\text{O}\cdot\text{CH}(\text{CHCl}_2)\cdot\text{O}\cdot\text{CHCHCl}_2\cdot\text{H}_2\text{O}$  (**III**), m.  $150-5^\circ$  (de-

compn.), is obtained, and its  $\text{NH}_4$  salt has been prepd. When **III** is dissolved in  $\text{H}_2\text{SO}_4$

and nitrated  $\text{C}:\text{CH}\cdot\text{C}(\text{NO}_2):\text{CH}\cdot\text{C}(\text{NO}_2):\text{C}\cdot\text{O}\cdot\text{CH}(\text{CHCl}_2)\cdot\text{O}\cdot\text{CHCHCl}_2$ , m.  $133.5-$

$4.5^\circ$ , is obtained. The nitration of the mononitro deriv. gives the same dinitro compd.

Alc.  $\text{KOH}$  reacts with the dinitro compd. to give  $\text{C}:\text{CH}\cdot\text{C}(\text{NO}_2):\text{CH}\cdot\text{C}(\text{NO}_2):\text{C}:-$

$\text{O}\cdot\text{C}(\text{CHCl})\cdot\text{C}\cdot\text{CHCHCl}_2$  or  $\text{C}:\text{CH}\cdot\text{C}(\text{NO}_2):\text{CH}\cdot\text{C}(\text{NO}_2):\text{C}\cdot\text{O}\cdot\text{CH}(\text{CHCl}_2)\cdot\text{O}\cdot\text{C}:-$

$\text{CHCl}$ , m.  $144^\circ$ , which does not react with  $\text{Br}$  despite its unsatn. **III** is converted by  $\text{PCl}_5$  into the corresponding sulfonyl chloride, m.  $105-6^\circ$ , from which the *Me* and *Et* sulfonates, m.  $110-5^\circ$  and  $148-9.5^\circ$ , resp., have been obtained, while  $\text{NH}_4\text{OH}$  or  $\text{PhNH}_2$  gave the sulfonamide, m.  $175.5^\circ$ , and the sulfonanilide, m.  $166-7^\circ$ , resp. A. L. H.

Plant colors. **XI**. The lycopins. P. KARRER AND W. F. BACHMANN. *Chem. Inst. Univ. Zurich. Helv. Chim. Acta* 12, 285-91 (1929).—The constitution and properties of lycopins are considered. The prepn. of alkali lycopin compds. and the reaction of (1)  $\text{Na}$  lycopin with  $\text{CO}_2$ , (2)  $\text{Li}$  lycopin with  $\text{H}_2\text{O}$ , (3)  $\text{K}$  lycopin with  $\text{MeI}$  and (4)  $\text{K}$  lycopin with dry  $\text{O}_2$  are described. Analyses of some of the compds. are given. **XII**. The constitution of the monardaeins and salvianins. P. KARRER AND ROSE WIDMER. *Ibid* 292-5.—Exptl. evidence is given to prove that monardacin (the coloring matter of golden balm) and salvianin (from *Salvia coccinea* L.) are one and the same compds. A possible structural formula is suggested. M. H. SOULE

Nitration of benzylpyridines and the oxidation of benzylpiperidines. FRANK BRYANS AND FRANK L. PYMAN. *Univ. of Manchester. J. Chem. Soc.* 1929, 549-53.—In continuing the work of Forsyth and Pyman (*C. A.* 21, 585) on the nitration of phenylpyridines, the corresponding benzylpyridines were nitrated; the proportion of the *m*-isomer produced (in the case of the 2- and 4-substituted compds.) was greatly diminished in the benzyl- as compared with the phenylpyridines. 1-Benzenesulfonyl-2-benzylpiperidine, m.  $65^\circ$  (all *m*. ps. cor.); 1-Bz deriv., m.  $68^\circ$ ; 1-benzenesulfonyl-4-benzyl-

*piperidine*, m. 118°. 2-Benzyl-1-methylpiperidine,  $b_{760}$  30–510°, yields a *picrate*, yellow, m. 181°. 2-Benzylpyridine *nitrate*, m. 116°; nitration gives 10.4% of 2-*m*-NO<sub>2</sub> and 66.7% of 2-*p*-NO<sub>2</sub> derivs. 2-*m*-Nitrobenzoylpyridine, m. 122°. Nitration of 3-benzylpyridine (*nitrate*, m. 140°) gives 63.1% of the *p*-NO<sub>2</sub> deriv., m. 88° (*picrate*, m. 145–6°; *nitrate*, m. 157°) and a trace of the *m*-isomer. 3-*p*-Nitrobenzoylpyridine, m. 106° (*picrate*, m. 185–7°). 4-Benzylpyridine (*nitrate*, m. 110°), on nitration, gives 70.2% of the *p*-NO<sub>2</sub> and 4.8% of the *m*-NO<sub>2</sub> deriv. 4-*m*-Nitrobenzoylpyridine, m. 129°. 2- and 4-Benzylpiperidines and 2-benzyl-1-methylpiperidine do not undergo the same type of fission on oxidation with H<sub>2</sub>SO<sub>4</sub> and MnO<sub>2</sub> as the 1-benzyltetrahydroisquinolines or 1-benzyl-2-methyltetrahydroisquinolines. C. J. WEST

**2,6-Dibromopyridine-4-carboxylic acid, 2,6-dichloropyridine-4-carboxylic acid and some of their derivatives.** W. H. LEVELT AND J. P. WIBAUT. Univ. Amsterdam. *Rec. trav. chim.* **48**, 466–73 (1929).—CO<sub>2</sub>H acids of the pyridine series with the CO<sub>2</sub>H group in position 4 are only prepd. with difficulty; thus 4-C<sub>5</sub>H<sub>4</sub>NCO<sub>2</sub>H (isonicotinic acid) is prepd. mostly from 2,3,4-C<sub>5</sub>H<sub>3</sub>N(CO<sub>2</sub>H)<sub>3</sub>, which may be prepd. by oxidation of cinchona alkaloids. Several methods were tried by L. and W. in order to prep. this acid in satisfactory yield from 4,4'-dipyridyl; however, the oxidation by means of KMnO<sub>4</sub> in acid and alk. media, CrO<sub>3</sub> in AcOH or H<sub>2</sub>SO<sub>4</sub>, fuming HNO<sub>3</sub>, a mixt. of HNO<sub>3</sub> and KClO<sub>3</sub> or H<sub>2</sub>O<sub>2</sub> only gives the desired product in very small yields. For the prepn. of substituted 4-C<sub>5</sub>H<sub>4</sub>NCO<sub>2</sub>H, L. and W. started from 2,6,4-C<sub>5</sub>H<sub>3</sub>N(OH)<sub>2</sub>CO<sub>2</sub>H (citrazinic acid) which was prepd. from citric acid (cf. *Ber.* **17**, 2687 (1884)); yield 190 g. from 1 kg. of citric acid. On heating 30 g. citrazinic acid with 90 g. POCl<sub>3</sub> in an autoclave at 200° for 3.5 hrs., 2,6-dichloropyridine-4-carboxylic acid, m. 208–9°, was obtained in a 34% yield (cf. *Ber.* **35**, 2933 (1902)). The acid chloride of this acid, prepd. in the usual way with SOCl<sub>2</sub>, was converted into the amide with (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> at 100°, m. 207–8°; the acid chloride,  $b_{760}$  243–6°, m. 25–7° (cf. *J. Chem. Soc.* **71**, 1076 (1897)). On heating the amide with SOCl<sub>2</sub> in a sealed tube at 120°, it is converted into 2,6-dichloro-4-cyanopyridine, m. 94–6°. On treatment with POBr<sub>3</sub> in the same way as with POCl<sub>3</sub>, citrazinic acid is converted into 2,6-dibromopyridine-4-carboxylic acid, m. 184–5°, from water; yield 25%. This acid yields the chloride,  $b_{21}$  160°,  $b_{760}$  256–8°, m. 9–11°, on heating with thionyl chloride; on treatment with (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> at 100°, this acid chloride is converted into the amide, m. 202–4°. When this amide is heated in a sealed tube with SOCl<sub>2</sub> at 140°, 2,6-dichloro-4-cyanopyridine is formed. According to Rosenmund (*C. A.* **12**, 2569; **15**, 2569, 2852), 2,6,4-C<sub>5</sub>H<sub>3</sub>NCl<sub>2</sub>COCl could not be reduced to the aldehyde, using boiling xylene as a solvent and Pd-BaSO<sub>4</sub> as a catalyst; only a small amount of 2,6-dichloropyridine, m. 84–6°, was obtained, the same result being obtained with 2,6,4-C<sub>5</sub>H<sub>3</sub>NBr<sub>2</sub>COCl, where a very small amount of a compd., m. 107–10°, was obtained. Probably this substance is 2,6-dibromopyridine, m. 118–9°, which was prepd. in 16% yield by heating 2,6,4-C<sub>5</sub>H<sub>3</sub>NBr<sub>2</sub>CO<sub>2</sub>Ag. Other reduction expts., viz. with Ni-asbestos as a catalyst at 300° or with xylene contg. a trace of sulfuretted quinoline, did not give the desired result. C. F. VAN DUIN

**Action of organomagnesium compounds on the anhydrides of asymmetric polycarboxylic acids: the action of ethylmagnesium iodide on cinchomeronic anhydride.** F. P. MAZZA. Inst. of Org. Chem. and Pharm. of R. Univ., Naples. *Rend. accad. sci. Napoli* [3], **34**, 59–65 (1928).—Grignard and Tissier (*Compt. rend.* **132**, 683, 1182) found that anhydrides react with 3 mols. RMgX to form tertiary alcs. and RCO<sub>2</sub>MgX. Succinic anhydride yields a glycol, and camphoric anhydride 2 isomeric lactones (Houben and Hahn, *C. A.* **2**, 2380). C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O forms a dialkylphthalide (Bauer, *Ber.* **37**, 735), or with C<sub>10</sub>H<sub>7</sub>MgBr, C<sub>6</sub>H<sub>4</sub>(COC<sub>10</sub>H<sub>7</sub>)CO<sub>2</sub>H (Pickles and Weizmann, *Chem. News* **90**, 746). Simonis and Arand (*C. A.* **4**, 207) obtained from phthalic acid and RMgBr the keto acid and the dialkylphthalide. Tetrachlorophthalic anhydride gave the monoethylphthalide (Bauer, *loc. cit.*). Berlingozzi and Mazza (*C. A.* **20**, 2489) noted that RMgI with Δ<sup>2</sup>-tetrahydrophthalic anhydride gave chiefly the monoalkyl-Δ<sup>2</sup>-tetrahydrophthalide. M. with Ornella Fici found that cinchomeronic anhydride (I) reacts like C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O. EtMgI (1 g. Mg and 5.8 g. EtI in 150–200 cc. ether) and I (3 g.) heated and shaken 6 hrs., left overnight, decompd. with ice and dil. H<sub>2</sub>SO<sub>4</sub>, and extd. with ether, yielded 0.25 g. of brown oil, which was distd. The fraction  $b_{90}$  132–3° was a slightly yellow liquid, C<sub>11</sub>H<sub>13</sub>NO<sub>2</sub>, of terpene odor, the lactone of diethyl-2-methylol-3-pyridinecarboxylic acid (3,3-diethyl-1,3-dihydro-1-keto[3,4-*c*]furopyridine), C<sub>8</sub>H<sub>9</sub>N(CEt<sub>2</sub>)OCO, as

shown by its hydrolysis with concd. KOH to Et<sub>2</sub>CO and isonicotinic acid. The fraction  $b_{90}$  165° solidified to a mass of pale yellow needles, m. 65°, of the lactone of diethyl-3-methylol-2-pyridinecarboxylic acid (1,1-diethyl-1,3-dihydro-3-keto[3,4-*c*]furopyridine), as shown by its hydrolysis to Et<sub>2</sub>CO and nicotinic acid. JANET D. SCOTT

**Mercury compounds of quinoline. III.** T. UKAI. *J. Pharm. Soc. Japan* **48**, 1175-8(1928); cf. *C. A.* **23**, 839.—Since U.'s 8-chloromercuquinoline (I) (*C. A.* **22**, 785) is little sol. in  $C_6H_6$  and other org. solvents, the more sol. 8,8'-mercuribisquinoline (II) was synthesized. The addn. of I in small amts. to 50%  $Na_2S_2O_3$  gave II, m. 178-82° (decompn.), quant. Dry distn. of the mixt. of II and Cu powder gave quinoline, Hg and von Niementowski's (*Ber.* **38**, 764) 8,8'-diquinolyl, showing that the HgCl group in I is at position 8.

**1,3,4-Oxdiazines. IV.** J. VAN ALPHEN. Univ. Leiden. *Rec. trav. chim.* **48**, 417-21(1929).—Previously (cf. *C. A.* **22**, 2566; **23**, 145, 1904) were described the

prepn. and properties of various 1,3,4-oxdiazines contg. the nucleus

in which the Ph group was always present in position 4. The present paper deals with  $\Delta^2$ -5-ketooxdiazines in which the Ph group in position 4 is missing, this position being occupied by a H atom. These compds. were prepd. in a similar manner to that described for 5-ketooxdiazines, viz., by the action of the chloride of an aromatic or aliphatic  $\alpha$ -Cl-acid on a monoacylhydrazine and the subsequent removal of a mol. of HCl from the  $\alpha$ -[ $\alpha$ -chloroacyl]- $\beta$ -acylhydrazine, so formed. On adding 10 g.,  $ClCH_2COCl$  in  $C_6H_6$  to a suspension of 22 g.  $BzNHNH_2$  in 80 cc. of boiling benzene,  $\alpha$ -chloroacetyl- $\beta$ -benzoylhydrazine, m. 165°, is obtained; on heating this compd. for 3 hrs. in a sealed tube at 100° with acetone and  $K_2CO_3$ , it is converted into  $\Delta^2$ -2-phenyl-5-keto-1,3,4-oxdiazine (II), m. 161°, which is easily decompd. on boiling with 20 times its wt. of 10%  $H_2SO_4$  with the formation of  $N_2H_4$ ,  $H_2SO_4$ . In an attempt to prep. triphenyloxidiazine by boiling 13 g.  $Ph_2CClCOCl$  with 20 g.  $BzNHNH_2$  in 40 cc. benzene,  $\alpha$ -diphenyl- $\beta$ -benzoylhydrazine  $Ph_2C(CONHNHBz)NHNHBz$  (III), m. 217°, was obtained; it remains unchanged on boiling for 0.5 hr. with 10%  $H_2SO_4$ . The desired triphenyloxidiazine,  $\Delta^2$ -2,6,6-triphenyl-5-keto-1,3,4-oxdiazine (IV), m. 185°, was obtained, however, on adding 9 g.  $BzNHNH_2$  in small quantities at a time to 13 g.  $Ph_2CClCOCl$  in 40 cc. boiling benzene. IV again is stable toward boiling 10%  $H_2SO_4$ . From  $ClCH_2COCl$  and cinnamic hydrazide,  $\alpha$ -chloroacetyl- $\beta$ -cinnamylhydrazine, m. 185°, was obtained; on heating in acetone with  $K_2CO_3$ , it is converted into  $\Delta^2$ -2- $\beta$ -phenylvinyl-5-keto-1,3,4-oxdiazine (V), m. 190°, which was not changed on boiling with 10%  $H_2SO_4$ . These results and those published previously throw more light on the factors governing the hydrolysis of oxdiazines. While  $\Delta^2$ -2-methyl-4-phenyl-5-ketooxdiazine is hydrolyzed on boiling with 10%  $H_2SO_4$ , the corresponding 2,4-di-Ph compd. is not; this hindrance of ring opening is the consequence, however, of the combined action of the Ph groups in position 2 and 4, for, if the latter is missing as in II, described in this paper, hydrolysis again takes place by means of this agent. At least 2 Ph groups appear to be necessary to prevent hydrolysis; it is not essential, however, for position 4 to be occupied by a Ph group, IV being stable to hydrolysis. The effect of the  $PhCH:CH$  group is comparable with that of 2 Ph groups, since V cannot be hydrolysed.

C. F. VAN DUIN

**Constitution of Sonn's phloracetophenonemonomethyl ether and Hattori's kikokunetin.** J. SHINODA. *J. Pharm. Soc. Japan* **48**, 1178-9(1928).—Sonn (*C. A.* **20**, 375) obtained 2 kinds of phloracetophenone mono-Me ether, one, m. 136-7° (I) and the other, m. 205-6° (II). Recently (*C. A.* **23**, 1403) he assigned the structure 4,2,6-MeO(HO) $_2$ C $_6$ H $_2$ COME to I, and 2,4,6-MeO(HO) $_2$ C $_6$ H $_2$ COME to II. Attention is called to the fact that the structures of these substances have already been established in another way by S. (*C. A.* **22**, 2947). Hattori recently isolated 4-methoxy-5,7-dihydroxyflavanone from *Pseudaegle trifoliata* and called it *kikokunetin* (*C. A.* **23**, 2717). Since this is identical with S. and Sato's synthetic *isosakuranetin* (*C. A.* **23**, 836), S. proposes that the latter name should be used and the former as a synonym. N. U.

**The reaction of Rung, Behrend and Pinner. II.** G. GASTALDI and Q. TALU. Reale Univ. Sassari (Sardinia). *Gazz. chim. ital.* **58**, 664-6(1928).—The similarity in the behavior of salts of quaternary  $NH_4$  bases of imidoazolic and of hydroxypyrazinic compds toward alk. hydroxides depends upon the equivalence of the 2 groups:

hypothesis is strengthened by new researches on hydroxypyrimidines. Salts of the tertiary  $NH_4$  bases which are formed from them by the action of alkyl halides are decompd. by alk. hydroxides, 2 N atoms being eliminated from the pyrimidine nucleus (as alkylamine and  $NH_3$ , resp.). There is, however, one difference, for from imidoazolic and hydroxypyrazine compds. 2 mols. of alkylamine are obtained, but from hydroxy-

pyrimidinic compds. 1 mol. of alkylamine and 1 mol. of  $\text{NH}_3$ . This difference depends upon the fact that in the 1st case alkyl iodides but in the 2nd case hydriodides of the resp. bases undergo cleavage. Having proved that *N*-alkyl derivs. do not add alkyl halides to give salts of the corresponding quaternary  $\text{NH}_4$  bases, the decompn. of hydroxypyrimidine compds. was studied. 2,4-Dimethyl-6-hydroxypyrimidine (1 mol.) in MeOH, KOH (1 mol.) and MeI (4 mols.) heated 10 hrs. at  $100^\circ$  in a sealed tube, evapd. at room temp., and recrystd. from EtOH, yields *N*-methyl-2,4-dimethyl-6-keto-1,6-dihydropyrimidine-III,  $\text{O}:\text{C}:\text{CH}:\text{CMe}:\text{NH}:\text{CMe}:\text{NMe}$ , m.  $215^\circ$  (decompn.). Heated

with 33% KOH, it evolves  $\text{MeNH}_2$  and  $\text{NH}_3$ .

C. C. DAVIS

**Quinoxaline synthesis: some derivatives of 2,3-dimethylquinoxaline.** STANLEY T. HENDERSON. *J. Chem. Soc.* 1929, 466-8.—The synthesis of 2,3-dimethylquinoxaline (I) from  $\alpha\text{-C}_6\text{H}_4(\text{NH}_2)_2$  and  $\text{AcCMe}:\text{NOH}$  (Gabriel and Sonn, *C. A.* 2, 851) involves the formation of an intermediate compd., the I deriv. of dimethylglyoxime,  $\text{C}_6\text{H}_4\text{N}:\text{CMe}:\text{CMe}:\text{NHON}:\text{CMe}:\text{CMe}:\text{NOH}$ , lemon-yellow, m.  $182^\circ$ ; this also

results from I and dimethylglyoxime(II) in EtOH; concd. HCl gives  $\text{Ac}_2$  and a salt of I, while alkali gives I itself. In EtOH this deriv. shows as sensitive a color reaction as II with Ni salts. 2,3-Dimethylnaphthaquinoxaline likewise gives an intermediate compd.,  $\text{C}_{22}\text{H}_{20}\text{O}_2\text{N}_6$ , light orange, m.  $123^\circ$ . Excess of Br and I in EtOH give the 5,6,7,8-tetra-Br deriv., m.  $234^\circ$  (decompn.); the Br is not removed by aq. alkali or boiling  $\text{AgNO}_3$  in EtOH, nor is the compd. appreciably attacked by boiling  $\text{CrO}_3\text{-AcOH}$  or alk.  $\text{KMnO}_4$ . Bromination of I in  $\text{CHCl}_3$  gives as the chief product a compd.,  $\text{C}_6\text{H}_8\text{N}_2\text{Br}_2$ , m.  $150^\circ$ ; this Br is partly removed by hot aq. alkali.

C. J. WEST

**Solanine.** GIUSEPPE ODDO. *Ber.* 62B, 267-71 (1929).—Zemplén and Gerecs (*C. A.* 23, 1412) do not seem to be adequately acquainted with the numerous papers of O. and his collaborators on solanine. They quote only 1 of these and in a manner which is entirely misleading. They did their work with a com. solanine which was probably prepd. from *Solanum tuberosum*, as the com. article usually is, while the work of O. and Cesaris which they criticize was done with solanine from *S. sodomaeum* and these 2 products have been shown to be quite distinct from each other.

C. A. R

**Alkaloids of Sinomenium and Cocculus. XXII. Alkaloids of Stephania japonica,** Miers. IV. H. KONDO AND T. SANADA. Tokyo Imp. Univ. *J. Pharm. Soc. Japan* 48, 1141-56 (1928).—In paper III (*C. A.* 22, 965), it was concluded, after comparing the sp. rotation of desoxydehydroepistephanine-MeI (I) and dimethylapomorphine-MeI (II), that these compds. are optical antipodes. Since I was obtained in an amorphous state, however, its complete racemization with II was impossible. K. and S. have now succeeded in prepg. I in a pure cryst. state from MeOH and thus its complete racemization was possible. I decomps.  $165^\circ$ ,  $[\alpha]_D^{23}$   $42.28^\circ$ . II, m. and decomps.  $190\ 5^\circ$ ,  $[\alpha]_D^{26}$   $-42.03^\circ$ . Equal quantities of I and II in MeOH gave the *dl*-compd., m.  $214^\circ$ . The above facts show that I is of the tetrahydroisoquinoline type belonging to the phenanthrene group. There is no doubt that its 2 MeO groups are present on  $\text{C}_3$  and  $\text{C}_4$ . There still remain 2 points to be cleared in the structure of epistephanine (III), *i. e.*, (a) the position of the  $>\text{CO}$  group, and (b) whether it possess a nucleus of a perfect isoquinoline type or a bridged structure like thebaine. In order to solve the first point the properties of isostephanine (IV), a phenolic compd. obtained either by a reduction of III by Clemmensen's method or by heating III with concd. HCl, were studied in detail. It has the compn.  $\text{C}_{19}\text{H}_{21}\text{NO}_8$ , m.  $160\text{--}85^\circ$ ,  $[\alpha]_D^{20}$   $169.16^\circ$ , and contains 2 MeO groups. Dimethyl-methosulfate (V), m.  $245^\circ$ . Hofmann's decompn. of V gave the methinmethiodide, m.  $210^\circ$  (decompn.), and *des*-*N*-methylisoeptistephanine (VI), m.  $60\text{--}1^\circ$ . Picrate, yellow, m.  $125\text{--}30^\circ$ . Morphothebaine and  $\text{Me}_2\text{SO}$  gave dimethylmorphothebaine methylmethosulfate, (VII), m.  $212^\circ$ ,  $[\alpha]_D^{23}$   $-73.7$ . VII and KI gave dimethylmorphothebaine-MeI (VIII), m.  $187$ ,  $[\alpha]_D^{25}$   $-97.8$ . VII and VIII belong to the apomorphine group and have a MeO group at  $\text{C}_6$  so that they are isomeric with methylisoeptistephanine- $\text{Me}_2\text{SO}_4$  (IX) and methylisostephanine-MeI (X), resp. If the sp. rotations of IX and X had been compared with those of VII and VIII, the position of the  $>\text{CO}$  group on  $\text{C}_6$  could have been established with certainty on the ground that these compds. are optical antipodes. Unfortunately IX and X are amorphous and this method could not be applied. Hofmann's decompn. of VIII gave 3,4,6-trimethoxy-8-vinylphenanthrene (XI), m.  $60\ 1^\circ$ . Picrate, reddish violet, m.  $125\text{--}6^\circ$ . The mixed m. p. of VI and XI was not depressed, but the mixed m. p. of their picrates was  $112^\circ$ , showing the identity of these compds. is still questionable. There is another substance which might be useful in proving the position of the  $>\text{CO}$  group in III. This

is *ψ*-epistephanine (XIII)  $C_{16}H_{11}(OMe)_2(OH)NMe$  (decomps.  $257^\circ$ ,  $[\alpha]_D^{27}$   $174.56^\circ$ ), which was recently isolated from the ext. of *Stephania japonica* (XIV). It is isomeric with III, the only difference being that the third O is in the form of OH instead of CO. Besides XIII, 2 other phenolic bases were isolated from the same ext., making a total of 8 bases which have thus far been isolated from the ext. of XIV. Two new bases are *stephanoline*,  $C_{27}H_{22}N_2O_2(OH)(OMe)_4$ , m.  $186^\circ$ ,  $[\alpha]_D^{17}$   $-255.37^\circ$  (HCl salt, m.  $230^\circ$ ) and *homostephanoline*,  $C_{33}H_{44}N_2O_7$ , m.  $232^\circ$ ,  $[\alpha]_D^{28}$   $-255.6^\circ$  (HCl salt, decomps.  $238^\circ$ ). XXIII. Constitution of coclaurine. IV. H. KONDO AND T. KONDO. *Ibid* 1156 63.—In the structure of coclaurine (I) proposed in the previous paper (C. A. 22, 3414), there remained only one point of uncertainty. This was the position of the OH group in the tetrahydroisoquinoline nucleus. This point has now been made clear to complete the structure of I. I and EtBr give triethylcoclaurine (II) ( $R = p\text{-CH}_2\text{C}_6\text{H}_4\text{OEt}$ ). HCl salt, m.  $162^\circ$ ,  $[\alpha]_D^{29}$   $0.66^\circ$ ; chloroplatinate, m.  $130\text{--}1^\circ$ ; chloroplatinate of the methochloride, m.  $175^\circ$ . II and  $\text{Me}_2\text{SO}_4$  give the methylmethosulfate, m.  $122^\circ$ , which with KOH gives the methin base (III) (chloroplatinate, decomps. about  $190^\circ$ ). Oxidation of III with  $\text{KMnO}_4$  gives  $p\text{-EtOC}_6\text{H}_4\text{CO}_2\text{H}$  and an amino acid,  $\text{MeO}(\text{EtO})(\text{NMeEtCH}_2\text{CH}_2)\text{C}_6\text{H}_4\text{CO}_2\text{H}$  (IV). IV and  $\text{Me}_2\text{SO}_4$  give the methylmethosulfate which with KOH and heating gives  $\text{EtNMe}_2$  and an acid (V), m.  $165^\circ$ , which was later proved to be  $3,4,6\text{-EtO}(\text{MeO})(\text{CH}_2\text{:CH})\text{C}_6\text{H}_4\text{CO}_2\text{H}$ . Reduction of VII with Pd-C gives an acid which is identical with synthetically prepd.  $3,4,6\text{-EtO}(\text{MeO})\text{-EtC}_6\text{H}_4\text{CO}_2\text{H}$ , m.  $137.5\text{--}8.5^\circ$  (cf. following abstr.). The above facts show the OH group in the tetrahydroisoquinoline nucleus of I must be located at C<sub>7</sub> and the structure of I is represented by VI.

NAO UYEI

Synthesis of 3-ethoxy-4-methoxy-6-ethylbenzoic acid. T. KONDO, T. NOTO AND S. TANAKA. *J. Pharm. Soc. Japan* 48, 1163-6(1928).—One mol. each of  $o\text{-MeO-C}_6\text{H}_4\text{OEt}$  and  $\text{AcCl}$  give 2 Ac derivs., one of which is  $4,5\text{-EtO}(\text{MeO})\text{C}_6\text{H}_3\text{Ac}$  (I), m.  $79^\circ$ . Reduction of I with Zn-Hg gives  $4,5\text{-EtO}(\text{MeO})\text{C}_6\text{H}_3\text{Et}$ , b.  $95^\circ$ , which with  $\text{AcCl}$  gives  $3,4,6\text{-EtO}(\text{MeO})\text{EtC}_6\text{H}_2\text{Ac}$  (II), m.  $50^\circ$ . Oxidation of II with  $\text{NaOI}$  gives  $3,4,6\text{-EtO}(\text{MeO})\text{EtC}_6\text{H}_2\text{CO}_2\text{H}$ , m.  $137.5^\circ$ .

NAO UYEI

Ozone cleavages in the morphine series (preliminary communication). EDMUND SPEYER Univ. Frankfurt A. M. *Ber.* 62B, 209-18(1929).—The results thus far obtained in this work are reported now because of the appearance of Wieland and Small's paper (C. A. 23, 1642). Their thebaizonedicarboxylic acid (I) had already been prepd., at Speyer's suggestion, by ROELL; the results obtained agree with those of W. and S.; furthermore, the presence of two  $\text{CO}_2\text{H}$  groups was shown by potentiometric titration. It had been found that  $\text{O}_3$  with dihydrocodeine and ethyldihydromorphine ruptures the double bonds between C atoms 3 and 4 of the  $\text{C}_6\text{H}_6$  nucleus with formation of an ester lactone (II). S. has now found with H. MOLZAHN (*Diss. Frankfurt a. M., 1927*) that further ozonization of  $\alpha$ -ozodihydrocodeine (II) and  $\alpha$ -ozodihydroethylmorphine (III) ruptures the 1,2-double bond, splitting off Me or Et glyoxylate and giving an aldehyde, dihydrocodinal (IV) (II, with  $\text{CHO}$  instead of  $\text{CH:CHCO}_2\text{Me}$ ). Analogous results were obtained with chloroozodihydrocodeine (V). A direct splitting off of  $\text{OHCCO}_2\text{R}$  and formation of derivs. of V was effected by ozonization of dihydrohydroxycodeinone (VI) and, with H. VOGT, of dihydromorphine and dihydrochlorocodide (VII). Furthermore, it was shown with Vogt (*Diss. Frankfurt a. M., 1928*) that II with  $\text{NaOEt}$  gives, depending on the temp., a  $\beta$ - or  $\gamma$ -isomer to which are provisionally assigned the structures VIII and IX. The development of these structures, based on the Scheopff *m*-thebainone formula, will be given in detail in a later communication. There are furthermore 2 other isomers of II whose study has not been completed. The ozonization of the *des*-bases of hydrogenated codeines has also been successfully undertaken. I, crystals with 1  $\text{H}_2\text{O}$ , decomps.  $208\text{--}10^\circ$  (W. and S.,  $189\text{--}90^\circ$ ). HCl salt, leaflets with 1  $\text{H}_2\text{O}$ , m.  $242^\circ$  (decompn.). IV, from II in 6 parts  $\text{H}_2\text{O}$  ozonized 26 hrs. with 3%  $\text{O}_3$ , was isolated in 40% yield as the yellow phenylhydrazone-HI,  $\text{C}_{21}\text{H}_{21}\text{O}_3\text{N}_3$ , III, decomps.  $247^\circ$ ; semicarbazone, decomps.  $278^\circ$ . Chlorodihydrocodinal perchlorate, obtained in 2 g. yield from 6 g. V in  $\text{HClO}_4$ , EtOH and AcOH ozonized 24 hrs. with 8%  $\text{O}_3$ , hydrated rodlets, sinters  $165^\circ$ , decomps.  $270^\circ$ ,  $[\alpha]_D^{20}$   $-19.74^\circ$  ( $\text{H}_2\text{O}$ ); free base, reddish yellow, m.  $206\text{--}7^\circ$  (decompn.). On ozonization of V in 10% AcOH for 14 hrs. the lactone union was ruptured and there was obtained about 30% of chloro-

*dihydrodiconal* (X) as the perchlorate, octahedrons with 1 H<sub>2</sub>O, decomp. 266°,  $[\alpha]_D^{20}$   $-31.08^\circ$  (H<sub>2</sub>O). VI (12 g.) with O<sub>3</sub> in 10% AcOH gives about 1 g. of the compd. XI, decomp. 285°. From 5 g. of dihydromorphine in 10% HCO<sub>2</sub>H was obtained IV (1 g. of the semicarbazone). VII in 20% HClO<sub>4</sub> and alc. gave 40% chlorodihydrocodinal and in 25% HCO<sub>2</sub>H it yielded X. VIII, obtained in 93% yield from 2 g. Na in 30 cc. abs. alc. at 10° added to 7 g. II. HCl and allowed to stand 15-30 mins. at 10-5°, m. 170.5°, easily sol. in dil. acids, pptd. from AcOH by NH<sub>4</sub>OH or dil. NaOH, reacts alk. to litmus in aq. alc., hydrolyzes on long standing in NaOH,  $[\alpha]_D^{18}$  24.4° (abs. alc.). IX (36% from II added to NaOEt in EtOH at 45-50°, cooled with ice when the brown soln. has changed to lilac (10-20 secs.) and treated with HCl gas), m. 175°, depresses the m. p. of VIII to 163°, easily sol. in dil. acids, pptd. by dil. NaOH as an oil which after a time sapons. and dissolves,  $[\alpha]_D^{18}$   $-8.2^\circ$  (abs. alc.). IX is also obtained by dissolving VIII in alc. with enough alc. HCl to form the salt, treating at 50° with alc. NaOEt and allowing to stand 15 mins. at room temp.

C. A. R.

**Synthesis of *dl*-apomorphine dimethyl ether.** H. AVENARIUS AND R. PSCHORR (in part with H. HERZ). Techn. Hochschule Charlottenburg. *Ber.* 62B, 321-5 (1929).—The constitution of apomorphine was established by P. and his collaborators by the degradation of its di-Me ether (I). The evidence has now been completed by the synthesis of I.  $\alpha$ -[Benzoylamino]-2-nitro-3,4-dimethoxycinnamic lactone, from 2,3,4-O<sub>2</sub>N(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>CHO, BzNHCH<sub>2</sub>CO<sub>2</sub>H, Ac<sub>2</sub>O and NaOAc, yellow needles with 1 EtOH, m. 169°, hydrolyzed by boiling N NaOH or 75% AcOH to the free acid, decomp. 215°; *Et ester*, m. 149°. With 7 N aq. alc. HCl at 100°, however, the lactone gives 2-nitro-3,4-dimethoxyphenylpyruvic acid, yellow, m. 172°; *Bt ester*, yellow, m. 109° (oxime, m. 108°). The oxime, m. 156-7°, of the acid at 160° loses CO<sub>2</sub> and H<sub>2</sub>O and forms 2-nitro-3,4-dimethoxybenzyl cyanide (II), m. 66°. PhCH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub> with anhyd. HCO<sub>2</sub>H at 150-80° gives, through the formate, the *formyl deriv.*, b<sub>35</sub> 210-4°, which in PhMe with K and MeI yields *N*-formyl-*N*-methylphenethylamine, isomerized by refluxing in PhMe with SOCl<sub>2</sub> into  $\alpha$ -hydroxy-*N*-methyltetrahydroisoguinoline (III), m. 110-1°. When mol. amounts of II and III (or its methiodide) and 1 (or 2) atoms Na in alc. are boiled about 15 mins., allowed to stand 24 hrs. at room temp., heated with concd. HCl to sapon. the CN group and split off CO<sub>2</sub> and reduced by heating with Sn and more concd. HCl, there is obtained  $\alpha$ -[2-amino-3,4-dimethoxybenzyl]-*N*-methyltetrahydroisoguinoline, isolated as the di-HCl salt, m. 198-9°; this, treated in dil. H<sub>2</sub>SO<sub>4</sub>

with a slight excess of  $\text{NaNO}_2$ , then gradually with Cu powder, gives I, isolated as the methiodide, m.  $195^\circ$ . C. A. R.

**Opium alkaloids. X. Synthesis of *dl*-apomorphine dimethyl ether.** HARNSTADT AND OTTO HROMATKA. Univ. Wien. Ber. 62B, 325–32 (1929); cf. C. A. 22, 1781.—Kay and Pictet attempted to synthesize apomorphine di-Me ether (I) by converting 2,3,4- $\text{O}_2\text{N}(\text{MeO})_2\text{C}_6\text{H}_2\text{CH}_2\text{CO}_2\text{H}$  (II) into the chloride (III) with  $\text{PCl}_5$  in  $\text{CHCl}_3$  and adding this in  $\text{C}_6\text{H}_5$  alternately with dil.  $\text{NaOH}$  to an emulsion of  $\text{PhCH}_2\text{CH}_2\text{NH}_2$  in a little  $\text{H}_2\text{O}$  but when the product so obtained (IV), m.  $98^\circ$ , was boiled 15–30 mins. in  $\text{PhMe}$  with  $\text{P}_2\text{O}_5$ , they obtained, instead of the expected dihydroisoquinoline deriv. (V), no basic product from the  $\text{H}_3\text{PO}_4$  part of the reaction mixt. while the  $\text{PhMe}$  part yielded, together with unchanged IV, a compd.  $\text{C}_{18}\text{H}_{18}\text{O}_4\text{N}_2$  (VI), which was insol. in acids and formed no methiodide and was, therefore, certainly not an isoquinoline; they, therefore, had to give up their attempt to synthesize I. Kondo was likewise unable to convert his amide (VII), which he reports as m.  $119^\circ$ , into an isoquinoline with  $\text{P}_2\text{O}_5$ ,  $\text{POCl}_3$ ,  $\text{PCl}_5$  and  $\text{AlCl}_3$ . S. and H., however, have now been able to effect the synthesis along these lines. At first they attempted to prep. the amide  $\text{O}_2\text{N}(\text{MeO})_2\text{C}_6\text{H}_2\text{CH}_2\text{CONHCH}_2\text{CH}_2\text{Ph}$  (VIII) by K. and P.'s method but later they made it by treating II with  $\text{SOCl}_2$  and the resulting III with 2 mols.  $\text{PhCH}_2\text{CH}_2\text{NH}_2$  in  $\text{C}_6\text{H}_5$  without an alkali. By the K. and P. method and once by their modified process they obtained a product, m.  $79^\circ$  and again, by their modified method, a compd., m.  $117^\circ$ . Both, however, gave the same dihydroisoquinoline deriv. (IX). They first tried to prep. the IX by converting the VIII with 1 mol.  $\text{PCl}_5$  into the imide chloride and then treating this with  $\text{AlCl}_3$  but they obtained no basic product. They then boiled the VIII in xylene (later in  $\text{PhMe}$ ) 1–2 hrs. with  $\text{P}_2\text{O}_5$ , and from the  $\text{H}_3\text{PO}_4$  part of the reaction mixt. obtained 30% of basic compds. yielding on recrystn. 10–5% of a pure cryst. base, which, from its properties, was shown beyond doubt to be VIII, whereas the xylene yielded a yellow, cryst., non-basic compd. (X), m.  $124\text{--}5^\circ$ , which was probably the same as K. and P.'s VI. VIII was converted through the methiodide into the methochloride, which with Zn and concd.  $\text{HCl}$  was both reduced to the  $\text{NH}_2$  compd. and converted into the tetrahydroisoquinoline compd. (XI) and this on diazotization and condensation with Cu powder gave *dl*-I. The sepn. of I from the by-products met with great difficulties, especially as the properties of the *dl*-form were unknown. Attempts to racemize *l*-I by long heating failed, and alc. I with subsequent hydrogenation as well as oxidation with  $\text{Hg}(\text{OAc})_2$ , likewise did not give optically inactive products. In order, therefore, to obtain derivs. which could be compared directly, both the synthetic *dl*- and the natural *l*-I were boiled with  $\text{BzCl}$ , which ruptures the N ring at the asym. C atom and gives the optically inactive *N*-Bz deriv. (XII); the products so obtained from the two I were identical in m. p., mixed m. p. and soly. The nature of the isomerism between the 2 forms of nitrohomoveratroyl- $[\beta\text{-phenylethyl}]$ amide (VIII) has not yet been investigated. IX becomes yellow on long standing in the air, m.  $129^\circ$  (evacuated capillary). Methiodide of VIII, m.  $203^\circ$  (decompn.) in evacuated tubes, methochloride, light yellow varnish. XI, brown sirup. XII, b.  $250\text{--}70^\circ$ , m.  $165\text{--}5^\circ$ . C. A. R.

**Sarmentocymarin and sarmentogenin.** WALTER A. JACOBS AND MICHAEL HEIDELBERGER. Rockefeller Inst. J. Biol. Chem. 85, 765–80 (1929).—*Strophanthus sarmentosus* seeds (2500 g.) were ground, defatted with gasoline, dried and extd. 3 times with 70% EtOH. The filtrates were pptd. with basic Pb acetate, the excess Pb was removed with  $(\text{NH}_4)_2\text{SO}_4$  and the soln. concd. under diminished pressure to about 1 l. The aq. soln. was extd. with  $\text{CHCl}_3$  and the  $\text{CHCl}_3$  soln. poured into petroleum ether. The ppt. obtained weighed 5.1 g. From its soln. in  $\text{Me}_2\text{CO}$  was obtained sarmentocymarin (I),  $\text{C}_{30}\text{H}_{46}\text{O}_8 \cdot 2\text{H}_2\text{O}$ , m.  $130^\circ$ ,  $[\alpha]_D^{20} -12.5^\circ$  (c 1.043 in MeOH). From the original aq. fraction was obtained 21 g. more of I. I (1.95 g.) in 20 cc. EtOH was treated with 40 cc. of 10%  $\text{HCl}$ . After 6 hrs. at room temp. sarmentogenin (II) crystd. out slowly, m.  $265\text{--}6^\circ$ ,  $[\alpha]_D^{20} 21.5^\circ$  (c 0.515 in 95% EtOH). Occasionally II was obtained in a form contg. solvent of crystn. and m.  $243^\circ$ . Covered on a watch glass with concd.  $\text{H}_2\text{SO}_4$ , II dissolves with a bright golden color and slowly develops around the edges a greenish color which deepens to indigo. II crystals from  $\text{C}_6\text{H}_5\text{N}$  as  $\text{C}_{28}\text{H}_{44}\text{O}_8 \cdot \text{C}_6\text{H}_5\text{N}$ , m.  $258^\circ$ . Dibenzosalt, m.  $281^\circ$ ,  $[\alpha]_D^{20} 14^\circ$  (c 1.000 in  $\text{Me}_2\text{CO}$ ). Dihydro deriv., prepd. by hydrogenation of II in MeOH with Pt black, crystals from EtOH as  $\text{C}_{28}\text{H}_{46}\text{O}_8$ , EtOH, effervesces  $142^\circ$ . Sarmentogenone, prepd. by oxidation of II in AcOH with Kiliani  $\text{CrO}_3$  soln., m.  $226^\circ$ . Semicarbazone, m.  $200^\circ$ . Isosarmentogenin was prepd. by suspending 0.5 g. II in 2.5 cc. anhyd.  $\text{C}_6\text{H}_5\text{N}$  and treating the mixt. at  $0^\circ$  with 2.5 cc. of a soln. of 4.8 g. KOH in 100 cc. dry MeOH (25–30% yield).  $\text{C}_{28}\text{H}_{44}\text{O}_8$ .

EtOH, m. 248°. *Dibenzozote*, m. 297°. *Isosarmentogenic acid*, m. 212°. *Me ester*, m. 274° (effervescence).  
LOUISE KELLEY

**Constituents of *Alectoria sulcata* Nyl.** Y. ASAHINA AND H. HAYASHI. *J. Pharm. Soc. Japan* **48**, 1094-8(1928).—By extn. of *Alectoria sulcata* with ether A. and H. obtained a cryst. substance, which, by treatment with soda soln., was sepd. into 2 parts, I sol. and II insol. in soda soln. I,  $C_{23}H_{20}O_{10}$ , m. 263-4°, was named *sulcatic acid*. It is almost insol. in all org. solvents except  $Me_2CO$ . With  $FeCl_3$  it gives a wine-red color. It does not contain the  $OCH_3$  group. Heating alc. soln. of I and  $PhNH_2$  gave yellow crystals, m. 290°. II, m. 195-6°, resembles *atranorin*,  $C_{15}H_{18}O_8$ . Anil. of *atranorin*,  $C_{25}H_{23}O_7N$ , m. 166°. II and aniline in abs. alc., heated, gave yellow crystals, m. 130°. From the mother liquid above A. and H. obtained yellow and white crystals. The white crystals m. 143° and their properties resemble *atraric acid* (decompn. product of *atranorin*). The yellow crystals m. 130° and have the compn.  $C_{17}H_{17}O_4N$ .  
F. I. NAKAMURA

**The components of Caucasian eucalyptus oils.** B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* **1927**, No. 17, 39-68.—A sample of oil contg. 2% aldehyde and sol. in 70% alc., when distd. over metallic Na gave fraction I with the following consts.:  $d_{20}^{20}$  0.9101,  $[\alpha]_D + 10.63^\circ$ ,  $n_D^{20}$  1.4600. On oxidizing with  $KMnO_4$ , pinonic acid (semicarbazone, m. 263-4°) was obtained. Pinene nitroschloride could not be sepd., showing the presence of cineole. From fraction II cineole was sepd. with the following consts.: m. 175-176°,  $d_{20}^{20}$  0.9232,  $n_D^{20}$  1.4590. In fraction III globulol (m. 86-88°,  $[\alpha]_D$  32.68° in chloroform at  $c = 16.77$ ) was demonstrated. With  $NaHSO_3$  the aldehydes which were recognized showed  $d_{20}^{20}$  0.8745,  $[\alpha]_D = 0^\circ$ ; upon oxidation it gave liquid acids with the odor of valeric acid and a solid acid which indicated the presence of cuminaldehyde. The oil contains  $\alpha$ -pinene about 5, cineole 82, aldehyde 2, alcs. about 5.5% and globulol. The oil from a sample of leaves of *Eucalyptus pulverulenta* Sims gave 4 fractions: I from which nitroschloride and pinonic acid were sepd. after removing the cineole. Fraction II consisted primarily of cineole ( $d_{20}^{20}$  0.9267,  $[\alpha]_D = 0^\circ$ ). From fraction IV an alc. mixt. was obtained from phthalic acid ester ( $d_{20}^{20}$  0.9444,  $[\alpha]_D + 4.8^\circ$ ;  $n_D^{20}$  1.4913), which upon sepg. the residues by distg. over Na gave the following consts.:  $d_{20}^{20}$  0.9368,  $[\alpha]_D - 12.48^\circ$ ,  $n_D^{20}$  1.4876. An aldehyde was sepd. with  $NaHSO_3$  and proved to be isovaleraldehyde. The quant. compn. of this sample was:  $\alpha$ -pinene about 8%, cineole 78%, aldehyde about 5%, alcs. about 13%. Another sample of oil from *Eucalyptus viminalis* Labill was investigated. The  $NaHSO_3$  compds. sepd. optically inactive aldehydes, contg. primarily isovaleraldehyde. From fraction I *d*- $\alpha$ -pinene was obtained, no camphene or phellandrene was obtained. Fraction II consisted primarily of cineole. The color reaction with Br vapor in fraction III indicates the presence of aromadendrene. Eudesmol could be obtained from the residue. The compn. of this sample is: *d*- $\alpha$ -pinene about 5, cineole about 65, aldehyde about 4, eudesmol about 10, other alcs. about 11%. Another sample, from *Eucalyptus maideni*, has the following compn.:  $\alpha$ -pinene about 3, cineole about 64, aldehyde (valeraldehyde and isovaleraldehyde) about 3, alcs. about 8 and eudesmol about 5%.  
J. S. JOFFE

**Dry distillation of abietic acid with activated carbon.** T. TSUKAMOTO. Tokyo Imp. Univ. *J. Pharm. Soc. Japan* **48**, 1169-75(1928).—By dry distn. of cholesterol with activated C (I), T. previously (*C. A.* **22**, 2361) obtained *d*-rotatory oil and chrysene due to the dehydrogenating property of the I. Adsol (II) (Japanese fuller's earth) gave similar results except for the fact that II had a greater cracking action and injurious effect on the optical activity than I. The dry distn. of colophony (III) and of abietic acid (IV) showed the same dehydrogenating action of I and II as well as the injurious action of II on the optical activity. In the high-boiling fraction of the dry distn. product of III by using I, *retene*, *phenanthrene* and *anthracene* were identified, while among the gaseous products of the dry distn. of IV,  $H_2$ ,  $CH_4$  and  $MeCH:CH_2$  were identified. These facts show that the side chains ( $Me$ ,  $Me_2CH$  groups) of *retene* are broken off during the reaction.  
NAO UYEI

**Hadromal, lignin and coniferaldehyde; preparation and identification of the last.** H. PAULY AND K. FEUERSTEIN. Privatlab. H. Pauly, Würzburg. *Ber.* **62B**, 297-311 (1929).—Coniferaldehyde (I) plays a special role in the present-day chemistry of lignin. Hoffmeister claims to have identified Czapek's hadromal (II) as being I and Klason believes he has proved that his " $\alpha$ -lignohydrosulfonic acid" (III) is a  $SO_3H$  acid of "coniferylparaldehyde." I was rendered somewhat more readily available some yrs. ago by P. and Wäscher's method of prepn. but even with this method the

prepn. depends on the strict observance of certain conditions. Nevertheless P. and his associates are so well acquainted with the possibilities of formation and properties of **I** that they can assert with all certainty that neither H. nor K. had, in their alleged syntheses, the least trace of **I** in any form, and therefore their work contributes nothing to the question whether **I** plays a part in the building up of lignin. An investigation of **II** showed that it is *not* identical with **I**, in fact, does not contain a trace of it, but in full agreement with Grafe, that along with much wood gum, tannin (oak), pyrocatechol (pine) and small quantities of other phenolic substances, it contains chiefly vanillin (**IV**) (yield of pure product from oak 0.05%, from pine 0.04%). H. describes his hadromal, for which he gives the elementary compn. and a mol. wt. detn. (184), as m.  $86^\circ$  but becoming yellow so that this m. p. cannot be considered as quite exact. As a matter of fact the purest **I** melts at the same temp. ( $82.5^\circ$ ) as **IV** and only by mixed m. ps. can the 2 be distinguished from each other. The fact that his product adds 2 atoms of **I** (which he considers important) shows that it is not **I**, for even under the conditions employed by him, **I** cannot add **I**. The other properties of his compd. likewise do not agree with those of **I**; **I** forms S-yellow crystals (not "almost white") sol in  $H_2O$  with lemon-yellow color, gives with phloroglucinol-HCl a Bordeaux-red, not a red-violet ppt., does not form a pyrocatechol-like substance on standing with  $H_2O$ , etc. Likewise, in his alleged synthesis of **I**, he does not seem to be aware that Tiemann states expressly that **IV** cannot be condensed with AcH nor that the synthesis of **I** is possible only if the phenolic HO group in the **IV** is etherified with a glucose or other residue. His crude product is a "yellowish white" residue, which after 3 recrystns. from alc. forms "very fine, greatly felted needles" m.  $85^\circ$  (becoming yellow), having the same soly. and odor and giving the same phloroglucinol-HCl reaction as the natural hadromal; he also gives an analysis but no other proofs of identity. Repeated trials with his method of condensation have given entirely negative results. The **IV** is recovered unchanged in yields of at least 97% and **I** is not formed in the slightest traces, as shown with a reagent (described below) with which **I** can be detd. gravimetrically in dilns. of 0.06% and colorimetrically in dilns. of 1:40,000. Again, the m. p. diagram for mixts. of **I** and **IV** shows that if **I** contains more than 3% **IV** its m. p. cannot be raised to  $80^\circ$  by 2-3 recrystns.; while **IV** can be sepd. rapidly from small quantities of **I** the sepn. of **I** from small quantities of **IV** is very difficult; if his product had really been **I** it would mean that his yield was at least 97%. Furthermore, his failure to observe the formation of a difficultly sol.  $NaHSO_3$  compd. likewise indicates that his product was unchanged **IV**. K. in his "synthesis" modified the P. and W. method in that, starting with a 3,4-MeO(MeOCH $_2$ O) $C_6H_3$ CHO (**V**) contg. 15% free **IV**, he effected the condensation with AcH and splitting off of the MeOCH $_2$ O group in 1 operation, and on extg. the product with  $C_6H_6$ , evapg., treating with  $SO_2$  and removing the unchanged **IV** he obtained his synthetic **III** in the form of an amorphous  $C_{10}H_7NH_2$  salt (**VI**). Repetition of his work showed that the **V** does not react quant. with the AcH and although there is obtained a product with the properties he gives and having approx. the compn. of **VI**, it is not formed from an intermediate **I** but from a mixt. chiefly of 2 hitherto unknown *unsald. aldehydes*,  $C_8H_7O_2$  (**VII**) and  $C_{10}H_{14}O_2$  (**VIII**), formed as by-products by autocondensation of the AcH. Pure **I** in aq.  $SO_2$  does not give the K. product but the mixt. of **VII** and **VIII** does. P. and F. never observed K.'s "coniferylparaldehyde"; **I** does not readily polymerize spontaneously, at least not in the course of 2 yrs., but its m. p. slowly falls as the result of the liberation of small quantities of **IV**. K.'s failure to effect a condensation with AcH was due to his use of a **V** contg. free **IV**. With a perfectly pure, freshly prepd. **V**, m.  $40^\circ$ , **I** can be obtained, with some practice, in 40% yield. As others besides K. have been unsuccessful with the method of prepn. it is described in greater detail than in the original paper. Under the same pressures, **I** boils about  $28^\circ$  higher than **IV** ( $157^\circ$ ,  $158^\circ$ ,  $160^\circ$ ,  $162^\circ$ ,  $169^\circ$ ,  $175^\circ$  under 2.5, 2.6, 2.8, 3, 4, 5 mm.); its alkali salts are egg-yellow and color the skin an intense brown-yellow; it dissolves in concd.  $H_2SO_4$  with orange color and  $H_2O$  ppts. blue flocks; it gives a blue-green color with  $FeCl_3$  only on heating; it is easily reduced by yeast fermentation to the alc. (**IX**). Refractometric consts. (by v. AUWERS):  $d_4^{20.5}$  1.1562,  $n_D^{20}$  1.63973,  $n_D^{25}$  1.65635, EM 8.32, 9.12. *Methoxymethyloconiferyl alc.*, from the aldehyde and a fermentation product, which at  $100^\circ$   $8^\circ$ ; *phenylurethan*, *Coniferal-diphloro-*

powder, m. above  $300^\circ$ , sol. in alkalis with purple color. *Diconiferalbenzide(X)*, from **I** and 0.5 mol. ( $C_6H_5NH_2$ ), in MeOH on the  $H_2O$  bath, brown-red, m.  $216^\circ$ ; *di-HCl salt*, red-brown, decomp. at high temps., dissociates completely in boiling  $H_2O$ . *Divanillalbenzide(XI)*, yellow, m.  $225.5^\circ$ ; *di-HCl salt*, cinnabar-red powder,

decomps. at high temps., dissociates (turning yellow) in boiling  $H_2O$ . Boiling  $C_6H_6$  (100 g.) dissolves 2.67 g. XI and only 0.064 g. X, so that as little as 0.06% I can be detected in mixts. with IV by extg. the benzidides with limited quantities of  $C_6H_6$ .  $(C_6H_5NH_2)_2$  (2%) in 50% AcOH gives with IV an orange color changing to yellow on adding glacial AcOH, with I a blood-red color up to 1:40,000, red-orange up to 1:80,000 and orange up to 1:100,000. From 1.5 l. 6% AcH heated 6 hrs. at  $66-8^\circ$  with 40 cc. of 5% KOH, 25 cc. more of KOH being added in 5-cc. portions as the alkyl. of the soln. disappeared, then cooled, neutralized with AcOH, salted out with NaCl, extd. with  $C_6H_6$  and fractionated *in vacuo* were obtained 26 g. aldehyde resin and 12 g. distillate which yielded VII,  $b_{14} 72-4^\circ$ ,  $b. 176-8^\circ$ , light yellow refractive oil of penetrating and at the same time sweetish odor and burning sharp taste, immiscible with  $H_2O$ , reduces  $NH_3-AgNO_3$ ,  $d_4^{20} 0.9767$ ,  $n_D^{20} 1.4909$ ,  $n_{H_2O}^{20} 1.4967$  (semicarbazone, yellowish, m.  $195^\circ$ ), and VIII,  $b_{12} 116-20^\circ$ ,  $d_4^{20} 1.035$ ,  $n_D^{20} 1.5370$ ,  $n_{H_2O}^{20} 1.5447$  (semicarbazone, m.  $133^\circ$ ). Both VII and VIII give with phloroglucinol-HCl deep red colors and ppts., with benzidine-AcOH orange shades. In the air they have a tendency to darken and resinify. C. A. R.

The preparation of hemin derivatives by thermal reactions. III. 1a. A new procedure for decarboxylation of porphyrins and iron-porphyratins; preparation of etiopyroporphyrin and etiomesoporphyrin. Preparation of etioporphyrins from hemin by the paraffin-phenol-oxalic acid method. b. A new procedure for conversion of hemin into pyroporphyrin. c. Decomposition of hematoporphyrin-Nencki, hemateric acid, uroporphyrin, dimethoxyhemin dimethyl ester and hematohemin by resorcinol, of hemin by hydroxyhydroquinone. 2. Bacteriochemical preparation of copratoporphyrin. O. SCHUMM. Hamburg Univ. *Z. physiol. Chem.* **181**, 141-75 (1929); cf. C. A. **23**, 153.—Removal of  $CO_2H$  groups from free porphyrins and from their Fe complexes can be effected by simply heating in liquid paraffin at  $340-60^\circ$ . Meso-porphyrin and pyroporphyrin are thus converted directly into etioporphyrins. Pyratin, hemin and mesohemin by this treatment yield Fe complexes from which the etioporphyrins can then be obtained by treatment with  $N_2H_4-AcOH$  or with  $PhOH-C_6H_5O_4$ . If the heating is continued for several hrs. at a higher temp.,  $385-8^\circ$ , further decompn. occurs. Hemin then yields not only etiomesohemin but also a product from which etiopyroporphyrin is obtained by the  $PhOH-C_6H_5O_4$  treatment. Besides the loss of  $CO_2H$  groups there occurs here either a satn. or a splitting off of the unsatd. side chains according to the temp. employed. The higher the temp. the more the compn. of the final product diverges from that of etiomesoporphyrin and approaches that of etiopyroporphyrin. Hemateric acid (protoporphyrin) and Nencki's hematoporphyrin likewise yield etioporphyrins. There is evidence here of an intermediate product whose soly. and spectrum differ from the original substance and from both etioporphyrins. Uroporphyrin and coproporphyrin undergo decarboxylation, yielding a product sol. in  $CHCl_3$  and insol. in KOH, and showing the spectrochem. behavior of etiomesoporphyrin, but lack of material prevented complete identification. Decarboxylation of porphyrins and porphyratins into their etio-derivs. can also be accomplished by refluxing with anthracene or phenanthrene. The yield of etiopyroporphyrin, either from pyroporphyrin directly or from pyratin with subsequent removal of Fe by  $PhOH-H_2C_2O_4$  or by  $N_2H_4-AcOH$ , is 5-10%. It is sol. in most org. solvents and in acids, but not in KOH. By fusion with resorcinol hemin is converted into a pyratin, an Fe-porphyratin, which is identical with copratin, the product of natural putrefaction of hemin in the intestine. The pyroporphyrin obtained by removal of Fe from pyratin is identical with copratoporphyrin obtained in the same way from copratin. A new procedure by which hemin can be converted into pyroporphyrin in a single step consists in dissolving the hemin in fused  $PhOH$  and adding small portions of  $KHSO_4$ , while heating to the b. p., until a test portion dissolved in  $N_2H_4$ -contg. pyridine shows only the porphyrin spectrum. The melt is then poured into  $H_2O$ , and excess KOH added, and the reaction product pptd. by AcOH. After repeated reppts. it may be crystd. from  $Et_2O$  or converted into its cryst. Me ester. The resorcinol fusion is applicable also to hemateric acid, Nencki's hematoporphyrin, dimethoxyhemin di-Me ester and hematohemin. It is not successful with mesoporphyrin and mesohemin. The reaction requires the presence of one or more multiple linkages in the side chains of the basic pyrrole groups. Uroporphyrin yields coproporphyrin, but its Me ester undergoes complete decompn. Fusion of hemin with  $1,2,4-C_6H_3(OH)_3$  converts it into pyratin, from which pyroporphyrin and its Me ester can be obtained in the usual way. The prepn. of pyroporphyrin, which is identical with copratoporphyrin, by the resorcinol treatment of hemin is far superior to the bacteriochem. method, where the process is time-consuming, the yield small and the putrefaction odors are highly offensive. A. W. DOX

**The bile acids. XXIII.** MARTIN SCHENCK AND HENRY KIRCHHOF. Univ. Leipzig. *Z. physiol. Chem.* 181, 185-98(1929); cf. *C. A.* 23, 1646.—In continuation of a study of the NO and NO<sub>2</sub> derivs. of bile acids, the action of HNO<sub>3</sub> on desoxybilanic acid oxime (I) and dehydrocholic acid trioxime (II) was examd. I gives a yellow soln. in which a transient green color is recognizable, then the color changes to brown and crystals of desoxybilanic acid sep. The transient green color would indicate the intermediate formation of a NO compd. which possibly undergoes further oxidation to a colorless NO<sub>2</sub> deriv., the NO group eventually being split off and replaced by O. This behavior suggests the presence of a double bond adjacent to the C to which the NO is attached. Replacement of the NO by OH would then yield an enolic deriv. capable of immediate transformation to the keto form. A soln. of I in 25% HCl, on the other hand, gives a cryst. deposit of the HCl salt of the oxime while the filtrate gradually splits off NH<sub>2</sub>OH. HNO<sub>3</sub> dissolves II with immediate development of a blue color and evolution of gas. The color gradually changes to green and finally brown with sepn. of crystals. These crystals after purification by recrystn. from 50% AcOH gave the empirical formula C<sub>24</sub>H<sub>42</sub>N<sub>2</sub>O<sub>8</sub> and decompn. p. 280°. When heated with Ph<sub>2</sub>NH and concd. H<sub>2</sub>SO<sub>4</sub> the substance gives a blue color and with PhOH and H<sub>2</sub>SO<sub>4</sub> a dark green color, indicating the presence of a NO<sub>2</sub> group. An intense brownish red color reaction with FeCl<sub>3</sub> indicates a hydroxamic acid structure. The NO<sub>2</sub> group is loosely bound, since it is easily split off by NaOH, yielding bilanic acid. In the reaction between HNO<sub>3</sub> and II all 3 oxime groups behave differently; one is split off by hydrolysis, another is oxidized to NO<sub>2</sub>, and the 3rd (isoxime) by rupture of the ring goes into a hydroxamic acid grouping. A. W. Dox

Manufacture of anthracene in U. S. S. R. (SOKOLOV) 21. Behavior of *N* alkali, erepsin and trypsin-kinase toward polypeptides containing 3,5-halogen substituted tyrosine, and toward glycyl-*D*-tyrosine, glycyl-*DL*-nitrotyrosine and glycyl-*DL*-*o*-tyrosine (ABDERHALDEN, SCHMITZ) 11A. LOCKEMANN, GEORG. Ernst Beckmann, Sein Leben und Wirken. Berlin: Verlag Chemie, G. m. b. H. 65 pp. M. 2.50.

**Oxidation of organic compounds.** THE SELDEN CO. Fr. 649,292, Nov. 7, 1927. In the catalytic oxidation of org. compds. for the production of intermediate oxidation compds. or for the purification of mixts. contg. org. impurities, the compds. are brought, preferably in the state of vapor mixed with gases contg. O, into contact at a high temp. with contact substances which contain at least one catalyst assocd. with at least one stabilizer other than a strong alkali, with or without stabilizer promoters. The catalyst may contain a non-siliceous base-exchange substance or deriv. or product of reaction of such a substance, and a 2- or multi- component zeolite or deriv. or product of reaction of such a substance. The base-exchange substance is intimately assocd. with a diluting agent to form a homogeneous product, the diluting agent being either catalytically active or inactive and contg. stabilizers or stabilizer promoters or both. The contact mass is preliminarily calcined or treated with acid gases at a high temp. The process is of very wide application and several examples are given.

**Halogenating organic compounds.** COMPAGNIE NATIONALE DE MATIÈRES COLORANTES ET MANUP. DE PRODUITS CHIM. DU NORD RÉUNIES, ÉTABLISSEMENTS KUHLMANN. Fr. 649,851, July 23, 1927. Halogen compds. are prepd. by halogenating the arylides of mono- or poly-sulfonic acids of aromatic, cyclic or heterocyclic compds. and sapon. In examples, (1) 5-chloro-*o*-toluidine is prepd. by condensing *o*-toluidine with *o*-toluene-sulfonylchloride, suspending the product in glacial AcOH, adding HCl and NaClO<sub>2</sub>, and sapon. (2) 3-chloro-4-aminotoluene by condensing *p*-toluidine with 3-nitro-4-methylbenzenesulfonic acid, passing Cl through a suspension of the product in tetrachloro-

ethane and sapon., (3) 2,4-dichloroaniline by condensing  $\text{PhNH}_2$  with *p*-toluenesulfonylchloride, chlorinating with gaseous  $\text{Cl}_2$  and sapon., (4) 1-chloro- $\beta$ -naphthylamine by condensing  $\beta$ -naphthylamine with *p*-toluenesulfonylchloride, chlorinating with  $\text{SO}_2\text{Cl}_2$  and sapon.

**Separation of organic gases or vapors.** I. G. FARBERIND. A.-G. (Hanns Carstens, inventor). Ger. 472,804, March 1, 1921. Addn. to Ger. 310,092. Org. gases and vapors are sepd. from mixts. contg. air or other slightly absorbable gases such as  $\text{H}_2$ , by using water-impregnated C. Thus, an open cylinder full of wood charcoal is placed in a current of steam at  $100\text{--}110^\circ$  until the charcoal is at the same temp. as the steam. The charcoal is cooled by blowing through air and then com.  $\text{C}_6\text{H}_6$  vapor at  $15^\circ$ . The  $\text{C}_6\text{H}_6$  is absorbed, with a rise of temp. to  $38^\circ$ . When the absorption of  $\text{C}_6\text{H}_6$  reaches satn., the substance is blown out by steam and sepd. therefrom by condensation. The charcoal is then ready for further use. A charcoal contg. 19.8% water, will absorb 69% of its weight of  $\text{C}_6\text{H}_6$  from an air and  $\text{C}_6\text{H}_6$  current contg. 92%  $\text{C}_6\text{H}_6$ .

**Olefins.** HENRI SPINDLER. Fr. 649,687, July 11, 1927. Satd. hydrocarbons are converted into  $\text{C}_2\text{H}_4$ , propylene, butylene, etc., by heating them with  $\text{CS}_2$  from  $400^\circ$  to  $800^\circ$  according to the mol. wt. of the hydrocarbon treated. The heated tube may contain pumice stone, bauxite, etc., and a catalyst.

**Aromatic hydrocarbons.** CHEM. FABRIK POTT & CO. and FRIEDRICH POSPIECH. Ger. 474,658, Nov. 29, 1922. Hydrogenated aromatic hydrocarbons and their derivs. such as tetrahydronaphthalene, cyclohexanol and methylcyclohexanol, in which a small amt. of aromatic sulfo acid is dissolved, form clear liquids, which give a colloidal soln. on addn. of water. Thus, Na propylnaphthalenesulfonate is mixed with tetrahydronaphthalene and warmed. The product is a clear soln., which, with water, gives a highly dispersed emulsion. Another example is given.

**Hydrogenating hydrocarbons.** COMPAGNIE DE PRODUITS CHIMIQUES ET ÉLECTRO-MÉTALLURGIQUES ALAIS, FRÖGES & CAMARGUE. Ger. 473,457, May 7, 1925. The hydrogenation of  $\text{C}_{10}\text{H}_8$ ,  $\text{C}_{14}\text{H}_{10}$  and other hydrocarbons is effected with the use of Na-K alloys as catalysts. Careful preliminary purification of the hydrocarbon is then unnecessary. Suitable alloys are NaK and  $\text{NaK}_2$ . The catalysts should be used in finely divided state on a support such as kieselguhr, and the reaction mixt. should be strongly agitated. Examples are given.

**Benzanthrone hydrogenation products.** LEOPOLD CASSELLA & CO., G. M. B. H. (Otto Bayer, inventor). Ger. 473,456, Dec 4, 1925. Addn. to 453,578. Ger. 453,578 describes the manuf. of a tetrahydrobenzanthrone by treating benzanthrone with H under pressure in the presence of a Ni catalyst. It is now found that higher hydrogenation products are obtained if the hydrogenation is effected under more energetic conditions. According to the example, tetrahydrobenzanthrone is first prepd. by hydrogenating benzanthrone at about  $120^\circ$ , and is then heated at  $160\text{--}200^\circ$  in the presence of H under pressure until 4 more atoms of H have been taken up. The product is  $\text{C}_{17}\text{H}_{18}\text{O}$ , m.  $137^\circ$  and b.  $250^\circ/15\text{ mm.}$  If the temp. is allowed to rise above  $200^\circ$  or if the process is allowed to continue, a hydrocarbon of the formula  $\text{C}_{17}\text{H}_{18}$ , b.  $228\text{--}230^\circ/15\text{ mm.}$  is obtained.

**Hydrogenated acids and esters.** I. G. FARBERIND. A.-G. Fr. 649,626, Feb. 23, 1928. Hydrogenated carboxylic acids and esters are prepd. by heating to  $120\text{--}150^\circ$  esters of aromatic acids with H under pressure and in the presence of a Ni catalyst with or without a solvent. The esters are finally sapond. if desired. In an example hexahydrobenzoic acid ethyl ester is prepd. by treating benzoic acid ethyl ester at  $130\text{--}150^\circ$  under  $30\text{--}40\text{ atm.}$  of H in an autoclave in the presence of Ni. Examples are also given of the prepn. of hexahydrophenylacetic acid ethyl ester, hexahydrocyclic acid methyl ester, hexahydrophthalic acid diethyl ester, hexahydroterephthalic acid methyl ester, 5,6,7,8-tetrahydro-1-naphthoic acid ethyl ester,  $b_{12}\ 156\text{--}159^\circ$ , 5,6,7,8-tetrahydro-2,3-hydroxynaphthoic acid ethyl ester,  $b_{17}\ 170^\circ$ , 5,6,7,8-tetrahydro-2,3-amino-naphthoic acid ethyl ester, m.  $55\text{--}58^\circ$ , which on sapon. gives the acid, m.  $178^\circ$ .

**Mixed esters.** PAUL F. H. SCHVING. Fr. 650,100, Aug. 8, 1927. Mixed esters of carbonic acid are prepd. by the action of a chloroformic soln. of ethyl chlorocarbonate on alc. solns. in the presence of pyridine, or on the Na deriv. of a tertiary alc. The ethyl carboxylic derivs. of phenylethyl, benzyl, cinnamic and anisic alc. and of geraniol, citronellol and linalool may thus be prepd.

**Esters of vinyl alcohol.** CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE, G. M. B. H. Fr. 649,455, Feb. 1, 1928. See Brit. 285,095 (C. A. 22, 4537).

**Alkamine esters of *N*-substituted  $\alpha$ -aminobenzoic acid.** I. G. FARBERIND. A.-G. (Otto Eisleb, inventor). Ger. 473,216, Oct. 29, 1925. Addn. to 431,166. This corresponds to Brit. 260,605 (C. A. 21, 3425) but gives an addnl. example.

**Basic ethers of resorcinol.** HANS HAHN (to Winthrop Chemical Co.). U. S. 1,711,020, April 30. Twenty parts Na is dissolved in 400 parts alc. and treated with 100 parts resorcinol monomethyl ether. The reaction mixt. is heated for about 2 hrs. to about 100–20° with 125 parts diethylaminoethyl chloride. After distg. off the alc. the residue is treated with water, the resulting oil sepd., dried and fractionated. The compd. thus obtained,  $b_{12}$  160–6°, is a colorless liquid. It gives with HCl a cryst. salt, m. 138–140°. Forty parts resorcinol monomethyl ether is treated with a soln. of 8 parts Na in 300 parts alc. and heated for about 3 hrs. to about 80–100° after the addn. of 60 parts 1-dimethylamino-2-methyl-3-chlorobutane. After distg. off the alc. the new basic ether,  $m\text{-MeOC}_6\text{H}_4\text{OCHMeCHMeCH}_2\text{NMe}_2$ , is sepd. with water and fractionated after drying. It  $b_{12}$  170–2°, and is a colorless oil. 3.5 parts Na is dissolved in 100 parts alc. and heated together with 20 parts resorcinol monoethyl ether and 20 parts diethylaminoethyl chloride for about 5 hrs. to about 100–10°. When the reaction is complete the product is worked up as in the case of the first product described. The new base,  $b_{12}$  171–9°, is a yellow liquid which is easily sol. in acids. These new products are vasoconstrictive and excite labor pains. They are of basic odor, difficultly sol. in water and easily sol. in acids.

**Carbohydrate derivatives.** WILLIAM HARRISON. Fr. 650,004, Oct. 29, 1927. See Brit. 286,331 and 286,332 (C. A. 23, 155).

**Derivatives of aminohydroxybenzenes.** I. G. FARBENIND. A.-G. Fr. 649,761, Oct. 10, 1927. *N*-Hydroxyethyl derivs. of 4-amino- and 2-amino-1-hydroxybenzene are prepd. by condensing the 4- or 2-amino compd. with glycol halohydrins or with ethylene oxide, at ordinary or raised temp. and pressure, preferably in the presence of solvents or diluents or acid-binding agents, and, if necessary, in the presence of catalysts. In examples, 4-amino-1-hydroxybenzene is heated with ethylene chlorohydrin and  $\text{Na}_2\text{CO}_3$ , yielding 4-[di(hydroxyethyl)amino]-1-hydroxybenzene, m. 140°. The following are also prepd.: 4-(hydroxyethyl)amino-1-hydroxybenzene, m. 96–97°. 2-[di(hydroxyethyl)amino]-1-hydroxybenzene, which decomposes slowly above 240°, and 2-(hydroxyethyl)amino-1-hydroxybenzene, m. 80–81°.

**Anthracene derivatives.** I. G. FARBENIND. A.-G. (Georg Kränzlein and Wilhelm Fekert, inventors). Ger. 472,825, Oct. 18, 1925. Anthracene derivs. are prepd. by reducing the corresponding anthraquinone deriv. at temps. over 300° with H or other reducing gas, in the presence of a catalyzer. Thus, 2-aminoanthraquinone is mixed with Cu or Zn dust in a tube and sublimed at 460–475° in a current of H. In the cool part of the tube, yellow-green crystals of 2-aminoanthracene, m. 235°, appear.

**$\alpha$ -Naphthylamine derivative.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 130,423, April 8, 1927. Tetrahydro-*N*-ethyl- $\alpha$ -naphthylamine is prepd. by the catalytic hydrogenation of *N*-ethyl- $\alpha$ -naphthylamine. The process is carried out under 30 atm pressure at 130° with Ni as the catalyzer.

**Tertiary nitriles.** I. G. FARBENIND. A.-G. (Max Bockmühl and Gustav Ehrhardt, inventors). Ger. 473,329, June 23, 1925. This corresponds to Brit. 253,950 (C. A. 21, 2478) but gives addnl. examples describing the prepn. of triethylacetone nitrile, b. 60–64°/10 mm., isopropylethylallylacetone nitrile, b. 78–81°/7 mm., and triallylacetone nitrile b. 100 120°/4 mm. Cf. C. A. 23, 396.

**Ureides.** J. D. RIEDEL-E. DE HAËN, A.-G. Ger. 473,519, June 17, 1926. Addn. to Ger. 461,814. Acids of the general formula  $\text{EtMeCH.CHR.CO.NH.CO.NH}_2$ , where R is an unsatd. residue, are converted to their ureides. Thus, Na and diethyl *sec*-butylmalonate are dissolved in abs. alc. and heated for some hours with allylbromide. The alc. is distd. off and the residue is dissolved in water, extd. with ether and dried over  $\text{Na}_2\text{SO}_4$ . On distg. off the ether, *sec*-butylallylmalonate remains. This malonate is sapond., acidified and heated to give *sec*-butylallylacetic acid. This is heated with thionyl chloride until no further HCl is evolved, and fractionated, to produce *sec*-butylallylacetyl chloride. This is heated with urea for several hrs. in a steam bath, and the product extd. with water and recrystd. with alc. giving *sec*-butylallylacetylureide.

***N*-Substituted diaminopropanols.** I. G. FARBENIND. A.-G. (Otto Eisleb, inventor). Ger. 473,219, Aug. 4, 1926. See Brit. 275,622 (C. A. 22, 2171).

**Propyl- and dipropylcresols and similar compounds.** RHEINISCHE KAMPFER-FABRIK GES. Brit. 298,600, Oct. 12, 1927. Propylene is condensed with *o*-, *m*- or *p*-cresol by the action of catalysts to attach a Pr or iso-Pr group at the nucleus or at the O atom or both. There may be used as catalysts: alumina, Al phosphate and Th oxide or W oxide, alone or on carriers such as pumice, kieselguhr, asbestos, silica gel and active charcoal, dried kaolin, brick clay, fuller's earth and similar materials,  $\text{ZnCl}_2$ , anhyd. acids and acid chlorides such as  $\text{H}_3\text{PO}_4$  and  $\text{H}_2\text{SO}_4$ , sulfonic acids,  $\text{P}_2\text{O}_5$ ,

or mixts. of these or similar substances. A compd. such as thymol, dipropyl-*m*-cresol, *m*-cresol isopropyl ether or thymol isopropyl ether may be used instead of all or part of the propylene. Numerous details and modifications of the process are described.
